The true *Seseli Massilienſe Dioscoridis*, as it is taken by the most judicious Herbarists of our times hath a very long white slender roote like unto Fennell, but smelling better, and tasting hotter and sharper, having but few leaves thinly set on the stalkes, thicker and shorter, and harder than Fennell leaves, turning downewards, of a grayish or ash colour, as all the rest of the plant is (especially in the hotter countries, for in some places they are thicker or longer or shorter than in others, as *Bauhinus* saith is observed) the middle stalke riseth not above a foote high, bowing to and fro sometimes, having many branches from the bottome with the like leaves on them, and each bearing umbells of white (most usually and seldome purplish) flowers, after which come small long seede more like to Annise seede than Fennell, somewhat pleasant in taste, yet sharpe and hot.

1. *Seseli Massilienſe folio Fœniculoquod Dioscoridis censetur.* The true *Seseli* or Hart wort of *Dioscorides* as it is thought.

2. *Seseli Massilienſe alterum.*
Another Hart-wort of *Marselles*.

This other *Seseli Massilienſe* hath likewise Fennell-like leaves, but thicker and shorter divided, greene and hard, but with white points, whose winged stalkes are large and more spread than Fennel: the middle stalke is two cubits or more high, of a fingers thicknesse, crested, jointed, and branced into divers other smaller parts, each of them carrying umbells of white flowers on their toppes which turne into flat seede, not much unlike to Angelica seede, and bigger than Dill, hot in taste, and very aromaticall, the roote is thicke, long, and white, with divers strings and fibres thereat encreasing earely.

2. *Seseli Massiliense alterum.*
Another Hart-wort of *Marselles.*

3. *Seseli pratense Monspelliensium.*
Medow Hart-wort of *Montpelier.*

4. *Seseli pratense nostras.*
Our *English* greene Saxifrage?

6. *Seseli palustre lactescens.*
Milkie Marsh Hart-wort.

3. *Seseli pratense Monspelienſium.* Medow Hart-wort of *Mompelier.*

The roote of this Hart-wort is blacke without and white within, parted into many ſtrings with fibres at them encreaſing well, from whence riſeth a ſtalke two or three foote high, with divers large ſpread ſtalkes of winged leaves, very finely cut into many parts, each being like unto Fennell, but larger, harder, and of a darke greene colour, ſet at the joynts, and branching forth towards the toppes, bearing umbells of white flowers, and after they are paſt, ſmall, long, and ſomewhat flat ſeede, larger and blacker than Fennell, and neare unto *Meum Spignell*, of little ſent, and a ſmall ſharpe taſte.

4. *Seseli pratense noſtras.* Our *Engliſh* greene Saxifrage.

The likeneſſe of this our *Engliſh* greene Saxifrage unto the laſt *Seseli* deſcribed, hath made me joyne it next thereunto, although I might have put into the Claſſis of the Saxifrages, but that being an umbelliferous, I would place it among the ſame Tribe or Family, which hath ſtalkes riſing nothing ſo high, ſomewhat creſted, and thereon ſtalkes of winged fine cut leaves, but nothing ſo largely ſpread, yet ſomewhat like them in greeneneſſe, harſhneſſe and forme, or ſomewhat leſſe; the umbells of flowers are ſmaller, paler, or ſomewhat tending to a yellowiſh whiteneſſe, and the ſeede after them like unto common Fennell ſeede, both for forme and greatneſſe, but of a browner colour and ſmall taſte.

5. *Seseli pratense tenuifolium.* Medow Hart-wort of *Germany.*

This *German* Hart-wort hath a round creſted or ſtraked ſtalke above two cubits high, with divers joynts and leaves at them, very like for the forme and diviſions unto the wild Carrot leaves, but ſmooth, and not rough, and of a deepe greene colour, branching forth into ſundry parts, bearing umbells of whitiſh yellow flowers, after which follow ſmall long ſeede ſomewhat like Fennell and Carraway, or betweene them both, and ſomewhat aromaticall: the roote is as thicke as ones finger, and very long, blacke without, and white within, of a ſharpe and ſomewhat bitter taſte.

6. *Seseli paluſtre lactescens.* Milkie Marſh Hart-wort.

This milke Hartwort riſeth up with a round ſtemme or ſtalke three cubits high, with joynts and long ſtalkes of well ſpread leaves ſet at them, the diviſions whereof are very ſmall and much cut in, almoſt like to thoſe of Carrawayes, or betweene them and Fennell, at the toppe of the ſtalkes it breaketh forth into branches, and they beare ſmall umbells of white flowers, after which follow thinne, flat, and winged ſeede: the roote is long and browne on the outſide, of an unpleaſant taſte, with no ſmall heate joyned therewith, which inflameth the throate, but being planted in a Garden, it looſeth much of the evill taſte of the burning qualitie becomming more milde: the whole plant, or any part thereof being broken, there iſſueth from it a certaine milke, as many other umbelliferous plants doe.

7. *Seseli Creticum majus.* The greater Hart-wort of *Candy.*

This greater *Candiot* kinde hath rough and hairy round ſtalkes, about two or three foote high, ſet with long ſtalkes of winged leaves, much reſembling Parſneppe leaves, both in forme and greatneſſe, yet ſomewhat longer and narrower, dented about the edges, and pointed at the ends, being rough and hairy likewiſe, and turning themſelves a little backward to the ſtalke, towards the toppes of the ſtalkes they branch forth and have ſmaller leaves ſet at the joynts than grow below, bearing umbells of purpliſh white flowers, whereon after they are fallen, grow flat whitiſh round ſeede, circled about, as it were, with a border, and cut in round about it alſo with round dents, of little or no ſmell or taſte: the roote is white, ſomewhat long and wooddy after it hath ſeeded, and periſheth, riſing from the ſowing of its owne ſeede againe plentifully.

8. *Tordilium ſive Seseli Creticum minus.* The leſſer Hart-wort of *Candy.*

The leſſer *Candiot* Hart-wort hath ſuch like ſtalkes of winged leaves, but ſmaller, rounder, and ſhorter, ſomewhat hairy and whitiſh: the ſtalkes are leſſer and lower, fuller of branches, bearing paler purpliſh flowers in umbells and ſeede after them, of the ſame faſhion, but ſomewhat ſharper and quicker, as the herbe is alſo, and therefore more accepted and uſed as a ſallet herbe with the *Italians* and others: the roote is as unprofitable and periſheth as the laſt.

9. *Seseli Creticum majus luteum.* Great *Candy* Hart-wort with yellow flowers.

This Hart-wort groweth very like the firſt greater kinde, having the like leaves on the ſtalkes, but ſomewhat broader and ſhorter, a little ſharpe in taſte, and not above two or three couples together, ſet on the like ſtalkes, but ſmaller of branches, and bearing umbells of yellow flowers like Dill, without any leaves under them as the others have: after which follow ſuch like whitiſh flat buckler-like ſeedes ringed and dented about the edges like them, but larger and ſmoother, and divided in the middle with a browniſh ſtroke or line, making the ſeede ſeeme like unto a kinde of *Thlaſpi* or Treakle-Muſtard ſeede: this flowered and ſeeded at *Naples* in *May*, as *Columna* ſaith, and that onely in gardens, and not wilde.

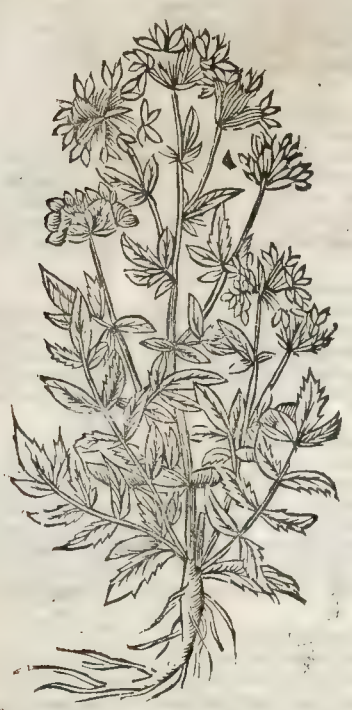
10. *Seseli Apulum Creticum minimum.* The ſmalleſt Hart-wort of *Candy.*

This ſmalleſt kinde is very like unto the leſſer *Candy* ſort that is eaten in ſallets, but with leaves like the lower leaves of Corianders, ſoft but a little hairy; the firſt leaves being of an inch and a halfe long, and an inch broad, and dented about the edges with round dents: the ſecond leafe is of two inches long; the third hath a longer ſtalke, with two leaves ſet thereon, ſmaller and rounder than the other, about halfe an inch broad, and a bigger leafe at the end, yet ſmaller and longer than the firſt leafe, the next are leſſer and longer, the ſtalke is naked of leaves below, being ſmall, hard, hairy and ſtraked, and carrying thicke umbells of white flowers, with yellow threds in the middle, and under ſet with long hairy leaves. the outer flowers being larger than the inner, thereby making the umbell reſembell that of the wilde Carrot, after which come ſuch like ſeede as the former have but not halfe ſo great, the middle part being of a darker colour, before they are ripe they looke of a purpliſh greene colour, but white when they are full ripe, of an aromaticall taſte, ſomewhat bitter, and ſomewhat ſweete in ſent: the roote is ſmall, white, hard, and a little heating in taſte. *Columna* ſaith, that the *Gingidium Syriacum foliis Bauci* of *Lobel* is like unto this plant, if the figure be not imperfect.

11. *Seseli montanum Cicutæ folio glabrum.* Mountaine Hart-wort with ſmooth Hemlocke-like leaves.

This mountaine Hart-wort hath large ſpread leaves, divided into many ſmaller parts, ſomewhat like unto Hemlockes or *Seseli Peloponenſe*: the ſtalke is hollow, and riſeth a cubit and a halfe high, dented into branches

7. *Seseli Creticum sive Tordilium majus.*
The greater Hart-wort of Candy.



8. *Tordilium sive Seseli Creticum minus.*
The lesser Hart-wort of *Candy*.

11. *Seseli montanum Cicutæ folio glabrum.*
Mountaine Hart-wort with smooth Hemlocke-like leaves.

12. *Seseli montanum Cicutæ folio hirsutum.*
Hairy mountaine Hemlocke Hart-wort.

13. *Seseli Peloponesia cum recentiorum.*
The most usuall received *Seseli* or Hart-wort of *Peloponesus*.

14. *Seseli Æthiopium frutex.*
Shrubbe Hart-wort of *Ethiopia*.

bearing small smooth long leaves, more finely divided at the joynts, and larger umbells of white flowers at the toppes, which turne into yellowish crested seede, two joyned together of an aromaticke and hot taste.

12. *Seseli montanum Cicutæ folio subhirsutum.* Hairy mountaine Hemlocke Hart-wort.

This other Hemlocke Hart-wort from a thicke roote, sendeth forth broad Hemlocke-like leaves, or like to the greater sweete Chervill, of a darke greene colour, and some what rough and hairy, especially the foote stalkes of the leaves, in the middle of whom riseth up a thicke hollow, crested, hairy and joynted stalke, about two foote high, divided into severall branches, with few leaves thereon but lesser: at the toppe whereof standeth a large umbell of white flowers, which are succeded by long, sharpe pointed seede, two joyned together.

13. *Seseli Peloponesiacum recentiorum.* The most usuall received *Seseli* or Hart-wort of *Peloponesus*.

This *Grecian* Hart-wort hath a great roote, blackish on the outside, and white within, growing deepe into the ground like *Ferula* or *Thapsia*, somewhat sweete in smell and hot in taste, the stalke riseth two foot high or better, as thicke as ones finger, with divers large spread leaves at the bottome as great as Hemlocke, but crumpled, rough and hairy; the stalke and branches beare large tufts or umbells of yellow flowers, which after yeeld broad flat winged seede, of a pale yellow colour, somewhat like unto Angelica, but greater, and nothing so thicke, of a very sweete sent as the Seseli *Æthiopicum* hath. This, saith *Lobel*, the chiefest learned and most judicious Herbarists of *Mompelier*, acknowledged upon due consideration thereof, to be the true *Seseli Peloponense* of *Dioscorides*, although formerly they tooke it to be a kinde of Thapsia, but saith he, the true Thapsia is much differing, both in forme and colour from this, so that none there doubteth of the truth thereof.

14. *Seseli Æthiopicum frutex.* Shrubbe Hart-wort of *Ethiopia*.

This Hart-wort of *Ethiopia* (to keepe his fellowes company for name sake is fittest to be placed here, although shrubbie and everliving) shooteth forth sundry wooddy rough stems, covered with a blackish barke, divided into many branches two or three cubits long, beset with many faire, large, thicke and hard, smooth and pale greene leaves, being long, and somewhat like unto Woodbind leaves, but not so broad, smooth on the edges, and not snipt or dented at all, on the toppes of the branches stand small tufts of yellow flowers, which afterwards beare browniish round and long seede, bigger and larger than sweete Fennell seede: the root is great and woody, having divers smaller parts set with fibres issuing from it, abiding many yeares, if it be defended from the cold: the whole plant smelleth very well, and the seede best, being of an aromaticke taste somewhat bitter and sharpe withall, which is commended by *Dioscorides* for the best of the *Seselies*, and beyond the *Massiliense*.

15. *Seseli Cretense nodosum.* Great joynted Hart-wort of *Candy*.

This *Seseli* riseth up with foure or five hard round, and rough, or rather prickly stalkes, about two foote high, whose joynts are great, and bunched out like knees, with a rough large winged leafe, or two at each of them, some of three, and others of five parts, and every of them also divided into severall parts, of a sad or dead greene colour, changing reddish at the seed time; the stalke is rough and crested, and the sundry branches hereof do carry small tufts of white flowers, which turne into great, long, and round, rough seede: the roote is composed of divers slender, long, white wooddy strings, perishing yearely.

The Place and Time.

Most of these *Seselies* grow about *Mompelier*, and in *Narbone* in *France*, yet some in *Germany*, other in *Italy* and *Candy*;

Candy, and some in our owne country; and although some of them be entituled of *Candy*, yet that is but to answer that kinde which *Dioscorides* doth so call, as likewise that of *Peloponesus* in *Greece*, and that of *Ethiopia*: and most of them doe beare ripe seede with us before the end of Summer, if care be had in the ordering and keeping of them.

The Names.

Σέσελι in Greeke, is likewise called *Seseli* in Latine, and of some *Sile*. The first is taken by *Lobel* to be the true *Seseli Massilienſium* of *Dioscorides*, because there is not about *Marſeilles* & *Mompelier*, any other herbe that answereth so truely unto the description thereof by *Dioscorides* as this doth, and *Clusius* also consenteth hereunto, and so calleth it. *Lobel* saith also that formerly it was called by the students, and others there, *Fœniculum turtuoſum*, because the stalke groweth seldome upright but crooked: the second is the other *Seseli Massilienſe* of *Lobel*, which he calleth *Ferulæ aut Dauci Cretici facie*, & the *Seseli Massilienſe* of *Matthiolus*, against whom *Lobel* contesteth for affirming that it grew on the hills by *Trent*, where he saith, it is not to be found, nor yet on *Baldus*, which is more fruitfull in rare plants than they are, and but onely to be found about *Mompelier*, and at the foote of Mount *Fiascone* in *Italy*, which is in the way from *Rome* to *Sienna*. *Camerarius* calleth it *Seseli Massilienſe nonnullorum*, and saith *Lucas Ghinus* affirmed to have seene twentie sorts of herbes called all by that name. *Gesner in horto*, *Lugdunenſis* and others, doe meane this kinde that they call *Massilienſe*: the third *Lobel* also calleth *Seseli pratenſe Monſpelienſium*, which *Gesner in horto* thinketh is the *Ligusticum* of *Matthiolus*, *Dodonæus* calleth it *Siler alterum pratenſe*, *Bauhinus* thinketh it may be the *Silaus Plinij in lib. 26. c. 8.* and withall saith it is the *Pastinaca nigra* of *Cordus* in his history, which in my judgement differeth much from it, for that of *Cordus* hath divided leaves like wilde Carrots, and this like Fennell, that hath yellowish flowers, this white, and the seede likewise seemeth to be more sharpe, which is not found in this, although growing in a hotter climate. *Tabermontanus* calleth it *Hippomarathrum*: the fourth *Lobel* calleth *Saxifraga Anglorum facie Seseli pratenſis Monſpelienſium*, for although it be somewhat like to it, yet it is not the same as he there sheweth: the fift is called by *Bauhinus Seseli pratenſe tenuifolium ſive Daucoides pratenſis tenuifolius* described in his *Prodromus*, as though none had expresst it before, when as it is the very same *Pastinaca nigra* of *Cordus* spoken off before, as any that will compare them together shall easily finde: the sixt *Camerarius in horto* described, but *Bauhinus* in *Prodromo* giveth the figure of it, which none had done before: the seventh is called *Tordylion ſive Seseli Creticum majus* by *Lobel* and *Lugdunenſis*, and *Seseli Creticum majus* by *Camerarius*; *Cæsalpinus* saith, that in *Italy* it is called *Pimpinellæ Romanæ alterum genus ſylveſtre*: the eight is the *Ordilion Nicandri*, and *Tordylion Dioscoridis* by *Anguillara*, *Tordylion* and *Gordilion* by *Dodonæus*, *Gesner*, and others, and *Seseli Creticum* by *Lobel*, *Dodonæus* and others; *Cæsalpinus* and *Columna* saith, this is commonly called in *Italy Pimpinella Romana*, and familiarly eaten as a sallet herbe, and *Bellonius* saith, that this is the *Cascalitra*, that is *Caucalis* which is used in *Candy* and *Greece*, as *Honorius Bellus* sheweth in his first Epistle to *Clusius*: the ninth is set forth by *Columna*, by the name of *Tordylion majus alterum luteum*: and the tenth is *Tordylium minimum Apulum alterum* by him also: the eleventh is thought by *Bauhinus* to be the *Leviſticum alterum* of *Lobel* and *Lugdunenſis*, *Ligusticum ſecundum herbariorum* of *Tabermontanus*, but I thinke it doth better agree unto the next, and is the *Seseli primum montanum* of *Clusius*, called by *Bauhinus Seseli montanum folio Cicutæ glabrum*, and thinketh it may be the *Seseli Peloponeſiacum* of *Dioscorides*: the twelfth is set forth by *Bauhinus* as it is in the title: the thirteenth is the true *Seseli Peloponenſe folio Cicutæ Dioscoridis*, as *Lobel* saith, and so taken by the learned at *Mompelier*, as I shewed before, and therefore thought fit to set it forth with them, although his *Peleponenſe* is placed with the Thapsias: the fourteenth is also taken at *Mompelier* for the true *Seseli Æthiopicum Dioscoridis*, as *Lobel* saith, all other authours acknowledge the verity thereof, onely *Matthiolus* maketh a doubt whether his *Seseli Æthiopicum* (which is an herbe and no shrubbe, and well knowne now to be the *Libanotis Theophrasti*) or this *Æthiopicum*, which he calleth *alterum* should be the truer, for that as he saith they both resemble it very well, but *Lobel* taxeth him too bitterly for it: the last hath his name in his title as I received it, and is not the *Daucus Creticus nodoſus* before.

The Vertues.

The true *Seseli Massilienſe* is commended by *Dioscorides* to helpe the strangury, and the straightnesse of breath, as also the suffocations of the mother, provoketh their courses, and expelleth the dead child, helpeth also the falling sickenesse, old coughes, and all other inward griefes, either the roote or the seede being taken in wine: the seede drunke in wine doth helpe digestion, expelleth winde and the paines in the bowells: it helpeth those that have taken cold in their journey, if they drinke it in wine with some pepper: it is given to Goates and other cattle to facilitate the delivery of their young. *Pliny* saith that women use it before their delivery of child (being taught by Hindes that eate *Sesels* to speede their delivery, as *Aristotle* did declare it before) to helpe them at that time. *Galen* sheweth that the rootes of *Seseli*, speaking in generall of them all, are so powerfull in heating that they provoke urine, and are of thinne parts, that they helpe the falling sickenesse, &c. the other *Seseli's*, saith *Dioscorides*, have the same facultie and operation: the *Candy Seseli* is good to provoke urine, if it be stopped or hindered, and womens courses also: the juyce taken with the seede in wine for tenne dayes together helpeth the paines of the kidneyes, and driveth forth the stone engendered therein: the roote being taken with honey is good to breake the flegme in coughes, and to cause it easily to be spit forth; *Paulus Ægineta* saith, that *Tordylium* taketh away bruises, and the blacke and blew spots that come by stroakes or otherwise if one part of *Terra Samia* be put to two parts thereof, and laid to with hony. Our *English Seseli* or Saxifrage is well experimented and much used by country people, either the juyce or the decoction or the distilled water or the seede in powder, and drunke in wine, to helpe to breake and expell the stone, to provoke urine, and to expell wind, and the chollicke in old or yong, and is much given to sucking children for the frets, as women call it, which is winde in their bodies and stomackes. The *Ethiopian Seseli* is preferred for the singular vertues therein, beyond all the other sorts of *Seseli*, and therefore most fit of all other to be used in medicines especially those two notable great compositions, *Mithridatum* and *Theriaca Andromachi*, and *Lobel* sheweth that he gathered about *Mompelier* at a time so much, that he sent thereof to *Venice* and other places sufficient for them to use in the said compositions: the rest of them are little or not at all used to any physicall purpose.

CHAP.

CHAP. XVI.

Ligusticum verum sive Siler montanum. Libisticke or Sermountaine of *Liguria.*

OF this *Ligusticum* I have two sorts to bring to your consideration both of them in face neare corresponding one another, and first of that which is held to be truest.

1. *Siler montanum vulgo Siselios.* The true Libisticke or Sermountaine of *Liguria.*

The true Sermountaine of *Liguria* riseth up with a round joynted stalke two or three foote high bearing both at the bottome and at the joynts large spread winged leaves, divided into many sundry and small leaves whose small footestalkes beare usually two leaves and sometimes foure, set one against another, and three alwayes at the end, each being much broader and shorter then Sow-Fennell leaves, almost equall to Melilot, of a small sweete sent if they bee a little rubbed, and spreading at the toppes into a few branches bearing very large umbells of white flowers and after them long, thicke, full brownish yellow seede larger by halfe then Cumin seede, two alwayes joyned together, striped on both sides and winged, with yellow shining wings at the edges, and of a quicke sharpe hot sent and taste: the roote is long great and whitish on the outside, of a hot sharpe sent and taste likewise abiding long.

2. *Siler montanum angustifolium.* Narrow leafed Sermountaine.

The stalke of this Sermountaine is small about a cubit high divided into branches, which beare small umbells of white flowers: the leaves are few separated into many thinne small leaves like unto Sow-Fennell but much shorter, and those towards and at the toppes more finely cut like haires.

The Place and *Time.*

The first is found plentifully growing on the *Appenine* hills in *Liguria*, whose chiefe Citie is *Genua*: and the other in *Austria*, and doe seldome beare ripe seede with us unlesse in a warme & kindly season.

The Names.

It is supposed by the most judicious writers of these times that it is the true Λιγυστικὸν of *Dioscorides* or Λιβυστικὸν of *Galen* by changing one letter, and tooke the name from *Liguria* the Countrey where the best and most store groweth, and there they call it *Sier montano*, in Latine it is also called *Ligusticum* but not *Levisticum*, which is our Lovage much differing from this as may soone be discerned: but this is also the same that *Matthiolus* calleth *Ligusticum*, and after him *Lugduenses Castor Durantes* and others. *Tragus*, *Lobel*, *Dodonæus* and *Clusius* call it *Siler montanum* as was used in the Apothecaries Shoppes, and *Siselios* also, because in former times they knew none of the true *Seselies*, but as *Lobel* saith this errour was tollerable, because they tooke a seede that had more sharpenesse and was of more efficacie then *Seseli*, although as *Gesner* saith it is like none of the *Seselies*, *Cæsalpinus* calleth it *Ser montanum* and *Peloponense*. *Pliny* sheweth that *Siler* tooke the name from *Sila* whereby

1. *Siler montanum vulgo Siselios.*
The true Libisticke or Ser mountaine of *Liguria.*

2. *Siler montanum angustifolium.*
Narrow leafed Ser mountaine.

they

they uſed the ſeede for *Seſeli*: and antiently they uſed to call *Seſeli* by the name of *Sili* and *Seli*: *Pliny* ſaith that *Cratevas* uſed to call it *Cunila bubula*, and ſome *Panaces*: the laſt is remembed onely by *Bauhinus* in his *Pinax*, and ſet downe in his *Prodromus*, I have called it in *Engliſh* Libiſticke, or Ser mountaine, as the fitteſt to expreſſe it.

The Vertues.

This Libiſticke or Ser mountaine is of a warming and digeſting qualitie both roote and ſeede, and helpeth inward gripings and paines, ſwellings and winde, eſpecially in the ſtomack, it provoketh urine alſo and womens courſes being drunke or the roote outwardly applyed, and is uſed againſt the bitings of venemous beaſts and Serpents, and therefore is put both into Mithridate and Treakle, and for the propertie to breake winde is uſed among other things tending to the ſame purpoſe: the *Ligurians* among whom it groweth uſe the ſeede familiarly in their meats, to ſeaſon and relliſh them as others doe with pepper.

CHAP. XVII.

Carum. Caraway.

ALthough with moſt writers there hath beene but one kind of Caraway formerly remembred, yet becauſe there are two other herbes that nearely reſemble it, I will put them together.

1. *Carum vulgare.* Ordinary Caraways.

The ordinary Caraway is well knowne to beare divers ſtalkes of fine cut leaves lying on the ground, ſomewhat like to the leaves of Carrots, but not buſhing ſo thicke, of a little quicke taſte in them, from among which riſeth up a ſquare ſtalke, not ſo high as the Carrot, at whoſe joynts are ſet the like leaves but ſmaller and finer, and at the toppe ſmall open tufts or umbells of white flowers which turne into ſmall blackiſh ſeed leſſer that the Anneſeede, and of a quicker and hotter taſte, the roote is whitiſh ſmall and long, ſomewhat like unto a Parſnep, but with a more wrinkled barke and much leſſe, of a little hot taſte and quicke, and ſtronger then a Parſnep, and abideth after ſeedetime.

1. *Carum vulgare.* Ordinary Caraways.

2. *Carum Alpinum.* Mountaine Caraway.

This mountaine Caraway is a ſmall plant and ſmooth, ſhooting forth from a long blackiſh aromaticall roote ſundry long ſtalkes with leaves on them like unto the former Caraway, but the devided leaves are ſomewhat broader and of a pale greene colour, from among which riſeth one or two ſlender ſtalkes halfe a foote high, from the middle upwards bare or without leaves and thence ſpreading five or ſix ſmall ſprigges to forme an umbell, each of them bearing at the toppe a few ſmall flowers in a tuft as it were together, of a reddiſh yellow colour.

2. *Carum pratenſe.* Medow Caraway.

The Medow Caraway groweth greater and higher then the ordinary kinde, with leaves ſomewhat like alſo unto it but larger, the ſpokie umbells of white flowers are likewiſe larger, and the ſeede like unto Cumin ſeede but much larger: the roote is ſmall and ſlender of a ſent ſomewhat ſtrange or like unto Dauke, of an hot and ſharpe taſte yet not ſo much as the ſeede.

The Place and *Time.*

The firſt groweth as *Tragus* ſaith in *Germany* in many places in the fields, and by the way ſides, it is uſually ſowen with us in Gardens: the ſecond was found on the *Pyrenian* hills, and the laſt in the fields and medowes of *Germany*, as *Tragus* ſaith alſo: they flower in *June* or *July* and ſeede quickly after.

The Names.

Κάρον in Greeke is *Caros*, and *Carum* in Latine or *Carui*, as it is in the Apothecaries ſhoppes, *Simeon Sethi* calleth it *Carnabadion*, and tooke the name as *Dioſcorides* ſaith from the Conntrey of *Caria*, from whence it was firſt brought. All Authors doe generally call the firſt *Caros* or *Carum* and ſome *Careum* and ſome *Carvum* as it is in ſhoppes, *Bauhinus* calleth it according to his owne country name *Carum pratenſe*: the ſecond *Bauhinus* hath onely expreſſed in his *Pinax* and deſcribed in his *Prodromus*: the laſt *Tragus* calleth *Cyminum equinum* after the high *Dutch* name as they call it there *Roſſkimmel*: *Bauhinus* referreth it to the *Fœniculum erraticum alterum Lonicer*i and *Hippomarathrum* of others, as if it were a Fennell when he himſelfe calleth it onely *Caruifolia*. The *Arabians* call it *Karvia*, *Karavia* or *Carvi*, the *Italians Carro*, the *Spaniards Caravea*, and *Alcaravea*, the *French Carni*, the *Germanes Wiſenkummell* that is, *pratenſe Cuminum*, and of ſome *Motthkummell*, the *Dutch Carve*, oft *Swicker peen*, and we in *Engliſh* Caraway.

The Vertues.

Caraway ſeedes are hot and dry as Galen ſaith, almoſt in the third degree, and have withall a moderate ſharpe qualitie, whereby it breaketh winde and provoketh urine, and that not the ſeede onely but the herbe alſo and the roote thereof is better foode then of the Parſnep, and is pleaſant and comfortable to the ſtomacke helping digeſtion:

ſtion: the ſeede is conducing to all the cold greefes both of the hēad and ſtomacke, the bowels or mothēr, as alſo the winde in them, and helpeth to ſharpēn the eye ſight: the powder of the ſeede put into a poultis taketh away blacke and blew ſpots of blowes or bruiſes: the ſeede is much uſed in Bread, Cakes, &c. to give a relliſh and warming qualitie to them as of a ſpice, and in Comfits, to eate with fruit to breake the windineſſe of them: the herbe it ſelfe or with ſome of the ſeede bruiſed and fryed layd hot in a bagge or double cloth to the lower part of the belly doth eaſe the paines of the winde Chollicke.

CHAP. XVIII.

Aniſum. Aniſe.

ANiſe is a ſmall low herbe ſeldomē a yard high, having the lower leavēs broader thēn thoſe abovē few upon the ſtalkes, ſeldome divided, but dented on the fore part, of a whitiſh greene colour, and of a good ſweet taſte and ſmell, the ſtalk is rounder and not ſpread into branches ſaving at the toppe, where the white umbells of flowers doe ſtand, which afterwards give ſmall round whitiſh ſeede very ſweete, yea more then any unbelliferous ſeede and pleaſant taſte, and ſmell yet ſomewhat quicke withall: the roote is ſmall and periſheth every yeare, and is to be nęw ſowen in the Spring.

The Place and *Time.*

It is every where ſowen even in the Eaſt Countries as *Syria*, &c. or elſe where, and not knowne where it is naturall, but is very fruitfull and plentifull in hot countries, being ſowen and gathered within three or foure moneths at the moſt.

The Names.

It is called in Greeke ἄνισον *quaſi* ἀνίκητον *vocavere, quia cibi appetentiam præſtaret, & forſan ſic dictum* ὅτι ἀνίησι τὰς ἔμπνευματώσεις, *quod tenſiones flatulentas internas & externas remittat laxetque*: it is generally called *Aniſum* of all authors, and almoſt by all nations according to their dialect, onely the *Spaniards* call it *Matahalna* and *yerva dolce*.

Aniſum. Aniſe.

The Vertues.

Galen hath erred very much in relating the temperaturē of Aniſe ſeede, ſaying it is hot and dry in the third degree, and burning withall, by reaſon of the ſharpeneſſe and bitterneſſe: when as it is well knowne it hath no ſuch acrimonie therein that it ſhould come neare to any burning qualitie: for the ſweeteneſſe doth ſo temper the ſharpeneſſe therein that it doth not exceede thē ſecond degree in heate nor the firſt in drineſſe: but the chymicall oyle drawen from the ſeed exceedeth much theſe degrees, thē ſpirits being contracted muſt needs be the more fierce: The ſeede being often taken helpeth a ſtinking breath and to breakē winde in any part of the body, bee it the head, ſtomacke, ſpleene, bowells or mother, and to provoke Vrine and ſleepe to them that want it: they helpe Nurſes to ſtore of milke for their children, to eate the ſeedes comfited faſting and laſt at night, and is very good alſo for teeming women or with child; they helpe thoſe that are ſhort winded, or have a Tiſicke or Conſumption, to take the decoction of them with Figs & Licorice, &c. they helpe alſo to expectorate flegme in them that have a Cough or ſtraightneſſe in the breaſts, and is very conducible to the ſtomacke, and being boyled in wine and taken it helpeth the obſtructions of the Liver aſſuredly, and thē Dropſie that commeth thereby: the ſame alſo ſtayeth the hickocke and helpeth digeſtion: the chymicall oyle taken in broth or in wine three or foure droppes at the moſt for a time doth wonderfully helpe the giddineſſe of the head, the ſtraightneſſe and paines in the breaſt and ſtomacke, or the crudities and belchings therein, the much deſire to caſt, and the riſing of the mother, as alſo all other griefes and paines inwardly that riſe of cold or winde: if Aniſe eyther greene or dry be beaten and laid to their eyes that have any hurtfull thing fallen into them it will ſoone draw it forth and likewiſe take away the venome of any hurt by the bitings of venemous creatures, and healeth them quickly: the herbe or ſeede boyled in oyle of Roſes and dropped warme into thē eares eaſeth the paines and noyſe in them: the bruiſed ſeede and ſtorax mixed together, and thē fumes thereof taken being caſt on quicke coales, ſo the head be covered over, that the fumes may penetrate the better, will ſoone eaſe the continuall head ach: The *Italians* have this ſaying, *Qui terr anno in mano nua pianta d'aniſo, non ſaran moleſtati dal mal caduco*; that is to ſay, he that holdeth a plant of Aniſe in his hand ſhall not be troubled with the Falling ſickneſſe: but although this may ſeeme ſomewhat too eaſie to helpe ſo grievous a ſickenes, yet aſſuredly the diſtilled water of the herbe, or more effectually the chymicall oyle, or I would ſay and uſe rather, the Quinteſſence thereof made as I ſhall ſhew you preſently will give much eaſe to thoſe that are franticke or diſtempered in their braines, eſpecially if alſo there be an outward application with the herbe or ſeede and other conducible things to the forehead and temples: the ſame likewiſe is very effectuall for old folkes as well as young children that have the Falling ſickneſſe, or are troubled with

with Spasma's and Convulsions. The Quintessence is made in this manner, having infused the seede bruised a little (what quantitie every one please) for 24. houres in good spirit of wine, let it stand as long in an hot Balneum then let it bee pressed forth and distilled or vapoured gently in glasse, the residence in the bottome when it is come to the thicknesse of thinne hony, keepe it for your use as aforesayd.

CHAP. XIX.

Ammi. Bishops weede.

ALthough we have not the trué *Ammi* of *Dioscorides* and the ancients in all the Christian world, eyther growing or to be seene with any Apothecarie or Druggist, yet wee have two or three herbes that learned men have called by that name which we will here set forth unto you.

1. *Ammi vulgatius.* Common Bishops weede.

Common Bishops weede riseth up with a round straight stalke, sometimes as high as a man, but usually three or foure foote high be set with divers small long and somewhat broad leaves, cut in in some places, and dented about the edges, growing on both sides of the long footestalke one against another, of a darke greene colour, somewhat like unto Skirret leaves, having sundry branches on them, and at the toppes small umbells of white flowers which turne into small round and browne seede, little bigger then Parsley seed, and not so bigge as Anneseede, of a quicke hot sent and taste, the roote is white and fibrous perishing every yeare after it hath seeded, and riseth usually of it owne sowing againe.

2. *Ammi Creticum.* Bishops weede of *Candy.*

This *Ammi* sendeth forth divers slender stalkes of fine cut leaves, somewhat like unto those of wilde Carrots, smelling somewhat quicke, from which rise slender stalkes with some joynts, and the like leaves set thereon, and at the tops umbells of white flowers, which turne into small seede like unto Smallage, of a sweet sharpe sent and quicke taste: the roote is somewhat great and browne on the outside, with sundry fibres thereat.

3. *Ammi parvum foliis Fœniculi.* Small Bishops weede.

This small *Ammi* hath rising from a small roote two or three small and slender stalkes, about a foote high branched towards the toppes, and set with divers very fine small leaves finer then Fennell, bearing small umbells of white flowers, and very small blackish seede after them like to Parsley seede, somewhat pleasant but sharpe and a little quicke withall: the roote is small and white, perishing after seedetime.

The Place and *Time.*

The first is found growing wilde in many places in *England* and *Wales* also; as by the hedgé side of the next field beyond *Greene hithe* on the way as you goe to *Gravesend*, *&c.* the second hath beene sent from *Candy*, and

1. *Ammi vulgatius.*
Common Bishops weede.

2. *Ammi Creticum.*
Bishops weede of *Candy.*

groweth

groweth likewise, as *Matthiolus* saith, from *Anguilara* on mount *Garganus* in *Italy*: the last was brought from *Alexandria* in *Egypt*, but groweth in *Arabia*, and do all flower & seed reasonable well with us, if the yeare prove kindely, or else not.

3. *Ammi parvum foliis fœniculi.* Small Bishops weede.

The Names.

It is called in Greeke ἄμμι and ἄμμιον, *Ammi* and *Ammium* in Latine also, *Ammi* and *Ameos* in shoppes, and is used in stead of the true in most shoppes: the first is called *Ammi & vulgare* or *vulgatius* by all authors, yet *Tabermontanus* calleth it *Ammioselinum*, and some tooke it to be *Beupleuron Plinij*, as *Lugdunensis* saith, and some to be *Bubonium Hyppocratis*, as *Lobel* doubteth: but as I said in the beginning, the true *Ammi* of *Dioscorides* is not knowne; and although *Dioscorides* doth not describe it, as in many other herbes that were commonly well knowne in his time he doth the like, yet from some notes thereof from him, from *Pliny*, and from *Galen*, it is plainely desciphered especially the seede, to be much smaller and whiter than Cummin seede smelling like *Origanum*, and therefore was called *Cuminum Æthiopicum*, and *Hippocrates* called it *Regium* from the excellencie; yet as both *Dioscorides* and *Pliny* say, some opposed it in their times, taking the *Ammi* to be of a different nature wholly, because it is smaller and whiter than Cumin: but yet saith *Pliny* the use of this seede in *Egypt*, both in their bread and meate, is like unto that of *Cuminum regiũ*, or *Æthiopicum*. Now none of these seeds, nor of any other that have beene shewed for *Ammi*, or used by the Apothecaries, have the smell of *Origanum*, or can be compared with Cumin: I have onely once seene a seede that was brought out of the *East Indies*, and obtruded for the true *Ammi*, whose smell was strong, somewhat neare to *Origanum*, but the other notes and markes agreed not with it, for it was larger and browner also than Cumin seede, which I sowed in my Garden, but sprang not, and therefore can say no more thereof: the second is the *Ammi* of *Anguliara* sent to some, *Matthiolus*, *Castor*, *Lugdunensis* & *Camerarius*, who all call it *Ammi Matthioli*, and *Camerarius Creticum* also, as both one; *Lobel* calleth it *Ammi Creticum aromaticum*: the last is called *Ammi aletrum parvum* by *Dodonæus*, and as he saith divers suppose it may rather be taken for *Sisan* than *Ammi*. *Ammi verum* by *Gesner*, and *Ammi perpusillum* by *Lobel*, and *Ammium primum Alexandrinum* by *Tabermontanus*. The *Arabians* call *Ammi Nanochach Nanachue* and *Nanazue*; the *Italians* and all other Nations *Ammi*, or neare thereupon, but we Bishops weede, I meane these sorts here expreſt: peradventure the true *Ammi* may be the *Cuminum sylvestre* before set downe, and would be better considered.

The Vertues.

The true *Ammi* is commended by *Dioscorides* and *Galen*, being of an heating and drying property in the third degree, and of thinne parts, a little bitter in taste, and sharpe withall, whereby it digesteth humours, provoketh urine and womens courses, dissolveth winde, easeth paines and torments in the bowells being taken in wine; and is good against the biting of Serpents: it is used to good effect in those medicines that are given, to hinder the poysonfull operation of *Cantharides* upon the *vritory* parts which they chiefely affect: being mixed with hony and applied to blacke and blew markes or spots by blowes and bruises, it doth take them away, and being drunke or outwardly applied, it abateth an high colour, and maketh it pale, and the fumes thereof taken with Rossin or with Raisins clenseth the mother. *Dodonæus* doth much commend the common sort here first set downe, that it hath all the faculties expressed of the true *Ammi*: The *Egyptian* or *Arabian* seede is said to be very powerfull to provoke venery, for which purpose the *Egyptians* doe much use it.

CHAP. XX.

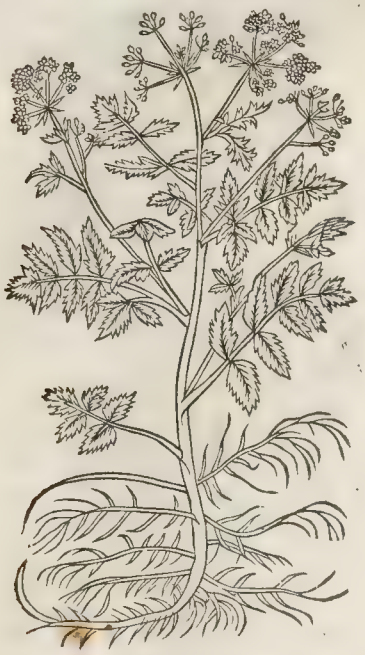
Sison vulgare sive Amomum Germanicum. Small wilde Parsley of *Germany*.

FOr some resemblance of this herbe, with the first in the last Chapter, I thinke good to joyne it next thereunto: this riseth up with a tall slender stalke scarse able to stand upright without helpe, thinnely set with winged leaves on the branches, the lower leaves being largest, and divers being set on a stalke on both sides, each whereof is as small almost as the former *Ammi* leafe, some whereof will be cut in on the edges more or lesse, and some not cut in at all, but all of them dented about the edges, at the toppes whereof loose small umbells of white flowers, which turne into small blackish seede, lesser than Parsley, but of a strong sent, and quicker hotter taste: the roote groweth downe much, and spreadeth every way, whereby it holdeth fast in the ground, and abideth long.

2. *Sisum odoratum.* Sweete wilde Parsley.

This plant I have entituled *odoratum* to distinguish it from the former sort called *Sisum*, although peradventure it is not the right *Sison* of *Dioscorides*: it beareth a single stalke about two cubits high, with long Fennell-

1. *Sisum vulgare sive Amomum Germanicum.*
Small wilde Parsley of *Germany*.



2. *Sisum odoratum.*
Sweete wilde Parsley.

like leaues at the ioynts, which swell sweete betweene Dill and Fennell: the umbells are small thin set and white, and the seede small blacke well smelling, but bitterish, somewhat like Smallage: the roote is long, white and slender: some have taken this to be *Seseli Massiliense*, but erroniously.

The Place and *Time.*

This was formerly taken to be a forraine plant, the seede being to be had in the Apothecaries shoppes onely in *Germany*, but afterwards diuers found it wilde with them, as *Gesner in hortis* sheweth, and we have done the like with us growing neere hedges by moist ditches almost every where, and flowreth in *Iuly*, the seede being ripe quickly after.

The Names.

Dioscorides calleth it in Greeke Σίσων, and so doth *Galen* & *Simon* a so, but *Hippocrates Sinnon*, and *Pliny* doth the like, so that *Sison* and *Simon* be both but one plant, as *Cordus* also doth acknowledge: *Tragus*, *Gesner*, and other *German* Writers doe testifie, that the seede hereof was called in the Apothecaries shoppes of their countrey, *Amomum*, and used in the stead thereof, so great ignorance was spread over the face of the world for many yeares, that not onely the knowledge of herbes, but of good literature was in a manner buried, or at least neglected and lost: and therefore it is still called by many *Amomum Germanicum*: *Fuchsius* calleth it *Petroselinum Macedonicum*, and *Dodonæus* maintaineth it, taking it to be the truest was extant before others: in the Chapter next going before this, I shewed you that he liked of their iudgement that called the *Ammi perpusillum* to be *Sison*, and now since this is knowne to be the true *Sison*, and called so by *Tragus Camerarius* and *Lugdunensis*, he would make it to be *Macedonian* Parsley, but surely this cannot be referred to any of the *Selinum*, the composure thereof, as well as other things contradicting it; *Alpinus* hath onely mentioned the other.

The Vertues.

The properties given to *Sison* are all found to be effectuall in this plant, that it is good against the diseases of the spleene and stitches in the sides, against the strangury and difficulty of making water, and womens courses when they are stopped: it likewise helpeth digestion, and is therefore used as Pepper in broths, meates, and sawces.

CHAP. XXI.

Cerefolium. Chervill.

OF the Chervills, there is both tame and wilde, which shall be here declared, but some doe account *Scandix* to be a kinde thereof, which although it doe in some sort resemble, yet I thinke good to sever them, and to speake of it, and the other kindes thereof in the next Chapter.

1. *Cerefolium sativum.* Garden Chervill.

This garden Chirvill at the first doth somewhat resembell Parsley, but after it is better growne the leaves are very much cut in, and jagged resembling Hemlockes, being a little hairy, and of a whitish greene colour, and sometimes turning reddish in Summer with the stalkes also: it riseth little above halfe a foote high, bearing

1. *Cerefolium ſativum.* Garden Chervill.

2. *Cerefolium ſylveſtre.* Wilde Chervill.

bearing white flowers in ſpoked tufts which turne into long and round ſeede pointed at the ends, and blackiſh when they are ripe, of a ſweete taſte, but of no ſmell when as the herbe it ſelfe ſmelleth reaſonable well: the root is ſmall and long and periſheth every yeare being to be ſowen a new in the Spring for ſeede, and after *July* for Autume ſallets.

2. *Cerefolium ſylveſtre.* Wilde Chervill.

The wilde Chervill groweth two or three foote high, with yellow ſtalkes and joynts ſet with broader and more hairy leaves devided into ſundry parts, nicked about the edges, and of a darker greene colour, which likewiſe grow reddiſh with the ſtalkes, at the toppes whereof ſtand ſmall white tufts of flowers, and afterwards ſmaller and longer ſeede: the roote is white and hard and as I ſuppoſe enduring long: this hath little or no ſent.

The Place and *Time*

The firſt is ſowen in Gardens to ſerve as a ſallet herbe: the other groweth wilde in their Vineyards and Orchards beyond Sea, and in many of the medowes of our owne Land, and by the hedge ſides, as alſo on heathes: they flower and ſeede early and thereupon are ſowen againe in the end of Sommer.

The Names.

Columella calleth the firſt *Cærophyllum* and is likely to be the *Cærophyllum* of *Pliny* which he ſaith the Greekes called *Paderota*, but becauſe he is ſo briefe nothing certaine can be affirmed, ſome alſo take it to be the ὀδοντίτης of *Theophraſtus lib. 7. c. 7.* which *Gaza* tranſlateth *Enthuſicum*, all authors doe call it *Cerefolium* or *Cherifolium*, &c. onely *Anguillara* and *Cæſalpinus* thinke it may bee *Oreoſelinum* which it cannot bee. *Tragus*, *Matthiolus*, *Geſner* and others alſo leaning to that opinion, *Fuchſius* and *Lobel* take it to be a kind of *Gingidium*: the *Italians* call it *Cerefoglio*: the *French du Cerfueil*, the *Germans Korffol* and *Korbelkraut*, the *Dutch Kervell*, and wee Chervill.

The Vertues.

The Carden Chervill by reaſon of the good relliſh it hath, is willingly put among Sallet herbes to make them taſte the better, as alſo into Loblollies of ſtewed herbes which the *French* & *Dutch* doe much delight in, for it doth moderately warme the ſtomacke: it is a certaine remedy ſaith *Tragus* to diſſolve congealed or clotted blood in the body, and ſo doth it likewiſe the blood by bruiſes, falls, &c. the juice or diſtilled water of it drunke, and the bruiſed leaves laid to the place it is taken alſo by divers to be good to provoke urine, and to expell the ſtone in the Kidneyes and womens courſes, taken eyther in meate or drinke, and moreover to helpe the Pluriſie and prickings of the ſides: wilde Chervill will helpe to diſſolve any tumors of ſwelling in any part of the body, as alſo to take away the ſpots and markes in the fleſh and skinne of congealed blood by bruiſes or blowes in a ſhort ſpace, by applying it to the place.

CHAP. XXII.

Scandix. Shepheards needle.

THere are three or foure ſorts of Sepheards needle that I am to ſhew you in this Chapter, ſome of which are revived and referred to thoſe of the ancients, and ſome never knowne before

1. *Scandix vulgaris ſive Pecten veneris.*
Common Shepheards needle.

The common Shepheards needle hath ſundry long hard large, greene ſtalkes of leaves, more divided, and into many more parts, and of a ſadder browne greene colour than Chervill, and of no ſent; the ſtalkes grow a foote high, bearing ſmall tufts of white flowers, and after them five, or ſixe, or more or leſſe long ſeeds, ſomewhat round pointed at the ends, and a little rough, as if they were dented, all of them comming from one head or ſtalke with a few ſmall leaves under them: the roote is very ſmall and threddy.

2. *Scandix altera capite glomerato.*
Round headed Shepheards needle.

This kinde of Shepheards needle hath ſtalkes of larger leaves than the wilde Carrot comming ſomewhat neare to Parſley, ſmooth, and of a pale greene colour, thoſe that grow at the joynts of the ſtalkes come forth out of a broad filme or skinne, as is ſeene in many ferulous and umbeliferous plants, and bearing at the top a round head, of many greeniſh white thredes ſet cloſe together: the roote is like the wilde Parſnippe, and of a bitter and ſharpe taſte.

3. *Scandix Cretica minor ſive Anthriſcus.*
Small Shepheards needle of *Candy*.

The ſmall Shepheards needle of *Candy* hath ſundry ſtalkes of very fine cut leaves, not buſhing thicke like

1. *Scandix vulgaris ſive Pecten Veneris.*
Common Shepheards needle.

4. *Scandix Cretica major.*
The greater Shepheards needle of Candy.

3. *Scandix Cretica minor ſive Anthriſcus.*
Small Shepheards needle of Candy.

the

the first, but more sparsed and thinne, comming somewhat neere to Camomill, but finer and a little hairy, of a pleasant both sent and taste, among which rise slender short stalkes, somewhat hairy or hoary, with but few joynts or leaves on them, at the toppes whereof stand five or six small white flowers close set together consisting of five leaves a peece, in the middle whereof is a darke purplish stile or leafe longer then the rest, spreading forth like a blazing starre, after which follow long seedes like the first but smaller, bigger below and ending above in two small points, whose edges are more rough and seeme more dented, and bee a little purplish as the young ones are before they be ripe, which are the seedes themselves: the roote is small long and white. This hath beene observed to have a better sent that groweth in untilled voyde and gravelly grounds then that which groweth in the fields.

4. *Scandix Cretica major.* The greater Shepheds Needle of *Candy*.

The greater kinde hath a crested small stalke a cubit high, parted into divers branches, a little hairy at the very joynts having the lower leaves broade and somewhat round, divided like unto the lesser Burnet Saxifrage one set opposite to another, standing upon long stalks, which together with the leaves are a little hairy: but those that stand at the joynts are much more finely cut in, and like unto the leaves of the first, the umbells are a little spread and small, yet greater then the first, which are succeeded by more store of long rough dented seede then the last, having each of them two small prickes at the end: the roote is small and fibrous.

The Place and Time.

The first groweth plentifully in our owne Land among Corne: the second in *France*, the third both in *Candy* and *Naples* also, and the last in *Candy*: they flower early and seede accordingly.

The Names.

The Greekes call it σκάνδιξ and the Latines *Scandix* also, and *Pecten Veneris*, *Acus Veneris*, and *Acus pastoris* or *Acula* and some call it *Scanaria*. There is much doubt and controversie among our later writers, first what herbe the *Scandix* of *Dioscorides*, *Galen* and *Pliny* should be, that was so common a Sallet herbe for the people to feede on and growing wilde with them, so that *Aristophanes* merrily taunted *Euripides* the Poet, that his mother sold not a true wort but *Scandix*, which was accounted the meanest or vilest of all others, for our *Pecten Veneris* is not taken to be the true *Scandix* in *Candy*, as *Honorius Bellus* sheweth in his first Epistle to *Clusius*; for he there saith the *Candiots* eate it not, calling it ἀγριοσκάνδιξ, and hath no smell, but another which they call σκανδικὶ *Sandice*, and σκάνδιξ smelleth well, but moveth nothing to Venery: divers therefore doe thinke that the *Gingidium* of *Matthiolus* should be *Scandix* as *Lugdunensis* setteth it downe, *Columna* taketh the *Caucalis echinato nodoso semine Bauhini* to be *Scandix*, which how farre they are from veritie or almost any shew of reason this one thing doth declare, that neither *Matthiolus* his *Gingidium* nor *Bauhinus* his *Caucalis* were ever used to bee eaten as *Scandix* was, nor is likely to grow so familiarly in Greece as *Scandix* so wilde a wort: but if I might spend my opinion in the matter, I should sooner beleeve *Bellus* his judgement hereof that lived long among the Græcians, (for I account the Candiots in speaking Greeke and using the Greekish rites, to be as it were the off-spring of the Greeks) and from both their denominations of herbes, and the use of them besides his owne both reading and observation, holding the ancient Greeke words although somewhat corrupted, who sheweth that *Scandiki* as they usually call an herbe that they eate should be the true *Scandix*, then eyther *Matthiolus* or *Columna*, whose opinionative conceits that he had found out the genuine plants of the ancients, made him runne faire awry in many things, as may be seene in his Hyssope, *Polium* and divers others the like: so that my opinion is that our *Pecten Veneris* is not the true *Scandix* of the ancients, but a kinde of wilde Chervill, and not used to be eaten with them or us, as the properties also do declare: but that *Scandici* which they in *Candy* (and as it is likely throughout all Greece also) doe take and use for their foode is the true *Scandix* which we have seldome seene or knowne: next what *Anthriscus* of *Pliny* should bee, whether this of *Honorius Bellus* sent to *Clusius*, or that of *Columna* in his Chapter of *Scandix*, which I take to be our *Pecten Veneris*; and whether *Bellus* his correction of *Pliny* his description be not true which explaineth the matter throughly. *Anthriscus* saith *Pliny* were the same that *Scandix* is, if it had thinner and sweeter leaves, which reading being admitted, *Anthriscus* is an herbe that hath broader leaves and not so sweete in smell as *Scandix*, which *Columna* as it should seeme would have to be the *Scandix* of *Dodonæus*, and is our *Pecten Veneris*, which *Columna* commendeth him so much for his true description thereof, and so would make our *Pecten Veneris* to be the true *Scandix* of the ancients, which is neither sweete nor used to be eaten, and all this is I suppose because he would have his *Anisomarathrum* to be a new plant of his owne finding, and not the *Anthriscus* of *Pliny*, as others before him had judged it to bee, when as his description of *Anisomarathrum* sheweth it must be a species of the *Scandix* by the manner of growing and the forme of the seed: but admitting *Bellus* his correction of *Pliny* that *Anthriscus* were the same, but that it hath finer and sweeter leaves, it endeth the whole controversie, putting all things without doubt. I am somewhat more ample and tedious in the explanation of these things then I thought to be, because they are intricate and various: the first here is called *Scandix* by divers authors, and *Pecten Veneris* by others without doubting or questioning whether they were true or no: the second *Lugdunensis* remembreth, and the last *Bauhinus* onely hath made mention of: the other I have I hope sufficiently expressed it to be called and taken to be the *Anthriscus* of *Pliny* which *Bauhinus* calleth *Scandix cretica minor*.

The Vertues.

Both *Dioscorides* and *Galen* say that Scandix is somewhat sharpe and bitter, being hot and dry in the third degree, and thereby is good both for the stomacke and belly being eyther eaten raw or boyled: being made into drinke and taken it is good for the Liver, backe and bladder, provoketh Vrine mightily and freeth the inward parts from obstructions: it also bindeth a loose body, the seede being taken with vinegar presently stayeth the hickock, and used in an oyntment it helpeth the parts that are burnt with fire: *Pliny* saith that the roote of *Pecten Veneris* beaten with Mallowes draweth forth splinters or any other thing sticking in the flesh. *Honorius Bellus* that the *Anthriscus* is used in *Candy* by the people with great delight, not onely because it is pleasant to the taste, but because it mightily provoketh to Venery and helpeth those persons that are weake or spent therein, and helpeth women to conceive in that it clenseth the seminary parts.

CHAP. XXIII.

Coriandrum. Coriander.

THe ancients formerly knew and set forth but one sort of Coriander, and sayd that it had no diversitie but the later writers have added two more unto it as shall be shewed.

1. *Coriandrum vulgare.* Ordinary Coriander.

When Coriander first springeth up the leaves are somewhat broad very like unto Parsley, but after it is growne up into a stalke which is three or foure foote high, being full growne they are smaller and finer every one then other up to the toppe, where stand small loose umbells of white flowers, turning into round striped hollow seede of a whitish yellow colour when it is ripe: the roote is small and perisheth every yeare after seede time: the whole plant, seede and all while it is greene and growing hath a strong and loathsome savour scarse to be endured, but when the seede is full ripe and dry it is of a reasonable good sent and taste without offence.

2. *Coriandrum minus odorum.* The lesse sweet Coriander.

This Coriander hath the lower as well as the upper leaves all finely cut in and jagged, the stalkes grow lower not halfe a foote high, and lying almost on the ground, with white flowers on them and round seede as the other but fuller and greater, and two alwayes joyned together.

3. *Coriandrum alterum fœtidissimum.* The stinking Coriander.

This other Coriander hath sundry small stalkes that are five square being firme, and not hollow, nor growing high, all the leaves whereof are as fine as the uppermost of the first: at the toppes of the stalkes stand such like small umbells of purplish white flowers, after which come round seede like the other, but two alwayes joyned together: the roote is great dying yearely as the other, the smell hereof is more strong and offensive then the other to the head and senses.

The Place and *Time.*

The two first are onely sowen in Gardens as well now as in ancient times, for *Pliny* saith it is not found wilde, their naturall places being not knowne: the last was sent from *Barcinona* to *Lyons* by *Myconus* to *Molinæus*, who hath set it forth in *historia Lugdunensi*: they doe all flower in *July* and ripen in *August*.

The Names.

It is cal'ed in Greeke κόριον and κορίανον, and so in Latine also *Corion* and *Corianon*, but usually *Coriandrum*, and derived from κόρις, which is that kinde of noysome flie or worme that is called *Cimex* in Latine, a wall Louse or Punie in *English*, whose stinking smell Coriander doth much imitate. There hath beene formerly some controversie betweene *Avicen* and *Galen*, and others also about Coriander, some condemning the use as hurtfull and dangerous by reason of the grievous smell, and that it maketh the voyce hoarse, procureth a kind of frensie

1. *Coriandrum vulgare.*
Ordinary Coriander.

2. *Coriandrum alterum minus odorum.*
The lesser sweete Coriander.

like

like unto drunkenneſſe, and that the juice thereof being drunke cauſeth death, and that it is very cold, all theſe properties the *Arabian* Phyſitions give it: the correction therefore of the ſeede they appoint to bee by ſteeping it all night in Vinegar, and dryed up againe to be ſafely uſed: but *Lobel* ſeemeth to refuſe this preparation, ſaying that the coldneſſe of the Vinegar can draw forth none of the foule and ſtinking ſpirits from it, but rather the drying of it of it ſelfe or by the fire, as it is uſed when they are made into Comfits, without any other preparation and then is not found hurtfull but rather comfortable to the ſtomacke, &c. as alſo by the continuall uſe of it in meates and medicines among many countrey people of it ſelfe without preparation: and ſome commending the uſe becauſe when the ſeede is dry it hath a warming, ſweete and no noyſome ſmell or taſte: the noyſome vapours ſubſiſting onely in the moyſture and not in the drying, as wee may ſee in many fruits which being not ripe are ſo hard and harſh that ſcarſe one can eate them without harme, but being ripe are both mellow and ſweete, heate onely working this effect: the hotter countries for the moſt part giving the mellower and ſweeter fruit: The firſt is called by all writers *Coriandrum*, the ſecond is mentioned by *Lobel*, and *Dodonæus* giveth the figure without deſcription, *Lugdunenſis* onely remembreth the laſt. The *Arabians* call it *Caſberra* and *Elcoſbur*, the *Italians Coriandro*, the *Spaniards Culantro*, the *French Coriandre*: the high and low *Dutch Coriander*, and we in *Engliſh* Coriander and Coliander.

The Vertues.

Firſt for greene Coriander and thē cooling qualitie thereof: the juice as is beforē ſaid being drunke killeth them that take it: outwardly applyed it diſſolveth knots and kernells, being mixed with Wheate or Barley Flower, as alſo Saint *Anthonies* fire being uſed with bread, and running and fretting ſores, wheales, puſhes and carbuncles, and botches riſing in the skinne or fleſh, and taketh away the ſwelling and inflammation of the cods, either the juice or greene herbe applyed: the juice thereof made into an ointment with *Ceruſſe*, *Litarge* Vinegar and Oyle of Roſes doth the like, Now for the dryed ſeede of Coriander which is moſt in uſe, and being taken in ſweete wine killeth the Wormes in the body and encreaſeth coiture: it is alſo good againſt the Serpent that is called *Amphiſbæna*, eyther drunke or layd to the bitten place: it is very comfortable to the ſtomacke, by heatin g and drying, the cold and moiſture thereof helpeth digeſtion and repreſſeth the vapours therein that riſe upwards, and reſiſteth forcible paines of the winde chollicke and the ſtopping of Vrine: and being a nouriſhment of a temperate qualitie it helpeth to encreaſe both blood and Sperme.

CHAP. XXIIII.

Caucalis. Baſtard Parſley.

OF theſe *Caucalides* I have above a dozen ſorts to expreſſe here in this Chapter, ſome whereof have ſmall fine cut leaves, others are larger and broad, ſome well knowne of a long time to many, and others of later invention.

1. *Caucalis vulgaris floribus albis.* The common Baſtard Parſley.

This Baſtard Parſley riſeth up with a ſhort ſtalke, not above halfe a yard high, ſet at the joynts with whitiſh rough diverſly cut leaves ſmaller then Parſley, furniſhed at the toppes with ſmall ſweete umbells of white flowers, the outermoſt being the greateſt, after which ſucceede divers rough prickly round ſeede, two alwayes joyned together, which maketh them but halfe round when they are parted.

2. *Caucalis Hiſpanica.* *Spaniſh* Baſtard Parſley.

This *Spaniſh* kind hath divers creſted rough ſtalkes and leaves very like unto the former, but the umbells of white flowers are ſmaller and growing more round together as it were into the forme of a round head, and the ſeede which followeth is greater very much ſtriped and rough but not prickly as this, it being broken in any part giveth a ſweete milke: the roote periſheth after ſeede likewiſe but giveth no milke.

3. *Caucalis major flore ſaturo rubente.* Deepe red flowred Baſtard Parſley.

This red flowred kinde hath larger winged leaves then the former, being divided and cut in after the manner of the leſſer Burnet Saxifrage leaves: the flowers hereof are larger then of the firſt and of an equall bigneſſe, but of a deepe red colour.

4. *Caucalis maxima.* The greateſt Baſtard Parſley.

This greateſt kinde bringing forth many upright tall ſtalkes three or foure foote high or more ſometimes, being creſted and hollow within with divers joynts on them, and the ſtalkes of the long and large winged leaves compaſſing them at the bottome, which leaves are large almoſt like Angelica leaves, ſet by couples on the middle rib and an odde one at the end, all of them finely dented about the edges, and of a darke greene colour: at the toppes of the ſtalkes grow large umbells of white flowers, ſomewhat purpliſh or of a bluſh colour underneath, after which come very large and flat rough ſeede, with a double point at the head and prickley, round about: the roote is white and wooddy.

5. *Caucalis Anglica flore rubente.* *Engliſh* Baſtard Parſley with reddiſh flowers.

This *Engliſh* kinde groweth about two foote high, of an Olive greene colour, with a ſtrong round creſted rough and hairy ſtalke, ſet at the joynts which are two or three inches in ſunder, with leaves three or foure inches long, conſiſting of ſeaven or nine narrow hairy leaves ſet by couples, ſomewhat deepely dented about the edges, the foote of the ſtalke being a broad thinne skinne or filme, and from betweene it and the ſtalke come forth leſſer ſtalkes of leaves, towards the toppe parted into three or foure branches, which at three inches diſtance doe each of them from one center, ſhoote forth foure, five or ſix equall ſtems about an inch and a halfe long apeece, having a thinne skin running all the length of them, and the two innermoſt ſtrings, being of a darke red colour compoſing a ſpokie umbell: at the toppes of each ſtemme grow five or ſixe long rough hairy ſmall knaps or bottomes crowned with flowers of a pinkie red colour, conſiſting of five leaves a peece, the outermoſt whereof ſheweth like two by the folding of it inward, and the inner foure with five chives and a double pointell ſhew not halfe ſo big as it when they are full blowen: in the center of the flower lye ſix or ſeven ſuch like ſmall flowers: the leaves give milke being broken of little or no taſte: after the flowers are paſt come the ſeede which are rough burres, ſticking

to any thing they touched, like the ſeede of Hounds tongue, within which are contained two browne ſeeds like unto hulled Oates but bigger: the roote is ſmall and long, white and hard, periſhing every yeare after ſeede time. It flowreth in *Iune* and the ſeede is ripe in *Auguſt* This may ſeeme to be the *Caucalis rubro flore folio latiore* of *Lobel*, and the *Caucalis rubello flore* of *Cluſius* ſet forth without deſcription, but the leaves of theirs are la ger.

6. *Caucalis tenuifolia purpurea.*
Fine leafed Baſtard Parſley.

I find in *Columna* one other very like unto this laſt alſo which he calleth *Echinophora leptophyllon purpurea*, but that the leaves as he ſaith are moſt finely cut into ſundry parts like unto the wilde Carrots, and the umbells of flowers, and ſo the ſeede after them ſtand by three and three at a place, whoſe kernell or ſeede within is ſomewhat like unto hulled Barley.

7. *Caucalis arvenſis latifolia purpurea.*
Broad leafed baſtard Parſley with red flowers.

This Parſley hath ſundry ſtalkes of hard rough leaves, divided into five parts, each leafe being three inches long and an inch broad, deepely dented in on the edges ſomewhat like unto Oaken leaves: the ſtalke is rough and hoary, two foote long, ſo crefted that it ſeemeth ſquare bearing ſuch like umbells as in the laſt ſtanding 3. together but their ſmall ſtems are ſhorter and thicker, the flowers are red like the former, but greater, having ſmall leaves like beards under them: after which followeth the ſeede being ſmaller then the former and not ſo rough, containing ſuch like ſeede within them but ſmaller and aromaticall: the roote is white, hard and aromaticall.

8. *Caucalis magno fructu echinato.*
Baſtard Parſley with great prickley ſeede.

The leaves hereof are divided ſomewhat like unto thoſe of the greater Parſley leated Dauke, ſet forth before in the

1. *Caucalis vulgaris albis floribus.*
The common Baſtard Parſley.

5. *Caucalis Anglica flore rubente.*
Engliſh Baſtard Parſley with red flowers.

6. 7. *Caucalis Echinophora major & minor & purpurea Columna.*
The greater and leſſer Baſtard Parſley with prickly ſeedes.

Chapter

Chapter of *Daucus* and hairy underneath: the ſtalke is two foote high, and ſomewhat rough, having the like leaves at the joynts upwards but ſmaller, bearing ſmall umbells of whitiſh flowers ſtanding three together and perfecting uſually but two ſeedes on them which are twiſe as big as others and more rough and prickly, having a large flat kernell within it: the roote is ſmall and white but ſomewhat ſweete both in taſte and ſmell.

9. *Caucalis minor flore rubente.* Small Baſtard Parſley with reddiſh flowers.

This ſmall Parſley hath a ſmaller and ſhort rough ſtalke, whoſe leaves are divided ſomewhat like unto Hemlock leaves but each of them broader, and the end leafe longeſt and hairy, all of them dented deepely about the edges, and of a darke greene colour, at the upper joynts of the ſtalkes come forth ſlender branches bearing ſparſed ſmall umbells of reddiſh flowers, and ſometimes more white, and after them ſmall round, rough ſeede: the roote is ſmall and white.

10. *Caucalis nodoſo echinato ſemine.* Small Baſtard Parſley with knotted burres.

This other ſmall Baſtard Parſley lyeth on the ground with long rough trayling branches, ſome longer then others ſet at ſeverall diſtances, with long winged leaves divided in the ſame faſhion almoſt as the laſt, but ſomewhat leſſe, being rough or crumpled, but not hairy, and of an overworne or evill greene colour: at every joynt almoſt cloſe unto it, and round about it come forth ſmall whitiſh flowers out of rough huskes which are after the ſeede, very ſharpe prickly and hard: the roote is ſmall and periſheth every yeare, the ſeed riſing by the falling of, in the fields or gardens whereinto it is brought.

11. *Caucalis folio Fœniculi.* Fennell leafed Baſtard Parſley.

This is both in ſtalke and leafe very like unto Fennell, but riſing ſeldome above a cubit high, bearing white ſweete ſmelling flowers in umbells at the toppe, ſet cloſe together, which afterwards give ſeede that is not rough like the former: and therefore *Lobel* that firſt ſet it forth ſaith, that although *Anguillara* in his time did call it a *Caucalis*, yet hee liked of the others better then of this: the roote is white growing deepe, and of the taſte of a Parſnep.

12. *Caucalis tenuifolia montana.* Small Mountaine Baſtard Parſley.

The roote hereof is ſomewhat thicke and from it riſeth a ſtalke of a foote long, divided from the bottome into ſmall round ſmooth branches, and they againe into leſſer, whoſe ſmalleſt branches even neere the roote as well as the others, beare ſmall umbells of very ſmall white flowers, and afterwards ſmall long ſtriped ſeede: the leaves next unto the roote are divided into very fine and ſmall leaves, but thoſe above on the ſtalke much more ſmall like haires.

13. *Caucalis pumila Hiſpanica.* Dwarfe Baſtard Parſley of *Spaine*.

This Dwarfe kinde which *Boelius* brought out of *Spaine* with a number of other fine ſeeds riſeth not with us halfe a foote high and lower in *Spaine*, whoſe leaves are very ſmall and much divided on the ſtiffe ſtalkes, bearing ſmall umbells of whitiſh flowers and after them ſmall rough whitiſh ſeede: the root is ſmall and annuall; I never ſaw this beare but once, which was from the firſt ſeede I received from *Boel*, which was thorough ripe.

9. *Caucalis minor flore rubente.*
Small Baſtard Parſley with reddiſh flowers.

11. *Caucalis folio Fœniculi.*
Fennell leafed Baſtard Parſley.

The

The Place and Time.

These sorts of Parsley grow in the severall countries of *Germany*, *France*, *Spaine*, *Italy*, &c. and divers of them in our owne Land likewise; and particularly the fift was found in *Lincolneshire*, on the North descent of the North field of *Witham* nigh to *Bourne*; and doe all, save the last, flower and seede reasonable well, but that worst, as I said.

The Names.

It is called in Greeke καυκαλὶς, and *Caucalis* also in Latine, either of the *hemisphericall* seede, or from the noise that the seede will make when it is dry, being shaken with the winde, or from narrow mouthed pots, such as the seed is like, that make a noise at the powring of the liquor out of them: the first here expresst is the *Caucalis albis floribus* of *Lobel*, the *Lappa agrestis* of *Tragus*, the *Lappula Canaria Plinij* of *Anguilara*; the *Caucalis alia vulgaris*, and *Myrrhis Lappa Dalechampij* of *Lugdunensis*, the *Caucalis* of *Dodonæus*, *Gesner*, and others, and the *Echinophora* σπονδύλιον κάπτης of *Columna*: the second is the *Caucalis Hispanica* of *Clusius* and *Camerarius*; and the third the *Caucalis flature rubente flore* of *Clusius*; the fourth likewise is his *Caucalis major*, which *Bauhinus* calleth *Caucalis maxima aculeato semine*: the fift is of our owne country not published exactly before, although *Gerard* seemeth to have *Sphondylij* had a hint of it: the sixt is the *Echinophora Leptophillon* of *Columna*: the seventh his *Echinophora major platyphyllos purpurea*: and the eight his *Echinophora altera asperior platycarpos* also, which *Bauhinus* calleth *Caucalis Monspeliaca echinato magno fructu*, and is the *Lappa boaria Plinij* by *Lugdunensis*, and the *Daucus Xanthiocarpos* of *Thalius*: the ninth is figured by *Bauhinus* in his *Prodromus*, but the description is of his *nodoso echinato semine*, which is the tenth, as may soone be perceived, if they be but compared, and are both growing wildin our own land: the tenth is also the *Daucoides minor* of *Cordus in historia*, and of *Thalius*: the eleventh is the *Caucalis* of *Anguilara*, as *Lobel* saith in his *Adversaria* which *Lugdunensis* calleth *Caucalis Pene*, and *Bauhinus Caucalis folio Peucedani*: the twelfth is *Bauhinus* his *Caucalis tenuifolia montana*; and the last I had from *Boel* by the name of *Caucalis marina Bætica*. The *Italians* usually doe call *Caucalis Petrosello salvatico*; and the *Germanes*, as *Tragus* hath it, *Feldt oder Ackerkletten*, and we in *English* Bastard Parsley, rather than wilde Parsley, as the *Italians* doe.

The Vertues.

Dioscorides in regard that *Caucalis* was a familiar sallet herbe, and therefore used more as meate than medicine giveth no other propertie belonging to it than to provoke urine, but our later Writers have found out and published divers others, as *Matthiolus*, who saith it is comfortable to the heart, and helpeth the obstructions of the liver and spleene, clenseth the raines and kidneyes, of the flegme and niter, gravell and the stone which ingendereth in them, if the juyce thereof be taken: the seede being drunke sharpeneth the eye-sight, and procureth womens courses: it is likewise given to men with Miltwast, and the seede of *Agnus castus* against the running of the raines: it also causeth fruitfulnesse in barren women, being drunke in wine, and helpeth the bitings of the Trigon (we understand it to be the Thornebacke) the *Draco marinus*, which is called a *Quaviver*, and the sea Scorpion being applied to the wound; if the whole herbe be taken with vineger after a vomit, it purgeth the belly and stirreth up a fainting appetite, taking away the evill of loathing ones meate: all the parts of the herbe, as well seede as juyce, or decoction being taken, is helpfull to melancholicke persons, and therefore is good to be given against a quartaine ague, and the itch and scabbes, as also for the great *French* disease.

CHAP. XXV.

Selinum sive Apium. Parsley.

UNder this title of *Selinum* or *Apium*, is contained divers and sundry sorts of herbes, for with the ancients, besides the Σέλινον κηπαῖον *Apium hortense*, they had ἐλαιοσέλινον *Baludapium* ὀρεοσέλινον *Apium montanum* πετροσέλινον *Petrapium* or *Petroselinum*, ἱππουρίς σέλινον ἄγριον, *Apium sylvestre* and others, of all which I must give you the knowledge, and therefore I thinke it fittest to distribute them into severall Chapters, and to comprehend under each all the species and sorts that pertaine to that genus or kinde: and first to beginne with the *Apium hortense*, which by an usuall received opinion is our *Petroselinum*, Garden Parsley, whereof I shall say more in its due place.

1. *Petroselinum vulgare.* Common Garden Parsley.

Common Garden Parsley is well knowne to have many stalkes of fresh greene leaves devided into sundry parts, first into three parts or leaves, and then each of them into three, somewhat round and finely snipt about the edges: the stalke riseth much higher in some places than in others, according to the soile wherein it groweth with divers smaller leaves at the joynts, and still finer cut, and long like Fennell at the toppe, that one would not thinke them to be the leaves of Parsley; the flowers are white growing in umbells, and the seede small and of a hot and sharpe taste: the roote is white and long, with somewhat a rugged barke perishing after seede time, and aromaticall as the herbe is also and very pleasant to the taste and stomacke.

2. *Petroselinum crispum.* Curl'd Parsley.

The curl'd Parsley differeth not in any thing from the former but in the leaves, which although they grow after the same manner, yet they are finely curled, or crisped, or folded in on the edges, seeming like a Ruffe or the like.

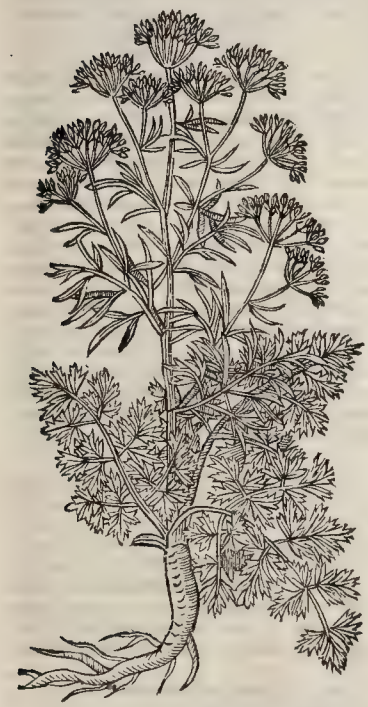
3. *Petroselinum majus sive Virginianum.* *Virginia* Parsley.

Virginia Parsley groweth after the very same manner that the Garden Parsley doth, but larger, having greater stalkes of leaves, set by three and three as in the former, but much larger, even as large as Smallage, and of a paler or yellower greene colour, the stalkes, flowers, and seede are alike, but still larger, the seede being twise, if not thrise as bigge as the common, the roote is greater and shorter, but perisheth like it.

4. *Petroselinum Creticum.* *Candy* stone Parsley.

This Parsley of *Candy* is very like to the ordinary parsley, but lesser in every part, having leaves made and cut into such like divisions, but lesser and somewhat thicker, the stalke is like, but shorter than Parsley, bearing tufts of white flowers, after which follow smaller seede than that of Parsley, but blacker: the roote is alwayes single that

1. *Petroſelinum vulgare.*
Common Garden Parſley.



3. *Petroſelinum majus ſive Virginianum.*
Virginia Parſley.

that is but one, of the thickneſſe of ones thumbe, long, and covered with a thinne blacke barke or rinde that may eaſily be rubbed off with ones finger, being white underneath, and of a ſweetiſh taſte, like unto the Earth Cheſnut, being often eaten by the Natives, and liveth after ſeede time, ſhooting forth a new every yeare. There is an other of this kind which differeth in nothing from it, but in the colour of the roote, which is reddiſh on the outſide, and not blacke as the former: this flowreth and ſeedeth earlier than others, and is called *Agriopaſtica* by the countrey people in *Candy*, that is, *Sylveſtris Paſtinaca*, but hath no likeneſſe to a Paſnippe, but in that it is fit to be eaten. Others there, as *Honorius Bellus* ſaith, doe call it *Saxifragia*, and uſe it as Saxifrage: but he himſelfe ſaith it doth come neareſt unto the *Buſelinon* deſcribed by *Pliny* in *lib.* 20. *c.* 16. eſpecially that with the red roote, and hath the ſame vertues that the ordinary hath.

The Place and *Time.*

Theſe doe all grow in gardens onely in our Ladd; the naturall place of the firſt being not certainely knowne, but the ſecond is of the Iland of *Sardis*, and the third, as the name ſheweth, was ſent out from *Virginia*; the laſt in *Candy*: they perfect their ſeede in *Auguſt*, but the laſt earlier.

The Names.

It is, as I ſaid, by a continuall received opinion held by moſt, that this Parſley is the σέλινον κηπαῖον *Apium hortenſe* of *Dioſcorides* and other the ancients; firſt, becauſe there cannot be found another herbe that can anſwer both the forme and the properties given thereunto, to be ſo pleaſant and to be eaten familiarly in all countries; and next that the uſe of this Parſley is continued to this day, as a ſallet herbe among the Greekes and Turkes, and called alſo *Petroſelino Macedonico* by the vulgar Greekes uſually, whereby there groweth ſome doubt with many whether this ſhould not be the *Petroſelinum Macedonicum* of the ancients, as *Iſidorus* and *Platina*, *Marcellus Virgilius*, and *Quatramius* did take, ſeeing, as *Bellonius* ſaith, it is ſo uſed and called throughout all *Macedonia*, *Epirus*, *Theſſalia*, *&c.* and in *Candy*, and with all the Greekes, and that all Chriſtian Nations alſo according to their Dialect doe follow the Latine *Petroſelinum*; but becauſe the ſeede is not bitter, as *Galen* ſaith the true ſort is, wee as many other doe, refuſe it, and doe not hold it for the right *Petroſelinum Macedonicum*. It is alſo called by all Writers *Apium veterum* or *hortenſe*, or *domeſticum*: yet *Fuchſius* tooke it to be *Oreoſelinum*; the laſt is declared ſufficiently in the deſcription: the *Arabians* call it *Charſſ Chares*, or *Charſi*, the *Italians Petroſello* and *Apio domeſtico*, the *Spaniards Perexill*, the *French du Perſill*, the *Germanes Peterſilgen* and *Peterlin*, the *Dutch Peterſeli*, and we Parſley, or garden Parſley. There is ſome caution to be uſed concerning this herbe that it is uſually called *Apium* ſimply, if it be to be uſed in any of the Greeke Authors medicines, for ſo *Selinon* is tranſlated, but the *Arabians Apium* is our Smallage, which they held to be hurtfull to the eyes, and the uſe therof to bring the falling ſickneſſe.

The Vertues.

This Parſley is much uſed in meate and broths, &c. in all countries, as hath beene aforeſaid, being of ſo milde a taſte, and ſo comfortable to the ſtomacke, that no other is more, and beſides doth helpe to provoke urine and womens courſes, and to breake winde, both in the ſtomacke and bowells, and doth a little open the body, but the roote much more, and openeth the obſtructions, both of the liver and ſpleene, and therefore is uſually put among thoſe

thoſe herbes and rootes that move the belly downewards, and is one of the five opening rootes, but doth binde the body as *Dioſcorides* hath it, and hereby alſo is profitable for the yellow Jaundies and Dropſie: and *Galen* commendeth it againſt the Falling ſickneſſe, and to provoke urine mightily, eſpetially if the rootes be boyled and eaten like Parſneps: the ſeede is held by moſt to be the moſt effectuall part of the plant, yet ſome doe thinke the roote to be ſtrongeſt: but the ſeede is effectuall to provoke urine and womens courſes to expell winde, to breake the ſtone and to eaſe the paines and torments thereof, or of any other part in the ſtomacke and body procured by winde, and is alſo effectuall againſt the venome of any poyſonfull creature, and is put therefore into counterpoyſons for that purpoſe, as alſo againſt the danger that commeth to them that have taken Litharge, it is alſo appointed among other things that ſerve for the cough: The leaves of Parſley eaten after Onions, Leekes, or Garlicke taketh away the offenſive ſmell of them, ſuppreſſeth the vapours that may offend eyther the head or the eyes: they uſe alſo to eaſt the herbe into their Fiſh ponds if there be any ſicke among them to cleanſe them. The diſtilled water of the herbe is a familiar medicine with nurſes, to give their children when they are wrung in the ſtomacke or belly with wind, which they call the frets, and is no leſſe availeable then the water of Saxifrage for that purpoſe, and is effectuall alſo for them that are of greater yeares. The leaves of Parſley laid to the eyes that are inflamed with heate or are ſwollen doth much helpe them, if it be uſed with bread or meale: and being laid to womens hard breaſts that come by the curding of their milke doth abate the hardneſſe quickly if it be fryed with butter and applyed, and doth alſo take away the blacke and blew ſpots or markes by bruiſes, falls, &c. the juice thereof dropped into the eares with a little wine eaſeth the paines. *Tragus* ſetteth downe an excellent medicine to helpe the Iaundies and Falling ſickneſſe, the Dropſie, and ſtone in Reynes or Kidneyes in this manner; Take ſaith he of the ſeeds of Parſley, Fennell, Aniſe, and Carawayes, of each an ounce, of the roots of Parſley, Burnet, Saxifrage and Carawayes, of each one ounce and a halfe: let the ſeedes be bruiſed and the rootes waſhed and cut ſmall; let them all lye in ſteepe in a pottle of white wine, and in the morning boyled in a cloſe earthen veſſell untill a third part or more be waſted, which being ſtrained and cleared, take foure ounces thereof at a time, morning and evening firſt and laſt, abſtaining from drinke for three houres after: this doth open the obſtructions of the Liver and Spleene and expelleth the Dropſie and Iaundies by Vrine.

Chap. XXVI.

Petroſelinum Macedonicum. Macedonian ſtone Parſley.

Diuers authors have ſet forth divers ſorts of herbes for the true ſtone Parſley of *Macedonia*, every one ſuppoſing that to be the right which they propoſe: of them all I entend not to entreate in this Chapter but ſeverally as they fall out. I will onely in this Chapter ſhew you that kinde, which now a dayes goeth currant under that name, and joyne thereto another which *Lugdunenſis* calleth *Petroſelinum Dalechampij*.

1. *Petroſelinum Macedonicum quibuſdam.*
The firſt ſuppoſed ſtone Parſley of Macedonia.

This Parſley of Macedonia hath divers ſtalkes of leaves next the ground, divided much like to the garden Parſley, but with greater, broader and rounder leaves, dented round about and in ſome places more deepely cut in or gaſhed, of a bright pale greene colour, among which riſeth a ſhort thicke and ſomewhat hairy ſtalke about halfe a yard high or better, full of joynts and leaves, and branches at them that it ſeemeth a ſmall thicke buſh, bearing ſmall umbells of whitiſh flowers and ſmall rough darke grayiſh ſeede after them, ſomewhat like unto ordinary Parſley ſeede, eſpecially after the roughneſſe is rubbed from them, yet ſomewhat longer and darker, of an aromaticke and ſharpe taſte, and of an unſavoury bitterneſſe laſt of all like cumin ſeede: the roote is ſomewhat thicke ſhort and white periſhing after it hath given ſeede, eſpecially with me in our countrey, but as I have heard not ſo in the warmer.

1. *Petroſelinum Macedonicum quibuſdam.*
The firſt ſuppoſed ſtone Parſley of *Macedonia*.

2. *Petroſelinum Macedonicum forte Dalechampij.*
The ſecond ſuppoſed ſtone Parſley of *Macedonia*.

This other Parſley taken to be the true Parſley of *Macedonia* by *Dalechampius* and not much gainſaid by *Columna*, hath a ſhort roote (a long roote ſaith *Columna* like ordinary Parſley) blacke on the outſide, with a tuft of haires at the head thereof, neither ſharpe nor ſweete which is wonderfull (but *Columna* ſaith it is both more ſharpe and bitter then the common Parſley roote) from whence riſeth up ſundry ſlender ſtalkes, with divers very thinne cut leaves thereon, all of them like the uppermoſt (and not the undermoſt) leaves of Parſley, or like unto Dill of a blew greene colour, having three of the leaves alwayes ſet together at the end of the winged ſtalke as Parſley hath, and ſmelling ſo like unto Parſley as both *Lugdunenſis* and *Columna* doe ſay, that if any ſhould ſmell it when it is a little bruiſed that were blinde and did not ſee it, or having his ſight did not plainely perceive a difference in the leaves, hee would ſurely ſay it were very Parſley: at the toppes of the ſtalkes ſtand ſmall umbells of pale reddiſh or bluſh coloured flowers: after which follow ſmall ſeede like unto that of Parſley, ſome-

what

what blackish furrowed or guttered like unto Cumin seede, of a very sharpe taste almost burning the mouth, and of a sweete sent, but so bitter withall that it may well bee accounted the most bitter of all the kindes of Parsley.

The Place and *Time.*

The first is thought originally to come from *Candy* unto *Venice* where they have sowen it, and taking it to be the *Macedonia* Parsley, have used it in their dispensations for *Mithridatum* and *Thyriaca Andromachi*, and have so much esteemed of it that they are loath to let any good seede come from them that might grow in any other place, besides the unreasonable price hath beene set upon it hath made it the more esteemed and sought after, yet I have had it growing in my garden and from it have gathered good store of seede in one yeare, but the first rootes perishing I could not get againe any to spring from the seede that I gathered, being as it should seeme not sufficient ripe, nor could I get any outlandish seede since to grow with me againe: the other groweth as *Lugdunensis* saith on the rockie hills of *Gratianopolis*, and as *Columna* saith on the hills of *Campoclarensis* and *Æquicoli*: they seede late with us.

The Names.

Fabius Columna hath much commented upon these two kindes of Parsley, concerning the first hee laboureth to prove it to be the second *Daucus* of *Dioscorides*, from the forme of the leaves thereof like unto *Apium agreste* as he compareth his second unto, and not to the seed as the qualities of sweetnesse, sharpenesse and heate might import: but in the description of this Parsley *Columna* assimilateth the leaves unto *Apium vulgare* (and not to *Apium agreste* as *Dioscorides* doth, which is that *herba Sardinia* called *Apium rusus*, for other *Apium agreste* is not set downe by *Dioscorides* in any place that I can finde) our common Parsley which although it doe, yet other authors have as likely herbes as this, and as agreeable to the second *Daucus* of *Dioscorides* in all things I thinke, but because neither *Dioscorides* nor any other ancient author hath given any description of the leaves, &c, of the *Petroselinum Macedonicum* more then of the seede, and that *Pliny* saith it differeth in the kinde, it is a hard matter to determine any certaintie upon so short a relation, all being but conjectures that can be said in it, which may as likely misse as hit. Concerning the other he saith that the *Neapolitans* where it groweth call it *Anethum sylvestre*, and others Saxifrage from the effects. But that the first should be *Petroselinum Macedonicū*, *Matthiolus*, *Lobel*, *Dodonæus*, *Castor Durantes*, *Lugdunensis* and *Tabermontanus* doe all call it as it was in their time held to be, and still continueth the same opinon and not undeservedly as I thinke, both the forme of the leaves flowers and seed, so nearely resembling the other kinds of *Selinon* or *Apiū* declaring it, but especially the qualitie of the seed being answerable to the properties that *Galen* doth appropriate it. And for the other it also commeth neare unto that relation of *Pliny* concerning *Petroselinum*, that it was another kinde, differing from the other *Apia* Parsleys as this doth, in the forme of the leaves being finer cut then any of them, but somewhat more like in the sharpenesse and bitternesse of the seed, and therefore saith *Columna* it may be used in the want of a better in stead of the true *Petroselinum Macedonicum* or untill a truer may be had out of *Macedonia* or *Epirus*. But *Bauhinus* calleth it *Apium montanum folio tenuiore*.

The Vertues.

The true *Petroselinum* saith *Dioscorides* provoketh urine and womens courses, and is profitable against the winde and belchings of the stomacke and against the winde Collicke also, and easeth the griping paines and torments of the belly, as also the paines in the sides and the raines and in the bladder being taken in drinke, it is put also into those medicines that provoke urine. The seede of this stone Parsley saith *Galen* is most in use, the herbe and roote also is used alike, but are of a weaker propertie but the seede is very sharpe in taste and bitter also, hot in qualitie, and of a cutting propertie withall, and hereby it mightily provoketh urine and womens courses, and driveth forth winde, and is therefore hot and dry in the third degree. This saith *Galen* in *lib.* 8. *simplicium medicamentorum*: but in his first booke *de antidotis* he doth prosecute this subject more fully, which although it bee somewhat large, yet I am the more willing to insert it here for young students sake, that they might be acquainted with *Galens* minde (who was in his facultie almost absolute) in this matter: As concerning *Petroselinum* stone Parsley (saith he) the best is knowne to all to be that of *Macedonia*, which some call also *Estreaticum*, imposing that name from the place wherein it groweth: yet it is but very little that groweth there, the place being very dangerous by rocks and small in compasse withall: and therefore this *Macedonian* stone Parsley that is of *Estriati*, and carried unto all nations (is but small in quantitie to be had in the countrey of *Macedonia* it selfe: but it happeneth to this stone Parsley of *Macedonia*, in the like manner that falleth out with the hony of *Athens* and the wine of *Falerno*. For as the Merchants doe export into all countries of the world the *Athenian* hony and the *Falerno* wine, so doe they this stone Parsley of *Macedonia*, when as there doth not grow such a quantitie thereof in *Macedonia* as may suffice all nations: but there groweth much of this Parsley in *Epirus*, as there is much hony gathered in the Ilands called *Cyclades* or *Sporades* (which are in the *Ægean* Sea) and as the hony is carried from the Iles to *Athens*, so is this stone Parsley first brought out of *Epirus* into *Macedonia*, and much of it if not all into *Thessalonica*, and from thence is carried forth as if it were of *Macedonia*: the same thing happeneth to the wine *Falerno*, for growing in a small peece of ground in *Italy* called *Falerno*, yet cunning Marchants doe so prepare the wine that they carry to all the subject Nations of the Romane Empire that they make it seeme the very same of *Falerno*. If you therefore at any time shall want this *Estreaticum Petroselinum*, doe not esteeme the Treakle the worse if you shall put thereinto others: for although another is not so fit against deadly poysons or the bitings of venemous beasts, yet against other diseases it may be not a little profitable, such as are the paines and torments in the body or bowells, the weakenesse of the stomacke, the Dropsie and divers other such like, which diseases the Treakles chiefe intent doth not promise to cure. And besides this *Estreaticum Petroselinum* doth make the Treakle more bitter, especially being used while it is fresh, for it differeth from other stone Parsleys, in that as it is most sharpe so it is most bitter of all other Parsleys: the seede whereof is thus described from *Dioscorides*, *Galen* and *Pliny*, without any relation of herbe, that it differeth in kinde from all others, the seede being like unto *Ammi* Bishops weede which is whiter and lesser then Cumin seede, but of a bitter sent, of a sharpe taste, and smelling aromatically, and as *Galen* addeth most bitter.

CHAP. XXVII.

Eleoſelinon. Paludapium ſive Apium paluſtre. Smallage.

WEe have beſides the Smallage that hath uſually beene knowne with us another ſort thereof (as I may call it from the likeneſſe) which in my former booke I called *Selinum dulce*, ſweet Parſley, and doe meane here to joyne it with the ordinary Smallage.

1. *Apium vulgare ſive Paluſtre.* Ordinary Smallage.

The ordinary ſmallage groweth up with greater hollow and more creſted ſtalkes then Parſley, and greater and larger winged leaves ſet one againſt another, broader, and of a darker greene colour and ſhining more then Parſley but dented ſomewhat unevenly about the edges, at the toppes of the ſtalkes and branches ſtand large tufts of ſmall white flower, which turne into ſmaller ſeede then Parſley: the roote is greater but not ſo long and ſlender, with a number of blackiſh fibres ſet thereat: the whole herbe and roote is ſtrong in ſmell, and much more unpleaſant and bitter in taſte then Garden Parſley, not to be endured to be eaten alone, but being boyled and otherwiſe dreſſed it ſavoureth better.

1. *Apium vulgare ſive paluſtre.* Ordinary ſmallage.

2. *Selinum ſive Apium dulce.*

Sweete *Selinum* or Smallage.

The ſweet Smallage or Parſley call it which you pleaſe, groweth up in the ſame manner that the former Smallage doth but larger then it, the leaves likewiſe are larger but not of ſo deepe a greene colour the flowers and ſeede likewiſe are like thoſe but ſomewhat larger: the roote is great and long with divers fibres ſet thereat, white and much more ſappie and pleaſant than eyther Smallage or Parſley, with a very warming and comfortable relliſh alſo nothing offenſive, but the whole herbe is ſo pleaſant as if Sugar had beene mixed with it: This both relliſh and forme wee have found it hath held for the firſt or ſecond yeare, the ſeede hath beene ſowen with us that commeth from beyond ſea, but as ſweete Fennell doth degenerate more and more in our Land, and onely continueth ſweete in warme countries, ſo doth this, the leaves alſo decay in their verdure and become nothing ſo freſh, but are more ſullen or ſad like Smallage.

The Place and *Time.*

The firſt groweth naturally in wet and marſh grounds, but if it be planted or ſowen in gardens it there proſpereth well: the other is familiar in Greece and *Italy*, where they eate it with great delight both herbe and roote, and is onely ſowen and replanted in all thoſe places, the naturall place being not knowne to us: they both abide greene all the winter and ſeed in *Auguſt* with us.

The Names.

The Greeks call the firſt ἑλειοσέλινον *Eſeoſelinon* which the Latines render *Paludapium* or *Apium paluſtre*, and is the ſame with the Greeke word: *Selinon* in Greeke is alwayes rendered *Apium* in Latine, and thereunto is added the other Epithite, which doth demonſtrate his kind as I ſayd before in the firſt diviſion of theſe *Apia*: but as I gave you then a caution concerning the Greeke and *Arabian* acceptation of *Apium*, ſo let it here be obſerved alſo that *Apium* after the *Arabian* authors, whom the Apothecaries ſhoppes have moſt followed in their appellations, is to be underſtand this Smallage, when as elſe *Apium* is the Greekes *Selinon*: and therefore it is by moſt writers called *Apium* and *Apium paluſtre* and *Eſeoſelinum* by *Dodonæus* and *Lobel*; *Columella* in his eleventh book and third Chapter ſheweth how by ſowing the ſeede of *Apium* (which *Matthiolus* thinketh is this *paluſtre* but I thinke rather he meant of the *hortenſe*) to make it have a broader leafe and how to make it have a crumpled leafe, and *Matthiolus* ſaith alſo that Gardiners in following his rules have made this Smallage to beare crumpled leaves, onely for pleaſure to looke on: but by his leave I beleeve they are but conceits, and rather fallacies then verities, for that *Apium latifolium* is this *Apium dulce* and his *Apium criſpum* is our curled Parſley, both of them being ſo by nature and not by art, for *Columna* ſaith the *Apium* or *Petroſelinum criſpum* is ſo naturally growing in *Sardinia*, and from thence the ſeede thereof hath beene diſperſed. The other is mentioned by *Bellonius* in his obſervations, yet taking it as *Columna* doth alſo but for *Apium Spontaneum* altered by art of tranſplanting, &c. to make it to be called *Geoſelinum* as *Quatramius* doth, who would alſo (as I ſhewed you before make our common Parſley to be *Petroſelinum Macedonicum*) make this herbe to be *Apium hortenſe*, whom *Columna* doth much inculcate for it: it is generally called *Selino* and *Selino dolce* by all *Italians* and *Greekes* likewiſe in their countries. I called it before *Selinum dulce*, ſweet Parſley, which as I ſayd you may eyther doe ſo or call it ſweete Smallage which you will. The *Arabians* call Smallage *Aſſilis*, the *Italians Apio paluſtre* and *Apio aquatico*, the *Spaniards Perexil dagua* and *Apio*, the *French de l'ache*, and *Perſil de'leau*, the *Germans Epſſick* and *Eppick*, the *Dutch Eppe*.

The Vertues.

Pliny hath erred much and cauſed others to follow his tract, in following and allowing *Chryſippus* and *Dioniſius* their writings, by miſtaking the various acceptation of the word *Apium* of the Latines from the Greekes, and

and from the *Arabians*, for he doth referre that to the *Apium hortense*, which is to be underſtood of this *Apium paluſtre*, *viz.* that it is an enemy to the eye ſight, condemned as not fit to be eaten: that it would breede the Falling ſickneſſe and many other ſuch like things, which if they were true of Smallage whereof very few doe beleeve their writings, yet can be no way true of Parſley in any part. Smallage is hotter and dryer then Parſley and is much more medicinable: for it much more openeth the obſtructions both of the Liver and Spleene, rarifieth thicke flegme and clenſeth it and the blood withall: it provoketh urine and womens courſes and is ſingular good againſt the yellow ſaundies: it is alſo very effectuall againſt *tertian* and *quartane* agues, if the juice thereof bee taken, but eſpecially made into a Syrupe: the juyce alſo put to hony of Roſes and ſome Barley water, is very good to gargle the mouth and throate of thoſe that have ſores and Vlcers in them, and will quickly heale them: the ſame lotion alſo doth clenſe and heale all other fowle Vlcers and Cankers elſe where, if they be waſhed therewith: the ſeede is eſpecially uſed to breake and expell winde, to kill wormes and to helpe a ſtinking breath: the roote is effectuall for all the purpoſes aforeſaid, and is held to be ſtronger in operation then the herbe but eſpecially to open obſtructions, and to rid away an Ague if the juice thereof be taken in wine, or the decoction thereof in wine bee taken: *Pliny* ſaith it hath an eſpeciall propertie againſt the poyſon of Spiders. The ſweete Smallage is chiefely uſed as a Sallet both herbe and roote eaten eyther raw or boyled: the roote being ſcraped is ſliced and ſo eaten with oyle and vinegar, it much warmeth a cold ſtomacke to digeſt their meate, and helpeth cold windy bodies to expell winde.

CHAP. XXVIII.

Oreoſelinon ſive Apium montanum. Mountaine Parſley.

I Have three ſorts of mountaine Parſley to ſhew you in this Chapter as they are taken by thē judicious, and thereunto referred.

1. *Apium montanum vulgatius.* The more common mountaine Parſley.

The firſt mountaine Parſley hath divers reddiſh ſtalkes of large ſpread leaves, divided into ſundry parts lying like a buſh on the ground next the roote, very like unto Garden Parſley but ſomewhat larger ſmelling well, from among which riſeth up a ſhort ſtalke of about a cubit height, with divers the like leaves upon it, branching towards the toppe, and bearing thicke tufts of white flowers, after which come ſmall ſeede like Smallage ſmelling ſomewhat ſweete ſharpe in taſte and bitter withall: the roote is long great and thicke with a buſh of haires at the toppe being ſweete ſharpe and aromaticall.

2. *Apium montanum verius.* The truer Mountaine Parſley.

This other mountaine Parſley ſhooteth forth a hollow kexie ſtalke in ſome places, tall and high in others, ſhort and low according to the ſoyle wherein it groweth, bearing ſundry large ſpread leaves cut and divided ſomewhat like unto the leaves of Hemlocke bearing umbells of white flowers, and after them ſomewhat long blackiſh ſeede, like unto Cumin ſeede, being ſharpe in taſte and ſweete in ſmell: the roote is ſmall long and white.

1. *Apium montanum vulgatius.*
The more common mountaine Parſley.

3. *Apium montanum Pariſienſium.*
The *Pariſians* mountaine Parſley.

The *Pariſians* mountaine Parſley hath a large, thicke, white roote, taſting and ſmelling much like unto the roote of Herbe terrible, the whole herbe doth reſemble Parſley lying thicke buſhing on the ground, the umbells of flowers are white and the ſeede is ſharpe in taſte, but ſmelling very ſweete.

The Place and *Time.*

The firſt groweth neare unto *Vienna* in *Auſtria* as *Cluſius* ſaith and on the mountaines among the rockes in *Germany* and other places, the next is found in the borders of the fields on the mountaines of *Burgundie*, the laſt on the ſandy top of the Surene hill by *Paris*: they floriſh in the Summer, and give ſeede ſoone after.

The Names.

The Greeke name ὀρεοσέλινον is given to theſe plants, and ſo likewiſe *Oreoſelinum* and *Apium montanum* in Latine, although the firſt and the laſt differ as well in leafe as in the ſeede from *Dioſcorides* deſcription of it, and yet is called *Oreoſelinum* of many, whereas the ſecond onely commeth neareſt to the true *Oreoſelinum* both in leafe and ſeede: The firſt is called *Oreoſelinum* by *Dodonæus* (who alſo ſaith it is called by the *Sileſians Veel gutta*: 1. *multi boni* good for many things) *Lobel* and *Cluſius*, and by *Lugdunenſis Oreoſelinum maius* and *Apium montanum Dalechampij*: the ſecond is the *Oreoſelinum aliud* of *Lugdunenſis*, the ſecond *Selinum peregrinum* of *Cluſius*, as *Bauhinus* ſetteth it downe and by himſelfe *Apium peregrinum Cicutæfolio*: I have as I preſume rightly referred it to bee the true *Oreoſelinum* of *Dioſcorides*, agreeing ſo well thereunto: the laſt is called alſo by *Lugdunenſis Oreoſelinum Pariſienſium*, and by *Bauhinus Apium montanum nigrum*.

The Vertues.

Dioscorides saith that the mountaine Parsley provoketh urine, if the roote and seede be broken in wine: it bringeth downe also womens courses, and is put among those medicines that are made to expell gravell, and those that doe warme any cold part. *Galen* saith it is in working like unto Smallage, but more effectuall. *Dodonæus* setteth downe that the first mountaine Parsley called *Veelgutta*, that is good for many things, is hot and drie in the end of the second degree, that it doth extenuate and make thinne the thicke grosse clammy houmours, that it cutteth tough flegme, openeth obstructions of the liver and spleene, and provoketh urine, breaketh and expelleth the stone, moveth womens courses, and helpeth the yellow jaundise, and being chewed in the mouth, it draweth much water and spittle into the mouth, and easeth the tooth-ach.

CHAP. XXIX.

Thysselinum sive Apium sylvestre. Wilde milkie Parsley.

THis kinde of wilde Parsley, hath sundry large spread leaves, somewhat resembling garden Parsley, but they are divided intomore parts, and each division hath swaller leaves, from among which riseth up an hollow straked stalke a yard high, reddish toward the bottome, sometimes with the like leaves at the joynts where it brancheth forth diversly, bearing large thicke umbells of white flowers, reddish on the one side and pale on the other, and after them fat seede, somewhat like unto Parsneppe seede, but a little lesse hot in taste, and somewhat aromaticall, the roote spreadeth divers long strings, blackish without, but white within, and deepe into the ground, somewhat like unto the *Meum* Spignell, and abideth many yeares. The whole plant and every part thereof, yeeldeth a milkie juyce, if it be broken in any part.

Thysselinum sive Apium sylvestre. wilde Milkie Parsley.

The Place and *Time.*

It groweth in moist and marshy grounds, and water-courses, and much also in the moist woods where Alders doe grow: it flowreth in *June* and *July*, and seedeth soone after.

The Names.

Both *Dioscorides* & *Theophrastus* have a σελινον ἀγριον *Apium sylvestre*, but they differ much one from another, for *Dioscorides* his is that kinde of *Ranunculus*, hee calleth *Herba Sardinia*, but *Theophrastus* doth not number his among his other *Selina*, and peradventure may be this that hath beene referred both by *Dodonæus* and *Lobel* unto the *Thysselinum* of *Pliny*, which *Lobel* calleth *Thysselinon Plinij*, supposing the name *Thysselinon*, better to agree with the forme of this plant, as comming neerest to a *Selinon*, but howsoever if it be not the same with *Pliny* his *Thysselinum* it commeth so neare it, that no other is yet found so neare, especially in the forme of the leafe and property of the roote, as you shall heare by and by; *Lobel* and *Dodonæus* doe both say, that this was in former times used in all the shoppes of the *Low Countries* instead of *Meum*, taking it to be the right; and therefore *Dodonæus* did also call it *Apium sylvestre* as *Lugdunensis* doth likewise; *Gesner in hortis* calleth it *Daucus palustris*, and *Cordus in historia Olsenichium* from the *German* word *Osenich*, whereby they so called it; *Bauhinus* calleth it *Apium sylvestre lacteo succo turgens*; and thereupon I have entituled it in *English*, Wild milkie Parsley, to distinguish it from other sorts of wilde Parsley.

The Vertues.

The roote hereof is hot and drie in the third degree, which being chewed in the mouth, draweth downe much flegme from the head to be spit out, and easeth the tooth-ach: and this quality, *Pliny* saith, the roote of his *Thysselium* is endued withall: the other properties appropriate to the other kinds of *Apium* are no doubt to be found herein, and that to no lesse effect, as both to extenuate, cut, and open, and to provoke urine, and womens courses

CHAP. XXX.

Selinum sive Apium peregrinum. Strange Parsley.

THis strange Parsley hath from along whitish roote, sharpe in taste, well smelling, and tasting like Parsley, growing woodly, and perishing after seede time, divers long stalkes of leaves lying on the ground, which are almost round, yet a little pointed and dented about the edges, five usually and more also, yet sometimes but three on the stalkes, set by couples and of a sad greene colour, the stalke, is straked and hollow

Selinum sive Apium peregrinum Clusij.
The first strange Parsley of *Clusius.*

Selinum sive Apium peregrinum primum Clusij.
The first strange Parsley of *Clusius.*

hollow, three or foure foote high with divers leaves, shooting from it, divided much, and into long parts, and branched likewise, at the toppes whereof grow umbells of small white flowers, bowing downe their heads almost double before they rise to be in flower, which better expressed in the former figure, after which come very small seede not so bigge as Smallage seede, but quicke and hot and of a good smell: this by the shedding of its owne seede doth easily abide in a garden if it once seede therein.

The Place and *Time.*

This groweth, saith *Clusius*, in the borders of the Vineyards, and by the paths and wayes side in the countrey of *Salamanca* in *Spaine*, and that it flowreth in *July*, and the seede is ripe in *August*, but with us it is more late before it ripen.

The Names.

Clusius who found it in *Spaine*, called it *Selinum peregrinum*, and is the first with him, *Bauhinus* calleth it *Apium peregrinum foliis subrotundis*; and is the third *Saxifraga* of *Cesalpinus*, and the third *Daucus* of *Dioscorides* with *Columna*, which he mketh the second with *Pliny*.

The Vertues.

The qualities of heate and drinesse perceived in the taste of both leaves and roote, but especially of the seede doth argue it to be no lesse effectuall to provoke urine, and to helpe to breake and to expell the stone than some of the former Parsleyes, and besides may be also good for other diseases, as they are formerly remembred, and the name of *Saxifraga* also, as *Cesalpinus* giveth it, sheweth the same: these things are probable, although we have had no certaine experience by triall.

CHAP. XXX.

Hipposelinon sive Smyrnium. Allisanders.

VNder this title of Allisanders, I must comprehend two sorts of herbes, each of them called *Smirnium*, and the last *Creticum*, as shall be shewed.

1. *Hipposelinum sive Smyrnium vulgare.* Garden Allisanders.

Our common garden Allisanders groweth the greatest of all the *Selina* mentioned by the old authours, having divers large spread leaves; cut into many parts greater and rounder than Smallage, and of a darke greene colour, and dented about the edges, of somewhat an hot and spicie taste, and a little bitter withall, the stalke that riseth up amongst them is thicke and round, a yard high and better, with sundry leaves on them, parted into smaller divisions, with branches also rising from the joynts, each bearing large tufts or umbells of white flowers, and after them great blackish seede, not full round, but a little straked on the backe, hot and bitter, as the leaves and roote also is, which is great, thicke, long, and blackish on the outside, spreading into many parts underground, and whitish within.

1. *Hyppoſelinum ſive Smyrnium vulgare* Common Alliſanders.

2. *Smyrnium Creticum.* *Candy* Alliſanders.

2. *Smyrnium Creticum.* *Candy* Alliſanders.

The *Candy* Alliſanders is the ſtrangeſt in the growth of any plant upon the ground, by the alteration of the upper from the lower leaves, for before the ſtalke riſeth, any one would take the leaves to be ſome kinde of *Selinum*, the whole leafe being large and more divided into ſmaller parts than the former, as if it were ſome great Parſley, of a darke greene ſhining colour and dented about the edges: the ſtalke is round and ſtiffe, ſtrong and not hollow, foure foote high or better, ſmall having at the joynts whole, and almoſt round leaves, yet ſometimes longer than round, and here and there cut in on the edges, of a yellowiſh greene colour which doe not ſo much compaſſe the ſtalke at the bottome of them, as that the ſtalke in a manner groweth through them: from the joynts likewiſe riſe ſundry branches with the like yellowiſh round leaves on them, and the ſtalkes running through them to the toppes, where ſtand thicke tufts or umbells of yellowiſh flowers, which afterwards turne into ſmall round blackiſh ſeede, about the bigneſſe of Radiſh ſeede: the roote is at the firſt almoſt round, as bigge as a great peaſe, yet a little long withall, and white on the outſide, which afterwards groweth thicker and longer, and greateſt at the toppe, ending ſmall, but periſhing quite after it hath borne ſeede, which hath nothing ſo hot, bitter, or ſpicie a taſte as the former hath, eſpecially in our countrey, but as ſome might thinke that it hath altered the qualitie, yet *Fabius Columna* ſaith, that even in *Naples* where it is naturall it hath no ſharpe or bitter taſte, nor the ſeede is neither with us. *Bauhinus* maketh another ſort hereof, the difference only conſiſting in the upper leaves, which are longer than the other and more cut in, both which ſorts hath riſen in my garden from one kinde of ſeede, and therefore I hold them to be both one, and make no more differing ſorts.

The Place and *Time.*

The firſt hath beene found wilde in ſome of the Iles about our own Land by Mr. *William Quicke*, a worthy Apothecarie in his time, who gave me and Mr. *William Cole* a famous Gentleman, and a great lover of plants, ſome of the ſeede, ſuppoſing it to be differing from the common ſort, but after they were growen up, we all ſaw there was no difference. It is uſually ſowen in all the gardens of *Europe*, as farre as I heare, where they have it: the other came from *Candy*. They both flower in *June* or *July*, and the ſeede is ripe in *Auguſt*.

The Names.

Ἱππος ἔλινον in Greeke, is called *Hyppoſelinum* alſo in Latine, *Gaza* rendereth it *Equapium*, becauſe, as I ſaid it is the greateſt of all other their *Selina*, *Dioſcorides* ſaith it was called by ſome in his time Σμύρνιον *Smyrnium*, yet as he ſaith the true *Smyrnium* is an other herbe, which he deſcribed in the Chapter following, and is this *Smyrnium Creticum*. There is ſome controverſie among Writers about this *Hyppoſelinum*; firſt, whether it ſhould be the true *Hyppoſelinum* of *Dioſcorides* or no, then whether it or the other *Smyrnium Creticum* be the *Smyrnium* of *Dioſcorides* or no: for the firſt, *Matthiolus* ſheweth the errour of *Ruellius* in taking the *Paludapium* to be the *Ma-*

cerone

cerone of the *Italians*, and saith he findeth not what herbe this *Hyppoſelinum* ſhould be, unleſſe it be *Leviſticum Lovage*, which yet he acknowledgeth not to anſwer *Dioſcorides* his notes thereof, becauſe it is in forme ſo like unto a great *Selinum*, and for this opinion *Lobel* yerkes him too critically, ſhewing that *Leviſticum* is too hot and ſharpe, and in no place uſed to be eaten as a wort or ſallet herbe, and that he did unworthily taxe *Braſſovolus* for taking the *Macerone* of the *Italians* to be this *Hyppoſelinum* by the falſe tranſlation of *Marcellus Virgilius*, in giving the roote of *Hyppoſelinum* to be blacke without and white whithin, when as *Dioſcorides* maketh no mention of any blackneſſe in the roote: *Lobel* alſo ſaith that it is the true *Hyppoſelinum* as they affirmed by the judgement of the moſt learned in theſe dayes, and yet by all their leaves, the roote of *Dioſcorides* is different from it, who ſaith it is white when as this is blacke, that it is ſmall, but this is not ſo, which maketh *Columna* in the ſcanning of *Smyrnium*, to ſay that he would further ſearch what *Dioſcorides* his *Hyppoſelinum* ſhould be, as not holding this that we account of to be ſo. Now concerning the other doubt whether this *Hippoſelinum*, or the other plant called *Smyrnium Creticum* ſhould be the true *Smyrnium* of *Dioſcorides* or no, the currant opinion of moſt Writers in theſe times, is that this *Smyrnium Creticum* is the ſame, and yet as *Columna* hath in the ſaid place very worthily, and throughly examined the matter, it is nothing ſo; for *Dioſcorides* deſcribeth his *Smyrnium*, firſt, that it was called *Petroſelinum* in *Cilicia*, and that it hath leaves of a good ſmell, ſharpe or quicke on the tongue, with ſomepleaſantneſſe therein alſo: that the ſeed is round like to Colewort ſeed, (wherein *Columna*, thinketh ſome, miſtaking of the Greek word to be that κράμβης is ſet down in ſtead of κάρυον, for as he ſaith, the ſeed is as like to the ſeed *Canchrys* as may be, except the black colour) black & of a ſharpe taſte like *Myrrhes* ſweete Chervill, ſo that one may be uſed inſtead of the other, and that the roote is blacke without and of a whitiſh greene colour on the inſide, of a ſweete ſmell, and of a ſharpe taſte, heating the mouth, both roote, ſeed, & leaves being of an heating propertie: not any one of all theſe markes or notes except in the ſeed to be blacke and round, is to be found in this *Smyrnium Creticum* and therefore it cannot be the right: whether then the *Hyppoſelinum* of *Dioſcorides* can be *Smyrnium*, *Dioſcorides* himſelfe denieth it, and ſaith that although ſome called it *Smyrnium*, yet the true *Smyrnium* was an other herbe, even the ſame that I have out of *Dioſcorides* his deſcription ſet downe a few lines here before unto you: *Theophraſtus* hath ſet forth an *Hippoſelinum*, *lib. 9. c. 5.* and ſpoken of it in other places, which is plainely differing from the *Hippoſelinum* of *Dioſcorides*, and neereſt unto, if not the ſame with his *Smyrnium*: for *Therphraſtus* ſaith that his *Hippoſelinum* (rendred by *Gaza Equapium*) doth yeeld a juyce from the roote like unto *Myrrha* or *Myrrhi*, as *Dioſcorides* ſaith of his *Smyrnium*: ſo that by this that hath beene ſaid (although it be ſomewhat tedious, yet I could not more briefely declare them) we finde that *Smyrnium Creticum* is not the true *Smyrnium* of *Dioſcorides*, as *Matthiolus*, *Camerarius*, *Dodonæus*, *Lobel*, *Lugdunenſis*, *Tabermontanus*, and *Gerard* hath ſet it downe, nor that the *Hippoſelinum* of *Dioſcorides*, which is called alſo *Olus atrum* with us is ſufficiently knowne, although ſome authors call it *Hyppoſelinũ*, nor is that which it is taken to be, by the defect of ſome of the notes or markes that *Dioſcorides* giveth it, and laſtly that the *Hippoſelinum* of *Theophraſtus* doth agree with the *Smyrnium* of *Dioſcorides*, but not with his *Hippoſelinum* being different plants, and ſo *Matthiolus*, *Cordus* on *Dioſcorides*, *Geſner in hortis*, *Camerarius* and *Columna* ſet it downe: *Columna* his Iudgement is, that the ſeede of this *Hippoſelinum*, or *Smyrnium* may more fitly be uſed for *Petroſelinum Macedonicum* (if his other fine leafed herbe that hath the ſmell of Garden Parſley be refuſed, or not to be had) than either the common Parſley ſeede, or that of *Venice* called *Petroſelinum Macedonicum* by many, and by him *Daucus ſecundus Dioſcoridis*. The *Italians* call the firſt *Macerone*, the *Spaniards Perexil Macedonico*, the *French Alexandre*, the *Germans Groſſ Epffich*, the *Dutch Peterſelie van Macedonien* and *Groote Eppe* and *Peterſelie van Allexandrien*, and we in *Engliſh* Alliſanders.

The Vertues.

Our Alliſanders are much uſed to make broth with the upper part of the roote, which is the tendereſt part, and the leaves being boiled together, and ſome eate them either raw with ſome vinegar, or ſtew them, and ſo eate them, and this chiefely in the time of Lent, to helpe to digeſt the crudities and viſcous humours are gathered in the ſtomacke, by the much uſe of fiſh at that time, it doth alſo warme any other cold ſtomacke, and by the bitterneſſe helpeth to open obſtructions of the liver and ſpleene, to move womens courſes, to expell the afterbirth, to breake winde, to provoke urine and helpe the ſtrangury, and theſe things the ſeede will doe likewiſe if either of them be boyled in wine or taken in wine, and is effectuall againſt the bitings of Serpents. Wee know of no good propertie the other hath, being in a manner incipide.

CHAP. XXXI.

Selinum Segetale. Corne Parſley.

TO finiſh theſe *Apia* Parſleyes, let me joyne this unto them, which *Iohn Goodier* firſt gave me the knowledge of, with ſome ſeede which ſpringeth in mygarden I thus deſcribe unto you; it is a ſmall low herbe having ſundry winged long leaves lying on the ground, many being ſet one againſt another, finely dented about the edges, with one at the end, which are each of them longer than Burnet leaves and pointed at the ends, among which riſe ſundry round ſtalkes halfe a yard high with the like, but leſſer leaves on them, branching forth likewiſe from the joynts, and all of them bearing ſmall umbells of white flowers, which turne into ſmall blackiſh ſeede leſſe than Parſley, but as hot and ſharpe in taſte as it: the roote is ſmall, long, and white, and periſhing every yeare after it hath ſeeded, and riſeth againe of its owne ſowing.

The Place and *Time.*

This groweth in the fields among the corne, or where corne hath beene ſowne in divers places of the land: it flowred not with me untill *Auguſt*, and the ſeede ripened a month after at the leaſt.

The Names.

Mr. *Goodier* firſt gave it me by the name of *Sium terreſtre*, and after that I found it an umbelliferous plant, I thought it might beſt be referred to the *Selina* or *Apia*, and called it then *Apium Sifolijs* from the compoſure of

of the leaves like unto *Sium odoratum Tragi*; but ſince that I heard it, I ſuited it with *Selinum Segetale*, which is Corne Parſley, but it is called in ſome places of the land Honewort.

The Vertues.

Becauſe the ſeede is both in forme like Parſley, and as hot in taſte, there is no doubt but that it is very neere of the ſame propertie with Parſley, but becauſe I have not made any triall thereof my ſelfe, I can ſay no more, but what Mr. *Goodyer* related to mee, that the uſe of the juyce of a handfull of the leaves to be drunke in a draught of beare every morning for a fortnight, did cure one that had a ſwelling in her cheeke yearely there ariſing ſometimes, but whereof it proceeded I could not be ſhowen.

Selinum Segetale. Corne Parſley.

Chap. XXXII.

Cicuta. Hemlocke.

THere are many ſorts of Hemlockes to be ſhewed you ſome greater, others leſſe, ſome growing in the marſhes, and others by the hedge ſides, &c.

1. *Cicuta vulgaris major.*

The common greater Hemlocke.

The common great Hemlocke groweth up with a hollow greene ſtalke foure or five foote high or more, full of red ſpots ſometimes, and at the joynts very large winged leaves ſet at them which are divided into many other winged leaves, one ſet againſt another, dented about the edges, of a ſad greene colour branched toward the toppe, where it is full of umbells of white flowers, and afterwards with whitiſh flat ſeede, the roote is long, white, and ſometime crooked and hollow within, the whole plant, and every part, hath a ſtrong headdy illfavoured ſent, much offending the ſenſes.

2. *Cicuta minor ſive fatua,* Fooliſh Hemlocke or counterfet Parſley.

This ſmall Hemlocke riſeth not a yard high, with whiter and ſmaller ſtalkes not ſpotted at all: the leaves are much ſmaller comming neare unto Parſley, ſo that many are miſtaken in gathering one for another, being often found as a wilde weede in gardens of a paler greene colour, and with few branches, the flowers and ſeede are both white as the roote is, but ſmall, and periſhing every yeare: the ſent hereof is much leſſe or offenſive.

3. *Cicutaria maxima.* The greateſt Hemlocke.

This Hemlocke hath much larger winged leaves than the former, thicker ſet, more ſpread, and of a ſadder greene colour (for the ſmell whereof, which *Lobel* calleth *a fetidiſſima*, I that have had it growing in my garden for many yeares could never take offence by the ſmell of it, if it be the ſame that *Lobel* meaneth) the ſtalke is great, but riſeth not ſo high as the common ſort doth, and beareth large umbells of white flowers, whereafterwards grow large and thicke white crooked ſeede of no ill ſent that ever I could perceive: the roote is very great and white both growing deepe in the ground, and ſpreading many great branches therein, which ſometimes dieth after it hath given ſeede, and yet not alwayes, but at ſometimes, and in ſome places will abide. *Lobel* hath joyned to this another, which he calleth *maxima Brancionis*, but he himſelfe doubteth whether it be not the ſame with this laſt, and therefore I thinke good to make no further mention of it.

4. *Cicutaria paluſtris alba.* White wilde Hemlocke.

The white wilde Hemlocke hath a white long thicke roote like Fennell, but divided into many parts, being of a ſweete ſent, and an hot ſharpe taſte, from whence riſe divers ſtalkes of winged leaves much cut in on the edges, among which riſeth a ſlender branched and crumpled ſtalke, a cubit high, bearing umbells of white flowers, and long blacke well ſmelling ſeede, after taſting ſharpe, two alwayes joyned together with a ſmall thread betweene them.

5. *Cicutaria paluſtris rubra.* Red wilde Hemlocke.

This other red Hemlocke hath a thicke blacke, and jointed roote with divers fibres thereat, the leaves are in forme like the laſt, but larger, and not ſo much cut into parts, and paler of colour, the ſtalke is round and joynted a foote high, bearing flat umbells, with pale red, or bluſh flowers, and long blacke ſeede after them, ſweete in ſmell and ſharpe in taſte.

6. *Cicutaria paluſtris tenuifolia.* Marſh or Water Hemlocke.

The Marſh or Water Hemlocke hath a great thicke hollow ſtalke, two or three cubits high, full of joynts and leaves at them, at the joynts with the leaves which are cut into divers parts ſomewhat like unto Parſley but ſmaller come forth the branches up to the toppe, bearing ſmall umbells of white flowers, the ſeede is ſweete in ſmell and blacke, ſomewhat greater than Aniſeede: the roote is long and blackiſh, with ſundry joynts and fibres growing from them.

7. *Cicutaria bulboſa.* Bulbous rooted wilde Hemlocke.

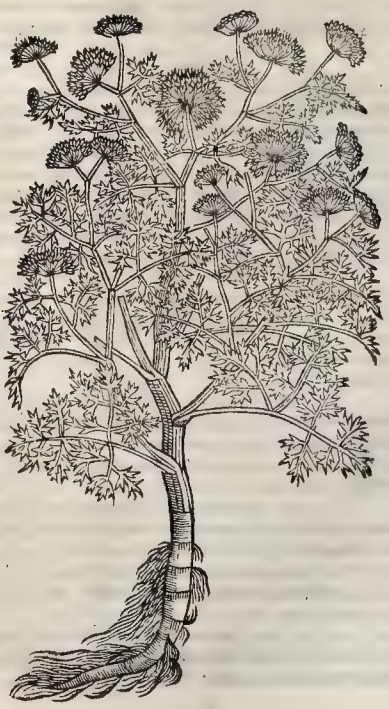
This bulbous Hemlocke hath divers ſtalkes of fine cut leaves, more jagged than the upper leaves of Parſley, and comming ſomewhat neare unto the *Bulbocaſtanum*, Earth Cheſnut leaves, of a little ſharpe hot taſte, the ſtalke is a foote

1. *Cicuta vulgaris major.*
The common greater Hemlocke.

2. *Cicuta minor sive fatua.*
Foolish Hemlocke or counterfeit Parsley.

3. *Cicuta maxima.*
The greatest Hemlocke.

6. *Cicutaria palustris tenuifolia.*
Marsh or Water Hemlocke.



a foote and sometimes a cubit high, having thicke and knobbed joynts and leaves at them, at the toppes whereof standeth an umbell of white flowers, and after them somewhat long seede like Chervill seede: the roote is round and tuberous, somewhat like unto the roote of the round *Aristolochia* Birthwort, knobbed or bunched forth in some places, blackish browne without and white within of the taste of a Parsnep roote, but growing somewhat longer like a Turnep roote, when it runneth to seede and perisheth yearely, being raysed of it owne sowing.

The Place and *Time.*

The first groweth in all countries by walls and hedge sides in waste grounds and untilled places, the second is found as well abroad also as in gardens, and the third in Gardens alone in these parts, the fourth and fift in moist grounds and marshes and by waters sides in *France*, the sixt by our Thames sides in many places: and the like Rivers sides in our owne Land, and the last as *Clusius* saith in *Hungaria* and *Austria*, both wilde abroad and in their gardens, they all flower and seede in *July* or there abouts.

The Names.

It is called κώνειον in Greeke παρὰ τὸ κωνᾶν, *a circum vertendo, quod vertigimem & imaginem earum rerum quæ aspiciuntur, tanquam circumagantur ac in tenebras inducat ijs quæ eam biberunt, ut fusius declarat Nicander*: in Latine *Cicuta*. The first is called *Cicuta* and *Cicuta major* by all writers, yet *Clusius* calleth it *Cicutaria*: the second is the *Cicuta minor* of *Cordus* and *Camerarius Cicutaria fœtua* by *Lobel*, *Apium cicutarium* by *Thalius*, *Petroselinum Caninum* by *Tabermontanus*, *Petroselini vitium* by *Tragus*, and *Apij comes vitium* by *Gesner in hortis*: the third is called *Cicutaria latifolia fœtidissima*, and *Cicutaria maxima Branciorij* by *Lobel*, for as I said he judgeth them both one, and *Cicutaria Myrrhis* by *Thalius*; by *Matthiolus*, *Gesner in hort. Lugdunensis* and others *Sesels Peloponense*, which *Lobel* contradicteth, but without just cause as I suppose, as I said before: the fourth and fift is called by *Lugdunensis Cicutaria alba*, and *Cicutaria rubra*, and by *Camerarius* and *Bauhinus Cicutaria palustris flore albo* and *flore purpureo*, and peradventure may be the *Meum Selesianum* of *Camerarius* also as *Bauhinus* saith, the sixt is called *Cicuta palustris* and *aquatica* by *Cordus*, *Gesner* and *Thalius*, and *Cicutaria palustris* by *Lobel* and others, and taken to be *Phellandrium* of *Pliny* by *Dodonæus* and *Lugdunensis*, who make it also a kinde of *Sium* or *Laver*, *Ligusticum sylvestre* by *Thalius*, and *Silaus Plinij* by *Cæsalpinus* and others: the last was first found out and named *Cicutaria Pannonica* by *Clusius*, *Camerarius* calleth it *Bulbo astanum Coniophyllum*, *Tabermontanus Myrrhis Cicutaria*, and by *Bauhinus* as I doe also *Cicutaria bulbosa*. The *Arabians* call it *Sucaram*, the *Italians Cicuta* the *Spaniards Ceguda* and *Canheja*, the *French Cigue* and *Cocue*, the *Germanes Wurtzerling Scirling* and *Wetterich*, the *Dutch Scharbuk dullekernell*, and we in *English* Hemlocke and Kexes.

The Vertues.

Hemlocke is exceeding cold in qualitie and very dangerous, especially to be taken inwardly; For the *Athenians* adjudged the most wise *Socrates* to dye by taking the juice thereof, for not thinking rightly of their Gods as *Aristus* and *Melitus* accused him: yet as it was then well knowne some countries bred it stronger to kill then other, and although some doe appoint it to be applyed outwardly to the cods of those that have venerous dreames or the like, or to maidens and womens breasts to represse their swellings and repell their milke, yet by reason the places are so tender and full of vitall spirits, it often proveth that the remedy is more dangerous then the disease; it may safely be applyed to inflammations, tumors and swelling, in any other part of the body, as also Saint *Anthonies* fire, wheales, and pushes and creeping Vlcers that rise of hot sharpe humors by cooling and repelling the heate: the leaves bruised and layd to the brow or forehead is good for their eyes that are red and swollen, and doth soone ease the paine and take away the swelling and redness, as also to take away a pinne and web growing in the eye, this is a tryed medicine, to take a small handfull of the herbe and halfe so much bay Salt beaten together and applyed to the contrary wrist of the hand for 24. houres doth within thrice dressing remove it If the roote of Hemlocks be roasted under the Embers wrapped in double wet papers untill it bee soft and tender, and then applyed to the goute in the hands or fingers will quickly helpe this evill. The remedy for Hemlocke if any shall by mischance eate the herbe in stead of Parsley, or the roote in stead of a Parsnep, whereby happeneth a kinde of frensie or perturbation of the senses, as if they were stupified or drunke, is to drinke of the best and strongest pure wine before it strik to the heart, as *Pliny* adviseth, or Gentian put into wine as others say, but *Tragus* saith that he holpe a woman that had eaten the roote, by giving her a draught of good Vinegar, but if it be given with wine it procureth death without remedy: *Matthiolus* sheweth that Asses by chance eating of the herbe fell into so deepe a sleepe that they seemed dead, which when some came to slay them they slang from them in the doing it, to their amazement and merriment.

CHAP. XXXIII.

Myrrhis. Sweete Chervill or sweete Cicely.

HEre are three or foure sorts of this *Myrrhis* to be shewed you in this Chapter some whereof are of later invention then others.

1. *Myrrhis major sive vulgaris.* The ordinary Garden sweete Chervill.

This sweete Chervill by reason of the so neare resemblance unto Hemlockes, I thought good to joyne next them, which groweth not so high, but hath large spread leaves cut into divers parts, somewhat resembling the greatest Hemlocke but of a fresher greene colour, tasting as sweete as the Anneseede, the stalke riseth up a yard high or better, being crested or hollow having the like leaves at the joynts but lesser, and at the toppes of the branched stalkes umbells or tufts of white flowers, after which come large and long crested blacke shining seede pointed at both ends tasting quicke, yet sweete and pleasant like the leafe or Anneseede: the roote is great and white growing deepe in the ground, and spreading sundry long branches therein, in taste and smell stronger then the leaves or seede and continuing many yeares. Of this kinde wee have another much greater and larger that was brought from *America*, especially the leaves, which are foure times as large as the former, not differing else.

Latifolium Americanum.

Myrrhis

1. *Myrrhis major vulgaris ſive cereſolium majus.* The ordinary greater ſweete Chervill.

2. *Myrrhis altera minor.* The leſſer ſweete Chervill.

2. *Myrrhis altera minor.* The leſſer ſwēet Chervill.

The leſſer ſwēete Chervill is ſomewhat like the former, but the whole winged leafe is much leſſer, and divided into fewer and leſſer leaves alſo, and ſofter in handling, the ſtalkes are lower and the umbells of white flowers ſmaller: the ſeede that followeth is long but much ſmaller, and not blacke but taſting neare unto the former: the roote is a buſh of many blackiſh fibres.

3. *Myrrhis ſylveſtris.* Wilde ſweete Chervill.

The wilde ſweete Chervill is likewiſe a low plant, and not much differing from the laſt in the forme of leaves but that it is ſomewhat hairy and whiter, the flowers are white, but in more thinne and ſparſed umbells, and the ſeede that followeth is ſmall, long and ſmooth: the roote is thicke and blackiſh and liveth many yeares.

4. *Myrrhis ſylveſtris Neapolitana & etiam Anglicana.* Wilde ſweete Chervill of *England* as well as *Naples.*

This kinde of Chervill is ſo like in leafe unto the common Hemlocke, that before it be growne up to ſtalke it deceiveth many that gather it, for the ſtalke is ſpotted ſometimes with white and red, yet ſeldome ſo with us as that of Hemlocke is but whitiſh, at the joynts whereof with the leaves which are leſſer come forth ſmall tufts of white flowers, and not at the toppes of the ſtalkes as in all other umbelliferous plants ſaith *Columna* which wee have not obſerved in ours, after which the ſeede followeth which are ſomewhat long and with a long point more rough and hairy, and cleaving faſter to garments then the wilde Carrot ſeede doth, and is of an aromaticall ſharpe ſweete taſte, mixed with a bitterneſſe as *Columna* ſaith with them but nothing ſo much with us: the roote is ſmall long and white, not bigger uſually then a Parſley roote dying yea rel.

The Place and *Time.*

The firſt is thought to grow wilde in ſome fields of *Germany*, but I doubt the report was onely true for the third ſort here, which groweth wilde with us as well as with them, neare unto ditch ſides and other water courſes, for the firſt is onely kept in Gardens with us and them too as I heare: the ſecond is naturall of *Geneva* and the parts there abouts as *Lobel* ſaith, but was ſent alſo by *Aicholzius* from *Vienna* to *Norunberge* to *Camerarius* as hee ſaith in *horto*, and is likely to be naturall of thoſe parts alſo: the laſt *Columna* found upon ſome of the hills in *Naples*, and we have often ſeene it growing with us in waſte places by way ſides, in the fields ſometimes and walls ſides.

The Names.

It is called in Greeke μύρρις as well as μύρρα and *Myrrhis* and *Myrrha* likewiſe in Latine, in imitation of the Greek, *Pliny* ſaith that ſome called *Myrrhis* by the name of *Smirniſuſa* and others *Myrrha*, yet ſome have it *Smyrrhiza* from the likeneſſe unto *Smyrnium*, as before the *Smyrnium* was likened to *Myrrhis*, ſome alſo call it *Carefolium magnum* and ſome *Cicutaria* from the likeneſſe of the leaves, and of ſome *Conilaus*: the firſt is generally called *Myrrhis* by moſt authors, yet *Anguilara* calleth it *Seſeli Peleponenſe*, and is *Cæſalpinus* his *Cicutaria tertia*, and by *Tabermontanus Cærefolium Hiſpanicum*, and by *Bauhinus Myrrhis major vel Cicutaria odorata*: the ſecond *Lobel* calleth *Myrrhis altera parua* and *Camerarius Myrrhis ſativa minor*; and is the ſecond *Cicutaria* of *Cæſalpinus*, and by *Tabermontanus Myrrhis montana*: the third is the *Myrrhis* of *Fuchſius* and others which *Camerarius* calleth *ſylveſtris*

ſylveſtris, and *Geſner in hortis Cicutaria ſimilis Cicutæ herba* that grew in the fields, and was not hurtfull which *Bauhinus* calleth *Myrrhis ſylveſtris ſeminibus lævibus*, becauſe hee calleth the laſt *Myrrhis ſyl. ſeminibus aſperis*, which *Columna* called *Myrrhis ſylv. nova Æquicolorum*, and I have added to the title *Anglicanum* becauſe it is ſo like his. The *Italians* call it *Murrhida*, the *French Perſil d'aſne*, the *Germans Wilder kerffell*, the *Dutch* wilde *Keyvell* and we in *Engliſh* ſweete Chervill, great Chervill and ſweet Cicely.

The Vertues.

Galen ſaith that *Myrrhis* is hot in the ſecond degree with ſome tenuitie of parts: both leaves, ſeede, and rootes are ſo fine and pleaſant in Sallets as no other is comparable to it, and give a better reliſh to any other herbe is put with it: the ſeedes while they are freſh and greene ſliced and put among other herbes make them taſte very pleaſant: the roote boyled and eaten with oyle and Vinegar, or without oyle if any miſlike oyle, doth much pleaſe and warme a cold or old ſtomacke oppreſſed with flegme or winde, or thoſe that have the Tiſſicke or Conſumption of the Lungs: the roote drunke with wine is a remedy againſt the biting of the venemous Spider Phalangium, as alſo the Plague or Peſtilence: the ſame alſo provoketh womens courſes, and expelleth the afterbirth: it alſo procureth an appetite to meate and helpeth to expell winde: the juice is good to heale the Vlcers of the head and face: the candid rootes of this Chervill are held as effectuall as Angelica to preſerve the ſpirits from infection in the time of a Plague, as alſo to warme and comfort a cold weake ſtomacke.

CHAP. XXXIIII.

Leviſticum vulgare. Ordinary Lovage.

HAving finiſhed the two former rankes or order of umbelliferous plants, I am comē now to ſpeake of the third and laſt ſort which is of ſuch as have broader leaves like *Panax* or Angellica: and becauſe I could not well place the Lovage among the *Selina* or *Apia* although it be moſt like unto them, and not to be accounted one of them, let me ſet it in the forefront of this broad leafed order, whoſe deſcription is thus. It hath many long and great ſtalkes of large winged leaves, divided into many parts, ſomewhat like unto Smallage, but much larger and greater, every leafe being cut about the edges, broadeſt forwards and ſmalleſt at the ſtalke, of a ſad greene colour, ſmooth and ſhining, from among which riſe up ſundry ſtrong and tall hollow greene ſtalkes five or ſix foote high, yea eight foote high in my Garden, full of joynts and ſuch like but leſſer leaves ſet at them then grow below, and with the leaves come forth toward the toppes long branches, bearing at their toppes large umbells of yellow flowers, and after them flat browniſh ſeede bigger by much then Dill, and leſſer then Parſneps and thicker alſo: the roote groweth great and deepe, ſpreading much and enduring long, of a browniſh colour on the outſide and whitiſh within: the

Leviſticum vulgare.
Ordinary Lovage.

Leviſticum vulgare Germanicum.
The Lovage of *Germany*.

whole

whole plant and every part of it ſmelleth ſomewhat ſtrongly and aromatically, and of an hot ſharpe biting taſte. Having another figure of *Leviſticum* which *Camerarius* in his *Epitome* upon *Matthiolus* exhibiteth, I could not but inſert it here, that the difference from the other may be ſeene, our rootes being great and thicke, and nothing ſo fibrous, and in the flowers which they ſay are white, and are yellowiſh with us, which *Dodonæus* noteth alſo, ſo that either they obſerved it not well when it was in flower, or theirs doth differeth from ours therein, even as it is noted in the *Panax Heracleum*. *Germanicum.*

The Place and *Time.*

It groweth no where wilde in *Europe* that I can here of, but is onely planted in Gardens where it will grow huge and great if it be ſuffered: it flowreth in the end of *Iuly*, and ſeedeth in *Auguſt*.

The Names.

It is called uſually in Latine *Leviſticum* (for Greeke name it hath none) and not *Liguſticum*, being farre differing plants, although ſome have taken them to be both one, deceived chiefely by the vicinitie of the name, as namely, *Cordus*, *Geſner*, *Tragus*, *Camerarius* and *Tabermontanus*, who all call it *Liguſticum*, either *ſativum* or *vulgare*; *Fuchſius* calleth it *Libyſticum* and *Smyrnium* alſo, for which he is reprehended by *Matthiolus*, *Anguillara* tooke it to be *Laſerpitium* and *Dodonæus* ſaith it is likely to be a kind of *Laſerpitium*, and *Lobel* calleth it *Laſerpitium Germanicum*, but *Lugdunenſis* maketh it to be *Hppoſelinum*, after *Matthiolus* his opinion, who ſaith, if this be not *Dioſcorides* his *Hippoſelinum*, he knoweth no other: *Matthiolus*, *Dodonæus* and *Lobel* doe call it *Leviſticum*, *Bauhinus* ſetteth it among the *Libanotides*, and called it *Liguſticum vulgare*; and *Libanotis fertilis Theophraſti*. For the true *Liguſticum* called *Siler montanum*, and in ſhoppes *Siſelios*, I have ſhewed you here before. The *Italians* call it *Leveſtico*, the *French Leveſche*, the *Germanes Libſtockel*, the *Dutch Laverſe* and *Lavas*, and wee in in *Engliſh* Lovage.

The Vertues.

Lovage is hot and drie in the beginning of the third degree, and is of thinne parts alſo, and thereby doth open cut and digeſt humours, and doth mightily provoketh womens courſes and urine, as much as any of the kindes of Parſley: the dried roote in powder taken to the weight of halfe a dramme in wine, doth wonderfully warme a cold ſtomacke, helping digeſtion, and conſuming all ſuperfluous moiſture and raw humours therein, eaſeth all inward gripings and paines, diſſolveth winde, and reſiſteth poyſon and infection effectually: the greene roote hereof bruiſed in a ſtone morter, and ſteeped for twelve houres in faire water, then ſtrained and drunke firſt in the morning and laſt at night two or three ſpoonefulls at a time, aſſwageth any drought or great deſire to drinke more than a carouſe of cold drinke, found true by often experience, although the roote is well knowne to be hot: it is a knowne remedy, and of much and continuall experience in divers ſhires of this Land to drinke the decoction of the herbe for any ſort of ague, whether it be *quotidian*, *tertian* or *quartaine*, and to helpe the paines and torments in the body and bowells comming of cold: the ſeede is effectuall to all the properties aforeſaid, except the laſt, and worketh more powerfully: the *Germanes* and other Nations in times paſt, uſed both the rootes and ſeede in ſtead of Pepper to ſeaſon their meates and brothes, and found them as comfortable and warming to the ſtomacee: the diſtilled water of the herbe helpeth the quinſie in the throate, if the mouth and throate be gargled and waſhed therewith, and helpeth the pluriſie, if it be drunke three or foure times; the ſaid water alſo dropped into the eyes taketh away the redneſſe or the dimmeneſſe of the eyes, it likewiſe taketh away ſpots or freckles in the face: the leaves of Lovage bruiſed and fried with a little hogges larde, and laid hot on any botch or bile will quickely breake it: the greene rootes may be kept in pickle made with ſalt and vinegar for a long time, but preſerved with Sugar is more pleaſant.

CHAP. XXXV.

Laſerpitium. Laſerwort.

BEcauſe Lovage was called *Laſerpitium Germanicum*, I thought good a little to declare the true *Laſerpitium* or *Laſer* of the ancients, both to ſhew what it was, and what with divers it is now taken to be; and withall to joyne both the *French* kinde and that which *Alpinus* hath ſet out for the true.

Laſerpitium Gallicum. French Laſerwort.

The *French* Laſerwort hath a great long roote, bigger than that of Ferula Fennell giant, of a grayiſh or aſh colour on the outſide, and white within, full of a fat or thicke jayce, and ſmelling ſweete, from whence riſe up great ſtalkes as thicke and high as the Ferula, whereon are ſet divers ſtalkes of winged leaves like unto Smallage, but thicker, harder, and of a darker greene colour, ſomewhat deepely dented about the edges, and ſometimes more deepely jagged than others: at the toppes of the branches and ſtalkes ſtand large umbells of flowers like unto Ferula, and after them large flat winged ſeede like unto Angelica, of the colour of Boxe, and ſmelling ſweete.

2. *Laſerpitium Alpino. Alpinus* his Laſerwort.

The ſtalke of this Laſerwort, ſaith *Alpinus* groweth to be of three cubits in height, hollow, and of the bigneſſe of a great Ferula ſtalke, having large winged leaves ſet thereon, ſomewhat like the great *Selinum*, or ſweete Parſley, and greater than thoſe of wilde Angelica, yeelding a milke being broken; the umbells of flowers at the toppes yeeld large broad flat ſeede, as *Theophraſtus* ſaith of his: the roote is great, and as thicke as ones arme, yeelding alſo a milke when it is broken, which is white at the firſt, but groweth yellow being drie: the proportions hereof is extant upon ſome of the ancient copines of *Iupiter Ammon*, as *Alpinus* ſaith.

3. *Laſerpitium antiquorum.* The true Laſewort of the ancients.

Dioſcorides deſcribeth the true *Laſerpitium* in this manner: it groweth, ſaith he in *Syria*, *Armenia* & *Media* and *Lybia* with a Ferulous ſtalke (which they call *Maſpetum*) and leaves like to *Apium*, and with a broad ſeede: the *Laſer* or juyce is taken from the roote and from the ſtalke by ſcarifying them: that is preferred to be beſt, that is ſomewhat red, tranſparent, like unto Myrrhe and not greene, of a ſtrong ſent and ſweete taſte, which being moi-

1. *Laserpitium Gallicum.*
French Laserwort.

2. *Laserpitium Alpino.*
Alpinus his Laserwort.

stened with water quickly becommeth white, if any shall taste the *Cyrenian* sort it will move and stirre all the humours in the body to a sweate, with a moist sweet sent, so that his breath shall smell well that hath tasted but a little: that of *Media* and *Syria* is not so forcible or good, and giveth a stranger unwholsome sent. All the sorts of *Laser* are adulterated with *Sagapen*, or with Beane flower before they are dried, the falsehood whereof may be found out by the taste, by the smell, by sight, ot by the wetting or washing it in water. Some doe call the stalke *Silphium*, the roote *Magydaris*, and the leaves *Maspetum*; the most effectuall is the Laser, the next are the leaves and the stalkes last. This is *Dioscorides* his text: but *Theophrastus* doth more largely expresse it; and *Pliny* from him, which is too tedious to insert here: I will therefore but onely mention a few of those things that are most pertinent, and not expressed before, which are these: the seede is broad spread like a leafe, and called *folium* and is as yellow as gold; the stalke is annuall as is that of Ferula; the flesh of the cattle that feede thereon doth taste most savoury, the stalke is eaten by men sundry wayes dressed or boyled: it groweth wilde by nature, and will not abide to be manured or transplanted. *Pliny* saith that in his time it was not to be had but after the weight of silver, and that it was so much destroyed, that onely one branch was brought unto the Emperour *Nero* of all that could be found in his time; and *Pliny* saith also that it groweth in plenty on mount *Parnassus*. Thus farre *Theophrastus* and *Pliny*, whereby it may be seene what losse there is of it by the great esteeme was made of it, and by the vertues it had which they have expressed, and how hard a thing it is to find out the true plant of all that are knowne now unto us, although divers have referred sundry herbes thereunto as is formerly set downe, and yet still is by divers: for some would make *Benzoin* the sweete gumme to be the Laser, and called it *Asa dulcis*, which is a word but derived from Laser as it is most likely, and is so farre from reason, that I wonder how men could be drawen so to thinke, the *Benzoin* being the gumme of a great tree in the *East Indies*, as all may know that will enquire after it, and is neither hot, sharpe, nor bitter as Laser is said to be: but it is very probable that the Apothecaries, who had many of their names from the *Arabian* authors, had these likewise of *Assa dulcis*, and *Assa fœtida*, and peradventure rose from *Serapio* his two sorts of Laser, one pure, and the other impure, but that he saith the pure is of a stronger sent, and the impure of small sent. The *Arabians* call the plant *Anjuden*, the juyce *Altith* and *Avicen Almarut*, and the *Indians Imga* and *Imgara*.

The Place and *Time.*

This former sort was found about *Marselles* in *France*, as *Lobel in Adversaria* saith, and adjudged the truest by *Rondeletem* of any other that he had seene before, flowring and seeding in the end of the yeare as Ferula doth, the other is expressed in the narration before, *Alpinus* saith it was first seene in Cardinall *Bembo* his Garden, and afterwards in that of the *Mussaros*.

The Names.

It hath not found any other name since the first invention, than *Laserpium* and *Silphium* which was given it at the first by *Lobel*, onely *Bauhinus* calleth it *Gallicum*, and *Tabermontanus Massilioticum*; the other is declared in the description sufficiently.

The Vertues.

There is not extant in any that hath written of the *French* kinde for what disease it is effectuall, and therefore we can say no more thereof: but of the true Laser *Dioscorides* hath given a very ample recitall, which although I thinke it almost needlesse to set downe the vertues of an herbe which is so little likely to be had as this is, for

ignoti

iguoti nulla cupido, yet to satisfie those that are curious, these they are: the roote, saith he heateth, and is hardly digested, it hurteth the bladder, and healeth knots and kernells of the throate, called the Kings evill, if it be made into a cerot or plaister, and laid to with oyle, taketh away blacke and blew spots that come by bruises or strokes: it helpeth the Sciatica if it be made up with *Ceratum Irinum* or *Cyprinum*: it taketh away the outgrowings about the fundament, if it be boiled with vinegar in the rinde of a Pomegranat: it resisteth the force of deadly poisonfull medicines. The Laser of *Media* and *Syria* is weaker than that of *Cyrene*, & hath a loathsomer sent: it is a juyce that is windy and sharpe in taste, and cureth the falling of the haire, if it be annointed with it Wine, Pepper, and Vinegar, it sharpeneth the sight, and discussеth the pinne and webbe in the beginning; it is put into hollow teeth being tied up in a little linnen cloth, with some white Francumsence, and being boiled with Hisope and Figges in Vinegar and Water, it is good to wash the mouth; it helpeth the biting of mad dogges, if it be applied to the wounds, also the venome of any other creature, or envenomed darts or arrowes, if it be either drunke or outwardly applied: it cureth the wounds of Scorpions if it be relented in oyle and anointed; it is put into those ulcers that are ready to runne into a Gangreene if they be first scarified: it breaketh carbuncles or plague sores being applied by it selfe, or used with Rue, Niter and Honey: it taketh away warts, cornes, and hard skinnes growing in any place being first pared, and it mollified with a cerote, or the pulpe of a dried Figge, and healeth tetters and ringwormes while they are yong being applied with vinegar: it healeth the polypus in the nose, which is a peece of flesh growing there, if it be annointed for certaine dayes with it, made up with Coperas or Vardigrease, or other superfluous wens or outgrowings in the flesh being first clipped off: it helpeth a continuall hoarsenesse in the throate, and cleareth the voyce that is suddenly growen hoarse, being delaied in water and supped off: it staieth the falling of the pallate of the mouth; being applied with honey, and helpeth the quinsie if it be put into honied water, and the mouth gargled therewith: being taken in meates, it maketh one better coloured: it helpeth the cough being taken in a reare egge, and being put into broathes with dried Figges, it is very profitable for those that have the dropsie or the yellow jaundise: it taketh away the shaking fits of agues being taken with Pepper and white Francumsence in wine: it is given to those that have strong crampes or crickes in their neckes, halfe a scruple weight rowled up in waxe and swallowed: it draweth out horse-leeches that by chance are got into the throate and there sticke, if the mouth be gargled with it and a little vinegar: it helpeth those who have the milke curded in their breasts, and the falling sicknesse being taken with Oxymell, or vinegar and honey: it provoketh womens courses being taken with Pepper and Myrrhe, and helpeth the chollicke being eaten in a Raisin, and being drunke in lye it suddenly helpeth crampes or convulsions, and burstings: it is dissolved with bitter Almonds or with Rue, or with hot bread, to be given in potions: the juyce of the leaves worketh the like effects but lesse powerfully: this is eaten with Oxymell, to helpe the windepipe when the speech is lost. *Pliny* declareth many of these things out of *Dioscorides*, but varieth from him in his remedy for teeth-ach, for I cannot thinke, saith he, that any author would appoint it to be put into hollow teeth to take away the paine, when as we have seene the experience thereof in a man, that for the same cause threw himselfe downe headlong from an high place: for it inflameth oxen if it be put into their noses: and being mixed with wine, it burseth those Serpents that take it, who are most greedy of wine, and therefore, saith he, I would perswade men not to be anointed therewith, although they doe appoint it. *Galen* also *lib. de simpl.* briefly speaketh thereof thus; the juyce of *Silphium* is very hot (saith he) the leaves, stalkes, and rootes, doe sufficient stoutly heate any cold part, but they are all of flatulent windinesse hereby it is hard of concoction, but applied outwardly it is of more effect, & the juyce is the strongest of all other, having a mightie drawing facultie, yet it holdeth a certaine power to take away excrescences in the flesh, by reason of the temperature is said to be in it, thus farre *Galen*: *Serapio* likewise speaketh of the Greekes *Laserpitium* in this manner: Laser, saith he is knowne to the *Indians* to be of two sorts, the one sincere shining and cleare, like to *Electrum*, of a stronger sent and greater price, which is brought, as it is thought from *Guzarate*, *Patane*, *Maudou*, *Chitor* and *Dely*, which is a cold countrey, and extending unto Chervam: the other is foule and muddy smelling lesse, which they say is brought from *Corasone* to *Ormus* in *Persia*, and from thence is carried to *Pegu Malaca*, *Tauasiris*, and the countries next adjoyning: the *Baneans* of *Cumbaya*, who were in times past Phylosophers, and are now Merchants, and forbeare to eate of any living creature which was the institution of *Pythagoras* doe buy this Laser, according to their abilitie, and put it into their broaths and sallats, rubbing the vessells therewith first, and use no other sawse to their meates being pleasant to them, both in taste and smell, yet doth it not breede any loathing in any that are not accustomed to it: the taste thereof is at the first somewhat bitter as pickled Olives are, but being chewed a while longer it is very pleasant, that which is impure, Porters and others of meane qualitie that live on bread and water only doe buy, because they cannot for the greatnesse of the price buy that which is sincere, and the *Baneans* who deale in this kinde of merchandise doe purge and clense the impure, and doe not suffer it to be used in meates before they have cured it by their skill; and thus much *Serapio*.

CHAP. XXXVI.

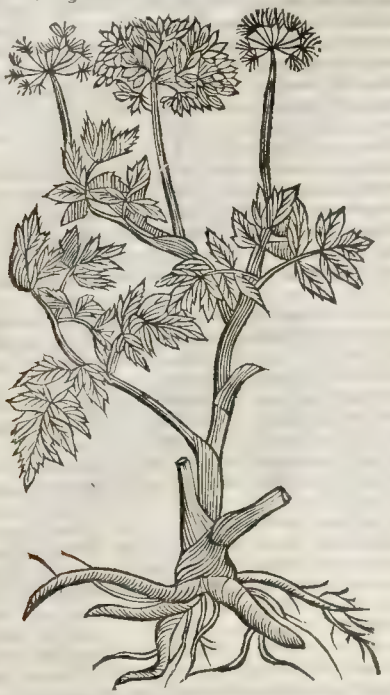
Angelica. Angellica.

ALthough I have spoken of Angelica in my former booke, yet having more to say thereof, and to shew likewise some other sorts thereof, I will here insert it with the rest.

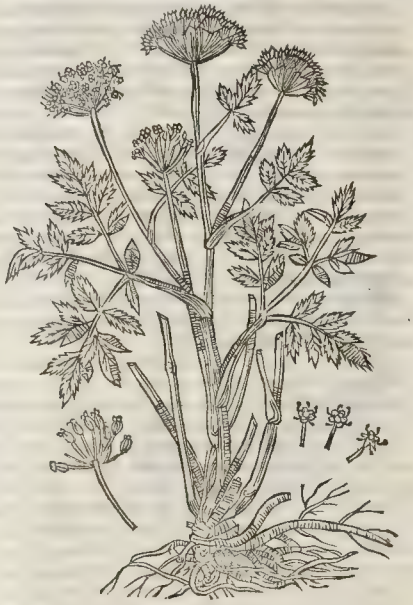
1. *Angelica sativa*. Garden Angellica.

The Garden Angellica hath divers large and faire spread winged leaves, three foote long or better sometimes, made of many great and broad ones, set usually one against another on a middle ribbe, of a pale, but fresh greene colour, and dented about the edges, from among which usually riseth but one round hollow stalke being very thicke, and five or sixe foote high, with divers great joynts and leaves set on them, whose foote stalkes doe compasse the maine stalke at the bottome, and from thence also towards the toppe come forth branches with the like, but lesser leaves at them, and at their toppes, large round spread umbells of white flowers, but *Brausius* describeth his with yellow flowers, which I never saw; after which commeth the seede which is somewhat flat, thicke, short, and white, two alwayes set together, and is usuall in all these umbelliferous plants, and a little

1. *Angelica sativa.* Garden Angellica.



2. *Angelica sylvestris.* Wilde Angellica.



3. *Angelica sylvestris montana duarum specierum.*
Two sorts of Mountaine Angelica.

4. *Archangelica.*
The great water Angellica.

creſted on the round ſeede: the roote groweth great and wooddy when it flowreth, with many great long branches to it, but periſheth after ſeede and will riſe and ſpring againe, better from the ſeede that doth fall of it ſelfe, then what is ſowen by hand at any other time: the whole plant both leafe and ſeede and roote is of an excellent pleaſant ſent and taſte very comfortable, being not fierce or ſharpe but rather ſweete, and giveth a moſt delicate relliſh when it is taſted or uſed: the leaves be the weakeſt and ſome hold the ſeede to bee next, and the roote to be the ſtrongeſt, eſpecially being not ready to grow up for ſtalke. Of this kinde wee have another ſort in our Gardens called ſweet Angellica, not differing in any thing from the former, but in that it hath a ſweeter relliſh then the other. *Dalech.*

2. *Angelica ſylveſtris.* Wilde Angellica.

The wilde Angellica groweth up with large ſpread leaves on the ground having ſmaller ſtalkes and leſſer divided leaves by much, of a darke greene colour, not ſmelling halfe ſo ſtrong as the garden kinde, yet ſavouring ſo much like Angelica that by the ſmell one may ſoone ſee and know it to be a kinde of Angellica though wilde: the ſtalkes are much ſlender and ſmaller, yet growing three or foure foote high with ſmaller joynts and leſſer leaves thereat: at the toppes grow leſſer umbells of white flowers, which turne into ſmaller ſeede and blacker: the roote is nothing ſo great as the former neyther are the ſtrings ſo great or long, and of a blacker colour on the outſide not ſmelling halfe ſo well.

Of this kinde likewiſe there is ſome varietie, one growing likewiſe wilde with us, not much differing in the leaves, but being ſmaller and not ſo much divided, the ſtalkes being reddiſh and the ſeede thicker and longer, the roote being great and thicke. *Sylveſtris altera.*

3. *Angelica ſylveſtris montana.* Mountaine wilde Angellica.

Mountaine Angellica groweth like the former wilde kinde, but much lower and ſmaller in every part, the roote hereof differeth moſt in that it is nothing ſo great, but ſendeth forth many ſmall browniſh ſtrings from the the head round about it, yet holding the ſame ſtrong ſent of Angellica that the former doth.

I give you here the figures of two other ſorts of Angellica, taken out of Doctor *Foxes* booke of dryed herbes, which he had from *Padoa* garden, and might ſeeme to be the *Laſerpitium* of *Alpinus* ſet forth before, but that they had ſeverall denominations to them.

4. *Archangelica.* The greater water Angellica.

This Angellica groweth with a taller and much greater ſtalke ſometimes reddiſh, the leaves likewiſe being more in number and ſmaller divided, and of as deepe a greene colour as the firſt ſort: in the tufts of white flowers it is like the firſt garden Angellica, and ſo is the ſeede but greater and blacker, the roote is great according to the plant, and endureth many yeares without periſhing.

The Place and *Time.*

The firſt ſorts are with us ſowen in Gardens, the ſecond ſort is wilde both in many places of *Eſſex*, *Kent*, and neare *Kentiſh Towne* by *London* alſo, and in other places: the third groweth on divers mountaines in *Germany*, *Hungary* and the reſt: the laſt is not onely naturall to grow in watery ditches, but in moiſt grounds alſo in many places with us, and in the Marſh ditches by *Rederiffe*.

The Names.

This herbe hath gained many worthy names from ſundry worthy perſons: for ſome have called it *Sancti Spiritus radix*, *Lacuna*, and *Dodonæus* thinke it ſome kinde of *Laſerpitium*, *Cordus*, and ſome others take it to be *Smyrnium*, and *Cordus* to be *Panax Heracleum*, but all in generall call it *Angellica* from the Angell-like properties therein. All theſe ſorts are ſo called by moſt Authors as their titles beare, and therefore I neede not explaine them further, onely the laſt is called *Archangelica* by *Cluſius*, and *Angelica aquatica* by *Geſner*. All Chriſtian nations likewiſe in their appellations hereof follow the Latine name as neare as their Dialect will permit: onely in *Suſſex* they call the wilde kinde Kex, and the Weavers winde their Yarne on the dead ſtalkes.

The Vertues.

Angellica is hot and dry, ſome put it in the ſecond and others in the third degree. It reſiſteth poyſon by defending the heart, the blood and ſpirits, and giveth heate and comfort to them: it doth the like againſt the Plague and infection of the Peſtilence, if the roote be taken in powder to the weight of halfe a dramme at a time, with ſome good Treakle in Cardus water, and layd to ſweate thereupon in their bed: if Treakle be not at hand take the roote alone in Cardus or Angellica water, the ſtalkes or rootes candid and eaten faſting are good helpes alſo in time of infection, and at other times to warme and comfort a cold or old ſtomack: The root alſo ſteeped in Vinegar, and a little of that Vinegar taken ſometimes faſting, and the roote ſmelled unto are both good preſervatives for that purpoſe, a water diſtilled from the rootes ſimply, or ſteeped in wine and diſtilled in glaſſe, is much more effectuall then the water of the leaves, and this water being drunke two or three ſpoonefulls at a time doth eaſe all paines and torments that come of cold or winde, ſo as the body be not bound: the ſaid water taken with ſome of the roote in powder helpeth the Pluriſie being taken in the beginning, as alſo all other diſeaſes of the Lungs, and breaſt, as coughes, and ſhortneſſe of breath, Tiſſickes, and ſo doth the Syrupe of the ſtalkes mentioned in my former booke: it helpeth likewiſe the torments of the Chollicke, the ſtrangury and ſtopping of the urine, procureth womens courſes and expelleth the afterbirth: and briefely eaſeth and diſcuſſeth all inward tumors and windineſſe: it openeth the obſtructions of the Liver and Spleene: and the decoction thereof being drunke before the fit of an Ague, ſo that they may ſweate if it be poſſible before the fit come, will in twice or thrice taking rid it quite away: it helpeth alſo digeſtion in the ſtomacke, and is a remedy for a Surfet. The juice or the water dropped into the eyes cleareth the dimneſſe of ſight if any filmes doe begin to breed in them, and helpeth deafeneſſe by dropping it into the eares: the juice alſo put into hollow teeth eaſeth the paine; the rootes in powther made up with a little pitch into a plaiſter, and layd on the biting of a mad dog, or any other venemous creature doth wonderfully helpe them: the juice or the water drooped or tents wet therein and put into old and filthy deepe Vlcers, or the powder of the roote in want of the other, doth clenſe them and cauſe them to heale quickly by covering the naked bones with fleſh: the diſtilled water applyed to places pained with the Goute or Sciatica, doth give a great deale of eaſe: the wilde Angellica is not ſo effectuall as the Gardens, although it may ſafely bee uſed to all theſe purpoſes aforeſaid: the roote of the Garden Angellica is a better ſubſtitute in *Theriaca Andromachi* and *Mithridatium* then many other that have beene formerly accepted.

CHAP. XXXVII.

Imperatoria ſive Aſtrantia. Maiſterwort.

OF this herbe there are two ſorts, the one well knowne, and the other ſet forth firſt by *Camerarius* in his Epitome on *Matthiolus*, and *Bauhinus* after him in his *Matthiolus*.

1. *Imperatoria ſive Aſtrantia vulgaris.* The common Maſterwort.

Common Maiſterwort hath divers ſtalkes of winged leaves, divided into ſundry parts three for the moſt part ſtanding together at a ſmall footeſtalke on both ſides of the greater, and three likewiſe at the end of the ſtalk, each of which leaves are ſomewhat broad & cut in on the edges into three or more diviſions and all of them beſides dented about the brims, of a darke greene colour, and doe ſomewhat reſemble Angelica leaves at the firſt ſight, untill they bee better regarded and that they grow lower to the ground, and upon leſſer ſtalkes, among which riſe up two or three ſhort ſtalkes in compariſon of Angelica, being about two foot high and ſlender, with ſuch like leaves at the joynts as grow below, but leſſer and with fewer diviſions, bearing umbells of white flowers, and after them ſmall thinne flat blackiſh ſeede bigger then Dill ſeede: the roote is ſomewhat great and rather groweth ſidewiſe then downe deepe into the ground, ſhooting forth ſundry heads which taſteth ſharpe biting on the tongue, and is the hotteſt and ſharpeſt part of any of the reſt of the plant, and the ſeede next unto it, being ſomewhat blackiſh on the outſide and ſmelling well.

2. *Imperatoria Alpina.* Mountaine Maiſterwort.

The mountaine Maiſterwort groweth ſomewhat like the former, but leſſer in every part, having nine leaves ſtanding on each ſtalke by three and three, but they are ſmaller and narrower, and have fewer inciſions in them, but finely dented about the edges: the flowers and ſeede are alike, and the roote groweth in like manner, with a blackiſh outſide, but is more ſharpe and hot biting on the tongue then the former by much.

The Place and Time.

The firſt is found on ſundry hils in *Italy*, as alſo in *Germany*, yet it is uſually kept in Gardens, with them as well as with us: The other was found on the *Alpes* in *Switzerland*. They flower and ſeede late with us, as not untill the end of *Auguſt*.

The Names.

It is called by the latter Writers generally *Imperatoria*, from the excellent vertues it hath, yet many have referred that name to ſundry plants of the Auncients, not thinking that an herbe of ſuch rare qualities ſhould be unknowne to them, and therefore *Anguillara* tooke it to be *Liguſticum*, and *Ruellius* and *Fuchſius* to be *Laſerpitium* yet not finding it fully to anſwer thereunto, calleth it *Laſerpitium Germanicum*, *Tragus* referreth it to *Smyrnium*, and calleth it *Smyrnium hortenſe*, and *Oſterſtium*; and yet nameth other herbes by that name alſo, and *Cordus* in *hiſtoria* unto *Struthion*, *Matth.olus*, *Geſner in hortis*, *Lobel*, *Lugdunenſis*, *Tabermontanus* and others, call it *Imperatoria*, *Brunfelſius*, *Dodonæus* and *Cluſius* call it *Aſtrantia*, *Camerarius Magiſtrantia*, and *Cæſalpinus Herba rena*, as the vulgar with him did. The other *Camerarius* calleth *Imperatoria, vel Aſtrantia Alpina*, and ſaith, the *Germanes*

1. *Imperatoria ſive Aſtrantia vulgaris.*
Common Maiſterwort.

2. *Imperatoria ſive Aſtrantia Alpina.*
Mountaine Maiſterwort.

call

call it *Bergſtrents*, and the former *Meiſterwurtz*, and thence it is like they derived their *Magiſtrantia*, We in *Engliſh* call it uſually Maiſterwort, and by ſome Pelletory of *Spaine*, but falſely.

The Vertues.

The roote of Maiſterwort is hotter then pepper, even to the third degree compleate, and is of very ſubtile parts, it is very availeable in all cold griefes and diſeaſes, both of the ſtomacke and body, diſſolving winde very powerfully, both upward and downeward, it is alſo uſed in a decoction with wine, againſt all cold rheumes, or deſtillations upon the lungs, and ſhortneſſe of breath to be taken morning and evening, the ſame alſo provoketh urine and helpeth to breake the ſtone and expell gravell from the Kidneyes, it procureth womens courſes and expelleth the dead birth, and is ſingular good for the ſtrangling of the mother, and other the like womens diſeaſes: it is effectuall alſo againſt the dropſie, crampes, and the falling ſickneſſe, for the decoction in wine being gargled in the mouth doth draw downe much water and flegme from the braine thereby, purging and eaſing it of what oppreſſed it: it is of a rare qualitie againſt all ſorts of cold poyſons, to be taken as there is cauſe either more or leſſe and provoketh ſweate, the ſeede worketh to the like effect, although not with the like efficacie if they can brooke the taſte thereof: and therefore many doe diſtill the water from both herbe and roote that they may take it with the better content: the juice hereof dropped or tents dipped therein and applyed eyther to the greene wounds or rotten ulcers, yea although they fret and creepe, and be almoſt gangrenated, and thoſe alſo that come by envenomed weapons doth ſoone clenſe and heale them, or if they be bathed with the diſtilled water: the ſame alſo is very good to helpe the Goute comming of a cold cauſe. *Tragus* ſaith that the decoction of the roote in wine being drunke doth revive the abilitie of generation being almoſt extinct, which you may truly beleeve and try to be certaine as he ſaith: but by his leave this is againſt *Galens* rule, for hee ſaith that thoſe things that are ſo hot to expell winde doe not helpe but hinder nature: the other ſort as I ſaid before is more effectuall and in eſpeciall for quartaine Agues, to expell the dead child, to purge the braine, and to expell winde and helpe the Collicke.

CHAP. XXXVIII.

Podagraria ſive herba Gerardi. Goutwort or herbe Gerard.

OF this herbe likewiſe there are two ſorts, the one knowne but to few, yet the other is two well knowne eſpecially where it getteth into any ground, and although for their likeneſſe one to another, divers have joyned this and the foregoing Maiſterwort in one Chapter, yet becauſe they are differing plants in many notable parts, I have thought good to part them into two.

1. *Podagraria vulgaris.* Common herbe Gerard.

The common herbe Gerard is a low herbe ſeldome riſing halfe a yard high having ſundry the like leaves ſtanding upon browniſh greene ſtalkes by threes as in the former, but they are ſmaller narrower and not cut in on the edges at all, or very ſeldome but ſnipped about and of a ſtrong unpleaſant ſavour: the umbells of flowers are white and the ſeede blackiſh and leſſe: the roote runneth and creepeth like Quich in the ground, ſoone occupying a great deale of roome.

1. *Podagraria vulgaris.* Common herbe Gerard.

2. *Podagraria hirſuta.* Hairy herbe Gerard.

This hairy herbe Gerard hath a thicke fibrous roote of a blackiſh browne colour on the outſide, & white within enduring many yeares and of a good ſent, from whence ſpringeth up a ſtalke about a cubit high, blackiſh at the bottome and a little hairy, ſpreading into divers ſhort branches, bearing much divided leaves thereon like to wilde Angellica or the laſt herbe Gerard, but more deepely gaſhed, of a greene colour and hairy all over: the footeſtalkes as alſo the umbells of flowers are ſmall and white, and followed with blackiſh ſeede.

The Place and *Time.*

The firſt groweth by hedge and wall ſides and oftentimes in the borders or corners of fields and in gardens alſo ſometimes, if it be not rid and weeded out: the other groweth in a part of *Germany* called *Luſatia*, and flower and ſeede ſomewhat earlier then the Maiſterwort.

The Names.

This herb hath found ſundry appellations as every ones judgement led him, for *Brunfelſius* calleth it *Pycnomos*, *Geſner in hortis Coronarum quibuſdam*, *Cordus* on *Dioſcorides Elaphoboſco ſimilis*, *Tabermontanus Ægopodium*, *Tragus Oſteritium ſylveſtre*, and *Angelica vitium*, *Camerarius Angelica ſylveſtris communis*, *Thalius Angelica erratica*, *Bauhinus Angelica ſylveſtris minor ſive erratica*, *Dodoneus herba Gerardi*, becauſe the *Brabanders* call it *Geraert*, and *Lobel Podagraria Germanorum*, which as he ſaith the *Dutch* call *Flercincruit*, and *Camerarius* ſaith the *Germans* call *Strentzel* or *Gierſick* and *Tragus Hynfuſſ* and *Witſcherlewetſch*, and wee in *Engliſh* Goutewort or herbe Gerard after the *Brabanders*, and of ſome in our Land Aiſweede or Axeweede as *Lyte* and *Gerard* ſay: the other is onely remembred by *Bauhinus* who numbreth it among the Angellicaes, and calleth it *Angelica ſylveſtris hirſuta inodora*, and *herba Podagrariæ cognata.*

The

The Vertues.

Goutewort had not his name given as it ſeemeth at randome, but upon good experience to helpe the cold Goute and Sciatica, as alſo joynt aches and other cold griefes, for as *Lobel* ſaith his vulgar in taking it to bee *Ebulus* Danewort, applyed it for the ſame diſeaſes that Danewort was good for.

CHAP. XXXIX.

Paſtinaca Latifolia. Parſnep.

OF Parſneps there are two ſorts, the tame or Garden kinde, and another that groweth wilde in divers places beyond the Seas, as well as in our owne Land.

1. *Paſtinaca latifolia ſativa.* Garden Parſnepps.

This Garden Parſnep hath large winged leaves, that is many ſet on both ſides of a long ſtalke, each of them for the moſt part ſtanding directly one againſt another, and one at the end, being much larger then thoſe of the Skirret, and cloſer ſet together and rougher, and dented about the edges: the ſtalke groweth five or ſix foote high, with divers the like leaves and branches thereon but leſſer: the flowers are yellow that grow in tufts and umbells at the toppe, which turne into browniſh thinne flat ſeede, ſmelling reaſonable well, the roote groweth greater and larger in ſome grounds then in others, being white within and without, very ſweet and pleaſant to be eaten, when they are ſodden tender and are dreſſed afterwards many wayes as every one liſt. Of this kinde I have declared in my former booke another ſort differing in nothing but the roote, which is thicker at the head and ſhorter, and not ſo favourie as the former.

Altera.

1. *Paſtinaca latifolia ſativa.* Garden Parſneps.

2. *Paſtinaca latifolia ſylveſtris.* Wilde Parſnep.

The wilde Parſnep differeth little from the former, but as a wilde plant, not growing ſo faire and large, nor hath ſo many leaves and that the roote (as all writers affirme of their countries) is ſhorter more wooddy, and not ſo fit to bee eaten, and therefore the more medicinable, but as I ſaid in my fotmer booke it is the garden kinde is found wilde in many places of our Land ſo ſweete and ſo tender after the ſowing, that by being manured it proveth as good as the Garden kinde.

The Place and *Time.*

The firſt is every where in theſe parts nurſed up in Gardens: the other growing wilde as I ſayd in divers places, as in the Marſhes by *Rocheſter* in the grounds of Sir *John Leveſon* there, and flowreth in *July*, the ſeede being ripe about the beginning of *Auguſt* the ſecond yeare after the ſowing, for if they doe flower the firſt yeare, the countrey people call them madde Neepes.

The Names.

The later writers generally call it *Paſtinaca latifolia* to put a difference betweene it and the Carrot which is called *Paſtinaca tenuifolia*, as I ſaid before, ſome authors calling it *ſativa* or *domeſtica* or *vulgaris*. *Fuchſius* calleth it *Siſarum ſativum magnum* and *Tabermontanus Elapoboſcum ſativum*; but *Columna* taketh it to be the *Siſer* of *Dioſcorides*. The wilde ſort is called by many *Paſtinaca ſylveſtris* or *latifolia ſylveſtris* as *Dodonæus* doth, *Cordus* upon *Dioſcorides* calleth it *Paſtinaca ſylveſtris Gallica*, *Matthiolus Dodonæus* and *Tabermontanus* *Elaphoboſcum*, *Fuchſius* calleth it *Siſer ſylveſtre*, and *Lobel Baucia Paſtinaca ſylveſtris Arabum an Elaphoboſcum*: but whether this ſhould be the *Elaphoboſcum* of *Dioſcorides*, I ſhall referre you to the next Chapter, in the Apothecaries ſhops of *Italy* and *Germany* it was uſually called *Baucia*, *Tragus* ſaith and ſo doth *Dodonæus*, that ſome in their time did call it *Staphylinus* as well as the other *tenuifolia*. The *Italians* call it *Carotta biancha*, the *Spaniards Canaoria Blanqua*, the *French Paſtenade*, the *Germans moren weiſſ*, *Paſteney* and *Paſtinachen* the *Dutch* *Paſtinaken*.

The Vertues.

The Garden Parſnep nouriſheth much, and the nouriſhment is good and wholſome, but a little windy, whereby it is thought to procure bodily luſt, but it fatteneth the body much if it be uſed: it little reſpecteth any phyſicall uſe as moſt of thoſe herbes and rootes doe that are much eaten, which made *Dioſcorides* and *Galen* not to inſiſt much upon them: onely it is conducible to the ſtomacke reines and bladder and provoketh urine: but the wilde kinde is more phyſicall, having a cutting, attenuating, clenſing and opening qualitie therein: it reſiſteth and helpeth the bitings of Serpents: it eaſeth the paines and ſtitches in the ſides, and diſſolveth winde, both in the ſtomacke and bowels which is the chollicke and provoketh Vrine, the roote is often uſed but the ſeede much more.

CHAP. XL.

Siser. Skirret.

I Have two ſorts of herbes to ſhew you under this title of *Siser*, whereof the one hath beene fetcht as farre as from *Syria*.

1. *Siser vulgare.* The common Skirret.

The common Skirret hath ſundry ſtalkes of winged leaves, ſomewhat like unto thoſe of the Parſneppe, but that they are ſmaller and farther ſet in ſunder, ſmother and greener, and likewiſe dented about the edges, among which riſeth up the ſtalke, little more than halfe the height of the Parſneppe, bearing at the toppes umbells of white flowers, which afterwards turne into ſmall darke ſeede, ſomewhat bigger than Parſley ſeede, the roote is compoſed of divers ſmall long round white rootes, ſet together at one head, like the Aſphodill, bunched out, or uneven in ſundry places, and rugged, or as it were wrinckled with all, and not ſmooth as other rootes are, with a ſmall pith within them, and very pleaſant to be eaten.

2. *Siser alterum Syriacum.* Skirrets of *Syria*, or white Carrots.

The *Syrian* Skirret hath a long, tender and ſmooth roote, grayiſh on the out ſide, and white within, and eaſie to be broken as thicke as ones finger, and twiſe the length, having ſundry ſmall bunches or knottes thereon, like unto wartes, of a pleaſant ſweete taſte like unto our Carrots, from whence riſe many ſtalkes of leaves, much divided and cut into ſundry parts like unto Carrot leaves: the ſtalkes likewiſe have ſuch like leaves at the joynts and umbells of flowers at the toppes like unto them for forme, but of a yellowiſh colour.

The Place and *Time.*

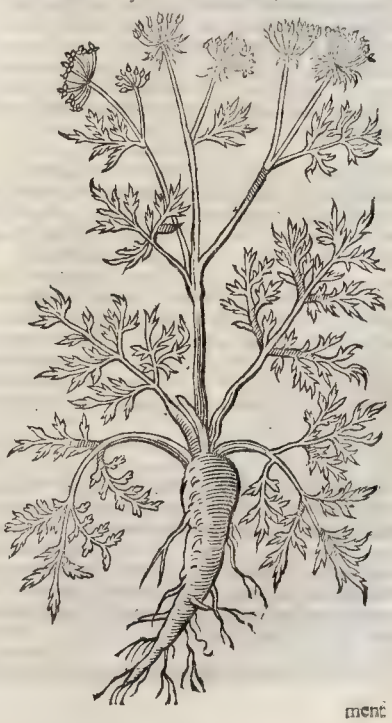
The firſt is not naturall in any places of *Italy* or *Germany* that I can underſtand, but in the countrey of *Narbone* in *France*, as *Lobel* ſaith, and is every where ſowen or planted in Gardens, and with us rather ſowne than planted, for ſowne among Onions, the one will not hinder the growth of the other, the Onions being ſtill drawne away that the Skirrets may have the full growth againſt Winter: the other groweth wilde in *Egypt* by *Cairo*, but not in their gardens, as *Rauwolfius* ſaith: they flower and ſeede later than the Parſneppe.

The Names.

It is called in Greeke Σίουερ, and in Latine alſo *Siſarum* and *Siser*: the firſt is called *Siser* by *Matthiolus*, *Cordus*, *Geſner*, and *Camerarius*, and *Siſarum* by *Tragus*, *Dodonæus*, *Lobel* and others. *Cæſalpinus* calleth it *Siser Germanicum*, and taketh it alſo to be the *Elaphoboſcum* of *Dioſcorides*, as *Columna* alſo doth: but aſſuredly herein they are both deceived, for *Dioſcorides* deſcribeth *Elaphoboſcum* at large, and howſoever the manner of the leaves deceived them, that they were like unto the leaves of the Turpentine tree, yet neither is the ſtalke of this Ferulous, that is ſtrong and great as that of the Parſnep is, nor hath any umbells of yellow flowers, nor ſeede like Dill, both which the Parſneppe hath; for this Skirret hath white flowers and ſeede like Parſley, ſo that I wonder how ſuch wiſe and judicious men, that in other things will ſcanne the text of *Dioſcorides* throughly before they give their judge-

1. *Siser vulgare.*
The common Skirret.

2. *Siser alterum Syriacum.*
Skirret of *Syria*, or Wilde Carrot.



ment

ment, and yet in this have failed much, as you may understand by this that hath beene said: now whether the manured or wilde Parsneppe should be *Dioscorides* his *Elaphoboscum*, I incline to thinke rather the wilde than the tame, although he saith, it is sweete and fit to be eaten; for as I said before, even the wilde might be good with them, as we have shewed it to grow wilde with us. Another controversie there is among many learned men, whether this be the true *Sisarum* of *Dioscorides* or no, in regard that neither he nor any other of the ancients, have given almost any touch of forme or leafe or roote it had, because it was so familiar and well knowne in their time, and so it falleth out in many other things that were so common with them, that they thought it needlesse to describe them, that they are now most unknowne to the succeeding times, and to us yet in our time: the greatest probability that we have, is that, as *Dioscorides* saith, *Sisarum* is pleasant to the pallate, profitable to the stomacke, provoking urine, and procuring an appetite if it be boyled (for he doth not say eaten raw as divers other rootes are) all which agree to the Skirret: but *Pliny* in setting forth his Siser, which assuredly is all one with *Dioscorides* his *Sisarum* sheweth plainely that it hath a nerve or string in the roote, which is to be taken away after the boyling, that the rest may be eaten with the more pleasure, and such hath this Skirret and no other roote, that either then was or now is edible but it: and therefore there is no doubt but that it is the true *Sisarum* or *Siser* of the ancients: the other *Ranwolfius* saith is called in *Egypt* by the *Arabians* there *Secacul* as *Scerapio* did, and therefore this may cease all controversies concerning it, that our Parsneppe roote is not *Siser*, as it formerly was taken, nor our ordinary *Siser* neither to be *Secacul*: the *Arabians* call it *Fisarum* and *Seisaron*: the *Italians* Sisaro: the *Spaniards Chiribas*: the *French Cheruy*, the *Germans Gierlin*: the *Dutch Swycker wortelen*, that is Sugar roote; and we in *English* Skirret.

The Vertues.

Skirret rootes (for no other part is in use as I know) being dressed according to every ones liking doe nourish well, but not so much as the Parsneppe, it being of a stronger taste, and this more delicate and pleasant, and is also very wholesome, yet engendreth a little winde, and provoketh to venery: it doth somewhat respect the Kidnies and bladder by moving to urine, and a little to consume the stone and gravell in them: and this is all that we have learned it to be availeable: for those herbes and roots that are temperate and most used to be eaten, are the lesse physically applied for any disease; the other as *Ranwolfius* saith, is used to be eaten also by the *Egyptians*, as other rootes are and is common with them.

CHAP. XLI.

Saxifraga Pimpinella. Burnet Saxifrage.

WE have foure or five sorts of this burnet Saxifrage, to shew you here, some being of our owne countrey, and some of others, and some greater or lesser than others.

1. *Pimpinella Saxifraga hircina major.* Great *Germane* Burnet Saxifrage.

This great Burnet Saxifrage of *Germany* hath divers large and long stalkes of winged leaves, one set directly opposite to another on both sides, each being somewhat broad, a little pointed and dented about the edges somewhat deepely, of a fresh greene colour almost shining, from among which rise up one or more round hollow stalkes, three foote high or more, set at the joynts, with the like, but lesser leaves, and bearing atthe toppes small umbells of small white flowers, after which come small blackish round seede like unto Parsley seede, but much hotter in taste, and sharper upon the tongue, the roote is small long and white, very like unto a Parsley roote, but much hotter in taste, and perisheth not after seede time, but endureth long.

2. *Pimpinella Saxifraga major flore rubente*, Great Burnet Saxifrage of *Germany* with a reddish flower.

This sort differeth little from the former, either in forme or greatnesse of leaves or tallnesse of the stalkes, the chiefest difference consisteth in the flowers which are reddish or of a blush colour.

3. *Pimpinella Saxifraga major nostras.* The greater *English* Burnet Saxifrage.

The greater sort of our *English* Burnet Saxifrage groweth up in the same manner that the former doe, the forme of whose leaves is all one likewise, but that they are usually not more than halfe so bigge or large, and not so deepely dented about the edges, but of a sadder greene colour; the stalkes likewise are smaller and shorter than the other, the umbells of flowers are white also and the seede small and blackish, but sharper than the former: the roote is long and whitish enduring long.

4. *Pimpinella Saxifraga hircina minor.* The smaller Burnet Saxifrage of *Germany*.

This lesser Burnet Saxifrage of *Germany* hath likewise sundry shorter stalkes of finer cut leaves by much than the former, every one set against other, being very narrow and much cut in or deepely dented about the edges, which maketh the leafe seeme as if it were made of many fine cut and jagged leaves set on both sides of a foote stalke, which sometimes groweth reddish, and is very neere of the same fresh greene colour that is in the first: the stalkes rise as high almost, and the umbells of flowers white like the former; the seede also is blackish but smaller than the former: the roote is long and white but smaller, but more hot, quicke and sharpe as the seede hereof is also.

5. *Pimpinella Saxifraga minor nostras.* The lesser *English* Burnet Saxifrage.

Our lesser *English* Burnet Saxifrage hath much finer cut leaves than the last, so that there is not halfe that breadth to be seene in them that there is in the leaves of the former, but yet divided after the same manner, and of as darke a greene colour as the greater *English* sort: the umbells of flowers are white, and the seede that followeth smaller than of the last, the roote likewise is smaller, but as hot and quicke in taste as it.

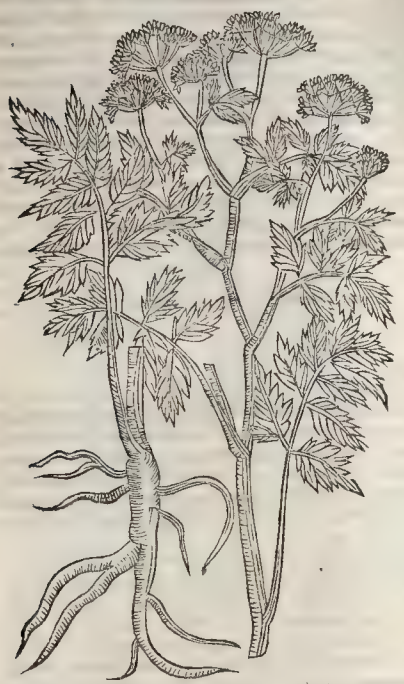
The Place and *Time.*

The *Germane* kindes grow as well in their fields, as on the mountaines, and in rockie grounds, and as it is affirmed unto me by divers in our owne land likewise; the other of our owne land, are usually growing in most medowes of this land to be easily found of them that know them, and will looke for them, for they lie hid among the grasse oftentimes scarsely to be discerned: they doe all flower about *Iuly*, and their seede is ripe about the end of *August*.

The Names.

The ancient Writers neither Greekes nor Latines had any knowledge of any of these plants, but are called of the

1. *Pimpinella Saxifraga Hircina major.*
Great *Germane* Burnet Saxifrage.



4. *Pimpinella Saxifraga Hircina minor.*
The ſmaller Burnet Saxifrage of *Germanie.*

the moderne Herbariſts *Pimpinella* ſimply by many, as *Cordi*, *Tragi*, *Fuchſius*, *Geſner*, and *Lobel*, & *Pimpinella Saxifraga* by *Matthiolus* and *Camerarius*, or *Saxifraga hircina*, as *Geſner* & *Cluſius* do, ſome alſo *Bipinella Saxifraga*, as *Lobel*, or *Bipenula* as *Lacuna*, or *Tragoſelinum majus* as *Tabermontanus*: the ſecond is remembred by *Geſner in hortis, & in deſcriptione montis fracti*: the third is the ſecond *Pimpinella* of *Tragus*, yet is greater than that kinde that groweth in our owne land; and ſo is the fift, and is moſt likely to be *Bauhinus* his *Pimpinella Saxifraga tenuifolia*; the fourth is the third *Pimpinella* of *Tragus*, and is called *Pimpinella minor* by divers, and *Saxifraga hircina minor* by others, taken by *Cordus* to be *Daucus Selinoides*, and by *Lugdunenſis Dauci tertium genus*, and by *Columna* to be *Tragium Dioſcoridis*. There is growing at the rootes of theſe Saxifrages in ſome countries certaine graines that will give a ſcarlet die, as *Lacuna* and *Anguilara* have ſet it downe, and by them called *Coccus radicum*, but *Amatus Luſitanus* ſaith that the like graines are found at the rootes of many other herbes. *Fragoſus* ſeemeth in reciting theſe graines growing at the rootes of theſe *Saxifrages*, to thinke that theſe graines are the Cochenill that the Diers uſe to die their ſilke and cloth in graine colours; for he ſaith, *lib.* 3. *c.* 15. that the Cochenill that commeth from *Peru* be the graines that grow at the rootes of certaine plants like unto our common Burnet Saxifrage, wherein he was much miſtaken, for as *Oviedus* ſaith, they are gathered from the leaves of great trees in the *Weſt Indies*, called there *Tunal*, and with us *Ficus Indica*, and as it is ſet downe in the eight part of the *Weſt Indian* Hiſtory, the fourth Booke and thirteenth Chapter (and in the Claſſis of the trees in this Worke) from whence it ſeemeth *John de Laet* of *Anwerpe* in his fift Booke and third Chapter, pag. 229. of the *Weſt Indian* Hiſtory tooke his relation thereof, which is ſomewhat too large to inſert in this place. I will therefore but briefely touch what he there ſaith, that there are divers ſorts of *Ficus Indica*, ſome that beare no fruit growing wilde, or ſo thorny that ſerveth to no uſe: others that are manured and beare fruit, which are eaten, and are either white, which are the better, or of a reddiſh purple colour dying their hands that gather them, like as Mulberies doe: and there is another manured ſort that beareth no fruit, but is of greateſt worth, and moſt carefully kept, becauſe that certaine Flies doe breede thereon (which are that graine called by the *Spaniards Cochenill*, derived from the *Coccus* of the ancients, and this as a diminutive thereof) which they gather twiſe or thrice in a yeare, and kill them by caſting cold water on them, and afterwards drie them in the ſhadow: but of this he ſaith there are foure ſorts, ſome better or worſe than others, the worſer being gathered from the wilde plants, the beſt from thoſe are planted in order like an orchard, and tended carefully. *Tragus* calleth this Saxifrage *Piper Germanicum*, and ſaith that no other plant can be more fitly referred to the *Petroſelinum Macedonicum* of *Dioſcorides* than it, who compared the ſeede thereof unto the ſeede of *Amoes*, yet to be ſweeter in ſmell like unto ſpice, and ſharpe and hote in taſte, and to grow in rockie places, and hereon complaineth that men more willingly ſpend their coſt on ſtrange things fetcht from farre, than upon their owne hombred and country plants: and aſſuredly the ſeede hereof is ſo aromaticall, and ſharpe piercing withall that I thinke he had reaſon ſo to thinke as he did, when as it farre ſurpaſſeth either the old *Petroſelinum Macedonicum* of our modernes, I meane our Alliſander ſeede or the new *Petroſelinum Macedonicum* that commeth from *Venice*, and is now a dayes in ſo great account, as though it were the true *Petroſelinum Macedonium* not to be doubted of, or none to goe beyond it: but I am in doubt I ſhall finde among my brethren ſome Critickes that will taxe me for inferring this noveltie: if it pleaſe not them, let the judicious cenſure it as they ſhall finde cauſe and reaſon. *Tragus* alſo ſaith that ſome others referred this to the *Oreoſelinum* or *Apium montanum* of *Dioſcorides*.

The

The Vertues.

Theſe ſorts of Saxifrages are hotter than any the former kindes of *Apia* Parſlies, and as hot as Pepper, and as *Tragus* ſaith, more wholeſome, by his often experience: it hath the ſame properties that the Parſlyes have, but in provoking Vrine, and eaſing the paines thereof, or of the Wind and Collicke is much more effectuall, the rootes or ſeede being uſed either in powder or in decoction or any other way, and likewiſe helpeth the windie paines of the Mother, and to procure their courſes, to breake and avoyde the ſtone in the Kidnies, to digeſt cold viſcous and tough flegme in the ſtomacke; and is a moſt ſpeciall remedy againſt all kinde of venome. *Caſtoreum* being boyled in the diſtilled water hereof, is ſinguler good to be given to thoſe that are troubled with Crampes and Convulſions: ſome doe uſe to make the ſeede into Comfits, as they doe Caraway ſeede, which is effectuall to all the purpoſes afore ſayd, and ſome doe diſtill the water that the more tender ſtomackes may take it, being a little ſweetened with Sugar: the juyce of the herbe being dropped into the moſt grievous wounds of the head, doth dry up their moyſture and healeth them quickely: the experiment is taken from Hennes whoſe combes and head being pierced through, ſo as the braine was not hurt, were ſoone helped hereby: ſome women alſo uſe the diſtilled water to take away freckles, or other ſpots in the skinne or face, and to make it the more cleere and ſmooth.

CHAP. XLII.

Pinax. Alheale.

Dioſcorides maketh mention of three ſorts of Panax, *Panax Heracleum* with Figge-like leaves, whereof I intend to intreate in this Chapter, and with it ſome others that for their likeneſſe may be referred thereunto: *Panax Aſclepius* with Fennell-like leaves, but I have ſpoken hereof in the fourth Chapter of this Claſſis, and *Panax Chironium* with Marjerome-like leaves, I have ſhewed you in the 84. Chapter of the fifth Claſſis of this Worke, but *Theophraſtus* maketh foure ſorts, for unto theſe three he added a fourth, which he calleth *Syriacum* but doth not deſcribe it. I have to ſhew you in this Chapter many other ſorts, that for their likeneſſe have obtained that epithite.

1. *Panax Heracleum verum ficulneo folio.* The true All-heale of *Hercules*.

The true *Panax* hath divers large broad greene leaves growing next the ground, cut into three or more parts, reſembling a Figge leafe each ſtanding on a long footſtalk, wch as well as the leafe is ſomewhat rough or rugged, from whence riſeth up a ſtalk foure or five foot high, having ſuch like leaves as grow below but leſſer & leſſe divided bearing a large tuft or umbell of yellow flowers, and ſomewhat large flat ſeede after them: the roote is white with divers branches thereat: the whole plant ſmelleth ſomewhat ſtrong and as it were ſower. From this it is probable the Gum *Opopanax* is gathered which commeth out of *Syria* and the parts thereabouts to the chiefe Mart townes, as *Damaſco*, *Cairo*, *Alexandria* and others the like, to be tranſported elſe where. And the like plant anſwering very notably to this diſcription have I had growing in my Garden, the ſeede whereof was ſent me among other rare ſeeds by ſome of my divers friends from *Italy*, but periſhed by ſome extreme hard winter.

2. *Panax Heracleum alterum ſive peregrinum Dodonæi.* The more ordinary Alheale of *Hercules* with us.

This *Panax* ſpreadeth many very large winged leaves round about upon the ground, moſt of them two foot long, conſiſting of foure, five or ſix couples of rough winged leaves, ſet each againſt other on a round great footeſtalk, furrowed on the upper ſide, each of them winged, conſiſting likewiſe of three or foure couple of rough but large faire freſh yellowiſh greene leaves & one at the end, broad below, and narrow to the end, the one of the lower ſides of the leafe, being alwayes deeper at the bottome then the other and finely dented about the edges, taſting a little hot and biting in the mouth, and yeelding forth a yellowiſh juice in the Sommer much more gummy, hot and bitter than the leaves; from among theſe leaves riſeth up one ſtrong great round greene ſtalk foure or five foote high or more, with ſome joynts and leaves thereat, and a few branches towards the toppes, where breake forth ſmall yellow umbells of flowers, which afterwards give whitiſh yellow flat ſhort ſeede: the roote groweth ſomewhat great and deepe downe into the ground, with two or three long branches from it, whitiſh yellow on the outſide and more white within, full of that yellow ſap iſſuing from it if it bee cut or broken, of a little ſtroug ſent and hot bitter taſte more then eyther leafe or ſeede: this deſcription is from the plant growing in mine owne Garden where it abideth the extreameſt winter without harme.

3. *Panax Heracleum alterum Americum ſplendente folio, Laſerpitium creditum quibuſdam.* *American* Alheale of *Hercules* with ſhining leaves, ſuppoſed to be the true Laſerwort.

This *Herculean* Alheale groweth for the forme very like unto the laſt, having ſuch like winged leaves ſet in the ſame manner, and the wings with foure or five or ſix couple of leaves, but differing in greatneſſe and colour, for neither is the whole ſtalke above halfe ſo long, nor are the leaves themſelves eyther halfe ſo great ſo broad or ſo long, but are rather ſomewhat ſhort, and of a deepe greene colour, very much ſhining on the upper ſide and paler greene underneath, much hotter and ſharper in taſte then the former and not bitter drawing water into the mouth: the ſtalk hereof is ſeldome above a yard high, with joynts and leaves thereon, and more branches towards the toppes then the other bearing larger umbells of yellow flowers ſucceeded by flattiſh but almoſt round ſeede, of a pale browne colour the roote is white and great at the head with ſundry long ſtrings thereat with a pith in the middle and endureth not after ſeede time which ſometimes is the ſecond yeare after the ſpringing and ſometimes the third. There is another ſort hereof with taller and purpliſh ſtalkes, and larger browne greene leave.

Atro purpurea.

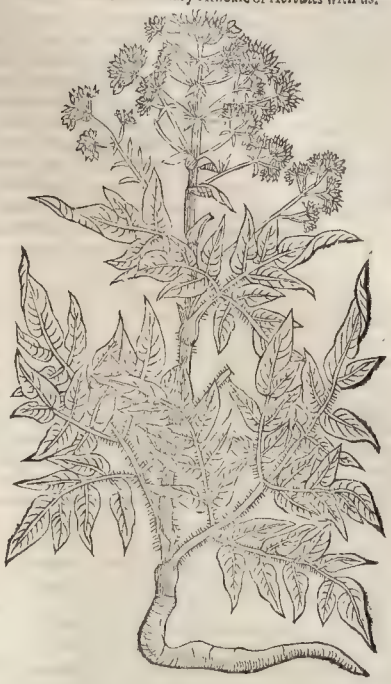
4. *Panax Coſtinum ſive Pſeudoſtus Matthioli.* Coſtus-like Alheale.

This Coſtus-like Alheale differeth not much in forme from the ſecond but in the greatneſſe and ſubſtance of the yellow juice which this giveth not and therefore is not of that kind, for this hath ſuch like large winged leaves, ſet in the ſame manner but leſſer together, each leafe whereof is larger then a Parſnep leafe, thicker, rougher and more crumpled alſo and dented about the edges: the ſtalke is ſmall and about two cubits high, full of joynts and leſſer leaves ſet at them, branched towards the toppes and bearing round tufts of yellow flowers, after which follow flat and ſomewhat round ſeede: the roote is ſappie with a thicke fleſhy barke, and of a ſhining aſh colour, bitter and ſharpe in taſte.

5. *Panax*

1. *Panax Heracleum verum.*
The true Alheale of *Hercules.*

2. *Panax Heracleum alterum sive peregrinum Dodonæi.*
The more ordinary Alheale of *Hercules* with us.



3. *Panax alterum Americanum splendente folio Laserpitium creditum quibusdam.*
American Alheale of *Hercules* with shining leaves.

4. *Panax Costinum sive Pseudocostus Matthioli.*
Costus like Alheale.

5. *Panaci Heracleo similis Tataria Ungaris dicta.* The *Hungarian* Alheale of *Hercules*.

This *Hungarian* or rather *Tartarian* herbe hath the leaves much cut in and gashed on the edges somewhat like unto Turneps, but more nearely resembling those of the Alheale of *Hercules*, full of a rough hairinesse, of a pale greene colour, with other smaller ones lesse divided and lesse rough also, among whom riseth a rough crested hollow stalke two foote high, and of the thicknesse of ones thumbe, full of joynts and such leaves set thereat as grow be ow, but smaller and more divided compassing the stalke at the bottome: at the toppe of the stalke commeth forth umbells of yellow flowers, after which follow the seede very sparingly set on the umbells (for every flower doth not perfit the seede many more failing then holding) which is very great and thicke, resembling those of the Cachrys, and straked like thereunto: the roote is very great and long even as thicke as ones arme, and of a cubits length which perisheth after seede time, and doth smell very fouly that one cannot well endure the smell, but rather cast them out of the garden, yet this before it be growen to seede is taken and eaten both by the *Hungars* and *Tartares* in stead of bread, and is pleasant to them being of great use with the *Tartares*, for without it they could not marke their long journeys through the Desarts where no foode is to be found.

6. *Panax χαμαῖμον seu racemosa Americana.*

The clustered berry Allheale of *America*.

6. *Panax χαμαῖμον seu racemosa Americana.*
The crusted berried Allheale of America.

This herbe of *America* riseth up with a round pithy brownish purple stalke, set at the joynts with large leaves divided into many parts usually by three at a space, little dented about the edges, bearing both at the joynts with the leaves and at the top, on sundry branches many tufts of flowers made of small threds like Vine blossomes, at the first greenish, but whiter afterwards, which turne into small bunches of greene berries, which grow to be darke red, when they are ripe, full of a pleasant tasted juyce, with many seedes therein: the roote is of the thicknesse of ones thumbe, and very long: it looseth both stalke and leaves every yeare, and new spring up againe after winter: The whole plant both leaves and roote, are eaten as sallets and potherbes, of the Indians where it is naturall, and the *French* also that live amongst them, and taste more pleasantly then the berries themselves.

7. *Panaces moschatum Americanum.*

Sweete scented Allheale of *America*.

The first leaves of this *Panax* are large and about a foote long, onely dented about the edges, somewhat like unto Costmary leaves, lying on the ground, and compassing the long white roote at the head, but those that follow are so deepely cut in that they reach to the middle ribbe almost, the stalke riseth to be two cubits high, without any leaves thereon save onely about the middle, where it hath a knot and a leafe that compasseth it, of a differing forme from the rest, the toppe branches are so heavily laden with umbels of white flowers, that before they open they hang downe their heads, which have so excellent a sweete smell, that they smell like Muske, a great way of the place where it groweth: the seede that succeede are like, but not so broad as the ordinary *Panax*. The leaves taste sharpe, and a little bitter, but the roote lesse:

The Place and *Time*.

The first groweth in *Nalpes* as *Matthiolus* saith, on the *Apperine* hills also and the Sea coasts by *Siena*: the second is thought to grow in some places of *Italy* also but generally in our gardens: the third came first from *America*, & the seede being imparted to sundry persons it received sundry names, and came to me out of *Italy* for *Laserpitium antiquorum*, and is set downe in *Cornutus* for *Angelica lucida Canadensis*, and the other sort thereof for *Angelica atropurpurea Canadensis*: the fourth as *Matthiolus* saith groweth on mount *Garganus* in *Apulia*: the fift in *Tartaria* and *Hungaria*, the two last in *America*, and doe all flower and seede in the end of Summer.

The Names.

It is called in Greek πάναξ ἡ πάνακες, and *Panax* or *Panaces* also in Latin, because it is a remedy for all diseases, and not as *Pliny* taketh it from *Hercules*, to be the first founder of it, and some would have it named rather from *Heraclea* a City in *Candy*, but the name *Panax* is referred to many plants, as *Theophrastus* saith, there are many other *Panaces*, and *Dioscorides* saith *Origanum sylvestre*, called also *Cunila bubula*, and *Cunila gallinacea*, which is like to *Origanum Heracleoticum* was called also *Panax Heracleum Centaurium magnum* also, and *Ligusticum* were called *Panax Heracleum*. The first here set downe is the *Panax* or *Panaces Heracleum* of *Matthiolus*, *Anguillara*, *Gesner* in *hortis*, *Lobel*, *Lugdunensis*, and others, but *Dodonæus* taketh that *Panax Heracleum* that grew in the low Country Gardens, bearing white flowers, to be rather another sort of *Sphondylium*, to whom I must consent, for that plant with such broad leaves and white flowers, is a greater *Sphondylium* then the ordinary, as I shall shew you in the next Chapter save one, that which *Lobel* saith he saw in the gardens of some *Franciscans*, with yellow flowers, is a differing plant from it, and may be the true *Panax Heracleum* or *Heracleū* of *Dioscorides*, the second is the *Panax Alterum recentiorum Olusatri aut Pastinacæ folio* of *Lobel*, the *Panaces peregrinum* of *Dodonæus*, but mistaken by *Lugdunensis*, who calleth it *Panax Chironium Dodonei*, when as *Dodonæus* taketh the *Panax Chironium* to be the *Helianthes* or *Helianthemum* of *Pliny* as it is, and so by *Clusius*, *Cordus* ond others, *Bauhinus* thinketh it may be the

the *Panax Syriacum* of *Theophraſtus*, whereof there is great probability, for the ſeede of this plant as *Lobel* ſaith was found among the gum *Opopanax*, and ſowen by *Coudenbergius* a famous Apothecary in *Antwerpe* which no doubt was from the plant that brought forth that gum *Opopanax*, out of which it was taken, which as you ſee differeth much in forme of leaves from that of *Dioſcorides* and *Theophraſtus*. The third was ſent to us by the name of *Laſerpitium verum*, but having well conſidered it, I found it remembred by *Cornutus* among his *Canada* plants, calling it *Angelica lucida Canadenſis*, but not rightly, for the ſmell of the root with me, is more like unto Turpentine then Angelica, the other ſort hereof he calleth *atro purpurea*, I cannot referre it better to any plant, then to the laſt *Panax* it carryeth ſo like a face thereunto, and therefore call it *Panax Heracleum alterum Americanum, &c.* The fourth *Matthiolus* firſt ſet forth by the name of *Pſeudocoſtus*, and ſo, many others have called it ſince, and *Coſtus ſpurius*, but *Camerarius in horto* ſaith, that ſome called it in his time *Panax Chironium*, and *Tabermontanus* calleth it *Panaces Coſtinum*, and *Coſtus Illyricus*, but *Ceſalpinus Herba Coſta*, and *Bauhinus Panax Coſtinum*, whom I follow: the fifth *Cluſius* ſetteth forth by the name of *Tataria Ungarica*, and *Bauhinus* thinketh it may be the *Baltracan*, which *Joſephus Barbarus* ſaith he ſaw in *Tartaria*, whereof he ſpeaketh in his journey into *Perſia*, that the *Tartarians* of the decoction of the leaves make their drinke, and the *Hungarians* their bread of the roote, and *Bauhinus* thereupon calleth it *Panaci Heracleo ſimilis Vngarica*, The laſt are ſo named by *Cornutus*, as they are ſet downe in their titles. The *Arabians* call it *Steuſir Ieuſir*, and *Giauſir*. The *Italians Panace Heracleo* and thereafter all other Chriſtian nations that know it, and we in *Engliſh* Allheale of *Hercules*, according to the Greeke ſignification of the word.

The Vertues.

From the rootes and ſtalkes of this *Panax Heracleum*, being cut ſaith *Galen*, commeth forth that juyce or gum called *Opopanax*, which is of much more uſe then any other part of the plant, and is hot in the third degree, and dry in the ſecond, being of an heating mollefying, and digeſting quality, the barke of the roote is heating and drying likewiſe, but in a meaner degree, having withall a little cleanſing property, whereby it is good for virulent and maligne ulcers, and to cover with fleſh the bones that are bare: the ſeede alſo ſaith he is hot, and is mixed with thoſe medicines that procure womens courſes, the juyce or gum ſaith *Meſues* hath a ſpeciall property therein to purge thicke and clammy flegme from the more remote parts, as the braine, nerves, ſenſitive parts, joynts and breaſts, and therefore profitably applyed to all the cold greefes incident to any of thoſe parts, as to helpe a weake ſight, an old cough, ſhortneſſe of breath, purſineſſe and wheeſing and is good alſo for the Sciatica, the gout in the knees and feete, it is good likewiſe for crampes, convulſions, paines, and ſtitches in the ſides, by the windineſſe, ſwelling and hardneſſe of the Spleene, for the ſtrangury alſo and difficultie in making urine: it likewiſe diſcuſſeth the windineſſe hardneſſe and ſuffocations of the mother, provoketh their courſes and expelleth the dead birth: being alſo drunke in mede or wine it helpeth the itchings and ſores in the bladder: it breaketh carbuncles or Plague ſores, and is profitabley applyed with mollifying ſalves, and thoſe that cure wounds and ſores in the head, it helpeth the toothach, being put into an hollow tooth, and helpeth the biting of a madde Dogge, and againſt all other poiſons of venemous creatures. The leaves of the *Hungarian Tataria* boyled in water is a familiar & uſuall drink with the *Tartars* as the roots are bread to the *Hungarians* as is before ſaid; the operation of the *American* plants are found to be more alimentall then medicinall, being familiarly eaten by the natives and *French*. *Matthiolus* doth recount the properties of his *Pſeudocoſtus* or *Panax Coſtinum* in this manner. It is ſaith he hot & dry in the third degree compleat, it openeth, clenſeth, cutteth & maketh thin, and ſeeing it is bitter, ſharpe and ſomewhat ſweet, it may performe all thoſe things that are related of it, that is, it helpeth all cold greefes of the head and nerves, and is alſo helpfull for the cough, ſhortneſſe of breath and the like, as alſo for the winde Collicke and againſt the obſtructions of the Liver and Spleene, the Stone and gravell in the reines and bladder, and the diſeaſes of the mother, to bring downe the courſes, and to expell the dead birth; it likewiſe helpeth all old greefes of the head, the ſwimming and turning of the braine, the falling ſickneſſe, the Lethargie, Convulſions, Crampes, Gouts and the like: it killeth alſo the wormes, and provoketh urine, and helpeth all joynt aches.

CHAP. XLIII.

Libanotis latifolia. Herbe Francumſence with broad leaves.

OF that kind of *Libanotis* that hath Fennell-like leaves with all the ſorts thereof, I have ſpoken before in the fourth Chapter of this Claſſis, there remaineth ſuch to bee entreated of that beare broad leaves which ſhall follow in this as I there promiſed.

1. *Libanotis Theophraſti major.* The greater white herbe Francumſence.

This greater *Libanotis* hath many great long ſtalkes with wings of large broad leaves ſome eight inches long a peece and almoſt foure broad, five being ſet together whereof one at the end, one againſt another, three or foure inches broad below and ſmaller to the end, being ſomewhat hard in handling, of an overworne greeniſh colour and a little dented about the edges, among which riſeth up a ſtrong round ſtalk, foure or five foot high oftentimes, having ſuch like leaves on the joynts but fewer and leſſer then grow below and a few branches riſing from the upper joynts bearing large ſpread umbells of whitiſh flowers, and after them ſomewhat flat and round light ſeede two joyned together, white on that ſide where it is joyned, and ſtraked with rough crumpled ſtrakes on the backe or round ſide, and of a pale browne colour when it is ripe but a little purpliſh before: the roote groweth great and long, whitiſh on the outſide with a tuft of haire at the toppe, abiding long, ſmelling and taſting ſomewhat ſtrong as many other umbelliferous rootes doe, but the ſeede much ſtronger.

2. *Libanotis Theophraſti minor.* The leſſer white herbe Francumſence.

This leſſer *Libanotis* agreeth with the former both in the forme of leaves, flowers, ſeede and rootes, but that they are all leſſe, and the number of leaves are more ſet together on every ſtalke, being alſo more deepely dented about the edges, the roote is white but more bitter then it.

There is another ſort hereof which *Bauhinus* calleth *Libanotis latifolia minor ſemine criſpo*, and differeth onely in having fewer leaves on the ſtalkes, although as ſmall and but one or two deepe cuts on the edges.

3. *Libanotis Theophrasti Apij folio Cretica.*
The trueſt herbe Francumſence of *Theophraſtus.*

This plant which I take to be the trueſt *Libanotis* of *Theophraſtus Apij folio*, that is yet extant, hath a ſtalke about a cubit high, diuided into ſome branches, with leaues both below and aboue ſet ſparingly, ſomewhat reſembling Smallage for the largeneſſe of the leaues, and dented about the edges, bearing white flowers, and large, rough, crooked browniſh ſeed: the roote is couered with a blackiſh barke, and very white underneath, ſmelling ſtrong like Francumſence.

4. *Libanotis latifolia Aquilegiæ folio.*
Columbine leafed herbe Francumſence.

This herbe Francumſence hath a thicke rugged browne ſtringie roote, with a white pith in the middle, ſmelling ſomewhat ſweete and bitter in taſte, hauing a tuft of blackiſh haires at the toppes, from whence riſe ſundry leaues upon long foote ſtalkes, broad & hollow at the bottome like a skinnie huske, cõpaſſing one another as thoſe do alſo onthe upper ſtalkes, and are hard in handling, yet of a ſhining darke greene colour aboue, and whitiſh underneath, with diuers purpliſh veines running through them, not all of them diuided like unto Colùmbine leaues, but many of them parted into fiue leaues, with three diuiſions apeece, others into three leaues, each ſtanding on a ſtalke: it hath one white round ſtalke, ſtraked with purple, riſing up more than three cubits high, with diuers ioynts thereon, and branched towards the toppes, bearing euery one a large umbell of ſmall white flowers, and after them long and broad ſtriped ſeede, of a purpliſh colour ſomewhat bitter, hot, and drawing water into the mouth, if it be a little chewed therein, and ſomewhat ſweete in ſmell.

1. *Libanotis Theophrasti maior.*
The great white herbe Francumſence.

The Place and *Time.*

The two firſt ſorts are found in many places in *Germany*, and the parts neere adioyning, the third in *Candy*, and the laſt it is likely came out of *Æthiopia*, by the name was giuen it. The two firſt ſeede with us yearely, after they are well growne; but the two laſt very ſeldome, unleſſe the yeare proue hot and kindely.

The Names.

It is called λιβανώτις in Greeke, from the ſent of Francumſence which it hath, and *Libanotis* in Latine, and ſome *Cervina alba*, and *Cervicaria alba*, but generally *Libanotis latifolia*, that it may be knowne to differ from the former, which is called *Ferulæ folio*, it is tranſlated *Roſmarinus* by diuers, when as properly the *Roſmarinus* of the Latines, is but the firſt kinde of *Dioſcorides* his *Libanotis*, called *Stephanomatice*, that is, *Libanotis Coronaria*, becauſe it onely was put into garlands, and ſo *Galen* did account it: the two firſt here ſet downe, are accounted by moſt of the later Writers to be the *Libanotis fertilis* of *Theophraſtus*, which is ſet downe in his 9. Booke and 12. Chapter, with leaues of Smallage, but much greater; the fruit or ſeede whereof was called *Canchrys*, with a great white thicke roote ſmelling like *Thus* or *Olibanum*: but how any can well make the leaues hereof to reſemble Smallage I cannot ſee, or that the ſeed hereof was euer called *Cachrys*, hauing a cauſticke qualitie, or the roote the ſmell of *Olibanum*. I onely touch this as a *Quære* further to be conſidered of: and it is probable that the figure that *Matthiolus* giueth for his *Liguſticum alterum*, was entended for this *Libanotis*, the fiue leaues being miſtaken in the placing, for that they ſhould not be ſet ſo cloſe together, or elſe he entended it for the *Aquilegiæ folio*, for he calleth this *Libanotis*, *Seſeli Æthiopicum* in another place, as *Geſner in hortis*, *Lugdunenſis*, *Cluſius*, and others doe, calling it *Seſeli Æthiopicum Matthioli*, and therefore to helpe the matter *Dodonæus* calleth it *Seſeli Æthiopicum herba*: it is alſo *Tragus* his firſt *Seſeli*, and the *Dauci alterum genus* of *Fuchſius*, *Turner*, and *Lugdunenſis*: the third *Camerarius* ſaith that it was ſent him out of *Italy* by the name of *Siler Creticum*, and is the *Roſmarinus Selini folio*, that *Honorius Bellus* maketh mantion of in his firſt Epiſtle to *Cluſius*, & ſaith is falſly called *Siler Creticum* by many, but is by him taken to be the true *Libanotis Theophraſti*, to whoſe iudgement I adhere thus farre, that it is the trueſt and the likelieſt of any other we know extant; the laſt is called by *Camerarius in horto Seſeli Æthiopicum alterum*, and ſaith the ſeede was in ſmell and taſte ſomewhat like Cinamon: *Bauhinus* calleth it; as I doe, *Libanotis latifolia Aquilegiæ folio*. *Bauhinus* in his *Pinax* maketh another leſſer ſort of *Libanotis* which he calleth *Apij folio*, and referreth the *Daucus anguloſo caule* of *Cordus* in his hiſtory thereunto, and likewiſe the *Libanotis alba minor* of *Thalius*, whereas both it and that of *Cordus*, as alſo that *Libanotis Theophraſti minor* of *Lobel* are all compriſed under his *Latifolia altera ſive vulgatior*, and are not ſeuerall plants, as I thinke.

The Vertues.

This herbe Francumſence is of a mollifying and digeſting qualitie, helping the old griefes of the breaſt and lungs, the falling ſickneſſe, and the iaundiſe, if it be taken with Pepper in wine: it increaſeth milke in Nurſes breaſts,

breasts, if the roote be taken in wine, it likewise easeth the paines of the stomacke and belly, and the biting of venemous beasts and Serpents, procureth womens courses and the urine being stopped: the leaves being bruised and applied staieth the bleeding of the piles or hemorrhoidall veines, the heate also and swelling of the sundament, and bringeth those hard tumours and impostumes to ripenesse, which doe hardly yeeld to be easily cured: the dried roote mixed with honey and put into foule ulcers cleanseth them throughly: it helpeth likewise those that are burstен, or that have convulsions and crampes, and the gout, being bruised and applied with the meale of Darnell and some vinegar; and being used with vinegar, it taketh away the morphew or discolouring of the skin, or the leprye also: the juyce of the leaves and rootes cleareth the eye-sight, and sharpneth it, and also the rheume fallen into them, applying it to the forehead: the seede also of any of these sorts doe the like, but if it be that seede, which is called *Cachrys* that is forbidden to be taken inwardly, by reason of the causticke and burning qualitie therein to inflame the mouth and throate being taken or drunke.

CHAP. XLIIII.

Sphondylium. Cow Parsneppe.

ALthough formerly there was but one sort of the Cow-Parsneppes knowne and divulged to the world, yet there are now divers others found out, some in our owne land, and some in others, all which shall be entreated of together in this Chapter.

1. *Sphondylium vulgare.* Ordinary Cow Parsneppe.

The ordinary Cow Parsneppe groweth with three or foure large spread winged rough leaves, lying often upon the ground or else raised a little from it, with long round hairy foote stalkes under them, parted usually into five divisions, the two couples standing each against other, and one at the end, and each division or leafe being almost round, yet cut in somewhat deepely on the edges, in some leaves and places, and not so deepe in others, and of a whitish greene colour, smelling somewhat strongly; among which riseth up a round crested hairy stalke two or three foote high, with a few joynts and leaves thereon, and branched at the toppe, where stand somewhat large umbells of white flowers, but sometimes a little reddish, and after them flat whitish thinne winged seedes, two alwayes joyned together, as is usuall in most of these umbelliferous plants: the roote is long and white, with two or three long stringes growing downe into the ground, smelling likewise strongly and unpleasant.

1. *Sphondylium vulgare.*
Ordinary Cow Parsneppe.

2. *Sphondylium majus sive Acanthus Germanica major.*
The great Cow Parsneppe of *Germany*.

This greater sort differeth onely from the former, in the largenesse both of leaves and stalkes, being neere twise as large, I meane every single leafe or division, which are seldome above three on a great long foote stalke, above halfe a foote long, unto the leafe, which is hairy and rough, of the like evill greene colour, and a little foulded in or crumpled, and dented besides on the edges, the flowers and seede are alike, but larger, as I said, growing higher, of an hot unpleasant taste; but not so unpleasant as the other: the roote is white, and like the other but greater.

3. *Sphondylium majus aliud Laciniatis foliis.*
Iagged Cow Parsneppe of our owne Land.

This jagged Cow Parsneppe groweth as high or rather higher than the last, and with greater stalkes, and a white hairinesse on them, the lower leaves grow very large and much spread, divided into five parts or winged leaves, two couple standing directly each against another, but of another forme, for each of these leaves or divisions are parted into distinct parts, yet closely joyned at the bottome, the two sides leaves or divisions being not of halfe that length that the middlemost is, which is in some above sixe inches long, in others above five, and not above halfe an inch broad, each of them having a deeper cut or notch at the bottome, than is on the rest of the leafe, which yet is dented with greater notches than in most usuall herbes, the upper or end leafe being usually parted into five long divisions or leaves, dented in the like manner, little or nothing hairy, but of a deeper greene colour on the upper side, and grayish underneath, the umbells of white flowers are as large as in the last, and the flat thinne, white, seede is so like, but a little whiter, that they are hardly discerned one from another, but onely in the taste and smell, which is little or nothing in either: the roote is great, thicke, and white, living with me after seede time, and springing a new every yeare.

4. *Sphondylium Alpinum parvum.* Small mountaine Crow Parsneppe.

This small sort hath a stalke a foote high, parted into two or three branches, and pale greene great leaves on them, some whereof are parted into three divisions, and others into five, being somewhat round some of them, and

2. 3. *Sphondylium majus & aliud Laciniatis foliis.*
The greater Cow Parſneppe of *Germany*;
and another with jagged leaves.

5. *Sphondylium Alpinum glabrum.*
Smooth mountaine Cow Parſneppe.

and others pointed, hairy likewiſe, and dented about the edges, the flowers on the umbells are white, and the ſeede thinne and broad.

5. *Sphondylium Alpinum glabrum*, Smooth mountaine Cow Parſneppe.

The roote hereof is white and great, the ſtalke joynted, and two foote high, the leaves are like unto Figge-leaves and ſmooth, being a hand breadth long and two broad, beſides the foote ſtalkes which are a little rough, uſually divided into three parts, but not to the middle and dented about the edges: the toppes of the branches have umbells of ſmaller white flowers ſtanding on them than in the other: the ſeede is flat and round, but having a ſmall pricke or point at the end.

The Place and *Time.*

The firſt groweth in moiſt medowes, and the borders or corners of fieldes, and neere ditches generally through the land: the ſecond is proper onely to *Germany*, as I thinke: the third was found by Mr. *George Bowles* a worthy and induſtrious Gentleman in *Shropſhire*, as I take it: the fourth on the *Alpes* of *Auſtria*: the laſt on the *Alpes* of *Baſſil*: they doe all flower in *July* and ſeede in *Auguſt*.

The Names.

It is called in Greeke σφονδύλιον and σφονδύλιον *Sphondylium* and *Spondylion*, for both are extant in good authours, derived as it is thought from *Spondyle*, a flie ſtinking like this: *Matthiolus*, *Geſner*, *Lobel*, *Dodoneus*, and others doe call it *Sphondylium*; but *Tragus*, *Cordus*, and ſome others call it *Branca urſina*, and *Fuchſius Acanthus vulgaris ſive Germanica*, and ſo is moſt uſually the ſecond ſort called by divers; and this is the plant, as I thinke, that *Dodonæus* in his Chapter of *Panax*, did rather take to be *Spondylium alterum*, becauſe it bore white flowers, and as I ſaid, is very likely, for that which *Lobel* ſaith, he ſaw with yellow flowers was a *Panax*, and not this: the third as it is a plant lately found out to grow in our owne land, ſo I have given it a name, correſpondent, as I thinke to the forme, yet I thinke verily it is the ſame that *Bauhinus* hath deſcribed in his *Prodromus* by the name of *Sphondylion hirſutum foliis anguſtioribus*, and is, as I alſo verily thinke the ſame that *Matthiolus* ſet forth for his fourth *Crithmum*, and *Lobel* in his Obſervations (finding fault with *Matthiolus* for ſo calling it) *Eryngium montanum recentiorum alterum*, which why they ſhould ſet it, the one with the *Eryngia* bearing an umbelliferous toppe, ſuch as none of them doe, or that it ſhould be called an *Eryngium*, the other with the *Crithma* I ſomewhat mervaile: the two laſt are ſpecified by *Bauhinus* in his *Prodromus*, by the ſame titles that I give them: the *Italians* call it *Sfondilio*, the *Frence Brance urſine*; the *Germanes Berneclaw*, the *Dutch Beerenclaw*, and we in *Engliſh* Cow Parſneppe and Medow Parſneppe by ſome.

The Vertues.

The ſeede of Cow Parſneppe, as *Galen* ſaith, is of a ſharpe and cutting qualitie, and therefore is a medicine fit to be

be given to thoſe that have the cough and ſhortneſſe of breath, or the falling ſickneſſe, or the jaundiſe; the roote is of the like qualitie, and availeable to all the purpoſes aforeſaid, and beſides, is of great uſe to take away the hard callous skin that groweth on a Fiſtula, if it be ſcraped upon it: the ſeede likewiſe hereof being drunke doth clenſe the belly from tough flegmaticke matter abiding therein, eaſeth them that are liver growne and womens paſſions of the mother, as well being drunke, as the ſmoke thereof when it is burned received underneath, and likewiſe raiſeth ſuch as are fallen into a deepe ſleepe, or have the lethargie by burning it under their noſe, and if it and the roote be boiled in oyle, and the head rubbed therewith, it helpeth not onely thoſe that are fallen into a frenſie, but thoſe that have the lethargie or drowſie evill, and thoſe that of long time are troubled with the headach, if it be likewiſe uſed with Rue: it helpeth alſo the running ſcabbe, and the ſhingles: if the juyce of the flowers be dropped into the eares that runne, and are full of matter, it clenſeth and healeth them. It is ſaid that the people of *Polonia* and *Lituania* make a certaine decoction of the leaves and ſeede hereof, putting barme thereto as is uſed in beare with us, whereof the poorer ſort doe uſually make their drinke.

CAR-

CARDUI ET SPINOSÆ PANTÆ.

THISTLES AND THORNIE PLANTS.

CLASSIS NONA, *THE NINTH TRIBE.*

CHAP. I.

Cardui & Spinosæ Plantæ. Thistles and Thorny Plants.

UNto the Thistles I thinke meete to joyne such prickly or thorny Plants, as were neither fit for any of the former or subsequent Classis; yet I must except out of this number (although they pertaine to the Classis) those Thistles, or other prickly plants, as I have entreated of in my former Booke, referring those that would be informed of them to the Booke it selfe; whose names are these: *Acanthus sativus*, and *sylvestris*, *Eryngium Pannonicum sive montanum flore cæruleo & flore albo*, *Carduus mollis*, *Carlina humilis*, *Carduus Spherocephalus sive globobsus major & minor*, *Carduus Eriocephalus sive Tomentosus*, *id est*, *Caput monachi sive Corona fratrum*, *Cinara diversarum specierum alimentosa*, & *Corduus benedictus*.

1. *Carduus pratensis latifolius.* Broad leafed field Thistle.

The broad leafed field or medow Thistle sendeth forth sundry large and long leaves cut in on the edges, and every part finely dented, and set with small prickes that are very tender, of a whitish greene colour: those that grow up higher upon the stalkes are smaller, two of them set together at a joynt where they so compasse it, that they will containe water in them, even as the Teasell doth, at the toppes upon long stalkes grow single greene prickly heads, out of which start pale coloured thrummes, compassing a few purple threads in the middie, and after they are faded and gone, small whitish seede somewhat bigger than those of *Cyanus*, Corne flower, or Blew-bottle wrapped in downe, as all the sorts of Thistles are: the roote is somewhat long and great, abiding divers yeares.

2. *Carduus pratensis Acanthi foliis laciniatis.* The yellow jagged medow Thistle.

This medow Thistle hath very large leaves, almost a foote long and somewhat broad, cut in on both sides into foure or five deepe gashes, even to the middle ribbe, set with prickes at the dents of the edges, from whence riseth up a straked stalke about two foote high, set with a few lesser leaves, at the tops whereof stand divers small greene prickly heads, and out of the middle yellow threds or thrummes, which afterwards give seede inclosed in downe: the roote is great, long, crooked, and speading in the ground.

3. *Carduus bulbosus Monspelienſium*, The *French* bulbed Thistle.

The whitish leaves of this Thistle are of an hand breadth long, somewhat fat and thicke cut in on the edges, but not very deepe, armed at every dent with small sharpe prickes: the stalke is two cubits high hairy and slender, with few or no leaves thereon, at the toppe whereof stand harmelesse prickly heads upon long foote stalkes, and out of them pale purplish thrummes, wherein afterwards lie the seede inclosed in much downe: the roote is composed of divers tuberous small long clogs like unto those of the Asphodill fastened together at the head.

4. *Carduus Pratensis Asphodeli radicibus.* Medow Thistle with Asphodill rootes.

This Thistle hath divers blackish cloggie rootes like unto the Asphodill or Piony, which whither and perish every yeare (but give encrease from it before) which sendeth forth divers thicke, and long pale greene leaves

cut into many parts, armed with ſharpe prickles on all ſides, every pricke ending in three points, from whence riſeth up a tall ſtalke, ſomewhat branched with one or two prickly heads at the toppes of every one branch, out of which come purpliſh flowers, and afterwards ſmall long ſeede wrapped in downe.

5. *Carduus pratenſis polycephalos.* The many headed medow Thiſtle.

This Thiſtle hath but few leaves lying next the ground, being both ſhort and narrow, armed with ſharpe and long prickes, the ſtalke is round ſtraked and without prickes, ſpread into ſundry ſmall branches bearing many ſmall heads with purpliſh flowers, made of thrummes or threads thruſting out of the middle of them, but ſet with large and ſharpe prickes: the ſeede is incloſed in downe as the reſt are: the roote is long, hard and wooddy.

6 *Carduus paluſtris* The moiſt Medowes Thiſtle.

The roote of this Thiſtle is ſingle, the ſtalke three cubits high, ſtraight and full of prickes, thicke ſet with darke greene leaves unevenly waved, and ſometimes more deepely cut in on the edges, having a few prickes at them, and branched toward the toppe, with many ſmall heads upon ſlender ſtalkes, and reddiſh purple flowers like others, and then turne into downe.

7. *Carduus Ceanothos ſive viarum & vinearum repens.* The Creeping way or Vineyard Thiſtle.

The rootes of this Thiſtle are very ſmall and whitiſh, running both deepe and farre about under ground like unto quiche graſſe, but have no knotted joynts therein like it, but ſhooteth up heades of leaves from the branches of the roote, ſo that it will be as ill, or worſe than Quiche to weede out, if it be once got into a ground: the leaves are of a pale greene colour, ſomewhat like unto the rough or prickly Sowthiſtle, a little cut in, and as it were crumpled on the edges, armed with very ſwall, and ſharpe hard prickles, the ſtalke groweth to be a yard high, ſtraked and prickly, with ſome ſuch like leaves thereon as the lower be, but ſmaller to the toppes where it is ſtored with cruell ſharpe prickly heads and purple flowers made of thrummes in the middle paſſing into downe.

8. *Carduus Avenarius ſive Muſcatus.* The Oaten land or Muske Thiſtle.

This Thiſtle that riſeth ſometimes to the height of a man among the corne, is found growing lower in other places, having divers very ſharpe prickly jagged leaves ſet rounde about the ſtalkes, and at the toppes where they are branched many ſmall ſhort heads ſet cloſe together, out of which come the flowers conſiſting of threads or thrummes, as in other Thiſtles, ſome whereof will be white, ſome of a deeper, and others of a paler purple colour tending to a bluſh in many places ſmelling ſweete like Muske, which being faded, the ſeede followeth wraped in much doune like the reſt.

9. *Carduus Creticus minimus.* The ſmall Thiſtle of *Candy*.

This ſmall Thiſtle hath riſing from a ſmall long roote divers long leaves, ſomewhat like unto the *Attractylis* or Diſtaffe Thiſtle, but ſmaller, and armed with ſharpe prickles: the weake leaning ſtalkes are divided uſually into two other, betweene which groweth on a foote ſtalke a ſmall Thiſtle-like head armed with a dozen very ſmall long prickes ſtanding up round about it, being ſo finely netted that it maketh admirable the Workemaſter, the middlemoſt head, ever growing lower than the reſt round about it: when theſe heads open, the blew flower appeareth never ſpreading much, after which come ſmall white ſeede incloſed in a little downe, which will flie away with the winde, the heads are ſweete and edible before they flower.

The Place.

All theſe ſorts of Thiſtles grow in fields and medowes in Vineyards and grounds ſowne with corne, as well in our owne Land, as beyond the ſea, ſome of them alſo on Heathes, Greenes, and waſt grounds in many places, as the *Ceanothos* on *Kentiſh Towne greene* abundantly.

1. *Carduus pratenſis latifolius.*
Broad leafed field Thiſtle.

3. *Carduus bulboſus Monſpelienſium.*
The *French* bulbed Thiſtle.

The

4. *Carduus pratensis Asphodeli radicibus.*
Medow Thistle with Asphodell rootes.

7. *Carduus Creanothos sive viarum & vinearum repens.*
The creeping way or Vineyard Thistle.

8. *Carduus Avenarius sive Muscatus.*
The Oateland, or Muske Thistle.

9. *Carduus Creticus minimus.*
The small Thistle of *Candy*.

The Time.

They doe all flower in *July* and *August*, and their seede is ripe quickly after.

The Names.

Ἄκανθος *Acanus* in Greeke in my judgement is most properly *Carduus* in Latine, for from thence be all the *Cardui* called *Acanacea*; the prickly heads whereof being called ἐχῖνος *Echinus*, the Latines call *Echinata capita*, and yet *Theophrastus* in his first booke and sixteenth Chapter mentioneth *Acanor* with *Acarna* and *Drypis* as an especiall kinde of Thistle. Some would thinke that σκόλυμος in *Theophrastus* should better agree to denominate the generall kinds of Thistles, written as well with Ypsilon as Iota, because *Gaza* doth alwayes translate it simply *Carduus* and generally all the Latines, to which opinion *Lugdunensis* seemeth also to encline in the Chapter of *Scolymus*: The first here set forth is the *Carduus pratensis* of *Tragus*, of *Gesner in hortis* and *Lobel*, by *Lugdunensis Acanthus sylvestris*, and is thought to be the *Leimonia* of *Theophrastus*, *lib.6.c.3.* which he putteth among the Thistles with prickly leaves, but *Gaza* hath very evilly translated the word to call it *Beta sylvestris*: the second *Anguilara* and *Lugdunensis* doe set forth under the name *Eresithales* taking it to be that of *Pliny* in his 26. Booke and 13. Chapter, which *Bauhinus* calleth *Carduus pratensis Acanthi folijs laciniatis*: the third *Lobel* saith the learned of *Mompelier* called *Carduus bulbosus*, & he thereupon called it *Carduus bulbosus Monspelliensium*, but *Clusius* calleth it *Cirsio quinto congener*, and *Anguilara Leucacantha*, *Bauhinus* calleth it *Carduus pratensis Asphodeli radice latifolius*: the fourth is called by *Lugdunensis Acanthus sylvestris alter Dalechampij*, by *Tabermontanus Iacea aculeata sive tuberosa*, and by *Gerard* which followeth him *Iacea tuberosa*, but by *Bauhinus Cardanus pratensis Asphodeli radice folijs profundè & tenuiter laciniatis*: the fift is called by *Bauhinus Carduus polycephalos*: the sixt likewise is set forth by *Bauhinus* by the name of *Carduus palustris*: the seventh is taken to be the *Ceanothos* of *Theophrastus*, *lib.4.cap.11.* both by *Anguilara Lugdunensis* and *Columna*, by *Bauhinus Carduus vinearum repens folio Sonchi*: The last *Tragus* calleth *Carduus sylvestris in avena* and *Thalus Carduus Avenarius*, *Tabermontanus Carduus arvensis*, and *Gerard Cardnus muscatus*, and by *Bauhinus Carduus in avena provenies*, which *Lugdunensis* maketh to be *Drypis Loniceri* and would have to be *Scolymus*.

The Vertues.

All these Thistles are temperate in heate and drineſe, and are good to provoke urine, and to amend the stinking smell thereof, as also the ranke smell of the arme holes or of the whole body to be boyled in wine and drunke: the same also is said to helpe a stinking breath, and to strengthen the stomacke, *Pliny* saith that the juice being bathed on that place which wanteth haire or is fallen of, will cause it to grow againe speedily.

CHAP. II.

Carduus mollis Cirsium dictus. The soft Melancholy Thistle.

OF this Thistle there is much varietie, some growing in medowes, some on mountaines, some with broad leaves others with narrow, some greater others smaller as you shall finde them here expressed.

1. *Cirsium maximum montanum.* The greatest mountaine *Cirsium* or Melancholy Thistle.

This great mountaine *Cirsium* hath divers large whitish greene leaves lying on the ground, somewhat broad and long, pointed at the ends, as also dented about the edges or as it were a little jagged, set about with small short prickles: among the which the stalkes that rise up being great hoary and straked or crested are three or foure foote high, bearing sundry such like leaves but lesse up almost unto the toppe, where upon long and naked stalkes stand gentle prickly, scaly whitish greene heads, nothing so great as the largenesse of the plant might promise, from the middle whereof thrust forth divers small purplish threds as is usuall in most Thistles, which when they are past the head openeth being full of downe, having very small whitish seede, even smaller then in any other Thistle almost lying therein, which are carried away together with the winde: the roote is composed of many whitish great tuberous long clogs, like unto those of the Asphodill which abideth all winters, with a few greene leaves at the head thereof.

2. *Cirsium majus latifolium.* The great soft Melancholy Thistle with broad leaves.

This great Melancholy Thistle hath large and long leaves, larger and broader then those of Borage, dented and set with soft prickles about the edges, the stalke which is tender brittle or easie to breake and cornered, hath such like large leaves thereon as the lower are, but somewhat more rent or torne on the edges, branched towards the toppe, and bearing on each of them from among a tuft of small prickly leaves a small prickley Thistle-like head, out of which spring many purple threads which passe into downe: the roote is small and long with divers fibres annexed to it.

3. *Cirsium aliud montanum.* Another soft Melancholy Thistle.

This other Melancholy Thistle riseth up with divers stalkes about a foote high, winged as it were or set with filmes from the bottome, and leaves growing thereon which are somewhat like the first, but narrower dented about the edges set with prickes, and of a pale or blewish greene colour at the toppes of the stalkes upon long naked stemmes stand small, scaly, prickly, single heads, with purple thrums or threads in the middle, which when they passe into downe hang downe their heads, and conteine within them larger, shining, and browner seede then the formost that fall downe or are blowen away into the winde: the root is composed of many long strings, of the thickneſe of ones finger, which shooteth forth heads for encrease at the toppe on all sides, whereby it lasteth long.

4. *Circium Anglicum primum.* The first *English Cirsium*.

The former of these *English* Thistles riseth up with a tender single hoary greene stalke bearing thereon foure or five long hoary green leaves dented about the edges, the points whereof are little or nothing prickly & at the top, usually but one head, yet sometimes from the bosome of the uppermost leafe there shooteth forth another smaller head which are scaly and somewhat prickly, with many reddish purple thrums or threads in the middle, which being gathered fresh will keepe the colour a long time, and standing on the stalke fadeth not in a long time

2. *Cirsium majus latifolium.*
The great soft Melancholy Thistle.

3. *Cirsium aliud montanum:*
Another soft Melancholy Thistle.

4. *Cirsium Anglicum primum.*
The first English Cirsium.

5. *Cirsium aliud Anglicum.*
The other English Cirsium.

time while it perfecteth the ſeede, which is of a meane bigneſſe lying in the downe: the roote hath many long ſtrings faſtned to the head or upper part which is blackiſh and periſheth not.

5. *Cirſium aliud Anglicum.* The other *Engliſh Cirſium.*

This other *Engliſh Cirſium* is very like unto the former *Engliſh* kinde, whoſe leaves are as little prickly; but more hoary underneath and more greene above: the ſtalke alſo which is about two foote high beareth but one large ſcaly head with many purple threads and Thiſtle like ſeedes lying in downe: the roote is ſomewhat tuberous at the head, and blackiſh on the outſide with divers fibres thereat, and ſhooting forth long ſtrings which ſend forth heads for encreaſe.

6. *Cirſium anguſtifolium Germanicum.*
Narrow leafed *Cirſium* of *Germany.*

This *Cirſium* hath divers long and narrow darke greene leaves lying on the ground, dented and ſet with a few prickes, the ſtalke riſeth to be two foote high, ſet from leafe to leafe with ſharpe filmes which make the ſtalke ſeeme winged, having ſhorter leaves, more prickly and more divided on them then thoſe below, branched into many parts, each bearing naked long ſtems and ſingle ſmall heads at the toppes which are prickly like the reſt, and have purpliſh red threads in the middle of them as the others.

7. *Cirſium montanum capitulis compactis.*
Mountaine *Cirſium* with tufted heads.

This mountaine *Cirſium* hath ſofter leaves then the former, and ſomewhat more cut in on the edges, being long and ſomewhat narrow, and ſet with ſmall prickles: the ſtalke riſing to be two or three cubits high hath divers the like leaves thereon but leſſer and leſſe divided, bearing at the toppe a tuft of many ſmall ſcaly and prickly heads ſet together with purpliſh red threads in the middle: the roote is made of many long ſtrings and abideth long.

7. *Cirſium montanum capitulis compactis.*
Mountaine *Cirſium* with tufted heads.

The Place.

The three firſt ſorts grow in thoſe fields that are on the mountaines in *Germany* in many places: the fourth and fift in many moiſt medowes of our owne Land as well in theſe Southerne as in the Northerne parts: the ſixt was found on the hill *Walſerfall* not farre from *Baſſil*: the laſt by *Mompelier* in the moiſt grounds neare the outer towne.

The Time.

All theſe Thiſtles flower about *July* and ſome in *Auguſt*, their ſeede ripeneth quickly after.

The Names.

It is called in Greeke κίρσιον and not κεῖσιον as divers ſuppoſe for it commeth from κίρσος i. *varices quos ſanet ut Dioſcorides refert*, the Latines alſo call it *Cirſium* and ſome *Spina mollis*. *Fuchſius*, *Ruellius*, and *Lonicerus* in their times thought that the great *Bugloſſum* was both in outward ſhew and inward qualities not much differing from it, but herein they were much miſtaken as *Matthiolus* obſerved and objected againſt them. *Lobel* ſuppoſeth that none of theſe come ſo neare the deſcription of *Dioſcorides* his *Cirſium* as the third ſort here expreſſed. The firſt *Cluſius* maketh his firſt *Cirſium*, whereunto the former *Carduus bulboſus Monſpelienſium* was like, which *Bauhinus* calleth *Cirſium maximum Aſphodeli radice*: the ſecond is the firſt *Cirſium* of *Dodonæus*, as *Lugdunenſis* ſetteth it downe from his *French* booke, and the third in his *Pemptades*, which *Bauhinus* calleth *Cirſium Latiſſimum*, making it another ſort, whereby he confoundeth the next which is my third together, which is the firſt *Cirſium* of *Dodonæus* in his *Pemptades*, and the third *Cirſium* of *Cluſius* which *Bauhinus* calleth *Cirſium ſingularibus capitulis parvis*: the fourth and fift are generally called *Cirſium Anglicum primum* and *alterum*, and of *Cluſius Cirſium Pannonicum primum pratenſe*, and *Cirſium Anglicum* or *Britannicum ſecundum*, the ſixt *Bauhinus* entituleth *Cirſium anguſtifolium*: the laſt is the *Cirſium* of *Matthiolus*, *Geſner in hortis*, *Lacuna*, *Lobel* and *Lugdunenſis*, and is the ſecond *Cirſium* of *Dodonæus* in his *Pemptades*, and the fourth of *Cluſius*, which *Bauhinus* calleth *Cirſium foliis non hirſutis floribus compactis*. The *Italians* call it *Cirſio*, and ſo doe all other nations, but with little varying termination, and becauſe I would have it beare an *Engliſh* name in ſome ſort anſwerable to the effects and uſe I have entituled it, The ſoft Melancholy Thiſtle.

The Vertues.

There are no other properties found out or knowne whereunto any of theſe Thiſtles may be applyed then ſuch which *Dioſcorides* ſetteth downe taken from *Andreas* (who brought in many figments and untruthes to bee uſed in Phyſicke) that the roote thereof being bound unto the veine in the legge or other parts of the body ſwollen with Melancholy blood doth quickly helpe and heale it.

CHAP.

CHAP. III.

Atractylis. The Distaffe Thistle.

THis *Atractylis* or Distaffe Thistle is accounted a wilde kinde of *Cnicus*. The sorts whereof I have set forth in this Booke here before, and the *Cardum Benedictus* Blessed Thistle in my former Booke accounted another sort of this *Atractylis*, which I shall not not neede to describe againe; the other sorts I shall shew you here.

1. *Atractylis flore luteo.* The yellow Distaffe Thistle.

This wilde bastard Saffron or Distaffe Thistle (for so it may by both names fitly be called) hath the lower leaves somewhat long and narrow, much cut in on the edges, very hairy, or as it were a little hoary, and not prickly while they are young, and before the stalke riseth, but then are harder and more prickly, and still the higher, the more sharpe set with prickles, which rising to be three or foure foote high, are rough, round, and branched, from the middle upwards, & hath at the top of every branch a few smaller, but more prickly leaves, under every prickly head, which from the middle of them shoote forth a few pale yellow threads, which are the flowers, and being past have in them divers blackish hard seeds somewhat bigger than those of the Garden *Cnicos* or bastard Saffron, and lesser than those of *Cnicus alter Clusij* lying in downe, but nothing so much as in it: the roote is whitish and wooddy, perishing every yeare after seede time: the leaves hereof before they grow hard and old being gently broken but not bruised, will yeeld a reddish or bloody juyce.

1. *Atractylis flore luteo.* The yellow Distaffe Thistle.

2. *Atractylis flore purpureo.* Purple Distaffe Thistle.

This Thistle differeth from the last in the flower, which is of a purplish red colour, and in the leaves that they are not hairy or hoary, and in the stalke that it riserh seldome so high, in all other things it is so like it, yea even in the bloudy juyce also, that one would say it were the very same.

3. *Atractylis purpurea Cypria.*
The purple Distaffe Thistle of *Cyprus*.

This Thistle that *Anguilara* setteth forth, and *Lugdunensis* after him hath leaves like unto the manured *Cnicus*, or bastard Saffron, but lesser and somewhat rugged or crumpled, from among which riseth up a stalke, bearing a Thistle-like head at the toppe, from whence spring slender branches, bare or without leaves, halfe a foote high or more, having on each of them a small prickly head, with a purple flower in the middle (like unto an *Avemone*, as they say, but how truly I cannot tell) but in other places enclining to yellow: the whole stalke and branches rise to a cubits height, and have white seede like unto *Cnicus* of bastard Saffron.

The Place.

Clusius saith he found the first in the corne fields of *Sevill* and *Corduba* in *Spaine*: the second and third grow in many countries, as about *Mompelier*, and *Narbone* in *France*, in *Italy*, *Greece*, *&c.* the last is said by *Anguilara* to be found in the Ile of *Cyprus*, and *Lugdunensis* saith it is also found in *France*, but somewhat differing in the colour of the flower.

The Time.

They flowēr towards the end of Summer, and the seede ripeneth in the end of *August*, yet the last doth flower and seede sooner than the other sorts.

The Names.

The Greekē call the manured kinde κνικος *Cnicus*, and so doe the Latines also, and *Cnecus* of some, it is thought ἀπὸ τῦ κνίζειν *quod mordere aut pungere significat*, *vel* ἀπὸ τῦ κνήσμε *quod pungendo pruriginem excitat quod de sylvestri potius quam de satvo*, *dici potest*; or rather from the colour of the flowers, *Cum* κνικος *exponatur crocens vel rutilus*: the *Arabians* call it *Kartam*, from whence the names *Carthamus* is deduced, whereby it is knowne in the Apothecaries shoppes, hereof there is two principall kinds, the manured or tame, and the wilde, as *Dioscorides*, *Theophrastus*. and *Pliny*, from them doe set downe; of the wilde kinde there are two sorts recorded by *Theophrastus*. and *Pliny* from him, the former more upright, and like unto the manured kinde, which of divers is taken to be *Atractylis*, the other trailing on the ground, and more like a Sowthistle, which of all in generall is taken to be our *Cardaus benedictus*, unto the former *Theophrastus* giveth a blacke and a greater fruit, and more bitter than the other: but *Pliny* unto his former giveth a white great and bitter seede, which because that *Pliny* saith the former *Cnicus sylvestris* was called *Atractylis*, hath bred much controversie among many worthy Writers, some affirming the *Cnicus sylvestris prior* to be *Atractylis*, and others refusing that opinion, because that *Theophrastus* speaketh distinctly of them both in severall places: but notwithstanding, that allegation, which is the same that *Matthiolus* useth, who so shall heedfully observe the said places in *Theophrastus* (*Guilandinus* in *Papyro*, giving this note, that there are many things twise spoken of in him, by sundry names) shall certainely finde that the *Atractylis* here set downe, both is the same *Atractylis* with him and *Dioscorides*, and the *Cnicus sylvestris prior* of *Theophrastus*, and *Pliny* notwithstanding, the divers relation of the seede, as is shewed before: for there never could be heard of any that could shew any *Cnicus sylvestris* with a white seede; and our *Atractylis* doth so fitly answer in all

all things thereunto, the ſeede being blacke and bitter alſo that none can doe more, as alſo in that property peculiar to *Atractylis*, as *Theophraſtus* recordeth, which yeeldeth a bloudy juyce as ours doe, and therefore, as he ſaith, was called φόνῳ cruor, and is taken from the leaves, not by bruiſing and wringing out the juyce, as the juyce of other herbes are taken, but droppeth out of the veines of the leaves of it owne accord, being broken off and laid in any thing to receive it, in the ſame manner as I have ſhewed you here before the juyce of Aloes is prepared, and that I may enforme you throughly how to doe it, the time is chiefely to be regarded, that is, while the leaves are young, or before they grow hard and ſapleſſe upon the ſtalkes when they are old; for both leaves, ſtalkes, and the young heads being broken off will yeeld that red or bloody juyce. The *Atractylis* is in ſome copies of *Dioſcorides*, as *Matthiolus* ſheweth, called *Cnicus ſylveſtris*, and derived from ἄτρακτος, *id eſt fuſus*, whereupon *Gaza* tranſlateth it *Fuſus agreſtis*, the dried ſtalke whereof, as *Dioſcorides* ſaith, the women in ancient times uſed in ſtead of a Rocke or Diſtaffe, yet *Columna* thinketh it tooke the name from the head, which being ſtored, as he ſaith, with hoary downe, the reſt of the ſtalke underneath being bare reſembleth a Rocke or Diſtaffe with wooll upon it, and thereupon ſome called it alſo *Colus ruſtica*, howſoever *Matthiolus* thinketh, that the diverſitie of theſe names ſhould certainely demonſtrate two ſeverall plants, for you ſee they are indifferently uſed, and ſo called by the ancient Authors themſelves, *viz.* either for a Rocke or Diſtaffe, or for a Spindle. The firſt here ſet downe, is called by *Cluſius Cnicus alter*, becauſe, as he ſaith, it is ſo like the firſt *Cnicus* called *ſativus*, and from him *Camerarius*, *Lobel*, *Lugdunenſis* and others doe ſo call it, or *Cnicus cæruleus*: the ſecond and third is called *Atractylis lutea & purpurea* by many Authors, but *Bauhinus* in ſtriving to ſhew a *Cnicus ſylveſtis* differing from *Atractylis*, hath in my opinion erred much: for as I ſaid before, the moſt judicious of our times can finde no other *Cnicus ſylveſtris*, but the *Atractylis* which he doth not ſo acknowledge, but maketh the *Atractylis* of *Matthiolus* (whom *Caſtor Durantes*, *Lacuna*, *Lugdunenſis* and *Gerard* do follow, exhibiting the ſame figure of his, which is acknowledged by *Camerarius* to be a falſe one) to be the true *Atractylis*, which *Matthiolus* himſelfe did not ſo acknowledge, becauſe, as he ſaid, it wanted the true propertie of *Atractylis* to yeeld a bloody juyce, and moreover confoundeth the *Carlina ſylveſtris* of *Cluſius*, with the *Carduus vulgatiſſimus viarum* of *Lobel*, and his *Cirſium luteum Sequanorum*, and maketh the *Acarna* of *Lugdunenſis*, and the *Scolymus Plinij* of *Dodonæus* to be the ſame *Atractylis* of *Tragus*, *Fuchſius*, *Cordus*, *Geſner* and others, which he would rather call *Cnicus ſylveſtris ſpinoſior* than *Atractylis*, as alſo making the *Atractylis* of *Columna*, to be a differing herbe from that of thoſe former Authors, when as his deſcription and notes thereof ſhew it to be the ſame and no other. *Bauhinus* againe maketh the *Atractylis Cypria* of *Anguillara* and *Lugdunenſis* to be the ſame *Atractylis flore purpureo* of *Lobel*, *Dodonæus*, and *Lugdunenſis*, when as they plainely diſtinguiſh them; and laſtly, he maketh the *Chalochierni* of *Honorius Bellus* mentioned in the firſt Epiſtle he wrote to *Cluſius*, to be a differing plant from *Atractylis vulgaris*, when as *Cluſius* himſelfe ſaith that ſaw it growing with him that it was like the ordinary *Atractylis*. It may be called in *Engliſh*, either wilde baſtard Saffron, as referring it to *Cnicus* or Diſtaffe Thiſtle unto the *Atractylis*.

The Vertues.

The *Atractylis*, as *Galen* ſaith, is of a drying faculty, and moderately digeſting. *Dioſcorides* ſaith that they ſhall feele no paines of the ſtinging of the Scorpion for ſo long as it is held by them, but that the paines returne as ſoone as they lay it by. *Pliny* ſaith that it helpeth greatly againſt the venome of all creatures, as alſo againſt the harme that commeth by eating Muſhromes: I finde no propertie expreſſed of the other baſtard Saffron of *Cluſius*. The properties of the *Spaniſh* Saffron or garden baſtard Saffron called *Cnicus*, is briefely ſet downe in my former booke: but becauſe I was therein more ſhort than was convenient or expected, I thinke good to ſet downe the vertues thereof in this place ſomewhat more amply. *Galen* ſaith little of it, the ſeede onely, ſaith he, is uſed onely for purgations, and is hot in the third degree being outwardly applied: but *Meſues* ſpeaketh more largely thereof in this manner: it is hot in the firſt degree, and dry in the ſecond; the pulpe or kernell of the ſeede is chiefely uſed, yet the flower is not unprofitable, which being taken inwardly purgeth flegme and water by vomit, and ſo doth it alſo being uſed in a gliſter, which therefore is profitable againſt thoſe diſeaſes are bred thereof, as alſo the collicke and the like: it cleanſeth the ſtomacke and lungs of tough flegme ſticking therein, eſpecially being made into an Electuary or Lohoc, with the oyle drawne from the ſeede, which alſo maketh the voyce cleare that was hoarſe, as alſo encreaſeth the ſperme, if be much uſed, but it is of evill nouriſhment, very hurtfull to the ſtomacke, and procureth loathing and trouble thereunto, he therefore adviſeth to uſe ſtomachicall helpes, as Aniſeede, and Galanga or Maſticke if needebe, or of thoſe that are more forcible, that is, *Cardamomes*, Ginger, and *Salgemme*, which quicken his operation, and preſerve the inward parts from harme: the flowers thereof taken with ſweete wine helpeth the jaundiſe, for it cleanſeth and openeth, yet in a meaner degree than the milkie herbes, (which I underſtand to be the Tithymales) the Lohoc that *Meſues* ſo much commendeth againſt the defects of the cheſt and lungs is made in this manner. Take three drammes of the inner kernells of the ſeede of *Cnicus* or *Carthamus*, one dramme of Allmonds, and halfe a dramme of Pineapple kernells, theſe being made into an Electuary with honey, wherein the dried ſcales of Scylla have beene boyled is admirable good for the ſaid purpoſes. This note is given alſo of the ſeedes hereof, that thoſe that come out of the *Levant* countries are more quicke in purging, and more powerfull in operation than thoſe of theſe neerer parts.

CHAP. IIII.

Acarna. The Fiſh Thiſtle.

BEcauſe this Thiſtle is ſaid to be ſo like unto the *Atractylis* and *Cnicus* that it might bee the ſame, onely differing in the colour of the leafe and juyce, I thinke it not amiſſe to joyne it next thereunto: but becauſe the ancient Writers thereof, which are *Theophraſtus* and *Pliny* have beene very briefe in the deſcription thereof, or rather have given none at all, or but by compariſon, the moderne authors have referred divers Thiſtles thereunto as every ones opinion led them, of all which it is not amiſſe to ſpeak in this Chapter, and withall to ſhew you which of them is held to come neereſt unto that of the ancients.

Acarna

1. *Acarna flore luteo patulo.* The fish Thistle with a broad yellow flower.

This first Thistle hath many leaves lying in a compasse upon the ground, smaller, narrower, harder and more prickly then either *Cnicus* or *Atractilis* of a yellowish greene colour on the upper side and grayish underneath, whose prickes are small and yellow, and when the stalke being one or more riseth up are set thereon on all sides up to the toppe without order, where it brancheth forth into two or three parts bearing small prickly heads, from whence come forth the flowers composed of many small leaves of a yellow colour standing as a pale or border about a more yellow thrum, in forme of an After or Starrewort, which when they are past the seede being small and grayish is found wrapped in downe: the roote is about a foote long of a fingers thickenesse, and of a whitish colour with divers fibres growing thereat, smelling sweet and yelding also a white milke sweet in taste and viscous or clammy quickly growing thicke.

2. *Acarna flore purpureo rubente patulo.* The fish Thistle with broad reddish flowers.

This small Thistle hath shorter and broader leaves then the former dented or cut in on the edges, and set with small sharpe prickes greene on the upper side and grayish underneath: the stalke riseth nothing so high as the former, bearing smaller leaves thereon but not lesse prickly and such like heads and flowers at the toppes as in the other but that the pale or border of leaves are not yellow but reddish set about a middle yellow thrumme.

3. *Acarna altera Apula.* The Neapolitane Fish Thistle.

This Neapolitane Thistles lowest leaves are spread on the ground somewhat like unto the *Atractylis* or distaffe Thistle, but broader and set with more and sharper prickes, from the middle of whom rise up divers somewhat reddish stalkes about a cubit high, having such like leaves set thereon which yeeld a white milke like the last, and bearing at the tops (not severall heads like the last but) a tuft or umbell of many small prickly heads set together, somewhat like nnto the toppes of the blacke Chamæleon Thistle, and out of them rise small leaves as beards of a deepe yellow colour set about a middle thrum, of a paler yellow colour, the milkie juice that this giveth being condensate and made thicke is like unto Gum.

4. *Acarna globosis capitulis.* Round headed fish Thistle.

This Globe Thistle is a small plant about a foot high shooting forth from the head of the roote which is long and small many leaves some of an inch or more, or two inches long, and scarse halfe an inch broad, much cut in on the edges, and thicke set with prickes, growing round about the stalke without order, at the toppe whereof is set a round head, netted as it were all over, and composed of many very small ond narrow leaves, armed on both sides with long sharpe prickes, out of whose middle starteth forth a small yellow flower, from the toppe of which stalke springeth forth sometimes two other stalkes, bearing each of them a round head like the other but lesser: the whole beauty of the plant consisteth in those round heads formed like a net.

5. *Acarna humilis caule folioso.* The low fish Thistle with winged stalkes.

The stalke of this low thistle is winged from the bottome to the toppe that is having a jagged prickly filme set on both sides thereof, and long narrow jagged prickly leaves two set at a joynt, from whence it branches forth in divers places unto the toppe, and bearing thereon shining yellow flowers like those of *Cnicus* or *Atractylis* ri-

1. *Acarna flore luteo patulo.*
The Fish Thistle with a broad yellow flower.

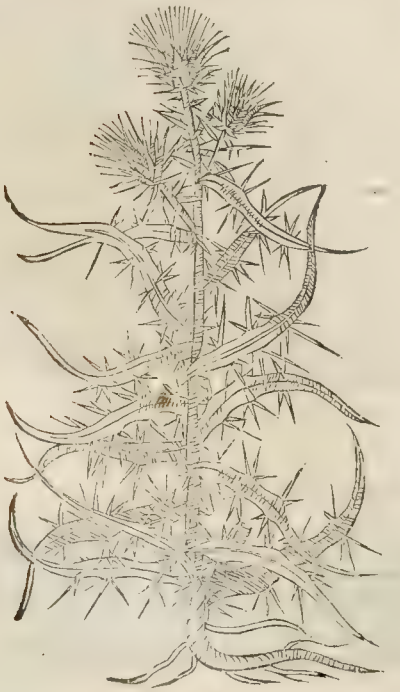
3. *Acarna altera Apula.*
The Neapolitane Fish Thistle.

sing

5. *Acarna humilis caule foliofo.*
The lower Fifth Thistle with winged ſtalkes.

6. *Acarna major caule folioſo.*
Cluſius his *Chamæleon* Thiſtle of *Salamanca*.

7. *Acarna major caule nonfolioſo.*
The ſuppoſed true *Acarna* of *Theophraſtus*.



8. *Acarna minor caule non folioſo, ſive Leo Cardnus ferox.*
The cruell ſharpe Thiſtle.

ſing out of long prickly heads, with ſuch like leaves under them: the ſeede that followeth is ſmall and blackiſh, but like unto the Atractylis or baſtard Saffron: the roote alſo is not much unlike it periſhing every yeare.

6. *Acarna major folioſo caule.* *Cluſius* his Chamæleon Thiſtle of *Salamanca*.

The ſtalke of this Thiſtle likewiſe is winged like the laſt but not with ſo large a filme nor ſo much jagged, from whence ſhoot forth branches on all ſides with longer and narrower leaves thereon, ſomewhat hoary and not ſo deepely jagged, but ſet with long & ſharpe prickles, at the tops of the branches ſtand many ſuch like ſharpe prickly leaves, from among which riſe five or ſix ſmall prickly heads as it were in a tuft ſet together, out of which come pale purpliſh flowers conſiſting of threads, in which after they are paſt lye the ſeede wrapped in downe, in forme like unto the *Cnicus* or baſtard Saffron but ſmaller and of a blackiſh gray colour.

7. *Acarna major caule non folioſo.* The ſuppoſed true *Acarna* of *Theophraſtus*.

The true *Acarna* of *Theophraſtus* as it is ſuppoſed by divers, hath ſundry leaves lying on the ground in a compaſſe, which begin to wither as ſoone as they riſe up with the ſtalke, being ſometimes but one, and ſometimes more, reddiſh and covered with downe, the leaves that are ſet thereon without order are long and narrow, and deepely endented, hoary or white underneath, thicke ſet with ſhort prickes very like unto the upper leaves of *Atractylis* or Diſtaffe Thiſtle, whoſe toppes are ſet with ſuch like leaves alſo, and very pale yellow flowers made of threads, riſing out of the midſt of ſmall prickly heads, after which come ſmall ſlender ſeede of the faſhion of *Cnicus*: the roote is ſmall ſhort and white, with divers fibres thereat.

8. *Acarna minor caule non folioſo ſive Leo & Carduus ferox.* The cruell ſharpe Thiſtle.

This cruell prickly Thiſtle that is almoſt wholly compoſed of ſharp pricks, groweth little above an hand breadth high, whoſe leaves are long and narrow, thicke ſet with moſt cruell ſharpe prickes on all ſides, at the toppes ſtand yellow thrummy flowers in ſharpe prickly heads, ſo ſtrongly armed that the moſt cautelous cannot touch it without being pricked: the roote is long and ſtringie.

The Place.

The firſt groweth in *Spaine* as *Cluſius* ſaith: the ſecond and third in the kingdome of *Naples*: the fourth in *Spaine* from whence *Guilaume Boel* brought it, & ſhewed it us as well as *Cluſius* who doth remember both him & it in the 66. page of his *Curæ Poſteriores*: the fift *Lobel* ſaith groweth in the countrey of *Crau* among thoſe of *Salon* in the Provence of *France*: the ſixt as *Cluſius* ſaith about *Salamanca* in *Spaine*: the ſeaventh on the heath grounds among the *Sequanis* as *Lobel* ſaith, and the laſt on the *Appennine* hills, and in ſome places of *Italy*.

The Time.

Some of theſe Thiſtles flower very late with us ſo that there is ſeldome ripe ſeede to be gathered from them, others flower and ſeede in *July* and *Auguſt*.

The Names.

It is called in Greeke ἄκαρνα and ἄκανα and ſo likewiſe *Acarna* and *Acorna* in Latine, reckoned by *Theophraſtus* and *Pliny* to be a ſpecies of *Cnicus* or *Atractylis* becauſe it is ſo like that it might be ſaid to be the ſame but, that the *Atractylis* is whiter and this more browne or yellow, and that it giveth not a blooddy juice which is proper onely to *Atractylis*. The firſt here ſet downe is thought to be *Eryngium Archigenis* which hath the leafe of *Atractylis*, and the yellow flower of *Buphthalmum*. with *Cluſius* and *Dodonæus* it is *Carlina ſylveſtris minor*, with *Lobel Acarna ſive Sequanorum Cirſij Carlinæue varietas*, with *Lugdunenſis Acarnæ ſimilis Carlina ſylveſtris minor*, and with *Bauhinus Acarna flore luteo patulo*: the ſecond is called by *Columna Acanthoides parva Apula*, and by *Bauhinus Acarna flore purpureo rubente patulo*: the third is called by *Columna Acarna altera Apula*, and by *Bauhinus Acarna capitulis parvis luteis in umbella*: the fourth *Cluſius* ſetteth forth in the 66. page of his *Curæ poſteriores*, by the name of *Carlinæ aliud genus*, but called by *Bauhinus Acarna capitulis globoſis*: the fift is called by *Lobel Picnomos Cretæ Salonenſis Galloprovinciæ*, by *Lugdunenſis* it is called in his Chapter of *Atractylis*, *Atractylis marina Picnocomon Penæ*, but in the Chapter of *Chamæleon* he giveth another figure with the ſame title of *Picnomos Cretæ Salonenſis Penæ*, accounting it there to be a kinde of *Chamæleon niger* as *Lobel* and *Pena* themſelves ſay it may beſt bee referred unto, yet *Bauhinus* maketh thereof no mention among the *Chamæleons* but in the *Scolymus Theophraſti*, by *Tabermontanus* and *Gerard Chamæleon niger*, and by *Bauhinus Acarna humilis caule folioſo*: the ſixt is the *Chamæleon niger Salmanticenſis* of *Cluſius*, *Dodonæus* and *Gerard* who follow him, by *Tabermontanus Chamæleon hiſpanica*, and by *Bauhinus Acarna major caule folioſo*: the ſeaventh is the *Acarna Theophraſti* of *Anguilara*, *Lobel*, *Lugdunenſis* and *Tabermontanus*, called *Cirſium luteum Sequanorum* as *Pena* ſaith, and *Eriſithales* of *Anguilara*, and is the moſt likely to be the true *Acarna* of *Theophraſtus* and *Pliny*, as by all theſe mens judgements doth appeare, and called by *Bauhinus Acarna major caule non folioſo*: the laſt is called by *Dodonæus Leo Carduus ferox*, and by *Lobel Phœnix Leo Carduus ferox*, and by *Bauhinus Acarna minor caule non folioſo*.

The Vertues.

The Vertues of *Acarna* either of the one or of the other are not ſet downe by any that have made experience of them, but as they are in forme neareſt unto *Atractylis*, ſo they may be in qualities alſo, unto it therefore it may be referred untill more certaine proofe hath beene declared of them.

CHAP. V.

Chamælion & Carlina. The Camæleon or changeable Thiſtle, and the Carline Thiſtle.

THe Chamæleon Thiſtle is divided by the ancient writers into white and blacke, both which I intend to ſhew you in this Chapter but the true knowledge of them and their right diſtinctions hath troubled many, as alſo whether the Carline Thiſtle be a different plant from the white Chamæleon Thiſtle.

1. *Chamæleo albus verus acaulis.* The true Chamæleon or changeable Thiſtle without a ſtalke.

The true Chamæleon or changeable Thiſtle without a ſtalke (which differeth from the Carline Thiſtle without a ſtalke as you ſhall heare by and by) hath ſundry large leaves lying on the ground a foote long or more cut in on the edges and more prickly then the Carline Thiſtle, whoſe cuts or diviſions are more like unto thoſe of the Artichoke

Artichoke, being white and as it were hoary and ſometimes greene, and reddiſh when they grow old, which varietie (as *Dioſcorides* ſaith was the cauſe of the name) would make many to beleeve they were differing plants and ſomewhat hairy underneath: among theſe leaves riſeth a round hoary prickly head without any ſtalke, of the bigneſſe of a great Thiſtle head in which the flower is conteined, and is not compoſed of a border of leaves with a middle thrum as the Carline Thiſtle hath, but out of the head riſe divers flowers made of threds, every one ending in five parts or points, in the ſame manner as is to bee ſeene in the flower of the Artichoke, whereunto it is moſt like, but not of ſuch a purpliſh blew, but rather of a pale reddiſh colour which withering, there groweth in the head ſmall long and grayiſh ſhining ſeede, lying as it were at the foote of every flower as is uſuall in moſt Thiſtles, but are not thicke and round or cornered as *Cnicus* the baſtard Saffron ſeede, and many other Thiſtles ſeede are, which when they are ripe the head openeth it ſelfe as other Thiſtles doe, and they together with the downe are carried away with the winde: the roote is ſomewhat thicke and long, reddiſh or browniſh on the outſide and white within, yeelding plentie of milke if it be never ſo little broken or cut, which becauſe it is very thicke and viſcous hardeneth quickly and falleth into ſmall droppes or peeces, of a ſtrong but aromaticall ſent not unpleaſant, and quickly pierſing the ſenſes, whoſe taſte is ſweete and fit to be eaten: about the leaves and prickly heads alſo hereof, is ſometimes and in ſome places found a certaine peece of gumme ſticking, which at the firſt is ſoft and glewiſh, and being dryed is harder like unto the milkie gumme of the roote.

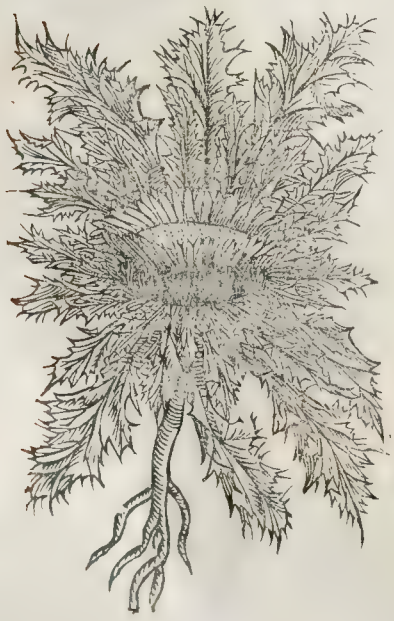
2. *Carlina humilis acaulis.* The low Carline Thiſtle.

The low Carline Thiſtle (which is uſually accounted for the white Chamæleon Thiſtle) hath many long and large leaves lying on the ground cut in on both ſides, and ſet with ſharpe prickles, but not cut in ſo deepe nor ſo ſharpe as the former or true white Chamæleon Thiſtle, among which riſeth a large head without any ſtalke, compaſſed about with divers long and narrow leaves, cut in on the edges and as prickly as the undermoſt, and both of a whitiſh greene colour not varying as in the former, the head hath a number of whitiſh not purpliſh leaves unleſſe it be a little purpliſh underneath, ſet about with leaves like a crowne or border as in the corne Marigold and many other the like flowers, which leaves are thinne ſomewhat long hard ſmooth and ſhining, the umbone or middle thrumme being flat and made of many ſmall and thicke yellow flowers like threads: this hath in ſome places a kind of viſcous or glewiſh gum iſſuing from the roote as alſo about the Thiſtly head which being hardned reſembleth white Maſtick very notably; the head before it ſeedeth openeth in the day and cloſeth at the night.

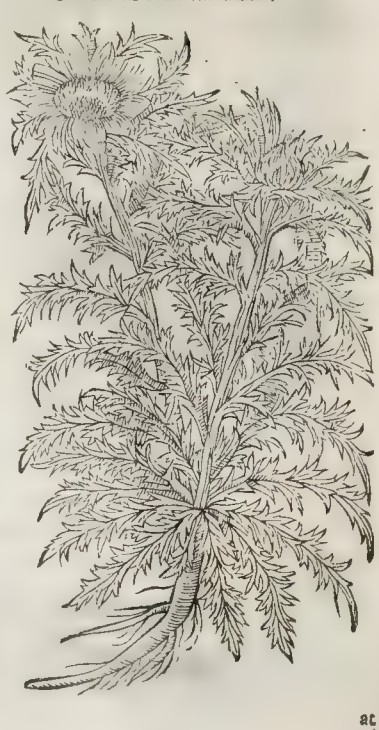
3. *Carlina caulescens.* The Carline Thiſtle with a ſtalke.

This Carline Thiſtle never flowreth low like the laſt, but beareth a reddiſh ſtalke about a foote high, and thereon narrower greener and more prickly leaves then the low kinde, the heads of flowers at the toppe of the ſtalke are many, every one ſtanding on his owne footeſtalke, compoſed of a border of ſmaller leaves being hard, thin, ſmooth and whitiſh like the former, whoſe middle thrumme is yellowiſh before the flowers therein begin to open but then are of a reddiſh purple colour, which thing unleſſe one heede it well hee may thinke them divers plants: the roote is blackiſh on the outſide, but whitiſh within, and as it were biſten off, which being cut or broken yeeldeth ſuch like thicke white viſcous milke, and hardneth into a gumme as in the former, but of no ſent

2. *Carlina humilis.* The low Carline Thiſtle.



3. *Carlina caulescens.* The Carline Thiſtle with a ſtalke.



at

at all, yet a little ſweete in taſte, whereupon (ſaith mine author) we may jndge it to bee of the ſame kind but not the ſame plant.

4. *Carlina acaulis Septentrionalium.* Our low wilde Cerline Thiſtle.

This low thiſtle doth yearely ſend forth divers very long and narrow leaves very much cut in on the edges into many parts, ſet with ſmall prickes and of a duſtie greene colour, not lying flat upon the ground but a little raiſed

4. Carlina acaulis Septentrionalium.
Our low wilde Carline Thiſtle.

5. Carlina ſylveſtris major.
The greater Carline Thiſtle.

6. Carduus Pinea ſive Ixine Theophraſti.
The Pine apple Thiſtle.

Cardui Pineæ capitulum.
The head of the Pine apple Thiſtle.

up from it, among which at the latter end of Sommer commeth forth a short stalke scarse two inches long, bearing thereon a large round scaly and prickly head with many bright purplish threads rising out of the middle, which abide in their colour a long time, and being past among the downe in the head lye many small whitish or silver coloured seede, somewhat like unto the first Chamæleon Thistle but shorter and smaller: the roote is great thick and blackish on the outside and whitish within enduring many yeares.

5. Carsina sylvestris major.

The great wilde Carline Thistle.

This wilde Carline Thistle hath sundry slender round but prickly stalks rising from a small long roote, bearing divers narrow long leaves thereon very prickly and somewhat like unto the former Carline Thistle, but lesser, and at the tops of each a flower, whose bordering leaves are yellow and the thrumme reddish.

6. Cardus pineas seu Ixine Theophrasti.

The Pine Thistle.

This brave Thistle hath a long thicke blackish yellow roote, of the thickenese of ones thumbe, growing smaller downe to the end, but white within, smelling sweete and tasting hot, somewhat like the Carline Thistle, but of a weaker and pleasanter smell: the many leaves that rise from thence are long and of a fingers breadth, with a middle rib therein, somewhat like to the leaves of Cyperus, but harder whiter and broader, without either dents, incisure or prickles; in the middle of which leaves lyeth hid a prickley head, armed fully with long prickes or thornes in manner of crosser, which growing ripe hath within it a hard white flockie substance, wherein as also from among the thornes without on the head, issueth forth a yellowish sweet gumme much like unto Mastick of a hot taste. *Alpinus* saith that both *Belius* and *Bellonius* & *Dalechampius* likewise took this thistle to be *Chamæleo albus*, but untruly, for *Theophrastus* maketh mentiō of *Chamæleo albus* in another place: but saith *Alpinus Chamæleo albus* differeth not from *Chamæleo niger* but onely in the colour of the leafe & therefore (saith he) I doubt not to affirme that the *Carlina* having blacker leaves then *Chamæleon albus* which hath white leaves as the *Chamæleon niger*, but *Theophrastus* putteth not any such difference in the leaves to be blacker or whiter, for that hee referreth to the rootes, and the leaves of the white *Chamæleon* to bee greater and the blacke smaller then those of *Scolymus*, and such distinction in the leaves *Dioscorides* also maketh, set in the wing them differences more amply there *Theophrastus* saith, that the white Chamæleon hath no stalke, and the blacke a stalke of a cubit high, the white hath purplish flowers and the blackē variable coloured flowers, and like a Jacinth, which by *Alpinus* his leave are not to be seene in *Carlina*.

7. Chamæleon niger verus.

The true blacke Chamælion Thistle.

7. Chamæleon niger verus. The true blacke Chamæleon Thistle.

The blacke Chamæleon Thistle hath many long leaves lying about the roote, much thinner and lesse prickly then the white Chamæleon Thistle, much cut in also on the edges into many fine parts or jagges, which as the stalke that riseth up among them are sometimes greene, and sometimes whitish, and sometimes reddish, which brancheth forth on all sides, and beareth at the toppes of them many small prickly heads in a tuft together, somewhat scaly, out of which come divers small long blew flowers, ending in five and sometimes in six sharpe prickly points or ends, somewhat like unto those of the Orientall Iacinth, with five or six white threads in the middle of them: the roote groweth great and thicke at the head ending in many great long strings, and is of a blackish colour on the outside and pale yellow within, of a most sharpe taste as the leaves are also, procuring itching, burning pimples, and almost exulcerating the skinne if the face or other tender part be touched therewith, or if the hands that have handled it doe touch the face as *Bellonius* hath observed.

The Place.

The first is not so frequently found in these Westerne or transalpine countries as the second which is usually found upon the hills and mountaines in many places of *Germany*, and the *Alpes*, where it is generally taken to bee the Chamæleon Thistle, though called the Carline Thistle; but the true Chamæleon Thistle is more frequent in *Italy*, *Greece*, and those parts where the Carline is more rare: the third is oftentimes found in the same places with the second and oftentimes by it selfe and in other countries also: and this wee have observed also that from the seede of the low kind sowen in our gardens sometimes it hath growen high and not abidden low: the fourth is as frequent in our countrey, especially in *Kent* every where almost, as the former are in others, and is also found in *Germany* and *France*, especially the more Northerly parts: the fift also many times with us, but the sixt onely in the warmer countries: the last is found but in *Greece* and *Asia* and those hotter countries.

The Time.

All these doe flower late in the yeare with us but in Sommer in their naturall places, but the Carline Thistle will well abide the cold of our climate, although the white Chamæleon will hardly, but the blacke and the Pine Thistle seldome doe abide.

The Names.

The Chamæleon Thistles both the white and the blacke are called in Greeke χαμαιλεων λευκος & μελας, and in Latine *Chamæleon* or *Chamæleo albus & niger* (*Gaza* translateth them both *Vernilago*) and so called from the various appearance

appearance of the leaves, *Dioscorides* saith it of the white, but *Pliny* both of the white and blacke, the Carline Thistle is called in Latine *Carlina quasi Carolina*, for it is supposed that the great Emperour called *Charlemaine* had this herbe shewed him in his sleepe by an Angel, with the roote whereof he might cure his Army infected with the Plague: it is thought as I said of many to be the *Chamæleo albus*, but of others observing the differences, it is thought not to be knowne to the ancient writers. *Lugdunensis* striveth with many words, and by altering and correcting the Greeke text of *Dioscorides* to prove them both one plant, yet lastly hee saith that many skilfull Herbarists did call *Carlina Ixine Theophrasti*: and so doth *Fabius Columna* indeede judge, and that the *Ixine spina* of *Theophrastus* (mistermed *Helxine* by *Pliny*) which *Gaza* translateth *Cardans pinea* & *Ixia* also, better doth agree with our *Carlina* then with the *Chamæleon albus* of *Dioscorides*: and that because as it is likely hee never saw the true *Ixine* of *Theophrastus*, which is a much differing plant: but *Dioscorides* saith the white Chamæleon Thistle was called *Ixia* by some in his time, because in some places there grew about the roote a kinde of birdlime, which the women used in stead of Mastick, and *Pliny* saith the *Cretanes* especially tooke a little thereof after supper, to keepe them waking in working in the night, but being a by name I thinke it also a false name, for *Ixia* is said to be a deadly poyson by *Dioscorides* himselfe, who sheweth it with the remedies thereof, in his sixt booke and 21. Chapter, and the roote of the white Chamæleon is said by *Dioscorides* to be an *Alexipharmacum* or counterpoyson, so that it or any thing growing from it can no wayes be accounted deadly or dangerous: but that clammy gum or birdlime (call it what you will) indeede that groweth at the roote of the blacke Chamæleon is truly called *Ixia* and *Vlophonon*, that is, the corruption or corrupter of the blood, and *Pliny* in his 22. Booke and 18. Chapter doth say that the roote of the blacke Chamæleon was called *Vlophonon* and *Cynozolon* (mistaking *Dioscorides* his *Cynoxylon*) and as it is set downe in the divers appellations of herbes attributed to *Dioscorides*, the blacke Chamæleon also is called *Vlophonon* by some, and *Ixia* by others, and *Cynoxylon*. Some also have affirmed as *Matthiolus* sheweth in his comments upon the *Ixia* of *Dioscorides*, that *Ixia* should be the *Ixine* of *Theophrastus* whom he confuteth effectually; shewing that *Theophrastus* in discribing *Ixine* doth not declare any evill quality therein, but morethen so, he saith that it yeeldeth a *Lacryma* or Gum that is of a good taste, and called *Acanthine* or *Spinalis Mastiche* because it was so like Mastick, and grew on a Thorne or Thistle, and although as *Matthiolus* saith, he had not seene any Gum about the roote of *Ixine* (which hee mistooke for the white Chamæleon both in that and in other places) in *Italy*, yet saith that such was sent him both from *Cortusus* of *Padoa* and *Calzolarius* from *Verona*, and saith also that he understood by a *Candiot* Herbarist, that the Fletchers in *Candy* did use the said Gum to fasten Feathers to Arrowes as others doe with Glew; *Matthiolus* setteth forth the *Carlina caulescens* (as it is judged by the best) to bee the true *Chamæleo niger* of *Dioscorides* and *Theophrastus*, although himselfe findeth some defect therein and likewise impugneth that which *Maranta* sent him from *Naples*, as not answering the description thereof, which is now received by the most judicious to bee the indubitate blacke Chamæleon. *Columna* seemeth to thinke in the discourse of *Chamæleo albus* and *niger* that *Ixia* (and not *Ixine*) was a small low plant, more agreeing with the blacke then the white Chamæleon, especially seeing that *Dioscorides* in the end of his Preface to his sixt booke numbreth *Ixia* as well as Chamæleon among the roots that are venemous. The first here set downe is the *Chamæleo albus Apulus purpureo flore gummifer* of *Columna* differing from the usuall *Carlina* which is taken by many to be *Chamæleon albus* as is evident the by description, it is also the *Chamæleon albus gummit Mastix ferens* of *Henorius Bellus*, expressed in his first Epistle to *Clusius*: but *Bauhinus* calleth it *Carlina acaulis gummifera*, whereof I much marvaile that he should continue that opinion of *Chamæleo albus* and *Carlina* to be both but one plant, knowing that *Columna* shewed them plainely in his booke to be different, although that *Carlina* as well as *Chamæleo albus* giveth a like gum also: and that *Theophrastus* his *Ixine* hath such likewise which *Columna* as is sayd being deceived thought to be *Carlina*: the second is the *Carlina humilis* of *Columna*, taken by him to be the *Ixine* of *Theophrastus* as *Anguilara* did before him) and *Dodonæus*, and called by *Lobel Carlina herbariorum* (yet thought by him & *Clusius* to be the *Chamælon albus* of *Dioscorides* as *Guilandinus* in *Papyro* did thinke before) as also by *Matthiolus*, *Cordus* and *Lugdunensis*, by *Cæsalpinus Carlina vulgo*, and by *Gesner in hortis Cardopatium caule nullo*, by *Ericius Cordus Carduus panis seu pacis*, by *Camerarius Carlina sessili flore*, by *Dodonæus* in former times taken to be *Spina Arabica*, and by the Monkes that commented upon *Mesues Acanthe lence* of *Dioscorides*, and by *Bauhinus Carlina acaulos magno flore*: the third is the *Carlina caulescens* of *Columna* and *Camerarius* both in *hortis* and in Epitome by *Dodonæus Carlina sive Leucacantha*, by *Cæsalpinus Carlinæ alterum genus*, by *Clusius Carlina major & elatior*, by *Lugdunensis Carlina caulem habens*, and taketh it also to be *Crocodilion*, by *Gesner in hortis Cardopatium flore albo caulem habens*, and called by *Lobel Chamæleo albus cauledonatus*, but *Chamæleo niger* by *Lacuna*, *Matthiolus* and *Lugdunensis*, *Chamæleon niger vulgaris* by *Tragus* and *Besler* that set forth the *Hortus Eystetensis*, by *Brunfelsius* as *Bauhinus* saith in his *Matthiolus Eberwurtz* that is, *Apri radix* (and from hence came the name of *Carduus Suarius*) and *Cardopacis*, but in his *Pinax* he referreth this name of *Brunfelsius* unto the *Carlina acaulis*, so that it seemeth the *Germanes* call both sorts *Eberwurtz*, he himselfe calling it in his *Pinax Carlina caulescens magno flore*, and in his *Matthiolus*, *Carlina caule donatus*: the fourth is called *Chamæleon albus seu exiguus* by *Tragus* and *Lugdunensis*, and *parvus* by *Lonicerus*, by *Columna Chamæleon Septentrionalium exiguus appellatus*, by *Lobel Carduus acaulis Septentrionalium*, by *Clusius Carlina minor purpureo flore*, who saith that some were of opinion that it did not seeme unlike unto the Chamæleon of *Theophrastus* in his sixt Booke and third Chapter; and by *Bauhinus Carlina acaulis minor purpureo flore*: the fift is the *Carlina sylvestris vulgaris*, the first *Carlina sylvestris* of *Dodonæus*, and the *Acarna vel Cirsium luteum Sequanorum* of *Lobel*, *&c.* the fixt is set forth by *Alpinus* in his book *de plantis exoticis*, and called also by him as *Gaza* did *Carduus Pinea*, but is not, although somewhat like the *Iacea pinea* called *pumila Narbon* of *Lobel*: the last is called *Chamæleon niger Dioscoridis* by *Anguilara Maranthæ*, *Cortusus*, *Camerarius*, *Lobel* and *Columna*, and *Chamæleon niger alter* by *Matthiolus*, *Chamæleon niger verus Dalechampy* by *Lugdunensis*, but thought to be *Crocodilion* by *Tabermontanus*, and called by *Bauhinus Chamæleon niger umbellatus flore cæruleo hyacinthino*. The *Italians* call the white and blacke Chamæleon Thistle *Camæleon bianco* and *nero*, and the white more usually *Carlina*, the *Spaniards* call both sorts *Cardo pinto*, the *French* call the white *Charline* and *Chamæleon blanc*, but the blacke *Chardonnette*: the *Germanes* as is said before call all sorts *Eberwurtz* as the *Dutch* doe *Ebewortele*, and wee in *English* Chamæleon Thistle or Changeable Thistle, white or blacke, or as they are set downe in their titles, and the rest accordingly.

The Vertues.

The roote of the white *Chamæleon* Thistle, saith *Dioscorides*, taken to the quantitie of a spoonefull in red wine, wherein *Origanum* hath beene boyled killeth the broad wormes in the belly: a dramme thereof taken in wine helpeth dropsie persons, for it extenuates their belly: the decoction thereof is profitable for them that cannot make water orderly; *Theophrastus* and *Pliny* from him saith, that the root hereof cut into peeces & hung up on strings to drie, & afterwards boyled in broath, or otherwise taken doth help the defluxions of rheume that fall from the head the eyes, teeth, nose, or lungs. If any, saith he, would trie whether a sicke person should die or live, if he beare and endure three times washing with the decoction of the roote he shall not die: it is as a Treakle or an antidote against poison being drunke in wine, and from hence it is supposed that the *Carline* Thistle roote was used against the plague in the Emperour *Charles* his army (although it be suggested to be declared by an Angell, without an Allegory or allusion to the good Angell from due observation and practise, which hath since found it very effectuall both to resist the infection, as also very powerfull against the biting of a mad dogge, or the sting of Serpents, and yet *Dioscorides* saith, the roote of *Chamæleon albus* given to dogs, swine, or mise, killeth them, which propertie is also found in divers other things, as on the contrary side divers creatures do feede on these things that are poysonous to men. The blacke *Chamæleon* Thistle is said by *Dioscorides* to cure the itch, the roote being beaten and mixed with *Axungia* and so used, and being boiled in vinegar and some brimstone put to it killeth tetters, and ringwormes: it cleanseth the face and skinne from all blemishes, deformities, and discolouring being used with some brimstone: it is put with other things that doe digest and mollifie, and also with those that consume and eate the flesh, and therefore is used to helpe foule sores, and stincking ulcers; hereby you see he doth not appoint it to be used inwardly for any disease, by reason of the virulent qualitie therein, but onely alloweth of the decoction thereof to gargle the teeth in the extreme paines of them; or by the roote bruised and boyled in vinegar to helpe the tooth-ach and to breake them if they be touched therewith. Of our wilde Carline Thistle I have not know ne or heard of any that have made any experiment, although I am perswaded that it commeth neere to the qualities of the low Carline Thistle, that is so much commended, as you heard before: and of the gummes, either of the white *Chamæleon* or Carline Thistle, there is no other speciall propertie set downe by any than is declared before, that as it is called Masticke of the Thistle, so it is used as Masticke to chew in the mouth, both to amend the evill savour of the breath, and by reason of the glewing qualitie to stay rheume, and to strengthen loose teeth: for the juyce doth follow the propertie of the herbe or tree from whence it is taken: and although the gumme of the white *Chamæleon* be called *Ixia*, as *Dioscorides* saith, yet the *Ixia* that is poysonous is another thing quite differing from this, for neither *Dioscorides* nor *Theophrastus* doe attribute any venemous or evill qualitie thereunto. Of the qualities both of the white and blacke *Chamæleon Galen in* 8. *simplicium med.* saith thus: in the roote of the blacke *Chamæleon* Thistle, there is somewhat that is deadly, and therefore the use therof is outwardly for scabs, itches, tetters, &c. and to cleanse the skin: but the roote of the white *Chamæleon*, Thistle, besides that it killeth the broade-wormes in the body or belly; it is given also to those that have a dropsie, and is somewhat like in the temperature unto the blacke *Chamæleon*, but that it is more bitter than the white. *Paulus* and *Ætius* in their Treatises of poysons, after they have spoken of the poysons in both sorts of *Chamæleon* Thistle, and of their cures, doe entreate of the poysonous *Ixia* in the same manner that *Dioscorides* doth, wherefore we may conclude that *Ixia* hath a double interpretation, and doth as well signifie the harmelesse gummes of the white *Chamæleon* and *Carline* Thistles, as the poysonous gumme or roote which is deadly: but because we are not sure that it is taken from the blacke *Chamæleon* Thistle, I thinke it needlesse here to set downe the cure of it.

CHAP. VI.

Cactos Theophrasti, id est Scolymus Dioscoridis & Scolymus Theophrasti qui Eryngium luteum est.

The prickly or wilde Artichocke Thistle, and the golden Thistle.

OF all the sorts of manured Artichockes, whether prickly like Thistles, or not being fit to be eaten, I have sufficiently spoken in my former Booke; and intend not further to speake of them againe: but of some other kindes that are more prickly, and more like Thistles, whereof there are two or three sorts which shall be here expressed.

1. *Scolymus Dioscoridis.* The prickly or wilde Artichocke Thistle.

This prickly or wilde Artichock Thistle hath divers long thicke, hard, but narrow leaves, ending in long points somewhat cut in on the edges, set with strong and sharpe great prickes, which growing on the stalkes compasse them at the bottome, and are of a darke greene colour: at the toppe of each stalke and branch standeth one scaly and prickly head lesser than those of the *Chardons* that are kept to be eaten, from the middle whereof put forth divers bright purplish crimson threads, which after they have stood some time passe away, the seede in their heads being flat and like other Thistles: the roote is great and spreadeth much.

2. *Cynara sylvestris Cretica.* The *Candy* wilde Artichocke.

This wilde Artichoke from among the long and hoary white leaves somewhat broader than the former, cut in on the edges, and thicke armed with long & sharpe prickes, rise up sundry round stalkes, set with but few leaves, and branched into two or three parts some times, at the toppes bearing small scaly sharpe prickly heads, which are eaten by the Peasants of the countrey, both greene and boyled after the scales and sharpe prickles are cleared, with salt, oyle, and pepper, and are as pleasant to their palate, as a daintie Artichoke to ours: the roote is very long, and groweth deepe.

3. *Scolymus Theophrasti sive Eryngium luteum Monspelienſium.* The golden Thistle.

The golden Thistle shooteth forth divers skinny & prickly stalkes, which in some places, as *Spaine*, &c. stand upright, and in other countries, as *Mompelier*, and ours also, bendeth with them ur to the ground, bearing at every joynt both a branch and a leafe, which is long and somewhat narrow smaller at the bottome than any where else, much cut in on the edges, and set with small white prickes in some places marked with white spots on the deepe greene leaves, but in others & in my garden none at all: at the joynts betweene the leaves and the stalkes, and at the toppes also come forth severall small heads, smaller than any of the former, composed of small scales with

1. *Scolymus Dioſcoridis.*
The prickly or wilde Artichoke Thiſtle.

2. *Cynara ſylveſtris cretica.*
The Candy wilde Artichoke.

with very ſharpe prickes at the ẽnds, out of the middle whereof ſtart forth many gold yellow threads, which abide not long, and wherein when they are paſt the ſeede is contained, being ſmall and thinne ſcales lying cloſe together: the roote is long, of the bigneſſe of a finger, very ſweete and pleaſant to eate like unto *Eryngium* Sea Holly: both roote and leaves doe yeeld a white milke, eſpecially when they are young, and periſh every yeare.

The Place.

The firſt is found about *Mompelier* and the laſt in *Spaine*: the ſecond is naturall of *Candy*.

The Time.

They doe all flower in the end of Sommer, and their ſeede ripeneth quickly.

The Names

Dioſcorides calleth the firſt in Greek Σκολύμος *Scolymus*, which the Latines generally traſlate *Carduus* ſimply, and *Theophraſtus* ſo calleth the laſt alſo, yet there is great difference betweene them, for that of *Dioſcorides* was knowne unto *Theophraſtus*, who called it κάκτος *Cactos* (being the ſame that is called κυνάρας and κυνάρα *Cynara* and *Cinara* for it is written both wayes by divers, and as *Columella* and *Palladius* thinke tooke the name *a cinere* wherein they delight to grow, but is not likely that the Greekes derived their names from Latine appellations, but contrariwiſe the Latines from the Greekes, for ſo the ancient both Poets and Orators doe declare, as *Sophocles*, *Hecateus*, *Mileſius*, *Callimachus* and others: and *Atheneus* in his ſecond Booke maketh mention of *Cynara Spina*, ſome Poets have therefore invented a tale of a faire maid called *Cynara*, metamorphoſed into an Artichoke, and ſome againe thinke it tooke the name from κύων *canis*, and that *Locrus* a King asking counſell at *Apollos* Oracle at *Delphos* it was anſwered him that hee ſhould there build him a City where he ſhould be bitten by a woodden Dog, who afterwards being hurt in the Legge by a wilde Artichoke,

3 *Scolymus Theophraſti ſive Eryngium luteum Monſpelienſium.* The golden Thiſtle.

where it grew did there build his City: but *Didymus* in *Athenæus* saith it was the *Cynosbatos Canis sentis*, the Bryer bush, but the *Scolymus* of *Theophrastus* was not kuowne unto *Dioscorides*. *Pliny lib. & cap. 22.* confoundeth both the kinds of *Scolymus* together, as if they were both one plant, giving the vertues of both as unto one, and saith moreover that the *Scolymus* of the *Græcians* is called also by another name *Limonium*, which is the λειμωνία of *Theophrastus lib. 6. c. 11.* which *Gaza* very falsly translateth *Beta sylvestris*, whereas *Theophrastus* numbreth it among the Thistle-like plants, and is a differing Thistle from *Scolymus* set downe in the same place. *Lobel* calleth the first *Cynara sylvestris*, because as he saith it doth so nearely resemble the *Cynara aculeata*, as also *Scolimus sylvestris sive Chamæleontha Monspelien sium*, and *Lugdunensis Scolymus Dioscoridis*, but *Bauhinus Cynara sylvestris latifolia*: the second is called by *Honorius Bellus* (as it is set downe in his second Epistle to *Clusius*) *Cynara sylvestris*, the *Cretanes* as hee saith calling it *Agrioanzinari*, and by *Pona* in his *Italian Baldus Agriocinara Cretica*, by *Bauhinus Cinara sylvestris Cretica*, and thinketh it may be the *Cinara sylvestris Batica* of *Clusius*, set downe in his *Curæ posteriores* in *quarto*, *fol. 66.* the last is called by *Clusius Scolymus Theophrasti* (whereof hee giveth two figures, the one of the *Spanish* plant growing upright, the other of that which groweth at *Mompelier* leaning downewards, and called by him *Narbonensis*, whom *Dodonæus* followeth, giving both his figures and calling the one *Cardus Chrysanthemus*, and the other *Cardui Chrysanthemi alterius icon*: and so doth *Lobel* (who also saith it is the *Eryngium luteum Monspelientium*) *Camerarius*, *Cæsalpinus* and *Tabermontanus*, *Anguilara* calleth it *Eryngium Vegetij*, and *Bellonius* saith it is called in *Candye Ascolymbros*, and by the Latines *Glycyrrhizon* as hee saith, wherein I thinke he is deceived; *Bauhinus* calleth it *Scolymus Chrysanthemos*, and saith it is the *Attractylis marina* of *Lugdunensis*, which as I said before in the Chapter of *Atractylis*, he saith was the *Picnomos* of *Lobel* and *Pena*, and yet as I shewed you in the Chapter of *Acarna* he maketh it an *Acarna* likewise, calling it *Acarna humilis caule folioso*, but it cannot be both an *Acarna* and *Scolymus*, this double denominations of plants is not agreeable to *Dioscorides* minde, who is never found of himselfe to name one plant in two severall places or to call one plant by two severall names, although he shew the divers appellations of others. The *Italians* as *Bellonius* saith doe *in agro Romano* call the last *Spina borda*, and thinketh it to be that plant which the ancients did call *Glycyrrhizon*, the *Spaniards* of *Salamanca* did call it *Sylibum*, but as he saith it cannot bee *Sylibum* of *Dioscorides*, and in their owne Language *Cardon lechal* or *lechar*, *id est*, *Cardnus lucteus*, because of the white spots upon the leaves: the *French* call the first *Chardonnette*.

The Vertues.

Dioscorides saith that his *Scolymus* is good to expell strong and stinking Vrine, and to amend the strong or stinking savour of the Armeholes, or of the whole body, if the decoction of the rootes in wine be drunke: the young shootes also are eaten like unto *Asparagus*, and the young heads also in *Spaine* before they flower: but they use to raise up the earth over the young shootes untill they bee risen to a good height, which then are not onely white but more tender and delicate, to be eaten raw as their usuall manner is with Oyle, Pepper and Salt, or boyled or stewed: the flowers are used by the *Italians* as *Lobel* and *Pena* say to curdle milke, whereof they make Cheese, as also are perswaded that the sayd flowers given to women with child in their broth or to drinke doth hinder aborsment, and cause them to goe out their full time in good plight, and also is very good for those that doe not teeme or are barren, and cause fertilitie. The *Cretanes* used their wilde Artichoke in the same manner that the *Italians*, *Spaniards* and *French* use their *Cardoni* or Chardons. *Theophrastus* also saith that the roote of his *Scolymus* is most pleasant being boyled or eaten raw, but then chiefly when it is in flower, as also that the inner substance of the heads are eaten. *Clusius* saith that they of *Salamanca* use to eate the young plants rootes and all, being washed eyther raw or boyled with flesh, and that with the milkie juice thereof they doe coagulate or curdle any milke, and with the flowers doe counterfet Saffron, for the like uses as in other places they doe with the flowers of Bastard Saffron.

CHAP. VII.

Acanus Theophrasti. The ancients Thistle.

THis Thistle riseth up with a great thicke prickly stalke three or foure foote high, branching forth on all sides from the very bottome, set at the joynts with somewhat large leaves, broad and long, cut in on the edges, and set with sharpe prickes at the points and corners: at the toppes of the branches come forth severall small Thistle-like heads, out of the middle whereof thrust forth the flowers, composed of many deepe purplish threads, after which come somewhat round and flat seede, of a brownish colour lying in downe: the roote is thicke with divers long strings at it.

The Place.

It groweth in *Candy* from whence the seede hath beene sent into divers other parts of Europe.

The Time.

It flowreth in the end of Sommer, that is, somewhat late as other sorts of Thistles that come out of hot countries.

The Names.

It is called in Greeke Ἄκανθος *Acanus*, which doth as well signifie a peculiar plant of it selfe, such as this Thistle here set downe as the head of any thistle, or any other Thistle-like head of any other plant; *Theophrastus* onely (and *Pliny* from him) making mention both of this and that, for in his first Booke and sixteenth Chapter he nameth it among the συλλαχάνα, those plants that beare prickly leaves, thus, ἄκανθα, ἢ δρυπίς, καὶ ὁ ἄκανθος, and in his sixt booke and fift Chapter, some saith he, have prickly leaves as ὁ ἄκανθος, περίγγιον, καὶ ἔχινος and then making *Acanus* to be the head of a Thistle also (which *Dioscorides* calleth ἐχῖνος *Echinus* from whence commeth *Echinacea*, as from *Acanos Acanacea* signifying all Thistles or Thistle-like plants) in his ninth Booke and thirteenth Chapter, where speaking of the Chamæleon Thistle he saith thus, τῶν δὲ κεφαλὴν ἔχει ὅμοιαν ἀκάνθῳ μεγάλην οἱ δ' ἄκανον καλοῦσιν, *caput hujus magnum Acano simile, unde quidam Acanum dixerunt*, and in his sixt Booke and fourth Chapter speaking

ing of *Ixine* he saith, ἀπὸ δὲ τῆς ῥίζης μέσης ὁ σπερματικὸς ἄκανθος ἐπιφύεται ὥσπερ μῆλον, *de media radicis seminalis acanus velut malum extuberat*, and therefore ἀκανίζειν doth signifie as much as *Acanum ferre*, as in the same Chapter hee saith χαμαιλέων ἀκανίζει *Acanum* (*id est Acanaceum caput*) *fert Chamæleon*, the Chamæleon beareth a Thistle-like head; but how this Thistle here expressed should bee thought to bee the true *Acanus* of Theophrastus, seeing hee hath thereof given no description, as being then so well knowne that hee thought it needed none, *Honorius Bellus* in his fift Epistle to *Clusius* sheweth; first that in *Candy* the Inhabitants call this Thistle *Agavano*, as they doe also the heads of other Thistles, in the same manner as *Theophrastus* doth his *Acanus* as is shewed before: and then that the name *Agavano* is but a corrupted word from *Acano*, for the naturall language of the *Cretanes* is a bastard or corrupted Greeke speech: both which reasons are not onely forceable, but sufficient to confirme any ones opinion in this truth; *Guilandinus* in his eight member and 128. page of his commentaries *de Papyro* the Paper rush, after that he had shewed that *Theophrastus* used divers names for one thing (in many whereof by his leaves hee is thought to be mistaken) saith that the *Ixine* of *Theophrastus* is his *Acanus* also, whom *Honorius Bellus* although hee had beene his scholler contradicteth, not allowing of that opinion for the reasons aforesaid. *Pliny* saith *lib. 22. c. 3.* that some thought the *Acanus* should bee *Eryngium* being a broad sharpe prickly herbe with broad thornes. I cannot finde that *Anguilara* or *Lugdunensis* did know any plant peculiarly called *Acanus*, although *Bauhinus* setteth them both downe to call this plant so, but that they tooke the name onely to signifie the prickly head of Thistles: *Pona* in his *Italian Baldus* giveth the figure thereof somewhat rudely done, but no other description then that of *Honorius Bellus* in the place aforesaid, *Bauhinus* calleth it *Carduus latifolius echinos obsoletæ purpuræ ferens*: because I could not finde a more proper appellation to call this Thistle by, then that I have given of The ancients Thistle in *English*, I will not refuse to alter it if any can give it a better.

Acharus Theophrasti.
The Thistle of the ancients.

The Vertues.

I cannot finde any propertie peculiar imputed to this Thistle by eyther ancient or modorne writer, and therefore untill I can be better informed I must be silent as others are.

CHAP. VIII.

Silybum sive Carduus lactens. Our Ladies Thistle, or the stript milkie Thistle.

ALthough formerly there hath beene but one sort hereof knowne to Herbarists, yet of late by the diligent search and observation of some that have beene curious, there are some other sorts found which together must be handled in this Chapter.

1. *Carduus Mariæ vulgaris.* The common Ladies Thistle.

The common Ladies Thistle hath divers very large and broad leaves lying on the ground, cut in and as it were crumpled but somewhat hairy on the edges, and of a white greene shining colour, wherein are many lines and strakes, of a milkie white colour running all over, and set with many sharpe and stiffe prickles all about, among which riseth up one or more strong round and prickly stalkes, set full of the like leaves up to the toppe, where at the end of every branch commeth forth a great prickly Thistle-like head, strongly armed with pickes and with bright purple thrummes rising out of the middle of them: after they are past the seede groweth in the said heads lying in a great deale of fine soft white downe, which is somewhat flattish and shining, large and browne: the roote is great spreading in the ground with many strings and small fibres fastned to them, all the whole plant is bitter in taste and therefore supposed not to be without very good effects.

2. *Silybum majus annuum.* Great Milke Thistle of a yeare.

This Thistle riseth up with one round stalke almost a yard high with somewhat large greene leaves, not halfe so large as the former, nor halfe so much marked with white lines, somewhat cut in also on the edges, and set with prickes but fewer: the stalke hath few or no branches, but beareth at the toppe and the upper joynts two or three prickly heads, out of which rise reddish purple threads or thrummes, and somewhat great browne seede afterwards lying in Downe: the roote is long and perisheth as soone as it hath given seede.

3. *Silybum minus Bæticum.* The small *Spanish* milke Thistle.

The first leaves of this Thistle are somewhat broad and smally cut in on the edges, of a pale greene colour, with some small white lines and markes thereon having footestalkes upon them, but those that presently rise up with the stalke are somewhat longer and broader forwards then below, where being narrow they compasse the stalke, and

1. *Carduus Mariæ vulgaris.*
The common Ladies Thistle.

3. *Silybum minus Beticum.*
The small *Spanish* Milke Thistle.

and are more cut in on the edges and set with some small sharpe prickes, and marked with white lines as the other, the upper leaves being still more divided and lesser at the upper joynts, and at the toppe come forth very small prickly heads with purplish threads breaking out of the middle, and after they are past come very small white seede lying in some downe, which by reason of a kind of cleare white Gum that issueth out of the head, sticketh so fast to the seede that they can very hardly be pulled in sunder, especially after they grow ripe and the Sunne hath dryed them: the roote is small and wooddy and perisheth every yeare.

The Place.

The first is frequent on every ditch banke in the fields every where: both the second and the last I received among divers other seedes that *Guillaume Boel* brought out of *Spaine*, and I beleeve the last may be the same, that *Camerarius* saith he picked out of *Epithyrsum*, and that *Rauwolfius* gave him brought out of *Syria*, because the seede being white in both and the leaves marked white doe demonstrate them to be both one.

The Time.

They flower and seede in *Iune*, *July* and *August* when other sorts of Thistles doe.

The Names.

This is generally supposed to be the Σίλυβον *Silybum* of *Dioscorides*, but thereof he hath made so breefe a relation that it is hard to say which is the right indeede: for he saith onely thus, *Silybum* is a broad Thistle whose leaves are like unto the white Chamæleon: *Pliny* in a manner saith the same in effect for the description; but saith in *Cilicia*, *Syria*, and *Phœnice* where it groweth it is hardly boyled tender, and that it hath no use in Physicke; but surely the white lines and markes in this Thistle is such an evident note and so remarkeable, that I thinke it could not be overpassed in silence by all the old writers if they had knowne it and described it: some therefore doe thinke that it more fitly agreeth with *Leucacantha* and *Spina alba*: *Lacuna*, *Matthiolus*, *Cornarius*, *Dodonæus*, *Fuchsius* and *Lugdunensis* take it to bee *Leucographis Plinij*, *Brunfelsius* calleth it *Carduus albus* and *Chamæleon*, *Matthiolus* and *Lobel Carduus Lacteus*, some *Carduus argentatus* and *Carduus ramptarius*, *Tragus*, *Lonicerus*, *Fuckſius*, *Gesner* and *Camerarius* call it *Carduus Mariæ*, *Cordus* on *Dioscorides* and *Tabermontanus Carduus Marianus*; *Dodonæus Carduus Leucographus*, *Anguilara* and *Lobel Silybum*, *Cæsalpinus Cardui sylvestris aliud genus* and *Acanon Theophrasti*: but *Bauhinus Carduus albus maculis notatus vulgaris*: the second is not set forth by any author before now, and from the likenesse thereof unto the former, I have so called it as it is in the title, *Silybum minus annuum*. The last as I sayd I had out of *Spaine*, and in regard it doth so nearely in all things resemble the *Carduus Lacteus Syriacus* of *Camerarius*, I presume it is the same which *Bauhinus* referreth as well as *Camerarius* to *Carduus Lacteus* or *Bedegnar Arabum* of *Rauwolfius*, which *Bauhinus* saith came to him by the name *Aga Cretensium*, and calleth it *Carduus albis maculis notatus exoticus*; our wilde kinde is generally called *Carduus Sanctæ Mariæ* in Latine, by the *Italians Cardo di Santa Maria*, by the *French Chardon nostre Dame*, by the *Germans* [illegible] *Frawen distell*, by the *Dutch Onser Vrowen distel*, and wee in *English* our Ladies Thistle and

The

The Vertues.

Our Ladies Thistle is thought to be as effectuall as *Carduus benedictus* for all the purposes whereunto it is put, as namely for Agues and for the infection of the Plague, both to prevent and cure it, as also to open the obstructions of the Liver and spleene, and thereby is good against the Iaundies, and provoketh Vrine, breaketh and expelleth the stone, and is good for the Dropsie; some doe hold that the young stalkes peeled and dressed as the stalkes of the other Chardons and wilde Artichokes are, and eaten doe helpe to encrease milke in Nourses breasts: It is effectuall also for the paines in the sides, and many other inward paines and gripings: the seede is held as powerfull if not more for the purposes aforesaid and so is the distilled water also, and besides is often applied both inwardly to drinke and outwardly with clothes or spunges to the region of the Liver to coole the distemperature thereof, and also to the region of the heart against swownings and passions of it.

CHAP. IX.

Carduus Spherocephalus sive Globosus. The Globe Thistle.

IN my former Booke I have given you the knowledge of two or three sorts of Globe Thistles, that is of the greater and the lesser Globe Thistle, and of the Fryers Crowne Thistle which is accounted one of them, although the head be a little more flat at the toppe then the rest: there remaine some other sorts to be shewen to you in this Chapter.

1. *Carduus Spherocephalus acutus minor.* The smaller Globe Thistle with long prickles on the head.

This small Globe Thistle hath divers long and narrow leaves, so much cut in on both sides, that every jagge or part seemeth a leafe, so to make the whole leafe winged each part cut in also, and the corners set with sharpe prickes growing on the whitish stalke up to the toppe, where stand divers round heads each upon a long foote-stalke, composed of bearded huskes in the same manner that the two sorts of Globe Thistles expressed in my former Booke doe, but that the ends are longer and sharper, out of which rise more blewish flowers than are in the lesser sort.

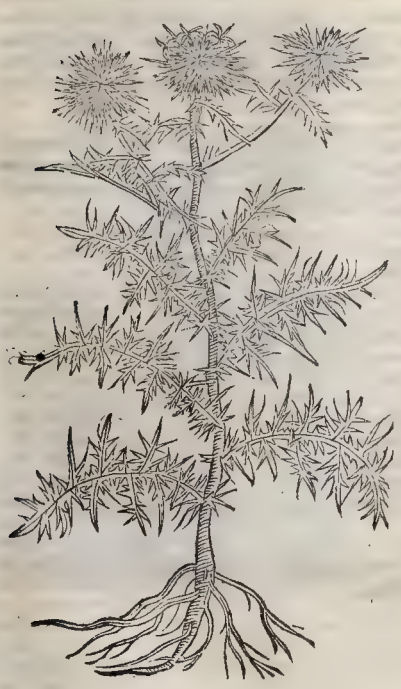
2. *Carduus Spherocephalus acutus major.* The great prickly Globe Thistle.

This other greater prickly Globe Thistle hath larger leaves and broader, somewhat like unto the former great Globe Thistle expressed in my sayd booke being nothing so much cut in on the edges, in all other things it is not unlike the former here set downe, but that the flowers out of these prickly heads are of a deeper blew colour.

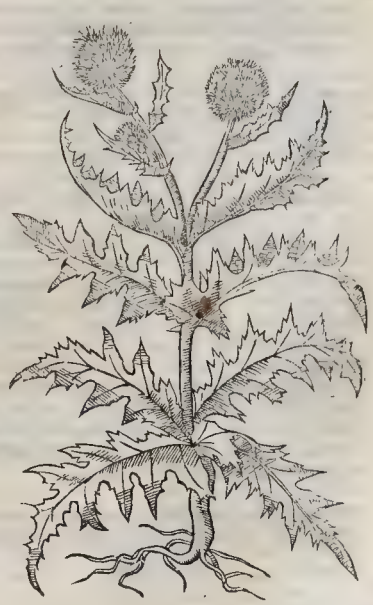
3. *Carduus Spherocephalus minimus acutissimis foliis.* The smalleſt Globe Thistle with the most prickly leaves

This small Thistle hath the smalleſt jagged leaves and most cut in of any of the rest, and most sharpely set with prickes on the edges: the stalke groweth lower then any of the other, and the round heads at the toppes smaller

1. *Carduus Spherocephalus acutus minor.*
The smaller globe Thistle with long prickes on the head.



2. *Carduus Spherocephalus acutus major.*
The greater prickly globe Thistle.



alſo, but not armed with ſuch long ſharpe prickes as the former out of the huskes whereof come whitiſh flowers.

4. *Carduus ſpinoſiſſimus ſphærocephalus Cardui Arabici nomine miſſus.*
The *Arabian* Gloe Thiſtle.

This Thiſtle hath a winged prickly ſtalke two foote high having large leaves thereon ſomewhat broad and long, ſet thicke with ſharpe prickes, but ſparingly placed on the ſtalkes bearing round ſphæricall heads, thick and ſtrongly armed with long prickes; out of the midſt whereof breake forth white threads ſomewhat ſweete: the ſeede is long and creſted or cornered.

The Place.

All theſe Thiſtles are ſtrangers to us, neither is their naturall places certainly knowne, but imparted and ſent by friends with whom as rarities they have beene accepted.

The Time.

Theſe flower at the ſame time with the reſt, that is, in *Iune* and *Iuly*.

The Names.

Wee cannot finde certainely that they were knowne eyther to the ancient Greeke or Latine writers, but *Anguilara* and *Lobel* ſuppoſe that the firſt is the Ἀκάνθα λευκὴ *Spina alba* of *Dioſcorides* (ſome alſo take the greater kinde mentioned in my former booke to bee *Spina alba*, as *Camerarius*, *Matthiolus* and *Lugdunenſis*, which as he ſaith is the *Bedeguar* of the *Arabians*; and ſome tooke it to be κροκοδίλιον *Crocodilion Dioſcoridis* as *Lacuna* and *Lobel*, and ſome to bee χάλκειος *Chalcheios Theophraſti*, which *Gaza* tranſlateth *Æraria* as *Lugdunenſis*, and ſome to be τετράλιξ *Tetralix ſpinoſa Theophraſti* as *Lugdunenſis*, and is called *Spinoſa* as a diſtinction from *Tetralix Atheniẽſium* which is *Erica*, of both which *Pliny* maketh mention, and ſome to be Ἀκάνθα ἀραβικὴ *Spina Arabica*, as the ſayd *Lugdunenſis* alſo and in ſome to be ῥοῦθος *Ruthos* or *Ruthro Theophraſti* as *Lobel*, and ſome to be *Silybum* as *Lugdunenſis* according to the deſcription, and ſome to be *Chamæleon verus* as *Tragus* and *Fuchſius*, and ſome to bee *Echinopus* as *Geſner in horto*, but *Cordus in hiſtoria* as I take it firſt called it *Carduus Sphærocephalus* or *globoſus* moſt properly, and from him *Camerarius*, *Dodonæus* alſo calleth it *Spina peregrina*, and *Tabermontanus* and others call it ſo: the leſſer ſort alſo of that *Carduus Spherocephalus* mentioned in my book is ſo called by many of the ſaid authors: theſe things I thought good to note here having ſo fit an occaſion, although I have a little digreſſed from the matter in hand) but *Dodonæus* and *Lugdunenſis* from him call it *Carduus Sphærocephalus acutus*. *Dodonæus* maketh the ſecond here ſet downe to be his third *Carduus Spherocephalus acutus*: the third is the ſaid *Dodonæus* his *Carduus Spherocephalus quartus*, and *Lugdunenſis* alſo mentioneth them from him as *Bauhinus* doth alſo: the laſt *Bauhinus* calleth *Carduus ſpinoſiſſimus Sphærocephalus rigidis aculeis armatus*, & ſaith it was ſent him under the name of *Carduus Arabicus*. Although the *Carduus Eriocephalus ſive Tomentoſus* be with moſt herbariſts now a dayes called *Corona fratrũ* that it doth ſomewhat reſemble the bald or ſhorne head of a Fryer, yet this is not that Thiſtle which *Bartholomæus urbe venetanus* and *Angelus Palea Franciſcan* Fryers ſay they ſaw growing in the confines of *Aragon* neare *Caſtile*, which while they were digging up demanded of a countrey man there paſſing by them if he knew the name thereof, who anſwered they called it vulgarly The Fryers Crowne, which ſay they had leaves ſpread upon the ground like to thoſe of the Carline Thiſtle, it bore divers heads of Thiſtles ſet cloſe one unto another without any ſtalke under them, whereof the middlemoſt was greateſt, and the reſt to the number of eight or ten or more or leſſe ſmaller ones ſtanding round about it, of the bigneſſe of a Wallnut or greater: which name ſay they may not inconveniently be given to it, in that the middle head ſeemeth as a father and the ſmaller as his children, that ſo as brethren they doe compaſſe their father in faſhion of a Crowne. The roote ſay they when they had digged up part of it was of the bigneſſe of a ſtaffe being white and tender and of a pleaſant taſte, yet with ſome aſtriction; *Dodonæus* reciteth this, but *Lugdunenſis* hath ſet the true figure of it in the Chapter of *Myacanthos* for *Iacea lutea capitulis ſpinoſis* of *Cluſius* and others, but hee ſaith withall that the *Carduus tomentoſus Anglicus* of *Lobel* is the the ſame alſo, when as it is his other *Carduus tomentoſus* that he calleth *Corona fratrum herbariorum*, and *Bauhinus* thinketh that his *Acanthium montanum Dalechampij* is the ſame alſo.

Carduus Tomentoſus Corona fratrum dictus.
The Fryers Crowne Thiſtle.

The Vertues.

I finde nothing recorded by any that have written of theſe Thiſtles that they are applyed to any Phyſicall uſe, neither have I any thing to declare of them by particular experience.

CHAP. X.

Acanthium & Carduus Tomentosus. The Woolly or Cotton Thistle.

HEre be divers sorts of woolly Thistles, although there bee but one or two that can fitly bee referred to *Acanthium Dioscoridis* which is also woolly, I have therefore put the other hereunto in one Chapter.

1. *Acanthium vulgare.* The common Cotton Thistle.

The common Cotton Thistle hath many large leaves lying on the ground, somewhat cut in, and as it were crumpled on the edges, of a greene colour on the upper side but covered over with a long hairy wooll or cottony Downe, and not much more white or hoary underneath, set with most sharpe and cruell prickes, from the middle of whose heads of flowers thrust forth many purplish crimson threads, and sometimes white, but much more seldome, the seede that followeth in these heads lying in a great deale of fine white Downe is somewhat large, long and round, resembling the seede of *Sylibum* or Ladies Thistle, but somewhat paler: the roote is great and thicke spreading much, yet usually dyeth after seede time.

2. *Acanthium Illyricum.* The greatest Cotton Thistle.

This great Cotton Thistle (remembred by *Lobel* and *Pena* in their *Adversaria* that *Valerandus Dourez* of *Lile* in *Flanders*, brought out of *Sclavony* and sowed at *Lyons* in *France*) groweth to be two or three cubits higher then any man, almost to the height of a Speare or Pike branched forth on all sides, set with a prickly filme all along like in forme to the other, and with large and long torne leaves fully fraught and armed with as cruell prickes and prickly large heads with purple flowers and seede like the former.

3. *Carduus tomentosus Anglicus.* Our *English* woolly Thistle.

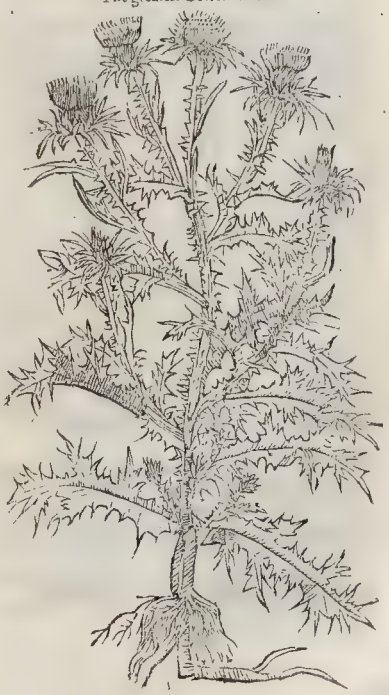
This woolly Thistle hath divers large and long leaves all covered over with a wooll or downe, cut in very deepely on the edges at certaine distances into severall parts or leaves even to the middle ribbe almost, making each leafe seeme winged with small and long leaves on each side, and set in divers places with long sharpe prickes: the woolly stalke riseth up to the height of two or three cubits, with few leaves set thereon, and with but few branches, bearing at their toppes a large round hoary head somewhat flat, covered over as it were with fine woolly threads like unto a net, not very prickly, with many purplish threads in the middle like unto those of the Artichoke, after which succeede Thistle-like seedes, greater and rounder then those of the first: the root is great and thicke, browniish on the outside and white within, not unpleasant to the taste.

4. *Carduus tomentosus minor.* The lesser woolly Thistle.

This lesser woolly Thistle hath many whitish woolly or hoary long leaves, much cut in on the edges into many parts, and each part also divided and set with small prickes: the stalke is not very great, nor much above two foote high branched towards the toppe, white and woolly also, bearing on them small prickly roundish heads having many purple threads rising out of the middle, and small Thistle-like seede after them.

1. *Acanthium vulgare.*
The common Cotton Thistle.

2. *Acanthium Illyricum.*
The greatest Cotton Thistle.



5. *Carduus*

5. *Carduus tomentosus capitulis minime aculeatis sive Acanthyllos Dalechampij Lugdunensi.*

The fine Cottony Thistle without prickly heads.

This fine Cotton Thistle hath long and somewhat narrow whitish or hoary leaves, larger at the lower end of the small stalke, which is about a foote high then they are above, somewhat cut in on the edges, but much & thick set with small short and soft prickes in some places: from the middle of the stalke up to the toppe at every leafe commeth forth a small whitish scaly head somewhat rough, but not prickly, and at the toppe likewise three or foure such like heads, out of which rise purplish flowers made of threads as in other Thistles whereunto the seede is like also. I doe thinke this doth rather resemble a *Iacea* then a *Carduus* but that I have not seene the plant, and therefore doe follow mine author.

6. *Carduus tomentosus capitulis spinosis sive Leucacantha Monspelienſium.*

The *French* supposed white Thistle.

This supposed *Leucacantha* of the *Mompelier* Herbarists, sendeth forth from a thicke sappie roote meanely set with fibres, many stalkes about a cubit high, branched from the middle upwards, set with many long hoary or woolly leaves, much cut in or torne on the edges, and armed with divers sharpe prickes: the heads that grow at the toppes are small, somewhat long and prickly, sending forth many bright red purplish threads from the middle, after which come the seede which are somewhat long and round like unto the other Thistles seedes.

The Place.

The first groweth on divers ditches, bankes and in the Corne fields and high wayes generally every where throughout the Land, it is also often found growing in Gardens: the second as is said was brought out of *Illyria*: the third groweth in divers barren fields in *Sommersetshiere* as *Lobel* noteth it, and in divers other places: the fourth *Dodonæus* saith he onely saw in some Gardens in the Low Countries, and *Matthiolus* saith it was sent him by *Cortusus*: the fift groweth in *France* in dry and sandy grounds, the last about *Mompelier* where some young students tooke it to be *Leucacantha* of *Dioscorides*.

3. *Carduus tomentosus Anglicus.* Our *English* woolly Thistle.

The Time.

They all flower and beare their seede about the end of Sommer, when other Thistles doe flower and seede.

The Names.

The first is taken by most of our moderne writers to be Ἀκάνθιον *Acanthium* of *Dioscorides* which name the Latines keepe also, no other being found that better agreeth thereunto, as *Matthiolus*, *Dodonæus*, *Durantes*, *Camerarius*, *Lobel*, *Tabermontanus* and *Lugdunensis* doe all agree, yet *Tragus* taketh it to bee the *Achantha leuce Spina alba* of *Dioscorides*, and *Fuchsius* calleth it *Spina alba sylvestris*, *Anguilara* and *Gesner in hortis Onopordon Athenei*, as also *Onogyros Nicandri*, *Cæsalpinus* calleth it *Carduus sylvestris*, and *Lugdunensis* by his figure maketh it to be *Silybum sive Leucacantha Lonicers*, and *Bauhinus Spina alba tomentosa latifolia sylvestris*, the second is the *Acanthium Illyricum* of *Lobel*, & peradventure may be the *Acanos Bellonij*, *Bauhinus* doth certainely set it downe for the *Onopordon* of *Dodonæus*, *Camerarius* and *Lugdunensis*, and as certainly for the third *Onopyxus Dalechampij of Lugdunensis*, and saith also it is the *Carduus viarum* of *Gerard* and others, in all which I am perswaded he is much mistaken, for however the severall Thistles of these authors may be in some things like it, yet they are not *idem* the same. Of the third, *Lobel* first made mention in his *Adversaria*, and called it *Carduus tomentosus Anglicus*, *Bauhinus* doubteth whether it be the *Spina Arabica* of *Anguilara*, but saith it is the *Spina Arabica Dioscoridis & Plinij* of *Matthiolus* in his last corrected edition, as also *Spina Arabica* of *Cæsalpinus*, and he himselfe calleth it *Carduus tomentosus capitulo majore*: the fourth is the *Carduus Sphærocephalus quintus* of *Dodonæus*, who saith that some referred it to the *Spina alba* of *Matthiolus* and *Lugdunensis* and others, to the *Spina alba altera* of *Matthiolus* and *Cæsalpinus*: *Bauhinus* calleth it *Carduus tomentosis capitulo minore*: the fift is called by *Lugdunensis Carduus Acanthyllos Dalechampij*, and by *Bauhinus Carduus tomentosis capitulis minime aculeatis*: the last is the *Leucacantha Monspelienſium Dalechampij* as *Lugdunensis* saith, and called by *Bauhinus Carduus tomentosus capitulis echinatis*: The *Italians* call the first *Acantho*, the *French Cardon argent*, the *Germanes Weiss wegedistell*, the *Dutch witte wech distell*, and we in *English* The white Cotton Thistle.

The Vertues.

Dioscorides and *Pliny* in the same manner write, that the leaves and rootes of *Acanthium* the common Cotton Thistle taken in drinke, doth helpe those that have a cricke in their necke, whereby they cannot turne their necke but the whole body must turne likewise. *Galen* saith that the roote and leaves hereof are of an heating qualitie, and good for such persons that have their bodies drawen together by some Spasme or Convulsion, or by some other infirmitie, which disease is truely to be called the Rickets, which happening sometimes to children doth so binde them in their Nerves, Ligaments and whole structure of their body, that it suffereth them not to grow or prosper eyther in height strength or alacritie.

CHAP.

CHAP. XI.

Cardui quidam ſylveſtres ſpinoſiſſimi. Certaine very prickly wilde Thiſtles.

THere are ſome other wilde Thiſtles that are very prickly, to be intreated of, which have not yet beene mentioned, which I thinke fit to place together in a Chapter, which are as followeth.

1. *Onopyxus.* The common way Thiſtle.

This common Thiſtle hath divers long leaves lying compaſſe-wiſe on the ground, very hairy all over, eſpecially while they are young, of a deepe or ſad greene colour, long, and ſomewhat narrow, rent and torne on the edges, and ſet with many very ſharpe prickes, from among which riſe up very prickly ſtalkes armed or fenced with ſharpe prickly filmes, branching forth in divers places, and ſet with the like leaves up to the tops, where ſtand divers heads exceedingly ſtored with ſharp pricks on all ſides; from out of the middle thruſt forth many purpliſh threads, of an excellent lively colour, after which come ſomewhat ſmall ſeede like unto other Thiſtles lying in downe: the roote is blackiſh, hard, and woody, where the ſtalke riſeth and periſhing every yeare after ſeede time.

2. *Onopyxus alter anguſtifolius.* Another narrow leafed way Thiſtle.

This other common Thiſtle differeth from the former, in that the leaves hereof are longer, narrower, more gaſhed or rent on the edges and not hayrie, but ſmooth all the leafe over; in the flowers which are purple and ſometimes white, in the ſeede and roote, and in the prickles like a Thiſtle, it differeth little or nothing.

3. *Onopyxus parum aculeatus.* The gentler way Thiſtle.

This alſo differeth from the other, chiefely in the heads which grow many together, and are but ſmally ſet with prickes, and nothing ſo much as the other but the leaves, are more jagged, and ſet very thicke with ſhort prickles: the ſtalkes are round and a little prickly, but not filmed as the other, the flowers are purple like others.

4. *Onopordon.* The Aſſes cracking Thiſtle.

This Thiſtle hath many long leaves ſet on the cornered woolly ſtalkes, which grow as high as any man, but not branched at all, the leaves ſeeming like branches being a foote long, and much divided into many leaves, ſome long and narrow, and others ſmaller and ſhorter ſet with them at certaine ſpaces, each ending in a ſharpe long pricke: from the upper joynts of the ſtalkes, with the leaves, and at the toppes alſo come forth woolly heads upon ſmall foote ſtalkes, ſet with long prickes, from the midſt whereof thruſt forth divers bright reddiſh purple threads: the ſeede that followeth is like unto other Thiſtles: the roote is a foote long, thicke and blacke with ſome fibres ſet thereat.

5. *Polyacanthos.* The moſt prickly Thiſtle.

This moſt prickly Thiſtle is as it were compoſed wholly of prickles, for the leaves are ſhort and narrow, ſo thicke ſet on both ſides with ſmall ſharpe prickes, that they take away all ſhew of leaves: the ſtalkes alſo and branches are ſo plentifully ſtored with ſharpe prickes up to the toppes, that nothing elſe is to be ſeene: the heads alſo are in the ſame manner thicke ſet with prickes, out of which riſe purpliſh threads, as in other Thiſtles.

6. *Carduus Polycephalos.* The many headed Thiſtle.

The ſtalke of this Thiſtle hath neither filme nor pricke thereon like the laſt, but branched forth into divers parts, and they againe parted into other ſmaller branches, on which ſtand many heads and ſmaller ones under them, with divers ſmall prickes about them, out of which riſe purpliſh flowers of ſhort threads, as in others, the leaves are but few on the ſtalkes being ſhort and narrow, but as thicke ſet with prickes as the laſt almoſt: the roote is hard and woody.

7. *Drypis Theophraſti Anguilara.*
Anguilara his launcing Thiſtle of *Theophraſtus.*

The leaves of this Thiſtle ſeeme to be compoſed onely of long ſharpe thornes, like unto Iuniper leaves, many ſet together on both ſides of the middle ribbe in tufts at certaine ſpaces: the ſtalkes are ſmall, a cubite high, with two ſuch winged leaves at each joynt: the toppes of the ſtalkes are ſet as it were, with bunches or tufts of ſuch long leaves like thornes, out of which come many ſmall white flowers, conſiſting of ſmall leaves, and not of threads, like other Thiſtles: the ſeede lying in the downe of the heads is ſmall covered with a browniſh barke, very like unto Rice in the huskes, but when the huske is taken away, it is very yellow, and like in forme unto the Corne-flower ſeede: the roote is ſmall like Couchgraſſe ſpreading farre about.

8. *Drypis quorundam Lugdunenſi.*
Another *Drypis* or launcing Thiſtle.

This launcing Thiſtle riſeth up with divers ſlender ſtalkes ſometimes to a mans height, whoſe long leaves and narrow are made up of many parts, ſmally cut in or divided

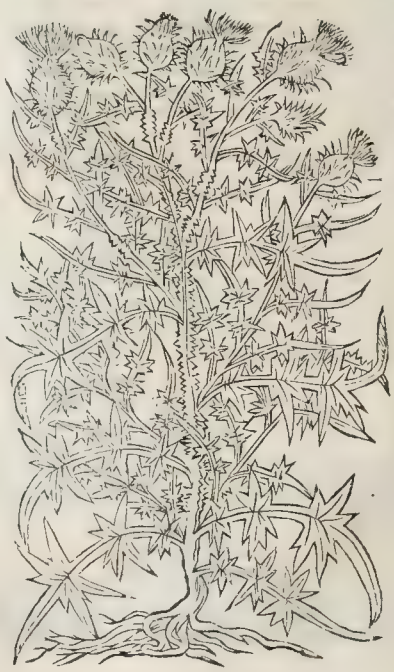
2. *Onopyxus alter anguſtifolius.*
Another wilde way Thiſtle.

4. *Onopordon.*
The Aſſes cracking Thiſtle.

5. *Polyacanthos.*
The moſt prickly Thiſtle.

7. *Dryps Theophraſti Anguillare.*
Anguilara his thorny Thiſtle of *Theophraſtus.*

9. *Carduus Lanceatus latifolius.*
The greater broad ſpeare Thiſtle.



into many ſmall points, with a ſhort foote ſtalke, compaſſing the ſtalke at the lower end, at the toppes grow ſingle ſcaly, greene and prickly heads, from the middle whereof thruſteth a number of long threads, which in ſome plants are purpliſh, in others whitiſh, and in other very red, or of a bright crimſon colour, the ſeede that followeth is ſmall, ſmooth, and reddiſh: the roote is white and thicke, and groweth not very deepe.

9. *Carduus Lanceatus latifolius ſive major.* The greater broad ſpeare Thiſtle.

The ſtalk of this ſpeare Thiſtle is armed with prickles like many other wilde Thiſtles, and the leaves ſet thereon are very long, cut in or divided on the edges in two or three places, ſet at diſtances one againſt another, and the ſeverall parts cut into five or ſixe points or corners, ſharpely armed, the end being long and narrow, pointed like the head of a Iaveline or Pike, whereof it tooke the name, the flowers are purpliſh in ſcaly and prickly heads.

10. *Carduus Lanceatus anguſtifolius.* The narrow Speare Thiſtle.

The narrow ſpeare Thiſtle is like unto the laſt in the skinny prickly ſtalkes, being ſtrong and ſtanding upright two cubits high, ſtored with few leaves, but jagged, prickly, and narrower than the laſt, yet the end is ſomewhat broader than the other, of a darke greene colour on the upperſide, and hoary gray underneath, the heads are many ſmall and ſcaly ſet at the toppes of the ſtalkes as prickly as they, with purpliſh, and ſometimes white flowers of threads riſing out of the middle of them, as in other Thiſtles.

11. *Carduus Chondrilloides.* The jagged Succory-like leaves.

The leaves of this Thiſtle are long and very much jagged very like unto the jagged, Gumme-Succory leaves, and prickly at the corners, the ſtalke riſeth up a foote high, with ſuch leaves on them up to the toppe, but ſhorter, broader and leſſe jagged, where it brancheth forth in two or three parts, each bearing a huske but no Thiſtle like ſcaly head, out of which groweth a yellow flower made of many leaves, ſet in compaſſe like a ſtarre, which paſſing away the huske containeth within it much downe wherein the ſmall ſeede lieth, and is carried away with the winde: the roote is white, long, ſlender, and wooddy, ſet with ſome fibres, and periſhing after ſeede time.

12. *Carduus paluſtris.* The Marſh Thiſtle.

The Marſh Thiſtle hath a prickly round ſtalke, two or three cubits high, with ſome branches towards the toppe, ſet with long and narrow darke greene leaves, ſomewhat jagged about the edges, with a few prickes on them: at the toppes of the ſtalke and branches ſtand many Thiſtle-like heads with purple threads, as in other Thiſtles.

The Place.

The five firſt ſorts are found in divers places of our owne countrey, upon ditch bankes, about hedges and wayes ſides: the ſixt groweth in the fields of *Michelfield* by *Baſil*: the ſeventh not farre from the ſea, in the *Marſis* countrey in *Italy*: the eight in corne fieldes, as well of oates as other graine: the ninth, tenth, and twelth, neere *Wieſa* and *Michelfield* marſhes about *Baſil*: the eleventh in craggy and ſtony places about *Lyons* in *France*.

The Time.

They doe all flower and ſeede much about the time that other Thiſtles doe.

The Names.

Ὀνόπυξος in Greeke, and *Onopyxus* in Latine *quaſi aſinius buxus*, and ſo *Gaza* rendereth it out of *Theophraſtus quod ſit aſinis cibus gratiſſimus, & ſummopere expetitus*; yet ſome thinke it ſhould be rather ὀνοπίξος *quod ad eum paſcendum aſinus perpetuo defigatur & hæreat* Ὀνόπορδον *Onopordon*; the ſignification thereof is rendred by *Pliny*, *quod ſi comederint aſini crepitus reddere dicuntur*, which Greeke name, ſaith *Dalechampius*, they about *Paris* keepe to this day, calling the ſaid Thiſtle *Pet d'aſne*, all thereabouts conſtantly affirming, that when Aſſes feede thereon, they will be more ſubject to cracking, and breaking winde backwaeds, than at other times when they doe not feede on them. Δρυπὶς *Drypis* ἀπὸ τοῦ δρύπτειν *dictum putent a lacinando, quod aculeis ſuis attractantes & colligere volentes vulnerat.* Πολυάκανθος *Polyacanthos, quaſi ſpinæ multæ*, *Gaza* tranſlateth *Aculeoſa*, and πολυκέφαλος, *Polycephalos, quaſi plura capita*, of the many heads, as the other of the many thornes or prickles: the derivations and ſignifications of the reſt are eaſie enough to be underſtood. The names likewiſe are moſt of them, as other Authers call them; only the *Onopyxus* is called *Carduus ſylveſtris* by *Dodoneus* and *Carduus aſininus* by *Geſner in hortis*, and the *Polyacanthos Theophraſti* of *Lugdunenſis* and *Tabermontanus*, is by *Ruellius* called *Agriacantha*, by *Lobel Carduus ſpinoſiſſimus & Onopordon* by *Gerard*, and the *Corduus Chondrilloides*, doth in my opinion better reſemble an *Hieratium* or *Chondrilla* than a *Carduus*.

The Vertues.

The chiefeſt properties attributed to any of theſe Thiſtles, are to the moſt common way Thiſtles that are hot and drie in the ſecond degree, and the rootes boyled in wine and drunke, are good to expell ſtincking urine, and to amend the ranke ſmell of the armeholes and whole body, as alſo good againſt a ſtinking breath, if the juyce thereof, ſaith *Pliny*, be taken before it flowreth; and if the place be bathed therewith where the haire is gone, it helpeth to bring it againe.

CHAP. XII.

Dipſacus ſive Carduus fullonum. The Teaſell or Fullers Thiſtle.

OF the Teaſell there are two kindes, the tame or manured and the wilde: of the tame or manured there is no varietie or differing ſort, but of the wilde there are two or three ſorts, as ſhall be ſhewed in this Chapter.

1. *Dipſacus ſativus.* The garden or manured Teaſell,

The manured Teaſell hath the lower leaves for the firſt yeare very large and long, faſhioned ſomewhat like unto Letice, of a pale greene colour, more gentle or not ſo hard, as thoſe that are ſet on the ſtalkes, but dented about the edges, and the middle ribbe on the backe or underſide, ſet very thicke with ſhort prickles, among which riſe up the ſtalkes, three or foure foote high, armed from the bottome to the toppe, with hard ſhort and ſharpe prickles joynted in ſeverall Places, and two ſuch leaves ſet thereat, both of them ſo joyned together at

the bottome, and ſo compaſſing the ſtalke about that they doe containe the raine and dew that falleth, and are ſomewhat harder and ſtiffer and more prickly then the lower: from betweene the leaves and the ſtalkes on each ſide riſe branches prickly alſo, and joynted with the like compaſſing leaves, but leſſer on them, and from their joynts riſe long ſtalkes bare of leaves but not of prickes, bearing on each of them a round head ſomewhat long, armed with ſtiffe ſhort and crooked prickles faſhioned like hookes bending downwards, greene at the firſt and white being ripe, from about which come forth whitiſh hoodded flowers appearing in circles flowring by degrees for the moſt part beginning in the middle and ſo downewards and upwards, in the ſeverall cells whereof which conteined the flowers grow ſmall and whitiſh round ſeede ſomewhat long, the middle part of the head being often hollow, and conteining ſometimes ſmall whitiſh wormes like unto Magots: the roote is white long and ſomewhat great at the head with divers long ſtrings and ſmall fibres ſet thereat and dyeth every yeare after the heads be ripe.

2. *Dipſacus ſylveſtris.* The wilde Teaſell.

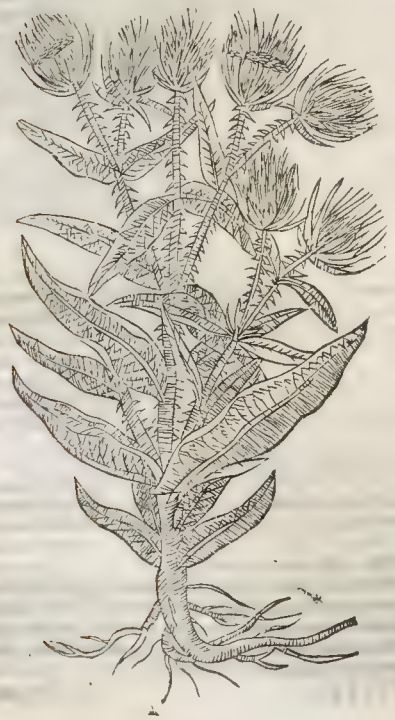
The wilde Teaſell is in all things like unto the manured ſaving in the heads, whoſe prickles are ſmall ſoft and upright: not hooked or ſtiffe (which is contrary to the nature of all other wild plants almoſt, which are harſher and more prickly then the manured) and in the flowers which are of a fine bluſh or pale carnation colour.

3. *Dipſacus ſylveſtris laciniatis foliis.*
Wilde Teaſell with jagged leaves.

This wilde Teaſell (whereof I have no knowledge and but follow mine author, whom I will not ſo farre miſtruſt as to ſay there is none ſuch, for who knoweth all the diverſities that other countries doe produce) is in all other things like the laſt ſaving in the leaves which are not whole and onely dented about the edges, but torne in on both ſides into deepe gaſhes.

1. *Dipſacus ſativus.* The garden or manured Teaſell.

2. *Dipſacus ſylveſtris.* The wilde Teaſell.



4. *Virga paſtoris.* The Shepherds ſtaffe.

4. *Virga*

4. *Virga pastoris.* The Shepherds staffe.

The Shepherds staffe is a kinde of Teasell also, but differeth therefrom in many notable parts, for the leaves hereof being large are of a sadder greene colour, and not so prickly on the backe ribbe, but finely dented about the edges: the stalkes grow higher and not so prickly, yet having some thereon, and leaves set by couples at the joynts but not compassing the stalke to hold water in manner like the former: the severall branches beare small heads not much bigger then Wallnuts, with soft prickles thereon and blush flowers like the wilde Teasell.

The Place.

The first is onely manured and sowen in gardens or fields for the Clothworkers use, by raysing the Wooll of cloth with the crooked prickles of the heads, make it fit for their sheeres to cut it smooth and thereby leave a fine nappe thereon pleasing to all: the other sorts except the third grow in moist places neare ditches and rills of water in many places of this Land; the third sort in some places of *Germany* and the last in sundry places of our owne Land.

The Time.

They flower in *July* and are ripe in the end of *August*.

The Names

It is called Δίψακος *Dipsacus* in Greeke, *quasi sitibundus, quod nomen a contrario invenit* (say divers authors) *quoniam concavo alarum sinu rorem vel imbrem recipiat, quo veluti ad abigendas sitis injurias abutitur*: but I thinke not so, for the water conteined in these leaves groweth bitter by standing in them, & therefore not fit to quench but to encrease thirst rather: the Latines also call it *Dipsacus* and after the Greeke ἀφρόδιτης λοῦτρον, *Labrum veneris, cujus nomenclatura a carinato foliorum habitu contraxit, qua se ambage anfractuosa sinuantia peluis speciem constituunt, & intra se humorem retinent*: but I am of a different opinion that it tooke the name of *Venus* lips from the effects of a whores lippes, which as the leaves the raine, so they are ready to receive all mens offers, and as the heads or Teasells, so they ready to carde and teare all mens skins that have to doe with them, untill they leave them bare and thin: pardon I pray this extravagancie who follow *Camerarius* and other good authors herein, that in the midst of their naturall phylosophie doe sometimes mix a little moralitie: it is called also *Cardaus Veneris* and *Lavacrum Veneris* it may be upon the like insinuation; it is thought also to be the *Gallidragon Xenocratis* of *Pliny* & *Cardaus fullonum* also, and some *Virga pastoris*, but that is more usually given unto the last sort, and so called because the dryed stalke clensed from the prickes, for so much as might be held in ones hand served the Shepheards to guide their sheepe withall, transferring the name of *Virga pastoris* to the *Dipsacus sylvestris*, calling it *Virga pastoris major* and this other *minor* as *Bauhinus* doth. Some, saith *Lugdunensis*, take it to be *Plumbago Pliny*, *Lobel* maketh doubt whether it should bee the *Spina Selenitis Theophrasti Guilandino*, *Camerarius* calleth it *Dipsacus fatuus*, and *Dalechampius* upon *Pliny* taketh it to be *Molybdena Pliny*: The *Arabians* call it *Chir* and *Moleta*, the *Italians Dissaco* and *Cardo*, the *Spaniards Cardo penteador*, and *Cardencha*; the *French Chardon de foullon* and *verge a bergier*, the *Germanes Karten distell Bubenstrall* and *Weberkarten*, the *Dutch Caerden* and *Voelder Caerden*, and we in *English* Teasell or the Fullers Thistle.

The Vertues.

Dioscorides saith that the roote bruised and boyled in wine untill it be thicke, and kept in a brasen vessell or pot, and after spread as a salve and applied to the Fundament doth heale the clefts thereof, as also Cankers and Fistulaes therein: the same also saith he, taketh away warts and wennes: *Galen* saith it is drying in the second degree, and hath withall some clensing facultie: others hold it to be cold and dry, and therefore they say the leaves applyed to the forehead and temples qualifieth the frenzie or madnesse: the juice of the leaves dropped into the eares killeth the wormes in them: the distilled water of the leaves is good to bee dropped into the eyes, to take away the rednesse in them and such mists as darken the sight: the said water is often used by women to preserve their faces in beauty, and to take away all rednesse and inflammations, and all other heate or discolourings. The Shepherds staffe is held profitable for no disease that wee know of.

CHAP. XIII.

Eryngium. Sea Holly.

ALthough *Dioscorides* hath made mention but of one sort of *Eryngium* (which is suspected by many to be appropriate rather to the *Mediterraneum* or *campestre* because he saith that it groweth in fields and rough places and not at the Sea side, when as his description may as fitly be referred to the one as the other) yet *Pliny* maketh mention of the Sea kinde also, and this later age hath added divers others which for some resemblance in leafe, head or roote, they have so termed. The *Eryngium Pannonicum flore caruleo & flore albo*, I have exhibited in my former booke, which is assuredly the *Eryngium Genevense* of *Lobel*, and *Eryngium planum* of *Matthiolus*, although *Bauhinus* doth make them different: the rest shall bee shewed in this Chapter.

1. *Eryngium marinum.* Our ordinary Sea Holly.

The first leaves of our ordinary Sea Holly are gentle or nothing so hard and prickly as when they grow older, being almost round, and deeply dented about the edges, hard, sharpe prõinted and a little crumpled also, of a blewish greene colour, every one upon a long footestalke, but those that grow up higher with the stalke doe as it were compasse it at the bottome, the stalke it selfe is round and strong yet somewhat crested with joynts and leaves set thereat but more divided, sharpe and prickly, and branches rising from thence which have likewise other smaller branches, each of them bearing severall blewish round prickly heads, with many small jagged prickly leaves under them standing like a starre, and are sometimes found greenish or whitish: the roote groweth wondrous long even to eight or ten foote in length, set with rings or circles towards the upper part but smooth and without joynts downe lower brownish on the outside and very white within, with a pith in the middle, of a pleasant taste but much more delicate being artificially preserved and candid with Sugar.

1. *Eryngium maritimum.* The Sea Holly.

2. *Eryngium mediterraneum sive campestre, &c.*
Vpland Sea Holly.

3. *Eryngium planum.*
The small smooth Sea Holly.

4. *Eryngium planum Hispanicum.*
Small Spanish Sea Holly, or Spaniz.

2. *Eryngium mediterraneum ſive campeſtre.* Vpland Sea Holly.

This other Sea Holly (which groweth in upland grounds is therefore more anſwerable unto *Dioſcorides* his *Eryngium*, but elſe as I ſayd before his deſcription doth anſwer them both directly) hath ſlenderer or not ſo thicke ſtalkes as the former, and hath the leaves more divided, more prickly and leſſe aromaticall: the heads are blew but ſmaller, and the roote ſlenderer and ſhorter, neither ſo ſweete nor fit to be preſerved, nor ſo aromaticall in taſte, in other things it is very like the former.

3. *Eryngium planum minus.*
The ſmall ſmooth baſtard Sea Holly.

This baſtard Sea Holly hath the lower leaves ſmooth and whole of a pale greene colour, ſomewhat long and round pointed narrow at the bottome, and ſomewhat deepely endented at the edges: the weake ſtalkes that trayling upon the grouud take roote againe at the joynts and riſe not above a foote high, have with the like leaves that grow below, others that are finely jagged into many parts and ſharpe pointed, from out of which all along the ſtalkes and at the toppes alſo, come forth blew heads leſſer than thoſe of the upland Sea Holly: the roote is compoſed of many thicke and long ſtrings which periſh not after ſeede time, but abide many yeares.

4. *Eryngium pumilum Hiſpanicum.*
Small baſtard Sea Holly of *Spaine.*

This ſmall baſtard Sea Holly hath divers leaves lying in a compaſſe upon the ground ſomewhat long, broad toward the middle ſmalleſt at the foote, and deepely dented but not jagged about the edges and ſomewhat ſoft withall: but thoſe that are ſet at the joynts of the ſtalke which is branched from the very bottome, are cut or devided into many ſmall narrow leaves dented about, hard alſo and ſharpe pointed or prickly: at the toppes of the ſtalke and branches, upon every one ſtandeth one round prickly head, with ſix or eight narrow long prickly leaves under it ſpreading like a ſtarre, which together with the head and flowers that come out thereof are of a faire blew colour, which give ſmall flat chaffie ſeede like the *Hungarian* kinde: it is ſeldome ſeene to have eyther the lower leaves, or almoſt any on the ſtalke and branches when it is in flower, but they all wither and are dead and dry before: the roote alſo periſhing as ſoone as it hath given ſeede, and is ſmall long hard and wooddy.

5. 6. *Carduus Eryngioides ſive Carduncellus montis Lupi & Eryngium trifolium.*
The French Thiſtle of *Lobel* and *Pena*, and Trefoile Thiſtle.

5 *Carduus Eryngioides, ſive Carduncellus montis Lupi Lobelio & Pena.*
The ſmall French Thiſtle of *Lobel* and *Pena.*

I put this ſmall Thiſtle-like plant among the *Eryngia* (herein following *Bauhinus* and *Alpinus lib. de exoticis plantis*, which elſe as *Lobel* and *Pena* in *Adverſarijs* ſay might be accounted a *ſpecies* of *Atractylis purpurea*, if as they ſay it be not the very ſame, but I would rather referre it to the *Iacea* or *Cyani*) which ſendeth forth divers long and winged leaves, ſomewhat prickly, among which a ſlender ſmooth ſtalke ariſeth ſcarſe a ſpanne high with the like leaves thereon, at the toppe whereof out of the middle of ſome long leaves ſtand two or three large, great, greeniſh vellow ſcaly heads bigger then may ſeeme proportionable to the plant, ſet with ſharpe hard white pricks, which are often eaten by thoſe where it groweth naturally; from the middeſt whereof iſſueth forth divers purple threads like unto the *Atractylis* or Diſtaffe Thiſtle ſaith *Lobel*, but *Alpinus* ſaith they are like unto *Cyanus* the Corne flower, after which come yellow Thiſtle-like ſeede; the roote is edible white and fleſhy, thruſting downe deepe into the ground with divers fibres thereat.

6. *Eryngium trifolium.* Trefoile Thiſtle.

This unknowne plant ſendeth forth at the firſt many long hard and narrow leaves from the roote which is like unto a Rampian and aromaticall, whereof ſome are parted into three, but thoſe that are ſet on the ſtalke have all for the moſt part three long leaves joyned together at the end of the footeſtalke at diſtances: at the top of the ſtalke ſtand two or three heads ſomewhat like thoſe of *Eryngium montanum* with purple flowers, and long leaves under them: the ſeede alſo is broad long and ſmall like unto it: the rootes encreaſe Venery and provoke Vrine.

The Place.

The firſt is found about the Sea coaſts almoſt in every countrey as well hot as cold, as *Spaine*, *Italy*, *France*, on our coaſts almoſt every where and low countries alſo, and others more Northerly: the ſecond groweth as *Camerarius* ſaith in *Franconia* in the vineyards and high wayes every where, but not about *Norimberge* where he lived as he ſaith: as alſo in the up and farther remote parts from the Sea in *Narbone* in *France*, as *Lobel* and *Pena* ſay: the third *Lobel* ſaith he never ſaw but in *Ioannes Matonus* his garden the ſeede hath beene imparted to friends, but it is likely to come out of ſome hot countrey, becauſe it flowreth late in theſe colder countries, and ſeldome commeth to perfection, even as the fourth doth alſo, which *Cluſius* ſaith, he gathered at the foot of certaine hills neere *Salamanca* in *Spaine*, and in no otherr place: the fift *Pena* ſaith groweth on that ſide of *Mons Lupus* that faceth the Sunne, neere unto a ſmall brooke of water.

The

The Time.

The first and second flower in the end of Summer, and give ripe seede within a moneth after: the other flower later with us, and therefore seldome doe their seede ripen with us.

The Names.

It is called in Greeke Ἐρύγγιον *Eryngium, quasi* Ἐρύγγιον *sive rictum, dictum nimis fabulosè autumant*, for I thinke that *Plutarke* was the first author of the fable, that one Coate cropping a branch of Sea Holly causeth the whole flocke to follow him, untill he spew or spit it out againe; or as others say untill the Shepheard take it out of his mouth: the *Latines* keepe the same name of *Eryngium*. yet in many Apothecaries shoppes it is called *Iringus*, and of some *Centum capita*, *Pliny* calleth it *Erynge*, and saith that some did referre *Acanos* unto *Eryngium*, and *Lobel* doth thereof make some doubt, and others referre it to *Dryps Theophrasti* as he saith also: *Cæsalpinus* unto the *Crocodilion* of *Dioscorides* and *Pliny*, *Lacuna* calleth it *Glycyrrhiza spinosa*, all other authors generally call the first *Eryngium marinum*, onely *Bauhinus* and *Gesner in hortis* call it *Eryngium maritimum*: the second is called *Eryngium vulgare* by *Camerarius*, *Clusius* and *Bauhinus*, because in *Germany* there is no other so frequent, the former being not so well knowne as being farre from the Sea side where onely it is naturall: *Fuchsius*, *Anguilara*, *Lacuna*, *Cordus* upon *Dioscorides*, *Cæsalpinus* and *Tabermontanus* call it simply *Eryngium* without other epithite, *Tragus* and *Lonicerus* make it their first *Eryngium*; *Matthiolus*, *Durantes* and *Lugdunensis* call it *Eryngium montanum sive ampestre*, *Turner*, *Gesner* and *Gerard* *Eryngium mediterraneum* and *Lobel* *Eryngium campestre mediterraneum*: the third is the *Eryngium pusillum planum Mutoni* of *Lobel*, *Lugdunensis* and *Clusius*, which *Bauhinus* calleth *Eryngium planum minus*: the fourth is called by *Clusius* *Eryngium pumilum hispanicum*, whom *Dodonæus*, *Lugdunensis*, *Tabermontanus* and *Gerard* do follow: the fift is called by *Lobel* & *Pena Carduncellus montis*, *Lupi*, and *Lugdunensis* *Carduncellus Penæ sive Cardui minimi species*, and *Bauhinus* *Eryngium montanum minimum capitulo magno*, *Alpinus lib. de exoticis* as I take it mentioneth this, calling it *Carduus Eryngioides*: the last is mentioned by *Alpinus*. The *Italians* call the first *Iringio marino*, The *Spaniards* *Cardo corredor*, the *French* *Chardon a cent testes* according to the Latine *Centum capita*, and of some also *Paracault*, the *Germanes* *Wallendistill Brakend stell* and *Mans trewe*, the *Dutch* *Meere wortele*, *Endeloos* and *Cruijs distel*, and we in *English* Sea Holly, or Sea Hulver.

The Vertues.

Both the Vpland and Sea Holly are temperate in heate somewhat drying and cleansing, but our Sea Holly is more effectuall than the Vpland kinde in all things whereunto it may serve, yet it is so neare thereunto that it is accepted in the steed thereof, and that to very good purposes, being not much inferiour, what therefore I shall shew you of the Sea kinde, you may transferre to the other, as divers other good Authours doe. The young and tender shoots are eaten of divers, either raw or pickled: the decoction of the roote in wine being drunke is very effectuall to open the obstructions of the spleene and liver, and helpeth the yellow jaundise, the dropsie, and the paines in the loynes and winde collicke in the guts and bowells, provoketh urine, and expelleth the stone, and procureth womens courses: the same also, or the powder of the roote, to the quantitie of a dramme at a time, with some wilde Carrot seede drunke in wine, or as *Apollodorus* doth appoint in the broth of boyled Fregges, or as *Heraclides* saith, in the broth of a Goose, is availeable anainst the sting or biting of Serpents, and other venemous creatures, the poyson also of the Aconite, and other poysonous herbes: the continued use of the decoction for fifteene daees taken fasting, and next to bedwards, doth helpe the strangury, the pissing by droppes, the stopping of the urine and the stone, and all defects of the reines and kidneyes, and if the said drinke be continued longer, it is said perfectly to cure them that are troubled with the stone, that the paines shall never returne againe, the experience on them that have beene troubled alone time therewith, declaaring it to be true: it is usually taken to helpe Venereous actions, and is good against the *French* disease: the rootes bruised and applied outwardly helpeth *Scrophula's*, or the kernells of the throate, called the Kings evill, or taken inwardly either, and applied to the stung or bitten place of any Serpent, &c. healeth it speedily: if the roote be bruised and boyled in old *Axungia* or salted lard, and applied to broken bones, thornes, &c. remaining in the flesh, doth not onely draw them forth, but healeth up the place againe, gathering new flesh where it was consumed, or almost fallen away: the juyce of the leaves dropped into the eares helpeth impostumes therein. The distilled water of the whole herbe when the leaves and stalkes are young, is profitably drunke for all the purposes aforesaid, and doth helpe the melancholy of the heart, and is availeable in *quartaine* and *quotidian* agues, as also for them that have their neckes drawne awry, or cannot turne them, without they turne the whole body therewith also. The other sorts are farre lesse effectuall to be used in Physicke, but the two last sorts are much used by the Natives to incite Venery both rootes and heads.

CHAP. XIII.

Carduus Stellaris. The Starre Thistle.

OF the Starre Thistles there are two or three sorts, some whereof have beene but lately found out, and exhibited to be knowne; the other of more ancient cognisance, the *Spina* or *Carduus Solstitialis* being one of the number in that it doth so meerely resemble them, as shall be presently shewed: but in my opinion these plants, but that custome hath entituled them Thistles, might as well be referred to the *Iaceas* or Knapweedes with prickly heads, as divers others there placed are, and even *Clusius* placing his *Iacea flore luteo capitulis spinosis*, at the first among the Thistles, doth afterwards change his minde, and set it among the *Iaceas*.

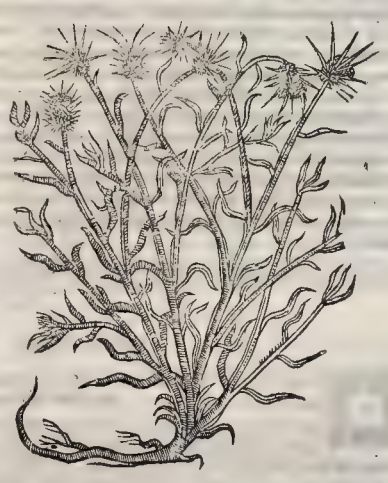
1. *Carduus stellaris vulgaris.* The ordinary Starre Thistle.

The common Starre Thistle, hath divers long and narrow leaves lying next unto the ground, cut or torne on the edges, somewhat deepely, into many, almost even parts, soft or a little woolly all over the greene, which is somewhat white, among which rise up divers weake stalkes parted into many branches, all lying or leaning downeto the ground, rather than much raised up, that it seemeth a pretty bush set with divers the like divided leaves up to the toppes, where severally doe stand long and small whitish greene heads, set with very sharpe and long

1. *Carduus ſtellaru ſive Calcitrapa vulgaris.*
The ordinary ſtarre Thiſtle.

4. *Carduus ſolſtitialis Dodonæo.*
S^t. *Barnabies* Thiſtle by *Dodonæus*.

Carduus Solſtitialis Lobelio.
Lobels S^t. *Barnabies* Thiſtle.



long white prickes, no part of the plant being in any place elſe prickly, which are ſomewhat yellowiſh, and as ſharpe as in any other Thiſtle; out of the middle whereof riſeth the flower compoſed of many ſmall reddiſh purple threads, and in the heads after the flowers are paſt, come ſmall whitiſh round ſeede lying in downe as others doe: the roote is ſmall, long, and wooddy periſhing every yeare, and raiſing it ſelfe from it owne ſeede ſowing.

2. *Carduus ſtellaris flore albo.*
The white flowred Starre Thiſtle.

There is no difference in this Thiſtle from the former, but in the white greeneſſe of the leaves, and the white threads in the flowers.

3. *Carduus ſtellatus latifolius.*
The broade leafed Starre Thiſtle.

This Thiſtle hath broader and ſhorter leaves than the former, but not much or ſo deepely cut in on the edges, with a few prickes ſet here and there at the corners; the ſtalke is but little divided, having few branches ſet with the like leaves, and at the toppes ſmall round thicke white heads, ſet thicke with prickes, many ſet together, in the faſhion of a Starre, ſeven for the moſt part ſet ſpreading in every place, the longeſt of them being middlemoſt, and the other on each ſide being ſhorter; out of the middle of the head riſe reddiſh purple threads like unto divers other Thiſtles: the roote is ſmall and annuall.

4. *Carduus Solſtitialis Dodonæi.* *Dodonæus* his Midſommer Thiſtle or S. *Barnabies* Thiſtle.

This Thiſtle of *Dodonæus* as hee ſaith hath long leaves lying next to the ground, deepely cut in on the ſides into many long and narrow parts, the lower part being ſomewhat broad and ending in a long point, of a blewiſh greene colour, from among which riſe up divers upright ſtalkes two foote high, with divers long and narrow leaves, ſomewhat divided but the uppermoſt without diviſion, and all of them without any prickes upon them; at the toppes ſtand ſundry ſmall ſharpe prickly heads, whoſe prickes are as white or rather more then

in

in any of the other, and are so cruelly sharpe that they pricke the Thighes and Legges of those that unadvisedly passe thereby, in the middle whereof stand a few yellow threads; the seede is white and long not much unlike those of the former starre Thistle: the roote is blackish, long, and slender not growing deepe, joynted or kneed in divers places somewhat wooddy and bitter in taste, somewhat like unto the long Ciperus grasse roote. *Lobel* giveth a figure hereof whose lower leaves are as little jagged as the upper, which I have here set to let you see the difference.

Solstitialis Lobelij.

The Place.

The first groweth in the fields about *London* in many places as at *Mile-end* greene, in *Finsbury* fields beyond the Milles, and in many other places: that with white flowers is much more rare and not to be met with in a great compasse: the third is found about *Narbone* in *France*, and the last about *Mompelier* in good plentie but is not to be found wilde with us.

The Time.

The first flowreth early and seedeth in *July* and sometimes in *August*: the last is usually in flower about Midsommer or a little after.

The Names.

It is very probable that the *Carduus Stellatus* or *Stellaris* is the μύακανθος *Myacanthus* of *Theophrastus, lib. 6. c. 4.* (and not the μύακανθος either of *Dioscorides* which is *Asparagus petræus* or *Plinie* which is *Corruda* or *Sylvestris Asparagus* which is *tota spina* a bush onely of thornes) which hath thornes or prickes not upon the leaves, but besides them, as *Capers Ononis* and *Tribulus*, for with them he setteth *Myacanthos* as being of a likenesse, and so called because the prickly heads being stucke upon salted flesh that was hung up, would sufficiently defend it from Mice or other vermine that would devoure it: *Brunfelsius* calleth the first *Eryngium* and so doth *Guilandinus*, *Tragus* maketh it his *Eryngium alterum*, *Matthiolus* calleth it *Cacatrepola quasi Cacotribulus, id est, infestus tribulus* and so doth *Cæsalpinus* also: who thinketh withall that it may bee the *Stœbe Theophrasti* whereof yee shall heare more a little after: *Dodonæus* and *Camerarius* call it *Carduus Stellatus*, and so doth *Lobel* also, and *Calcitrapa*, as the shops beyond the Sea in divers places doe. *Horatius Augerius* calleth it *Stellaria* and *Gesner in hortis, Carduus Stellatorius sive Stellaris, Cordus Polyacantha, Tabermontanus Spino stella, Lugdunensis Myacanthos Theophrasti Dalechampio, Clusius Carduus muricatus, Columna Hippophæstum vel Hippophaes, Dioscorides* and *Bauhinus, Carduus stellatus foliis papaveris erratici*: the third is called by *Lugdunensis, Carduus stellatus Dalechampij*, and *Bauhinus Carduus stellatus latifolius caulescens*: The last is thought by some to be the ἀκανθα βασιλικὴ, *Spina regia Theophrasti*, and is called by *Gesner in hortis Spina citrina sive lutea*, and *Spina Solstitialis* and so doe *Dodonæus*, *Lobel* and *Camerarius* who also call it *Carduus Solstitialis Lugdunensis Leucacantha quorundam*, who as *Lobel* also saith, the *French* call it *Auricles* in divers places, *Cæsalpinus Calcatrepola altera*, and *Columna Spina Solstitialis mitior Apula sive Carduus stellatus minor*, and *Bauhinus Carduus stellatus luteus foliis cyani*, *Gerard* his figure thereof is not right, for it is but the first *Carduus stellatus* which Mr. *Johnson* hath noted, yet giveth a figure for *Solstitialis* little or nothing differing from the *Stellatus*, when as this true figure hereof is extant in *Lobel*, and whereas *Gerard* his *Solstitialis lutea peregrina* is supposed to be *Acanthium peregrinum* of *Tabermontanus*, which *Bauhinus* knew not what to make of; it is plaine by *Gerards* owne words that hee ment it by *Clusius* his *Jacea lutea capitulis spinosis*: many such faults have passed Mr. *Johnsons* correction, which I am loth in every place to exhibit, knowing that none of us all can publish any thing but there may bee slippes and errours in many places thereof. The *Italians* call the Starre Thistle (as I sayd before) *Calcatrepola*, the *French Chaussetroppe*, the *Germans Wallendistell*, the *Dutch Sterre distel*, the other we call in *English* S. *Barnabies* Thistle or Midsommer Thistle.

The Vertues.

The seede of the Starre Thistle made into powder and drunke in wine doth provoke Vrine, and helpeth to breake the stone and drive it forth: the roote in powder given in wine is good against the Plague or Pestilence, by drinking thereof daily fasting for some time together is very profitable for a Fistula in any part of the body. They about *Franckeford* doe use the rootes hereof in stead of *Eryngium* which groweth there together with it as *Camerarius* saith. *Baptista Sardus* doth much commend the distilled water hereof being drunke to helpe the *French* disease, and to open the obstructions of the Liver, and clense the blood from corrupted humors, and is also profitably given against eyther *quotidian* or *tertian* Agues: The Midsommer Thistle is used by the *Savoyars* as *Camerarius* saith, and both flowers and roote admirably commended against the evill disposition of the whole body called *Cachexia*, against the Dropsie, daily Agues, maidens pale colour by reason of the greene sickenesse, or other obstructions, the countrey people saith hee, doth much use the distilled water or the decoction thereof, both against the swellings of the spleene and prickings in the sides, as also to provoke sweating and to helpe the hipgoute or paines in the huckle bones called the Sciatica.

CHAP. XV.

Carduus mollis. The gentle Thistle.

ONe of these kinds of gentle Thistles I have published in my former booke and therefore shall not needs speake againe thereof in this place, but of the rest as they follow.

1. *Carduus mollis laciniato folio.* The gentle Thistle with jagged leaves.

This jagged gentleman hath many leaves, some lying on the ground, others standing more upright much jagged or cut in on the edges, even to the middle ribbe, greene on the upper side, hoary white and woolly underneath like unto the younger and softer leaves of the first starre Thistle, not having any shew of prickles on them, of a little drying and bitter taste: from among which rise up one or two round striped stalkes about two foote high, of a reddish colour yet covered with a fine Downe or Cotton, set with divers leaves, the lowest whereof are like those on the ground but smaller, and those up higher are narrow and long without division, the ends and points of them being usually reddish, at the toppe of the stalke which is more usually without branches, groweth one head composed of many scales, set together with very soft and gentle prickes thereon

1. *Carduus mollis laciniato folio.*
The gentle Thiſtle with jagged leaves.

3. *Carduus mollis Heleniy folio Camerarij.*
Camerarius his gentle Thiſtle.

thereon, out of the mipdle whereof riſeth a reddiſh or ſtammell flowēr made of divērs ſoft and woolly threads: the ſeede that followeth is great and ſomewhat cornered: the roote is ſomewhat long and of the bigneſſe of ones finger, browniſh on the outſide with ſome fibres thereat.

2. *Carduus mollis anguſtifolius.* Narrow leafed gentle Thiſtlē.

This other Thiſtle hath ſhorter ſtalkes and narrower leaves then that ſort I have ſet forth in my other bookē, greene above and hoary underdeath, having a few ſoft prickles about the edges, at the toppes of the ſtalke ſtandeth one ſcaly head greater then any of the other, from the middle whereof commeth many fine blewiſh purple threads like wooll of the ſaid colour.

3. *Carduus mollis Heleniy folio Camerarij.* *Camerarius* his gentle Thiſtle.

This Thiſtle groweth very tall having large leaves next the ground, very like unto thoſe of Elecampanē, of a darke greene colour on the upper ſide, and whitiſh hoary or woolly underneath, thoſe on the ſtalkes are like the other but leſſer having no prickles on the edges, the toppe whereof is furniſhed with ſmall ſcaly heads upon ſhort footſtalkes, with reddiſh threads for the flower in the middle: the roote is blackiſh and ſpreadeth it ſelfe, encreaſing by new ſhootes from it.

4. *Carduus mollis latifolius Lappæ capitulis.* The Burre headed Thiſtle.

The ſtalke hereof is about a cubit high, ſet with divers ſoft and ſhort prickles, with divers long and broad leaves like unto Docke leaves, being ſmooth thinne and full of veines, and with a ſhew of ſome ſmall prickles about the edges, at the toppes of the ſtalke ſtand divers ſmall prickly heads like unto Burres, both for the forme and bigneſſe, out of which ſtart reddiſh ſtammell coloured threads which are the flower.

The Place.

The firſt *Cluſius* ſaith he found on all the hills that runne from *Callenberg* unto the *Alpes* and in other places in *Hungary*: the ſecond on the hill *Snealben*: the third *Camerarius* ſaith is frequent on all the hils of the *Hermoduri*; and *Bauhinus* ſaith the laſt was found on the hill *Taurerus* in *Auſtria*.

The Time.

They doe all flower in *July* and *Auguſt*.

The Names.

Theſe plants as *Cluſius* ſaith are not fitly termēd Thiſtles wanting prickles, but might more juſtly bee referred to the *Iaceas capitulis ſpinoſis*, & being plants lately found by the diligent ſearch of *Cluſius* and others they have no ancient Greeke or Latine Epithete whereby they may be called, *Camerarius* therefore and *Cluſius* have impoſed names on them as they thought moſt fitting to their naturall formes. *Cluſius* calleth the firſt *Carduus mollis tenuifolius*, and *Bauhinus Cardnus mollis laciniato folio*: the ſecond *Cluſius* calleth *Carduus mollis anguſtifolius vel tertius*, and *Bauhinus Cardnus mollis folio oblongo Cirſij capitulo*: the third *Camerarius* calleth *Carduus montanus foliis Heleniy non ſpinoſus*, *Cluſius* calleth it *Carduus mollis Camerarij*, and *Bauhinus Carduus mollis folio heleniy*: the laſt *Bauhinus* ſetteth forth by the name of *Carduus mollis latifolius Lappæ capitulis*.

The

The Vertues.

We have not knowne or heard unto what diſeaſe any of theſe plants have bēene applyed, and thereforē untill we have ſomewhat worthy the relation we muſt be ſilent, leaving them to every ones judgement to apply them according to diſcretion.

CHAP. XVI.

Acanthus ſive Branca urſina. Beares-breech.

THere are two ſorts of this herbe, the one ſmooth and without prickles eyther on thē leafe or head: the other very prickly in the leafe but not on the head: which although I have ſet forth in my former booke, yet I thinke good to repeate them here againe, in that I would a little more comment upon them, and ſhew you more fully their ſpecificall vertues.

1. *Acanthus ſativus.* The garden gentle or manured Beares-breech.

This gentle Thiſtle (as it is accounted) ſhooteth foote many very large thicke ſmooth and ſad greene leaves upon the ground with a thicke middle rib, and parted into ſundry deepe gaſhes on the edges, from among which after it hath ſtood long in a convenient place, riſeth a reaſonable great ſtalk 3 or 4 foot high without either joynt, branch or leafe thereon, but onely from the middle upwards, ſet with a ſpike as it were of white hoodded or gaping flowers ſtanding in browniſh huskes, ſomewhat ſharpe at the points, and a ſmall long undivided leafe under each flower: after which come in the hotter countries (but not in ours as far as I can learne) broad, flat, round, thicke, browniſh yellow ſeede; the text of *Dioſcorides* hath them ſomewhat long but ſuch did I never ſee, which having put into the ground hath ſprunge with me and growne, the rootes are many great thicke and long ſtrings, ſpreading farre and deepe in the ground, of a darkiſh colour on the outſide and whitiſh within, very clammy and more then the leaves, ſo full of life that a ſmall peece left in the ground, will ſpring up againe, but will require ſhelter or defence from the extremetie of the winter wether.

2. *Acanthus Sylveſtris.* The wilde or prickly Beares-breech.

This other wilde or prickly ſort hath likewiſe ſundry long leaves, lying on the ground but much narrower more devided on the edges into ſmaller parts, and each part with ſmall inciſions, and very ſharpe white prickles at them, from among which a leſſer and lower ſtalke ariſeth, with the like ſpiked head of flowers, and a few prickly leaves thereon in their way comming up, ſtanding in more ſharpe and prickely huskes than the former, after which the ſeede that it produceth, is as ſmall as a little Peaſe, hard, blacke, and round: the roote hereof ſpreadeth not ſo deepe, or farre as the former, nor groweth ſo great but is more tender to keepe from the Winter coldes.

The Place and *Time.*

They both grow naturally in many places of *Italy*, *Spaine*, and *France*, but are onely nurſed up in the gardens

1. *Acanthus ſativa.* Beares breech.

2. *Acanthus ſylveſtris.* Prickly Beares-breech.

of

of the curious with us: the first flowring in *Iune* sometimes or in *Iuly* but giveth no perfect seede with us, the other later flowreth and seldome or never yet gave us any shew of ripe seede.

The Names.

They are called in Greeke ἄκανθος and ἄκανθα, *Acanthus*, and *Acantha* and ἑρπακάνθα *Herpacantha* by some, and the smooth sort πολύκνημος and μελάμφυλλος *Pederos* and *Melamphyllos* as *Oribasius* and *Pliny* have it, *Fuchsius* also saith that it was formerly called *Marmoraria* by the *Romanes* which is corruptly turned into *Mamolaria* among the bastard names of *Dioscorides*, because the forme of the leaves was usually the patterne for many engravings, &c. in pillars and other workes, their pots and cups also flewred with the same: The first is called *Acanthus verus sativus*, *hortensis* and *levis* by all others, or *mollis Virgilii*, and *Branca ursina* by the *Italians*: there are some that make a doubt whether this be the true *Acanthus* of *Dioscorides* partly for the difference of the seedes as you have it before, and partly of the colour of the rootes to be red, but all other parts so exactly agreeing thereunto hath decided that doubt: some againe make a question as *Bauhinus* mistaking the matter, whether the garden kinde be not the *Acantha* of *Theophrastus lib.4.c.11.* which he putteth among the herbes: but he in disjoyning *Acantha* (from *Ceanothus* to make them two things altereth the same wonderfully, as you may see it in *Bauhinus* his *Pinax* in his *Scholy* upon *Acanthus*, and comparing it with *Theophrastus* his Text: but I thinke I may more truly wonder why the first *Acanthus* should bee numbred *inter Spinas & Carduos*, being so smooth an herbe without any shew of prickles or thornes in leafe or heads; which if I might give an answer thereunto, might rather proceede from the likeneſse of the thyrsus or spike of flowers unto the wilde or prickly sort then of it selfe: the other was first set forth by *Dodonæus* and *Lobel* who call it *Acanthus sylvestris* and *Scolymo Dioscoridis similis aculeatus*: some terme it *spinosus* and some *aculeatus* but it cannot bee *Chamæleontha Monspelienſium* which hath a prickly Thistle or Artichoke like head, although the title over it in *Lobels Icones* importeth so much. The *Italians* as I said before call it *Branca ursina* and *Acantho*: the *Spaniards Yerva gigante* and *Branqua ursina*, the *French* also *Branche ursine*, the *Germanes Welsch Berenklaw*, the *Dutch Beeren claew*, and wee in *English* Beares breech and not Beares foote, which is another herbe shewed you here before to be *Helleborastter minor*.

The Vertues.

By reason of the mucsilagines in the leaves they are often used in our times in the decoctions for glisters, so to make the passages more easie and slipperie: but *Dioscorides* saith that they binde the belly, and are good for those members that are out of joynt to confirme and strengthen them which no doubt it may doe by the slimy matter in the leaves and rootes, and soone convertible by heate into a binding quality; for as *Galen* saith *6. simpl.* the roote hath a drying as well as a gentle cutting facultie, being of thinne parts and the leaves often meanely digesting withall: the rootes say *Dioscorides* and *Pliny* are applyed to helpe those places that are burnt with fire, and also those that are burſten, Crampes likewise and the paines of the Goute, to be outwardly applyed, and the decoction of them taken inwardly provoketh urine, and is good for those that are falling into a Consumption.

CHAP. XVII.

Anonis sive Resta bovis. Rest Harrow or Cammock.

AFter I have shewed you all the Thistles that are usually knowne, let me to finish this Classis include those shrubbes or bushes that are thorny and prickly, some of which number are already entreated of in my former booke, and those are the Roses of all sorts for a Garden, the Raspis berries, the Gooseberries and Barberries, the Paliuras or Christs Thorne, the Pyracantha or overgreene Hawtherne and Savine of one sort, the *Ficus Indica* or *Indian* Fig, and the *Indian Iucca* which hath a prickly pointed leafe, & in the second Classis of this worke the purging Rhamnus or Buckes thorne: of the rest I shall speak here in order as they come next to hand, and first of the Rest Harrow which is distinguished into two kinds, the one thorny, the other gentle without thornes which is to be joyned to the other for the names sake, of each whereof there is some varietie as the succeeding Chapter will shew.

1. *Anonis spinosa flore purpureo.* Common Rest Harrow with purplish flowers.

The common Rest Harrow that is frequent as well in arable as waste grounds and by lanes, riseth up with divers tough wooddy twigges, halfe a yard or a yard high, set at the joynts without order, with little roundish leaves sometimes more then two or three at a place, of a darke greene colour, without thornes whiles they are young, but afterwards armed in sundry places with short and sharpe thornes: the flowers come forth at the tops of the twigges and branches whereof it is full, fashioned like Peaſe or Broome Blossomes, but lesser, flatter and somewhat closer, of a faint purplish colour, after which succeede small pods conteining within them small flat and round seede: the roote is blackish on the outside and whitish within, very tough and hard to breake while it is fresh and greene, and as hard as an horne when it is dryed, thrusting downe deepe into the ground, and spreading likewise, every little peece being apt to grow againe if it be left in the ground.

2. *Anonis spinosa flore albo.* Rest Harrow with white flowers.

This Rest Harrow differeth in little else from the former then in the leaves which are a little fresher greene, and in the colour of the flowers which are very white in some places more then in others, in other things they are alike.

3. *Anonis spinosa montana lutea major.* The great yellow prickly Rest Harrow.

This likewise differeth from the former onely in the leaves which are somewhat larger and longer and in the flowers which are yellow like the other yellow kinde without thornes.

4. *Anonis spinosa lutea minor.* The lesser yellow prickly Rest Harrow.

This other yellow Rest Harrow that hath thornes or prickes thereon is like the last yellow sort, but lower and smaller arising little above halfe a foote high, differing not in any other greater matter from the last.

5. *Anonis non spinosa flore purpureo.* Purplish Rest Harrow without Thornes.

This Rest Harrow hath no other difference in it from the most common, but that this hath no thornes or prickes

upon the ſprigges, no not in Autume when the other will have very many. Of this ſort there is one likewiſe that beareth white flowers which maketh all the difference.

Flore albo.

6. *Anonis non ſpinoſa lutea major.*

The greater yellow gentle Reſt Harrow.

This great yellow gentle Reſt Harrow ſhooteth from the roote which is long rough and blackiſh, divers flexible wooddy twigges branching forth on all ſides, covered with a browniſh red barke ſet reaſonably thicke with leaves, which are for the moſt part three ſtanding together upon a long footſtalke ſomewhat like unto Trefoile, but ſomewhat ſmall narrow and long with notches at the ends ſo much over ſpread with a ſtrong ſented clammineſſe that it will ſticke ſo faſt to their hands that touch them, eſpecially in the heate of the yeare, and in the hot countries that it will hardly be taken off againe: at the toppes of the branches ſtand many Peaſe bloſſome-like flowers, of a faire yellow colour, after which come ſmall & long cods with a crooked point at the end of every one of them, wherein is conteined ſmall flattiſh ſeed. Of this kind we have had from *Boel* of *Liſhbourne* a leſſer ſort, whoſe flowers ſmelt better then the former: the roots of both are annuall periſhing yearely. As alſo another with a more reddiſh flower.

Minor flore odorato & ſt. purpurante.

7. *Anonis non ſpinoſa lutea variegata.*

Variable yellow gentle Reſt Harrow.

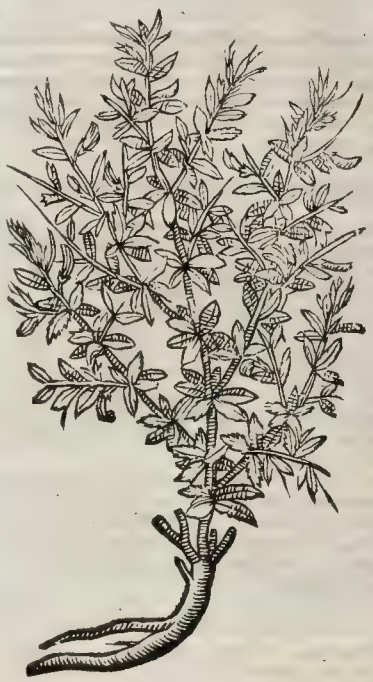
This differeth in no other thing from the laſt yellow, but in the flowers which are of a paler yellow colour, ſtriped all the length of the flowers with reddiſh ſtripes, which make them the more conſpicuous and regarded.

8. *Anonis viſcoſa minor lutea pendula.*

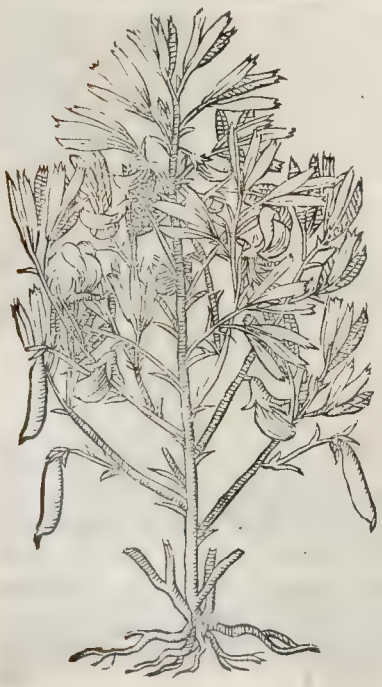
The leſſer yellow gentle Reſt Harrow.

This leſſer yellow, gentle Reſt Harrow groweth very low and ſmall not much above an hand breadth high, having many branches of two or three inches long a peece, with leaves ſet thereon, three joyned together for the moſt part, and clammy alſo like the other yellow ſorts, the flowers ſtand in like manner at the toppes of the branches

1. *Anonis aut Ononis ſpinoſa flore purpureo.*
Common Reſt Harrow with purpliſh flowers.



6. *Natrix Plinij ſive Anonis non ſpinoſa lutea major.*
The greater yellow gentle Reſt Harrow.



7. *Ononis non ſpinoſa lutea variegata.*
Variable yellow gentle Reſt Harrow.

Yellow

yellow but ſmaller and hanging downewards: the ſeede that followeth is much like the other, but ſmaller and in ſmaller cods. Of this ſort alſo wee have had from the ſaid *Boel* two other ſorts with reddiſh flowers both of them growing low and ſmall, the one being but annuall and the other abiding.

Minor aſtiva & perennis ſtrubria.

The Place.

The firſt ſecond and fift with the varietie thereof grow in many places of our Land, as well in the arable as waſte grounds, but the third and fourth I never met with growing naturally any where in our countrey, although *Lobel* ſaith of the fourth that it groweth as well about *Briſtow* as *London*, *Geſner* ſaith the third groweth on the hill *Gemma* among the *Valeſians*, and *Columna* ſaith the fourth groweth in the kingdome of *Naples*: the ſixt, ſeventh and eighth with their varieties groweth as well in *Narbone* in *France*, and about *Mompelier* as in *Spaine* and *Portugall*.

The Time.

They doe all flower about the beginning or middle of *July*, and their ſeede is ripe in *Auguſt*.

The Names.

Dioſcorides and *Pliny* call it Ἄνωνις *Anonis*, *Theophraſtus* and *Galen* Ὄνωνις *Ononis* the Latines keepe both names; *Anonis quaſi non juvando quod nullam utilitatem præbeat, dici videtur, ſiquidem aratoribus inimica eſt, vivaxq; nimis frugas opprimit & ſuis aculeis nocet nisi quis ex adverſo nomen inditum putaverit: Ononis* ἀπὸ τῆ ὀνῆ quaſi *d cas aſini oblectationem, namex Græcis quidam affirmant aſinos in ea ſe voluptare & dorſum ſub ejus aculeis libenter exterere.* It is alſo called *Areſta bovis* and *Reſta bovis*, and *Remorum aratri*, becauſe the roots are both ſo tough that the Plough Share cannot eaſily cut them, and ſo deepely and ſtrongly faſtned in the ground, that the Coulter happening under it cauſeth the Oxen to bee at a ſtand for the firſt twitch, not being able without more then ordinary ſtrength to pull them forth, *Cordus* on *Dioſcorides* calleth it *Acutella*, becauſe the thornes doe pricke thoſe that unwarily goe by it. *Geſner in hortis* adviſeth not to bring *Ononis* into a garden leaſt it prove *Anonis* that is not helpefull but hurtfull, being not eaſie to rid it out againe. *Anguilara* tooke it to be *Ægipyros Cratevæ*. All writers elſe call it eyther *Anonis*, *Ononis* or *Reſta bovis* with the ſeverall diſtinctions of *ſpinoſa* or *non ſpinoſa*, and according to the colour of the flowers onely the great yellow without thornes is taken of moſt herbariſts to be *Natrix Lutij*, which yet *Lobel* ſeemeth to doubt of, ſaying hee will neither gueſſe nor divine by what argument it is ſuppoſed, nor trouble himſelfe much to diſprove them, yet *Anguilara* doth rather thinke the *Fraxinella* ſhould be it. The *Italians* call it *Anonide Bonaga* and *Reſta bove*, the *Spaniards Gatilhos* and *Gattinos*, the *French Arreſte bruf.* the *Germans Hawhackell* and *Ockſenbreck*, the *Dutch Krangwortele*, oft *Stalcruyt*, and wee in *Engliſh* Reſt Harrow *Euphoniæ gratia* rather then Reſt Plough or Reſt Oxen as it is in other languages, in ſome countries alſo Cammock and Petty whin.

The Vertues.

Galen ſaith that the roote of Reſt Harrow is hot in the third degree having ſome clenſing and cutting faculties therein alſo. It is ſingular good to provoke urine when it is ſtopped, and to breake and drive forth the ſtone, which the powder of the barke of the roote taken in wine performeth effectually; for *Matthiolus* writeth that he knew divers freed from thoſe diſeaſes that uſed the ſayd powder in wine for many dayes together, and the ſame alſo to helpe that diſeaſe called *Ramex* or *Heirna carnoſa* the fleſhy rupture, that is, that fleſhy carnoſitie by little and little conſumed, in taking the ſaid powder for ſome moneths together conſtantly, when as the Phyſitions and Chirurgions had given them over, as deſperate or no otherwiſe to bee cured but by cutting or burning: the decoction thereof made with ſome vinegar and gargled in the mouth eaſeth the paines of the toothach eſpecially when it commeth of rheume: ſome alſo affirme that the decoction hereof drunke doth helpe the painefull hemorrhoides: but it is certainly found true that the ſaid decoction taken is very effectuall to open the obſtructions of the Liver and Spleene, and the other parts: a diſtilled water made in *Balneo* with foure pounds of the roots of Reſt Harrow, firſt ſliced ſmall, and afterwards ſteeped in a Gallon of Canary wine, is ſingular good likewiſe for all the purpoſes aforeſaid, and to cenſe the paſſages of the urine, not ſuffering any matter that is clammy to gather together or harden to become a ſtone: the ſaid quantitie of the rootes ſliced and put into a ſtone pot cloſe ſtopped with the like quantitie of wine, and ſo ſet to boyle in a *Balneo Mariæ* for 24. houres is as daintie a medicine for tender ſtomacks as any the daintieſt Lady in the Land can deſire to take, being troubled with any the aforeſaid griefes: the powder of the ſaid roote made into an Electuary or Lozenges with Sugar, as alſo the barke of the freſh rootes boyled tender and afterwards beaten into a Conſerve with Sugar worketh to the like effect: the powder of the rootss ſtrowed upon the hard callous, brims of ulcers, or the ſaid powder mixed with any other convenient thing and applyed doth conſume the hardneſſe and cauſe them to heale the better: it is recorded that in former times the young ſhoots and tender ſtalkes before they became prickly were picked up to bee eaten as a meate or ſawſe, wonderfully commended againſt a ſtinking breath, and to take away the ſmell of wine in them that had drunke too much. *Pona* in his *Italian Baldus* ſaith that divers Apothecaries with them there in *Italy* doe uſe the flowers of the yellow Reſt Harrow in ſtead of Melliſot eyther through want or ignorance.

CHAP. XVIII.

Tragacantha. Goates Thorne.

I Cannot but diſſent from *Bauhinus* who diſſenteth from *Cluſius* and others, that make *Poterium* another or leſſer ſort of *Tragacantha*, and differing from the *Pimpinella ſpinoſa*: for I muſt doe contrary to him, and thinke I have good reaſon for it, as ſhall be ſhewed by and by, and ſpeake of the *Pimpinella ſpinoſa* in a Chapter by it ſelfe, becauſe I finde the difference betweene *Poterium*, *Tragacantha* and *Pimpinella ſpinoſa* to conſiſt in many things.

1 *Tragacantha vera.* The true Goats thorne.

The true Goats thorne is a ſmall buſhie plant riſing up with many tough plyant or flexible wooddy ſtemmes not much above a cubit or two foote high divided into many ſlender branches, covered with a white hoarineſſe, ſet with divers long white thornes in a double row, among which riſe up divers winged leaves that is, many

small long and round leaves set on each side of a middle ribbe, which abide on all the winter long and fall not off, untill the spring doe bring on fresh, and then fall away, at the toppes of the branches and among the leaves come forth the flowers which are of a whitish yellow colour, fashioned somewhat like unto the flower of a Trefoile, after which come small short upright white cods, wherein are conteined small whitish cornered seede: the roote is very great and long, spreading much and farre in the ground, which being broken or wounded yeeldeth a tough pure shinig white gumme, in small crooked peeces tasting somewhat sweete. There is another sort hereof whose stalkes and branches are blackish and wooddy, having small thinne leaves all set on one side, and not opposite as in the former, the flowers and seede is somewhat like, but the roote yeeldeth no gumme.

Altera non gummifera

2. *Tragacantha altera seu minor Poterion forte Dioscoridis.* The small Goates thorne.

This other Goats thorne is so like the first that it is often mistaken for it, growing lower and smaller then the former, yet spreading and shooting forth pliant flexible stalkes, covered as it were with scales about a foot high, from whence springeth up a cottony or woolly head, which breaketh into sundry winged leaves in the spring of the yeare, made of many small and almost round leaves being set on both sides of a middle ribbe, which are very hoary and as it were woolly at the first budding forth, which the former hath not and so continue hoary as long as they abide on the ribbe, which proveth a thorne very cruell sharpe and prickly at the end when they are fallen away, so that all the winter long no leafe is seene on any, and the thornes that have cast their leaves never have any more growing on them, but abide bare and naked thornes ever after, the bush seeming all the winter long nothing but long sharpe white thornes: from the upper parts of the stalkes come forth two or three whitish flowers standing together, made of two leaves a peece an under and an upper, both formed somewhat like hoods, each flower in a hoary huske or hose; the pod that followeth is hoary, white, thicke, short and somewhat broad, ending in a point wherein is contained whitish seede, somewhat like unto a *Medica* seede: the roote is great long and tough, blackish on the outside and white within, some what sweet and gummy, yet yeelding but little gumme and that more yellowish. There is another sort hereof whose branches are very sharpe, not rising much above the ground, but they are many and thicke growing together, the roote being wounded yeeldeth a gumme like unto *Tragacantha*.

Poterium altud.

3. *Tragacantha Syriaca flavescens.* The yellow *Syrian* Goates thornē.

This *Syrian* thorne differeth very little from the last but in the flowers which are yellow, standing in round yellowish huskes, and that the whole plant groweth lower.

4. *Tragacantha Syriaca purpurascens.* Purple *Syrian* Goat s thorne.

This other *Syrian* kinde is as low as the last, having many browne thicke stalkes, thicke set with leaves and many white heads at the toppes, out of which come purple flowers like the former which are very beautifull.

The Place.

Both the formēr sorts with their varieties have beene found as well in *Candy* as about *Marselles* and *Mompelier*: the first anciently knowne both there and in other places sufficient plentifully, but the other was also found by *Clusius* in the kingdom of *Granado*, a more exact figure whereof was sent unto him after his death from *Aquasextias* which is not farre from *Mompelier*, and is published in his *Curæ posteriores* in *quarto*, *pag.* 113. the other two last sorts *Rauwolfius*, and *Lugdunenſis* from him in his *Appendix* setteth forth to grow in *Syria*.

1. *Tragacantha vera.*
The true Goates thorne.

2. *Tragacantha altera seu minor Poterion forte Dioscoridis.*
Small Goates thorne.

The Time.

All theſe ſorts are very tender to keepe with us, not enduring the cold of theſe cold climates without extraordinary care and proviſion, but in their naturall places flower and ſeede in the beginning of Autumne.

The Names.

The firſt is undoubtedly knowne to be the τραγάκανθα *Tragacantha* of the ancients, *id eſt*, *Hirci ſpina* not from any ſtrong ſent of a Goate as the *Tragium* and *Tragoriganum* have, but from the ſharpe forme of the buſh with thornes as it groweth repreſenting a Goates beard, the gumme likewiſe that is gathered from the rootes when they are cut or broken in the heate of the yeare is called *Gummi Tragacantha*, and in the ſhoppes of Apothecaries in *France*, &c. *Gum dragant*, the varietie thereof is mentioned by *Alpinus* in *Libro de exoticis plantis*: the ſecond is adjuged by the beſt herbariſts in theſe times to be the πτέρεον *Poterion* of *Dioſcorides*, which as hee ſaith ſome called νάρθηκα *Neuras quod nervis amica ſit & Poterium quod potrix herba paludoſum riguumque ſolum amat*, as ſome ſay, *Pliny* ſaith it was called alſo *Phrynium*: this differeth from the *Tragacantha* but yet commeth nearer thereunto then unto the *Pimpinella ſpinoſa* as you ſhall heare in the next Chapter, the chiefeſt difference betweene the *Tragacantha* and *Poterium*, conſiſting in that it keepeth no greene leaves in winter as *Tragacantha* doth, is more hoary or woolly and ſpreadeth more abroad with the branches then *Tragacantha*, which groweth more cloſe and upright, but agreeth therewith in the ſmall leaves and ſharpe thornes and in the roote which yeeldeth a gumme, ſomewhat like to gumme *Tragacantha* but the *Pimpinella ſpinoſa* hath both differing leaves branches and fruit, with ſmaller and leſſer prickly thornes and a dry ſapleſſe roote which yeeldeth no gumme, and abideth ever greene. Now let others judge whether this be more fitly referred to *Pimpinella ſpinoſa* as *Bauhinus* or to *Tragacantha* as *Cluſius* doth who calleth it *Tragacantha altera forte Poterion*, and ſo doe *Lobel*, *Tabermontanus*, *Alpinus* and *Lugdunenſis* and *Bellonius* likewiſe as it is likely, *Bauhinus* himſelfe although he ſever it from the Claſſis of *Tragacantha* yet calleth it *Tragacantha affinis*, *Matthiolus* calleth it *Poterium* and ſo doth *Tabermontanus* and *Lugdunenſis*. *Rauwolfius* maketh it his firſt *Tragacantha* and *Lugdunenſis* in his *Appendix* in the like ſort after him: the two laſt ſorts are ſet downe by *Rauwolfius* in his ſecond booke and in the ſaid *Appendix* of *Lugdunenſis*.

The Vertues.

I doe not finde that the leaves flowers, ſeedes or rootes of *Tragacantha* are uſed to any purpoſe, but onely the gumme it ſelfe, which beſides the phyſicall uſes ſerveth to many purpoſes as a kinde of ſtarch or Glew to binde or ſtiffen things withall: the gumme diſſolved is often mixed with pectorall Syrupes, hony or juice of Licoris to helpe the cough or hoarſeneſſe in the throate ſalt, and ſharpe diſtillations of rheume upon the Lungs, being taken as an Electuary or put under the tongue ſo to diſtill gently downe: the ſaid gumme diſſolved in ſweet wine a dram at a time and drunke, is availeable for the gnawing paines in the bowells and the ſharpneſſe and frettings of urine, eyther in the reynes or bladder, eſpecially if ſome harts horne burnt and waſt be mixed therewith: the ſaid gum alſo is an ocular medicine helping thereunto, being uſed alone or mixed with other things for the purpoſe, to allay the heate and ſharpenes of hot rheums falling into them, and ſtrengtheneth and bindeth more then *Sarcocolla*, the ſaid gumme mingled with milke taketh away white ſpots growing in the blacke of the eyes, the itching alſo of them and wheales and ſcabbes that grow upon the eyelids: being ſomewhat terrified and mixed with the juice or wine of Quinces and uſed in a gliſter is good againſt the bloody flux. And generally uſed where there is cauſe of making ſmooth any of theſe parts that is the Lungs, Cheſt, Throate or Windepipe growen hoarſe or ſharpe by rheumes or to repreſſe or dry up defluxions of ſharpe and thinne matter to the throate, jawes, &c. as for Vlcers in any of theſe parts it is an excellent and approved remedy: the rootes of the ſecond which as I ſayd is verily held to be the true *Poterium* of *Dioſcorides* boyled in wine and drunke is profitable againſt the poyſon of the red toade, and being made into a pultis and applyed to any of the Nerves or Sinewes that are wounded cut or hurt doth heale them and ſoder them together, as alſo all other ſorts of wounds and cuts: the ſaid decoction of the rootes in wine is alſo effectuall for the ſaid purpoſes to bee drunke, and for inward wounds and veines that are broken.

CHAP. XIX.

Pimpinella ſpinoſa. Thorny Burnet.

THe thorny Burnet (taken of divers to be *Poterium* but much differing therefrom, as I have ſaid before, and ſhall here more preſently) ſpreadeth divers wooddy whitiſh twiggy ſtalkes round about, not riſing much above a cubit high branching and interlaſing it ſelfe one within another very much bearing ſundry winged leaves of many ſet together on both ſides of a middle ribbe, which upon the firſt appearing are cloſed together, and afterwards ſpread themſelves more largely and dented about the edges very like unto ſmall Burnet leaves, greene on the upper ſide and hoary white underneath, with many ſmall prickes or thornes, not very ſtrong or ſharpe ſet confuſedly upon the ſtalkes and at the ends, at the toppes whereof and the branches ſtand divers ſmall reddiſh greene flowers ſet together, after which come ſmall berries divers growing together like unto ſmall Blacke berries, or Mulberries, greene at the firſt and reddiſh afterwards: the roote is not great but long and ſlender, ſpreading much under ground, being tough and not eaſie to breake, ſapleſſe alſo or without any gum comming therefrom when it is broken.

The Place.

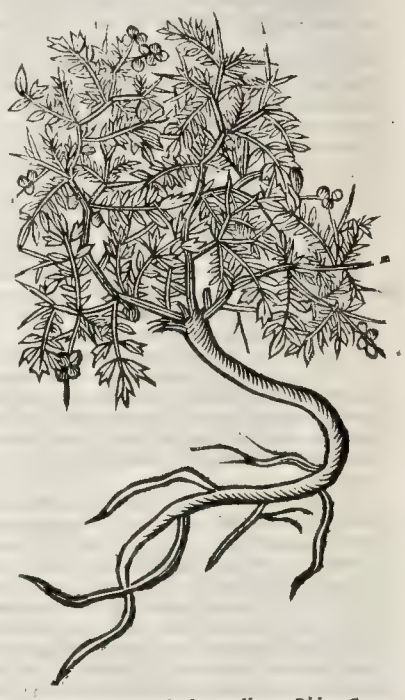
This groweth in *Candy* as *Honorius Bellus* ſaith and *Alpinus* alſo upon the hills where Time, Savory and Aſparagus grow, and with them having Dodder growing upon it alſo: and upon the ſide of mount *Libanus* in *Syria* as *Rauwolfius* ſaith, and as *Dalechampius* ſaith in the vallies beneath the hilly woods in *Savoy* about *Marra* which is but a little diſtant from *Gratianople* but is never found in wet or marſhy places.

The Time.

It flowreth in the end of Summer, and the fruit is ripe in Autumne when the young leaves beginne to ſpring forth.

The Names.

Pimpinella ſpinoſa. Thorny Burnet.



This plant is generally called *Pimpinella ſpinoſa*, and by ſome as is aforeſaid *Poterium* but falſly for *Poterium* as you have heard before hath very ſtrong and long white thornes, the leaves are like Lentills, the fruit are cods wherein lye the ſeede and the roote yeeldeth a kinde of gumme, all which are contrary herein as you may perceive by the deſcription, the leaves hereof being dented about, and in ſhew very like Burnet which together with the prickes hath cauſed the name of thorny Burnet. *Honorius Bellus* in his ſecond Epiſtle unto *Cluſius* ſheweth very learnedly and by ſound and good reaſons, that this plant being called σταβήδα *Stœbeda* not onely in *Candy* but of the Greekes in generall (which name is but corrupted from *Stœbe*) is the true *Stœbe* of *Dioſcorides* although hee hath not given any deſcription thereof (but differeth much from the *Stœbe* of *Galen*) firſt becauſe the names are ſo like, then that the drying qualities herein are anſwerable to the *Stœbe* of *Dioſcorides*: next hee ſheweth that the *Phleos* of *Theophraſtus lib. 6. cap.* 1. called alſo *Stœbe* of ſome as he ſaith (and not *Phleum* which is a marſh or water plant, the affinitie of the names having deceived many learned men in taking them to be both one) is numbred by him among the thorny plants that have thornes beſide the leaves as this Burnet hath (and not as *Gaza* tranſlateth it, at the thorny leafe hath another leafe placed with it) comparing it therein unto *Ononis* and *Tribulus*: and that *Stœbe* is a thorny plant, *Plutarke* in the life of *Theſeus* ſheweth, where ſaying, *Ioxus* the ſonne of *Menalippus* taking care to plant a *colony* at *Caria* from whence the *Ioxides* had their originall, have this cuſtome among them that they neither burne the thornes of *Aſparagus* nor of *Stœbe* but have them in reverence and honour: *Ætius* alſo in his third booke and 29. Chapter affirmeth that *Epithymum* (or rather *Cuſcuta*) groweth upon *Stœbe*: but whereas *Theophraſtus* in his ſixt book and third Chapter ſeemeth to make it peculiar to *Phleos*, *Capparis* and *Tribulus*, to have not onely a thorny ſtalke but a prickly leafe alſo, hee differing herein much from himſelfe: for in the ſame booke and fift chapter hee ſaith, that *Phleos* and *Hippopheos* (which *Gaza* tranſlateth *Lappago*) have gentle leaves and not prickly as *Intuis* or *Capparis* hath: but *Pliny* in his 21. booke and 15. Chapter not rightly conſidering what *Theophraſtus* had written of *Stœbe*, hath not onely erred himſelfe but hath beene the cauſe of many other mens errours. Now concerning *Phleum* that it is a plant farre differing from *Stœbe*, and reckoned alwayes by the Greeke writers among the marſh plants and not among the thorny, theſe things may ſufficiently induce. Firſt *Plutark* in his ſecond booke of naturall queſtions ſaith thus, *Lavius* muſt know that all marſh plants ſuch as *Typha*, *Phleum* and *Ulva*, doe neither ſpring nor grow if the raines fall not in their proper ſeaſon. *Ariſtophanis* alſo ſaith the ſame in his Comedy of Frogs, where the quire ſaith, we have beene skipping among the *Cyperus* and *Phleum* rejoycing in their ſongs: and *Theophraſtus* laſtly in his fourth booke and eleventh Chapter numbreth *Phleum* among the plants of the lake *Orchomenius*, and appointeth two kindes, the male that beareth fruit and the female that is barren ſerving onely to binde things withall, and ſaith alſo that the fruit of this *Phleum* is called *Anthella*, whereof they uſe to make a lye, and is a certaine flat thing like a Cake ſoft and reddiſh, which plant is yet unknowne to the beſt herbariſts of theſe times. *Anguilara* tooke this *Pimpinella* to bee χαλκεὶ & *Chalceios ſive Æraria Theophraſti*, and *Cluſius* doth ſo entitle it alſo, *Ranwolfius* ſaith that the Moores of the country about *Libanus* call it *Bellan* and ſaith it may well be the *Sanguiſorba ſpinoſa* of others: *Cluſius* and *Camerarius* call it *Pimpinella ſpinoſa*, and *Bauhinus Poterio affinis foliis Pimpinella ſpinoſa*, as though there were another *Pimpinella ſpinoſa* and that this had leaves but like unto it.

The Vertues.

This is of a very drying and binding qualitie, and therefore is taken to ſtay laskes and fluxes of the body, the herbe being boyled and the decoction taken faſting, which *Honorius Bellus* ſaith that they of *Candy* doe account to be a ſure medicine to helpe them, whenſoever they neede for that purpoſe.

CHAP. XX.

Aſpalathus, *Spalatos* thorny Buſh or Broome.

Dioſcorides maketh mention of two ſorts of *Aſpalathus*, the one reddiſh or purpliſh under the upper barke, the other white, both which are almoſt unknowne to the moſt judicious at theſe times, yet *Pona* in his Latine and *Italian Baldus*, hath expreſſed the figure of the firſt *Aſpalathus*, and in his *Italian* the figure alſo of the ſecond differing from thoſe of *Cluſius* and others, growing with *Signor Contarini*, all which I thinke fit to ſhew you here.

1. *Aſpalathus alter Monſpelienſis. Dioſcoridis* his ſecond *Aſpalathus* according to thoſe of *Mompelier*.

This *Aſpalathus* or thorny buſh of *Mompelier* (where the learned did judge to be the ſecond *Aſpalathus* of *Dioſcorides*

ſcorides) is a ſmall low buſh or ſhrubbe, not riſing much above a cubit high, ſtored with divers branches and ſharpe ſhort crooked thornes, bending downewards ſet on them, as alſo many ſmall greene leaves, divers ſet together on both ſides of the middle ribbe, no bigger then Lentill leaves, and ſuch likewiſe the young branches have, but ſmaller: the flowers ſtand on the ſtronger thorny branches, three or foure or more ſtanding together of the faſhion of Broome flowers, ſometimes more yellow and ſometimes paler, after which come ſmall ſeedes in ſmall pods.

2. *Aſpalathus alter ſecundus Cluſij.*
Cluſius his other ſort of *Aſpalathus*.

This other *Aſpalathus* of *Cluſius* groweth greater higher and ſtronger then the former, and ſet with ſharpe crooked thornes as plentifully as it, with ſmall leaves on them in the ſame manner, at the toppes whereof grow the flowers like the other, but alwayes of a paler colour, in the reſt there is little difference to be diſcerned betweene them.

3. *Aſpalathus alter tertius hirſutus.*
Small *Aſpalathus* with hairy leaves.

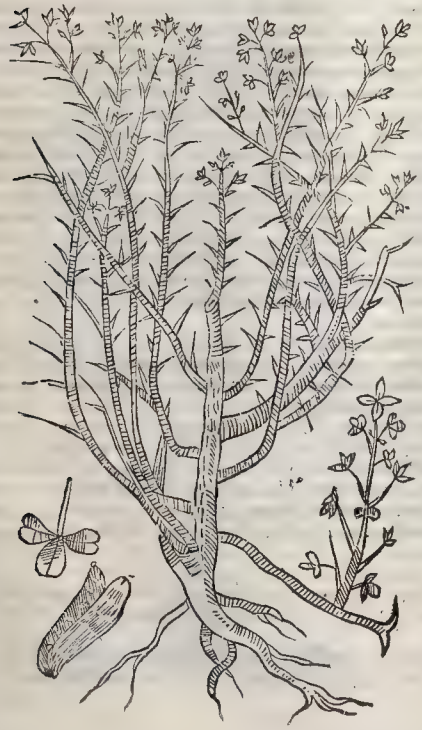
This ſmall *Aſpalathus* groweth uſually lower then the firſt, as not exceeding a foote in height furniſhed with more ſlender yet prickly ſtalkes, but divided into many ſuch ſmaller branches, that they ſeeme almoſt as ſmall as thoſe of Southernwood, being hard and prickly; from the elder branches ſhoote forth in the Spring of the yeare other ſmaller ſtalkes bearing many hoary leaves like thoſe of Lentills but ſofter and larger then thoſe of the firſt ſort: the flowers likewiſe being yellow like the other are greater then they by a little: the ſeede likewiſe keepeth a proportion like unto the reſt.

4. *Aſpalathus ſecundus Dioſcoridis legitimus Pona.*
Dioſcorides his true ſecond ſort of *Aſpalathus* according to *Pona*.

The true *Aſpalathus alter Dioſcoridis* (firſt deſcribed by *Honorius Bellus* of *Candy* in his firſt Epiſtle to *Cluſius* and the figure thereof afterwards exhibited by *Pona* in his *Italian Baldus*,

1. *Aſpalathus alter Monſpelienſis.*
Dioſcorides his ſecond *Aſpalathus* according to thoſe of *Mompelier*.

4. *Aſpalathus ſecundus Dioſcoridis legitimus Pona.*
Dioſcorides his true ſecond ſort of *Aſpalathus* according to *Pona*.



5. *Aſpalatus primus Dioſcoridis odoratus?*
The firſt and ſweete *Aſpalathus* of *Dioſcorides*.

wherein is many more rare plants set forth then is in the Latine, and received from *Signor Contarini*, who hath a Garden stored with the rarest plants that can bee gotten from all parts) is as the said *Bellus* saith generally knowne through all *Græcia* reteining yet the old name, wherewith they not onely make hedges and fences to their grounds but in some places whole Groves are found stored therewith: and is a small hedge bush rising up with many upright stemmes, branched forth into many parts, set full of small sharpe white thornes on all sides without order, and at every thorne on the young and tender branches one trefoile pale greene leafe upon a long footestalke, whose ends are round and dented in in the middle: the flowers stand at the toppes divers set together which are fashioned like unto Broome flowers at some times, and places, wholly yellow, and at others more reddish or inclining to purple, of so sweete a sent that with the winde it is felt a good way of: when the flowers are fallen there come up in their places small pods, conteining within them foure or five small round seede like Vetches, lesser then those of *Acacia altera*: the roote is wooddy and brancheth forth in the ground, sending forth suckers whereby it is plentifully encreased: the substance of the wood is very hard heavy and white, the heart or core whereof is blackish and utterly without any sent while it is greene, but dry senteth better.

5. *Aspalathus primus Dioscoridis odoratus.* The first and sweete *Aspalathus* of *Dioscorides*.

Although this plant be not throughly described and set forth as the former is with the leaves, flowers and seede being but declared with the trunke or body and with an arme and a few branches cut short with thornes thereon appearing, yet I thought it not inconvenient to set it forth as it is extant with so much description as is added unto it, that others may understand thereof and have thereby some knowledge of it, to further them when they shall happen to meete with it. The barke of the tree is of a blackish ashcolour, of an astringent and somewhat bitter taste and biting withall, which being taken off, the inner barke is of a faire purple colour, especially the innermost which is very thinne, fine and full of small strings or threads, the substance of the wood is firme and heavy but sinketh not in water as Ebony doth, of a pale colour and blackish for the most part in the middle, of a strong sent, somewhat quicke or fierce: There have beene formerly divers woods shewed and taken to bee true *Aspalathus* as by some the *Lignum Rhodium* and by some the wilde Olive, &c. but all have erred in their judgement, every one of them wanting the notes of the true in some part or other, and this onely comming nearest thereunto in every thing.

The Place.

The first groweth about *Salamanca* in *Spaine*, as also about *Mompelier* and in *Narbone* of *France*: the second in old *Castile* in *Spaine*: the third at the foote of the *Pyrenean* hills towards *Spaine*: the fourth in *Candy* in divers places in *Greece*: the last is not declared from whence it came.

The Time.

They all flower somewhat early in their naturall and warme countries, and give their fruit or seede in Summer; but in these coulder climates they will hardly endure the first colds of our Autumne as my selfe have proved who have had them sprunge from the seede that I sowed and have abiden onely the Summer Season.

The Names.

The Greekes call it ἀσπάλαθος *Aspalathus*, and so doe the Latines also, yet *Pliny* from *Dioscorides* saith it was also called *Erysiceptrum* and of some *Sceptrum*. The first three sorts *Clusius* doth acknowledge are none of them the true *Aspalathus alter Dioscoridis*, yet because saith hee others did call the first so (and the others are likest unto it) he calleth it and them *Aspalathus alter primus secundus & tertius*. *Bauhinus* entituleth them all *Genista spartium spinosum* as *Lobel* doth, set forth in his *Icones*; but in his Observations he calleth it *Aspalathus secunda Monspelienſium*, and *Lugdunenſis Aspalathus primus Monspeſſulanus* but should be *secundus* being the Printers fault; *Anguilara* tooke it to be *Acacia altera*, and *Tabermontanus* calleth it *Scorpius minimus*: the fourth is the *Acacia altera* of *Matthiolus*, *Lacuna*, *Lonicerus*, *Lobel*, *Lugdunenſis*, *Gesner* and *Camerarius*: but *Honorius Bellus* in his fift Epistle unto *Clusius* sheweth (as *Pona* also from him doth, and as I sayd in the description) that in *Candy* and throughout all *Græcia* it is called *Spalathos* to this day, and therefore is confident to call it *Aspalathus secundus Dioscoridis*, as *Guilandinus* in his Epistles did before him, who was *Bellus* his Tutour: but *Bauhinus* because he would go with the greater although not the better number as it should seeme (for he quoteth the same authors himselfe that I doe here, both that call it *Acacia* and *Aspalathus*) calleth it *Acacia trifolia*: the last onely *Pona* hath set forth in his Latine and *Italian* description of Mount *Baldus*, who saith that the wood is pale, and yet *Bauhinus* in setting it downe in his *Pinax* as having received a peece thereof from *Pona* himselfe saith thus of it, *Aspalathus cortice cinereo ligno purpureo* making the wood to be purple when as nothing but the inner rinde is so. *Clusius* saith that the *Spaniards* call the first *Eulalva*, the second *Aulaga*, and the third *Hallada*.

The Vertues.

Avicen saith that *Aspalathus* is hot in the first degree and dry in the end of the second, almost to the third. *Dioscorides* saith it hath an heating qualitie with some astriction, but *Galen lib. 6 simpl medicament.* saith thus. *Aspalathus* is in taste sharpe, together with some astriction also, the faculties therein being of unlike parts, to wit sharpe whereby it is heating; and harsh or sowre, whereby it is cooling by both which it is drying, and thereby good against putrefactions and Fluxes of all sorts: a decoction thereof made in wine and gargled in the mouth is singular good to heale the fowle Vlcers thereof, as also those in the nose to bee snuffed up or injected, as also those Vlcers of the genitoryes or secret parts, if they bee bathed therewith: the said decoction stayeth the flux of the belly and helpeth the spitting of blood, it helpeth also those that cannot make water, and dissolveth windy swellings. *Pliny* saith the same, and further saith that it helpeth the chappes in the hands or other parts, and that the barke is effectuall against the strangury, as also availeable to binde the belly, and the decoction thereof stayeth bleedings.

CHAP. XXI.

Geniſta Spartium ſpinoſum. The pliant thorny Broome.

OF this kinde of Plant *Bauhinus* maketh many ſorts, ſome whereof I have placed in the former Chapter as fitteſt for that place in my opinion rather then this, the reſt ſhall be declared here.

1. *Geniſta ſpartium ſpinoſum minus.* The leſſer pliant thorny Broome.

This ſmall thorny buſh riſeth about a foote high ſet with moſt ſharpe thornes, placed in order two alwayes together one againſt another, of a pale greene colour, many branches of theſe thornes ſpringing from the maine ſtemme up to the toppe, at the ends whereof ſtand three or foure ſuch yellow Broome-like flowers as are to be ſeene in the Furſe buſhes, after which come ſmall ſhort pods ſo encloſed in a hoary woolly downe that they ſeeme as it were covered with copwebs, wherein lie ſmall ſeede leſſer than Vetches: the roote is long and ſpreadeth much.

2. *Geniſta ſpartium ſpinoſum Syriacum.* The pliant thorny Broome of *Syria*.

This thorny buſh riſeth up more then a cubit high, ſet with divers branches and ſmall long aſh-coloured thornes yet more ſoft and gentle then the other, and more ſparſedly placed alſo, having divers long and narrow blewiſh or aſh-coloured leaves with them like unto thoſe of Knotgraſſe: the flowers are of a purple colour, ſtanding in ſmall red huskes, after which come ſmall long pods like unto the Scorpion podded ſeede veſſells, conteining reddiſh ſeede within them: the roote is long and browne.

3. *Spartum ſpinoſum Creticum.* The pliant thorny Broome of *Candy*.

This thorny Broome riſeth up with a wooddy ſtalke or ſtemme covered with a blackiſh barke, ſpreading ſundry ſlender blackiſh branches, and they againe divided into ſmaller like ruſhes, all ending in ſharpe thornes, beſides divers others, ſet here and there at the joynts of the branches, where alſo come forth fine ſmall hoary leaves ſet together the flowers are ſmall and yellow ſucceeded by ſmall long pods and ſmall ſeede in them.

4. *Spartum ſpinoſum aliud Creticum.* Another pliant thorny Broome of *Candy*.

I have joyned the figure hereof with the foregoing plant, and that it ſhould not paſſe undeſcribed, but take it briefly thus: It groweth very tall & high, buſheth and brancheth forth very much, the ſlender flexible greene branches are ſprinkled with ſmall white ſpots, having three ſmall leaves at a joynt, with yellow flowers and ſmall pods afterwards; each branch and twigge ending in a long thorne at the laſt.

5. *Erinacea Hiſpanica Cluſij.* *Cluſius* his *Spaniſh* Hedgehog Thorne.

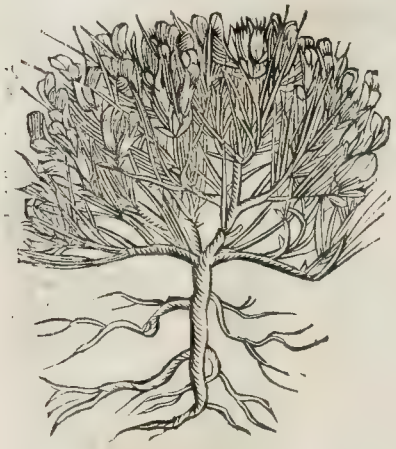
This no leſſe rare then daintie buſh groweth to be ſcarſe a foote high ſpreading many ſtalkes and branches one interlaced among another, and all ſet in a round forme or compaſſe repleniſhed with a number of cruell ſharpe greene thornes: at the toppes of the branches ſtand three or foure flowers alwayes together of the ſame faſhion with the former, but of a blewiſh purple colour ſet in rough and hairy hoary huskes, while it flowreth there are

1. *Geniſta Spartium ſpinoſum minus.*
The leſſer pliant thorny Broome.

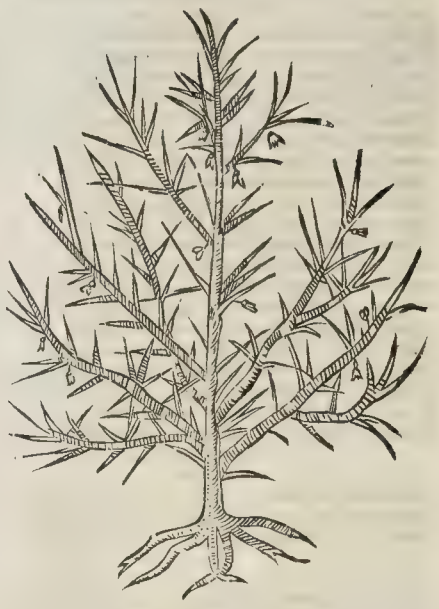
3. 4. *Spartum ſpinoſum Creticum duarum ſpecierum.*
The two thorny pliant Broomes of *Candy*.

ſome

5. *Erinacea Hispanica Clusij.*
Clusius his *Spanish* Hedgehog thorne.



6. *Echinopoda frutex Creticus.*
The Hedgehog Thorne of *Candy*.



some few small leaves to bee seene upon it in sundry places, but they prickly wither and fall away, leaving the bush without a leafe thereon all the yeare after, which by the round forme of the branches with the thornes sticking forth, doth represent a Hedgehog so fitly that the inhabitants thereupon have termed it *Eriza*, that is, an Hedgehog, the roote spreadeth many long strings and fibres on them under ground.

6. *Echinopoda frutex Creticus.*

The Hedgehog Thorne of *Candy*.

This other small Thornie bush groweth up with many thorny greene sprigges and branches set close together, having alwayes three prickes or thornes growing together at every place, and is seldome seene likewise to have any leaves thereon because they fall away so quickly; (*Alpinus* saith it never beareth any) the flowers hereof groweth at the toppes of the branches in great plentie (but *Alpinus* denyeth it and saith it beareth but very few) are yellow but like the other in forme, whereof the Bees never doe taste, standing in whitish greene huskes, a little hoary all over, and afterwards small pods with very small seede in them; this is very tender to keepe, not enduring any cold place Sommer or Winter.

7. *Echinus Creticus.*
The small round Hedgehog Thorne of *Candy*.

7. *Echinus Creticus.*

The small round Hedgehog Thorne of *Candy*.

This Thorne (saith *Alpinus*) doth better resemble a *Tragacantha* then the former *Echinopoda* as *Honorius Bellus* would have it: for this round formed thorne is not much bigger then a hand Vrchin or Hedghog, scarce rising above two or three fingers from the earth, but spreading the blacke branches halfe way within the ground, very thicke set together, and shooting out small roots at the joynts as they spread, all which end in small short white and broad sharp thornes thwarting one another thereby forming as it were crosses or starres, not having any leaves at all upon them, but innumerable small flowers like unto *Hyacinths* for their forme, but much smaller, after which succeede small long pods like unto those of the other *Tragacanth*: it groweth round and spreadeth not further out of that forme: the *Candiots* call it *Calofchirrida*.

The Place.

The first as *Clusius* saith groweth on the hills neare the kingdome of *Granado* going to *Corduba*: the second *Rauwolfius* found about *Aleppo* in *Syria*: the third *Clusius* found in the kingdome of *Valentia* in *Spaine* about a small towne called *Siete aguas* most plentifully, which is in the way to *Madrill*: the last *Bellonius* saith groweth in *Candy*, and *Honorius Bellus* saith in all *Græcia* likewise besides.

The

The Time.

All these doe flower in the beginning of Sommer, yet *Clusius* saith hee found the third in flower in *Aprill* where it grew naturally.

The Names.

Bauhinus as I said intituleth all these plants *Genista spartium spinosum*, calling the first *minus*, because he made the three first in the last Chapter to be *majus*. *Clusius* calleth it *Scorpius secundus*, and thinketh it may be the *Echinopoda Cretica* of *Honorius Bellus* for that as he saith it grew very like it, and *Lugdunensis* termeth it *Aspalathus secundus*: *Lobel* calleth it *Genista spartiũ spinosum alterũ*, *Cæsalpinus Spina Christi* and *Dodonæus Genista spinosa altera icon*, and *Tabermontanus Scorpius tertius*: the second *Lugdunensis* in his *Appendix* sheweth out of *Rauwolfius* journall, that the Moores of *Aleppo* did call it *Alhagi*, on whose leaves a kinde of Manna called by the *Arabians Terenjabin*, and by the Moores *Trunschibin* was used to be gathered especially in *Persia*, and calleth it *Planta spinosa Maurorum Alhagi*, and *Bauhinus Genista spartium foliis polygoni*: the third *Alpinus l. de plantis exoticis* calleth *Spartium spinosum*, and the fourth *Spartiũ Creticũ*: the fift *Clusius* calleth *Erinacea* from the *Spanish* word *Erizo*, for the likenesse in the growing round with prickles and thornes unto an Hedgehog, *Cæsalpinus* calleth it *Genistæ rotundæ alterum genus*, *Lobel Spartum aphyllon fruticosum junceis aculeis lanatis foliis*, *Tabermontanus Scorpius quartus* and *Spartium aculeatum aphyllon*: *Gerard* maketh it his fourth *Genista spinosa humilis*, and saith it groweth in the South and West parts of this Land, but sure I am he is much mistaken therein, for in his description hee saith it hath yellow flowers which this hath not: *Bauhinus* calleth it *Genista spartium spinosum foliis Lenticulæ, floribus ex cæruleo purpurascentibus*: the sixt is mentioned by *Bellonius* in his first booke of Observations and 18. Chapter calling it *Achinopoda*, and as he there saith is very like unto *Aspalathus*, but *Honorius Bellus* in his second Epistle to *Clusius* contraryeth him therein, shewing that *Echinopoda* differeth much from *Aspalathus* both in the greatnesse of the plant or bush, being much greater then *Echinopoda*, as also having fewer thornes, and three leaves set together, long abiding contrary to *Echinopoda* and sheweth it to be very common in all *Græcia*, and in the Iland *Chio* or *Sio*, and that *Dalechampius* was much deceived herein in his marginall note upon *Athæneus*, in taking *Echinopoda* to bee *Cardui Chij genus*, and that it may appeare to bee commonly growing there, and knowne, *Plutarke* in his *Symposiaks* and *libro de auditione* towards the end, setteth downe this old *Distichon*,

Inter Echinopodas velut asperam & inter Ononim,
Interdum crescunt mollia Leucoia.

And so doth *Athenæus* likewise mention it in his third booke of *Dipnosophistes*, as still growing among *Ononis* and thornes it selfe being one, *Pliny* also in his eleventh Booke and eighth Chapter mentioneth it under the name of *Chenopos*, *Melchior Guilandinus* knew it not, for in his Epistle to *Langius* he numbreth it among the unknowne plants to him.

The Vertues.

The second *Rauwolfius* saith is hot and dry, and that the *Syrians* with an hand full of the leaves make a decoction in water and drinke it, whereby they purge themselves: but I doe not finde any mention of the vertues of any of the rest of these plants, eyther used by the learned or by the inhabitants where they grow, and therefore untill I can learne more of them I must be silent also.

CHAP. XXII.

Scorpius sive Genista spinosa. Thorny Broome and Furse.

HAving as well before in this Worke as in my former Booke shewed you all the sorts of smooth Broomes or without thornes, and in these two last Chapters divers thorny bushes comming neerest to the thorny Broomes, it remaineth for me to declare them also, which although some grow so wild on barren heaths and dry grounds in our owne Land that they are not thought fit to bee planted in a Garden, yet there be divers others that are, let me not therefore sever them into many places, but set them together in this Chapter, the common Furse bushes being of the same tribe or family.

1. *Genista spinosa major vulgaris sive Scorpius Theophrasti quem Gaza Nepam transtulit.*

The ordinary great Furse bush or Scorpions Thorne of *Theophrastus*.

Our ordinary Furse or Gorse (as it it called in some places) is well knowne to grow much higher in some places then in others, yet still keepeth his forme, which is to send forth many wooddy grayish stalkes full of branches, and set with sharpe long thornes on all sides, so thicke that it seemeth nothing but thornes, and is seldome seene to have leaves on it, for if they be not heeded in the Spring when they come forth on small stalkes, being small and almost round, yet pointed at the ends, and some a little narrower and longer, many set together on both sides of a middle rib, of a grayish greene colour above, & silver like or hoary white underneath, they quickly fall away and are not seene, so that many have thought it never bringeth forth any: the flowers are many standing at the toppes of the branches, like unto those of Broome and almost as yellow, but not so shining, after which succeede thicke and short pods covered with a whitish hoary freese, and with a twining point or end, wherein are contained small browne seede: the roote is long tough and spreading.

2. *Genista spinosa flore albo.* The white flowred Furse bush.

In the North parts of this Land I heare that in divers places, the Furse or Gorse bushes as they there call them beare very white flowers, differing in nothing else from them that beare yellow, for they are oftentimes seene both growing together in one ground.

3. *Genista spinosa minor.* The lesser Furse bush.

The lesser Furse bush groweth alwayes lower, full of branches, and with smaller and shorter thornes thereon then the former, this hath many small greene leaves standing in the same manner which abide much longer on the thornes before they fall away, which is not untill the end of the Spring or beginning of Summer, so that both leaves and flowers are oftentimes seene a good while together: the flowers are smaller then the former and

of a paler colour: the cods are ſmall and ſhort without any freeſe upon them, blackiſh when they are ripe, and the ſeede reddiſh within: the roote is long, tough and wooddy.

4. *Geniſtella aculeata.* The ſmall prickly Broome.

This ſmall Broome ſendeth from the roote divers upright ſlender greene ſtalkes ſet with many ſmall ſharpe and ſhort prickles on all ſides from the bottome upwards, and branching forth into divers parts, having many ſmall hard greene leaves growing on the younger branches, at the toppes whereof ſtand many ſmall pale yellow flowers, much ſmaller then any of the former, and ſmall long pods a little pointed with ſmall ſeede therein following them: the roote groweth not very deepe, but ſpreadeth tough long ſtrings.

5. *Geniſtella Monſpeliaca ſpinoſa.*
Small thorny Broome of *Mompelier.*

This French thorny Broome hath divers ſlender pliant twigs bending downewards, of a ſpanne long or more, whoſe lower part is divided into many very ſhort branches which are nothing but thornes, and from the middle upwards ſpread alſo into branches that are hairy, but without any thorne or prickle on them, having many ſmall hoary leaves ſet on them and ſome ſmaller alſo with them: at the toppes grow ſuch pale yellow flowers like unto the laſt. A greater ſort hereof hath beene brought out of *Spaine.*

Matth. or Hiſpan. a.

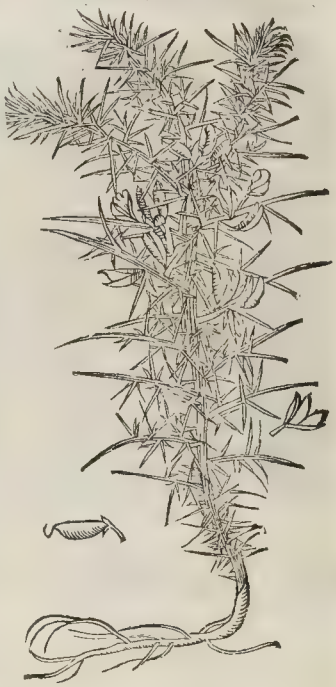
6. *Geniſtella minor Aſpalatoides.*
Small prickly Broome like *Aſpalathus.*

This ſmall buſh groweth a foot high or more, with a round wooddy ſtem covered with a reddiſh bark, ſet here and there very ſparingly with ſome few ſmall thornes divided into branches, which likewiſe are parted into other ſmaller branches, whereon are ſet a few ſmall and long leaves, and ſome more round alſo, the flowers ſtand not all on the toppes, but ſome from the boſome of the ſtalkes and leaves, not much ſmaller then the laſt, and of as pale a yellow colour, the branches not ending in a thorne as it doth.

The Place.

The foure firſt ſorts grow in our owne Land on dry barren

1. *Geniſta ſpinoſa vulgaris.*
The ordinary great Furſe buſh.



3. *Geniſta ſpinoſa minor.*
The leſſer Furſe buſh.

4. *Geniſtella aculeata.*
The ſmall prickly Broome.

heaths

heaths and other waſte gravelly or ſandy grounds, and ſo doth the laſt as alſo about *Orleance*: but the firſt is found about *Mompelier* and hath beene brought out of *Spaine* likewiſe.

The Time.

They all flower in the Sommer moneths but the greater ſorts ſomewhat earlier then the leſſer.

The Names.

The firſt is generally taken to be the σκόρπιος *Scorpius Theophraſti*, which *Gaza* tranſlateth *Nepa in lib. 6. cap. 1.* where he ſaith *Corruda* and *Scorpius* are wholly compoſed of thornes, but not that *Scorpius lib. 9. c. 14.* whoſe roote he ſaith doth repreſent a Scorpion, and is good againſt the ſting thereof, and which hee calleth *Telephonon* in the 19. Chapter of the ſame ninth Booke, which doth moſt properly decipher out the *Doronicum* whoſe rootes are very like unto Scorpions as I have ſhewed before, ſo that the word *Scorpius* is πολύσημος *Polyſemos dictio* a word of many ſignifications in *Theophraſtus*, but *Gaza* doth moſt unproperly make them both *Nepa*, thereby confounding this prickly *Scorpius* with the other: The firſt is the *Scorpius primus* of *Cluſius*, *Scorpius alter* and *ſecundus* of *Lugdunenſis* and *Tabermontanus*, and *Geniſta ſpinoſa* of *Dodoneus*, *Bauhinus* calleth it *Geniſta ſpinoſa major longioribus aculeis*: the ſecond is as I take it peculiar to our owne Land, and not mentioned by any before *Gerard*, yet *Bauhinus* referreth it to the next: the third is the *Nepa Theophraſti* of *Lobel*, *Camerarius* and *Tabermontanus*, and *Scorpius Theophraſti* of *Lugdunenſis*, *Scorpius ſive Nepa* of *Anguilara*, and called by *Bauhinus Geniſta ſpinoſa major brevibus aculeis*: the fourth is the *Geniſtella* of *Tragus*, *Fuchſius*, *Dodoneus*, *Lugdunenſis* and *Tabermontanus*, *Geniſta vel Geniſtella ſpinoſa* of *Geſner in horto*, *Geniſtella aculeata* of *Lobel* (who thinketh it may be alſo *Vlex Plinij lib. 20. c. 4. Tabermontanus* and *Lonicerus*, called by *Cæſalpinus Coroneolæ ſimilis ſuffrutex*, and by *Bauhinus Geniſta ſpinoſa minor Germanica*: the fift is called by *Bauhinus* in his *Pinax Geniſta ſpinoſa minor Hiſpanica villoſiſſima*, but in his *Prodromus Geniſtella Monſpeliaca ſpinoſa*, and ſaith that ſome of *Mompelier* called it *Corruda lutea*: the laſt *Bauhinus* calleth *Geniſtella minor Aſpalatoides vel Geniſta ſpinoſa Anglica*, ſaying it was ſent out of *England* by the name of *Geniſta ſpinoſa* (which is probable was found in ſome place of our Land unknowne to us as the plant it ſelfe is, and ſent him as a raritie, who ſaith the like thereunto was found about *Orleaunce* in *France*. The *Italians* call the firſt *Scorpione herba*, the *Dutch Guſpeldoren*, and wee in *Engliſh* Furſe, Gorſe, and of ſome Whinne, and thorny Broome, but that may be generally given to all theſe thorny buſhes, and more particularly is appropriate to the fourth ſort, which the *French* call *Geneſte picquant*, the *Germanes Stechend Pfrimmen*, and the *Dutch Stechende Brem*, and we in *Engliſh* the ſmall prickly Broome.

The Vertues.

The firſt and third are held to be hot and dry, good to open obſtructions of the Liver and Spleene, ſome have uſed the flowers of eyther in a decoction againſt the Iaundies, as alſo to provoke Vrine and to cleanſe the Kidneyes of gravell or ſtones ingendred in them. The others no doubt are participant of the ſame qualities.

CHAP. XXIII.

Rhamnus. Buckes thorne.

VNder the name of *Rhamnus* are comprehended divers ſorts of ſhrubbes, ſome much differing from other: the elder age in *Theophraſtus* his time acknowledged two ſorts, the one white, the other blacke and both ever greene: *Dioſcorides* in his time acknowledged three which have beene controverted by writers in theſe later times, wherein there are ſome ſorts found out; ſome of our later writers have called one *Rhamnus ſolutivus*, that is, purging Ramme, as a diſtinction from the other that are not ſo, whereof I have entreated in the ſecond Claſſis of this worke, and of the third *Rhamnus* of *Dioſcorides* (as the moſt judicious doe account it) called *Paliurus* Chriſts thorne, I have entreated in my former booke: the reſt that are referred thereunto and called *Rhamnus* by other authors ſhall follow in this Chapter, and beginne with that which is moſt frequent in the Low Countries by the Sea ſide as well as in the upland countries, and in our owne Land by the Sea coaſts in many places alſo.

1. *Rhamnus primus Dioſcoridis Lobelio ſive littoralis.* Sea Buckes thorne with Willow-like leaves.

This Buckes thorne ſhooteth forth many and ſundry pliant twiggie ſtemmes branched into divers ſmaller branches, whereon are ſet many long and narrow leaves without order, covered as it were with a white duſt or powder as the ſtalkes are alſo, with divers ſmall thornes ſtanding among them: at the joynts with the leaves from the middle upwards grow ſundry ſmall greeniſh moſſie flowers together, which turne into round berries, greene at the firſt, and of a yellowiſh redneſſe when they are ripe, having a juice or fleſhie ſubſtance within the outer skinne, and a flattiſh round griſtly kernell within, of a blackiſh browne colour: the roote is tough, long, and ſpreading much under ground: this abideth with the leaves on the twigges all the winter long, and ſo doth the fruit alſo.

Bauhinus upon *Matthiolus* ſetteth downe that this *Rhamnus* doth varie in ſome places neare the *Rhyne*, *viz.* that the one ſort that hath broader and longer leaves hath but one or two berries ſet together upon a ſtalke: but that ſort that groweth by the *Danow* and the River *Lycus* hath ſhorter and narrower leaves, and hath divers berries ſet together.

2. *Rhamnus ſecundus Monſpelienſium ſive primus Cluſij.* White flowred Buckes thorne.

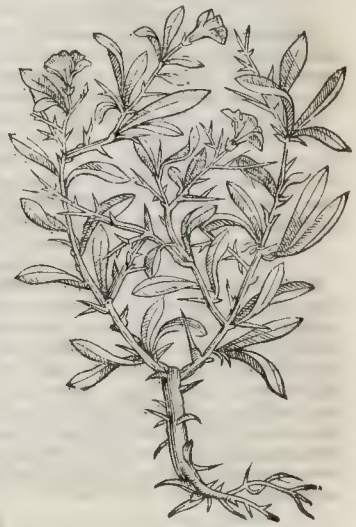
This Buckes thorne is a buſh fit to make hedges withall, riſing up with divers ſtraight upright ſtems, divided into many branches, armed with very ſtrong and ſharpe thornes ſtanding out, from whence the ſmall long and narrow thicke fleſhy leaves come forth foure or five ſtanding together, almoſt round at the point ſeldome falling away before other have ſprung forth: the flowers ſtand at the ſayd joynts with the leaves in hoary huskes three or foure together, being ſomewhat long and round ending in five leaves, of a pure white colour where after they are fallen a certaine round thing groweth like unto that of the *Iaſmine* which ſeldome commeth to beare any fruite: the roote is thicke and long creeping farre away.

3. *Rhamni primi Cluſij altera ſpecies.* Red flowred Buckes thorne.

This other buckes thorne is like unto the laſt in moſt things, onely growing not ſo high, buſhing with more

1. *Rhamnus primus Dioscoridis Lobelio vel Tragi.* Sea Buckes thorne with Bay-like leaves.

2. *Rhamnus secundus Dioscoridis Monspelien sium sive primus Clusij.* White flowred Buckes thorne.



3. *Rhamni primi Cussi species altera.* Red flowred Buckes Thorne.

Paliurus sive Rhamnus tertius Dioscoridis. Chrisis Thorne.

branches and somewhat lesser leaves, thicker whiter and of a more saltish taste: the flowers stand in the same manner but are of a purplish red colour.

4. *Rhamnus niger Theophrasti.*
Blacke berried Buckes thorne.

The blacke Buckes thorne groweth unto the bigneſſe of a Blacke thorne bush, having a blackish barke covering the greatest armes and body, set with divers narrow and long thicke greene leaves together at the joynts like unto the other before, but of a more astringent taste like unto Rubarbe, armed with long sharpe thornes, each branch ending also in a long sharpe thorne: the flower is small and of a greenish colour, comming forth in the spring of the yeare, and the fruit followeth in the Sommer which is small and blacke like unto a Sloe and harsh also in taste.

5. *Rhamnus Bavaricus.*
The *Bavarian* Buckes thorne.

The *Bavarian* Buckes thorne groweth to the height of a man with a reddish barke, with many very sharpe long thornes, thicke set on the branches, and leaves thereon of a pale greene colour, somewhat broad and long like unto the *Ilex* or evergreene Oake finely dented about the edges, and with some smaller and rounder leaves set with them also, each twigge ending in a thorne: what flowers or fruite this beareth is not yet come to our knowledge, but for the likeneſſe of the growing, and being a thorny everliving plant it hath beene accounted a *species* of *Rhamnus* and so called.

6. *Rhamnus Myrtifolius ex Insula Sancti Christophori*
Saint *Christophers* Myrtle leafed Ramme,

In the naturall places this groweth great and tall, but in *France* whether it was brought scarse a cubit high, the barke being greene and smooth, the leaves many set together on the stalkes by couples, somewhat like as the

4. *Rhamnus niger Theophrasti.*
Blacke berried Buckes thorne.

6. *Rhamnus Myrtifolius ex Insula Sancti Christophori.*
Buckes thornes with Myrtle-like leaves of Saint *Christophers* Iland.

5. *Rhamnus Bavaricus.*
The *Bavarian* Buckes thorne.

Wallnut tree leaves grow, but each leafe resembling those of the greatest Myrtle: at each knot on the branches where the leaves shoot stand one or two small short weake thornes on each side: the further relation wee cannot give you because the plant perished through the intemperature of the climate.

The place.

The first as I sayd groweth not onely neare the Sea coasts in the low countries and in our Land also, but in the uplands also of the higher and lower Germany also by rivers sides, as *Cordus*, *Gesner*, *Clusius* and others have set it downe: the second as *Clusius* saith groweth in divers places of *Spaine*, *Portugall*, and *Narbone* in *France*: the third he saith he onely found at the farther border of the kingdome of *Valencia* in *Spaine* about the Citie *Horiuela* neare the River *Sagura* and in no place else: the fourth he likewise saith he found plentifully among other shrubbes in the waste grounds of the kingdome of *Granado* and *Murcia*.

The Time.

They flower in the Sommer, and the fruit is ripe in *September*.

The Names.

There is great controversie among our moderne writers as I said before concerning this Πάλιουρος *Rhamnus*, as the Greekes and Latines call it, every one almost appropriating one thorny bush or other thereunto, for *Camerarius* and *Tragus* judge the *Grossularia* or *Vua crispa* our Goose berry bush, to be the *Rhamni tertium genus* of *Dioscorides*, and call the *Spina infectoria* before set forth in this worke to be *Rhamni alia species*, not knowing any purging qualitie therein as others afterwards did, and thereupon called it *Rhamnus Catharticus* or *solutivus*. *Matthiolus* setteth forth likewise a kind of prickly bush for the *Rhamnus secundus Dioscoridis* which *Pena* and *Lobel* mislike, giving another in the stead thereof, which they say commeth nearer to the description of *Dioscorides*: and even the ancient authors themselves are not constant nor free of variation herein: for as before said *Dioscorides* hath three sorts of *Rhamnus* (whereof the third sort is much doubted of by divers, some thinking the Text of *Dioscodes* to be corrupt, and the third sort to be added or superfluous) *Theophrastus* hath but two sorts, white and blacke and mentioneth *Palinrus* as a peculiar plant by it selfe, saying also it is of many sorts, and *Galen* maketh mention but of one sort, as if there were but one or that the rest were comprehended under that one. *Pliny* maketh two sorts, but he without consideration referreth them to the *Rubus* or Bramble. The first here set forth is the *Rhamnus secundus Dioscoridis* of *Matthiolus*, *Dodoneus*, *Clusius*, *Lugdunensis*, as also of *Lacuna* and *Lonicerus*, but *Pena* and *Lobel* in *Adversarijs* make it the first of *Dioscorides*, *Cordus* upon *Dioscorides* and in his history also calleth it *Oleaster Germanicus*, and in his *Observationum sylva*, *Oleastri peculiare genus*: *Camerarius in horto* and in *Epitome* calleth it *Rhamni species*, and *Casalpinus Rhamni alterum genus*, *Bellonius* in his Observations maketh mention of a *Rhamnus baccis rubentibus* which it is probable is this. *Columna* taketh it to be *Hippophae Dioscoridis*, and *Bauhinus* calleth it *Rhamnus Salicis folio angusto fructu flavescente*: the second is the *Rhamnus primus Dioscoridis* of *Matthiolus*, *Anguilara*, *Lacuna*, *Loniceens*, *Clusius*, *Dodoneus*, *Lugdunensis* and *Rauwolfius*; *Lobel* calleth it *Rhamnus alter Dioscoridis Monspeliacus*, *Cordus* upon *Dioscorides* and *Bauhinus* call it *Rhamnus candida Theophrasti*, as also *Rhamnus spinis oblongis flore candicante*. *Rauwolfius* saith that the *Arabians* call it *Haoser*, and they about *Tripoli* in *Soria* or *Syria Hanfegi*: the third is *Clusius* his *Rhamni primi altera species*: the fourth is his *Rhamnus tertius*, and so also it is of *Dodonaus* and *Tabermontanus*, and of *Lobel Rhamnus primæ speciei tertius* and is likely to be the *Rhamni genus baccis nigris* in *Gracia* of *Bellonius*, *Bauhinus* calleth it *Rhamnus niger Theophrasti* and *Rhamnus tertius flore herbaceo baccis nigris*: the fift *Lugdunensis* exhibiteth from a skilfull Herbarist as hee saith that brought it to *Dalechampius* gathered in *Bavaria*, and not knowing unto what plant to referre it better called it *Rhamnus Bavaricus* which name doth so continue untill it can be better disposed of: the last *Iacobus Cornutus* onely exhibiteth in his *Canadersium plantarum historia*. The *Arabians* call it as is aforesaid: the *Italians* *Ramno* and *Mauruca*, the *Spaniards* *Scambrones*, the *French* *Bourgespine* in some places, for that name is given to divers plants in sundry places: *Anguilara* saith that generally *Dioscorides* his first *Rhamnus* is taken to be that plant which at *Rome* is called *Spino santo*, and of others *Spino de Christo*, *Marcellus* in his booke *de re medica* calleth it *Salutaris herba* and *spina alba*: *Cordus* also witnesseth that *Rhamnus* is called by the Latines *Spina alba*, but wisely adviseth that this shrub *Spina alba* be not confounded with the other two sorts of Thistles so called also. *Ovid* also speaketh of it *lib. 6. fastorum*. shewing the use of it in his time to expell incantations in these verses,

Sic fatus, spinam qua tristes pellere posset
A foribus noxas, hac erit alba, dedit.

And in another place not farre from the former he saith the same of the same plant, otherwise called *Virga Ianalis* in this manner;

Virgaq; Ianalis despina sumitur alba.
Qua lumen thalamis, parva fenestra dabat.

The Vertues.

These thorny plants are in qualitie one much like another, being as *Galen* saith cold in the end of the first degree or in the beginning of the second and drying and digesting in the second, and thereby helpeth inflammations, Saint *Anthonies* fire and other fretting and eating Cankers and is good against pushes, wheales, &c. in using the young leaves whiles they are fresh. A decoction of the leaves and inner barke thereof made in water wherunto a little allome is put is very good to wash the mouth when there is any inflammation or Vlcer or other distate therein. (*Clusius* saith that the *Spaniards* doe eate the young shoots of his first *Rhamnus* as a Sallat herbe, and that they use the decoction of the Blacke berries of this fourth sort, to bathe those places that are out of joynt, and to helpe the paines of the Goute.

CHAP. XXIIII.

Lycium sive Pyxacantha. Box thorne.

ALthough we are not certaine that any of these thorny shrubs here set forth in this Chapter is the true and right *Lycium* of *Dioscorides* agreeing thereunto in all things, yet because all of them have some correspondence therewith in divers particulars, they have beene by the judicious finders out of them referred unto it as shall be shewed.

1. *Lycium*

1. *Lycium vulgatius.* The more common Box thorne.

The more common Box thorne is a ſhrubbe or low tree yet growing ſometimes foure or five cubits high, with many branches ſpreading therefrom, covered with a darke greene barke, ſomewhat grayiſh in the body and older boughes ſet ſomewhat thicke with ſmall hard and almoſt round leaves like Box, two for the moſt part at a joynt, from whence alſo thruſteth forth a ſmall ſharpe thorne: the flowers grow many together in a cluſter at the ſeverall joynts upwards of a greeniſh colour, after which come ſmall berries, greene at the firſt and blacke when they are ripe, of the bigneſſe of Privet berries but full of a bitter unpleaſant ſappe: the roote ſpreadeth diverſly.

2. *Lycium Italicum.* *Italian* Box thorne.

The *Italian* Box thorne is a ſmaller and lower ſhrubbe, whoſe older barke is rugged and of a darke colour, but the younger have it thinne ſmooth and greeniſh, the branches ending in a thorne, whereupon are ſet ſmall leaves dented about the edges ver like unto thoſe of the Sloe buſh, and of a darke greene colour, harſh in taſte and ſomewhat bitter withall: at the joynts with the leaves come forth a few flowers of a whitiſh greene colour, made of foure leaves a peece, after which follow ſmall greene berries and blacke when they are ripe, with two and ſometimes with three leaves as it were on the berrie: the roote is wooddy and ſpreadeth.

3. *Lycium Hiſpanicum folio Buxi.* *Spaniſh* Box thorne with ſmall round leaves.

The *Spaniſh* Box thorne hath divers ſlender but yet upright ſtemmes about two foote high, covered with a reddiſh barke parting into many branches every one not onely ending in a thorne, but having divers thornes ſet alſo here and there upon them, many times but weake and ſhort, and at other ſharpe and ſtrong with many leaves growing on them, ſomewhat like unto the ſmall Box Myrtle leaves being of a clammy acide taſte, ſomewhat biting, neyther flower nor fruit hath beene obſerved hereof.

4. *Lycium Hiſpanicum folio oblongo.* *Spaniſh* Boxthorne with longer leaves.

This other *Spaniſh* Box thorne riſeth up but with one ſtemme, parted into ſundry branches whereon grow long and narrow leaves ſet without order.

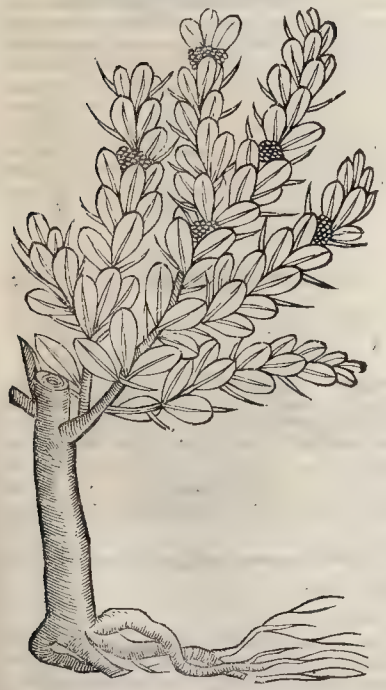
5. *Lycium latifolium Monſpeliacum.* Broad leafed Box thorne of *Mompelier*.

This cruell thorny buſh groweth and ſpreadeth like an hedge buſh, ſet thicke with ſharpe long thornes, and divers leaves ſomewhat broad with them, whereat likewiſe come forth ſmall flowers which turne into ſmall berries, blacke when they are ripe, three for the moſt part ſtanding together, having a reddiſh yellow juice within them, giving that colour on paper, leather, &c. and with three ſeedes in them, and of a quicke ſharpe taſte.

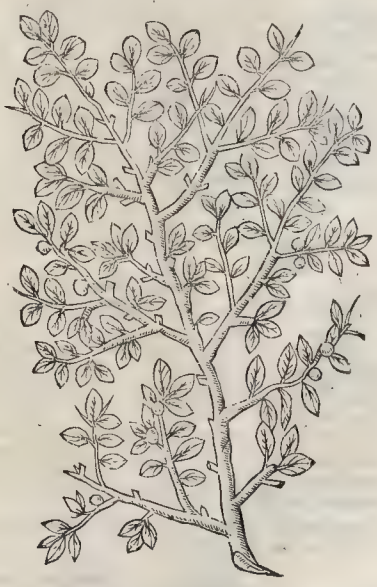
6. *Lycium Gallicum Avenionenſe.* The yellow graine of *Avignon*.

This thorny ſhrubbe groweth to the height of three or foure cubits, whoſe lower barke is of a grayiſh aſhcolour, ſpreading divers branches ending in thornes, ſet at the joynts with many ſmall leaves very like both for colour and thickneſſe unto the ſmall Box but ſomewhat narrower and longer, whereat alſo come forth ſmall flowers and after them ſmall berries upon ſhort footſtalkes ſome being three ſquare and others foure ſquare according to the number of graines within them, at whoſe head is ſet a ſmall cup or cover, and is of an aſtringent taſte, ſomewhat bitter, which being dryed are much uſed of Diers and others to give a yellow colour.

1. *Lycium vulgatius.*
The more common Box thorne.



2. *Lycium Italicum.*
Italian Box thorne.

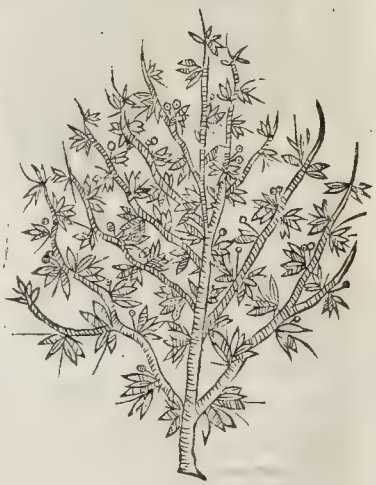


4. *Lycium Hiſpanicum folio oblongo.*
Spaniſh Box thorne with longer leaues.

6. *Lycium Gallicum Auenionenſe.*
The yellow graine of *Auignon.*

7. *Lycium creticum primum Belli.*
The firſt Box thorne of *Candy.*

8. *Lycium Creticum alterum.*
The other Box thorne of *Candy.*



10. *Lycium Indicum creditum Alpino.* The ſuppoſed *Indian* Box thorne.

12. *Agiahatid Egyptiaca Lycio affinis.* The *Egyptian* Tree like unto *Lycium*.

7. *Lycium Creticum primum Belli* The firſt Box thorne of *Candy*.

This *Candian* thorne groweth to be foure or five cubits high covered with a rough or ſcabbed barke, of a grayiſh colour, ſtored with ſharpe thornes, three alwayes growing together at a joynt, where the leaves alſo come forth three or foure together which are ſmall ſomewhat neare unto Box leaves, and leſſer then thoſe of the Barbary buſh, lightly ſnipped or dented about the edges: the flowers are yellow comming forth at the joynts with the leaves which turne into ſmall long berries not fully round, therein ſomewhat like unto a Barbary but blacke when it is ripe, each of them ſtanding ſingly by it ſelfe upon a ſmall footeſtalke, of a taſte betweene ſweete and ſower: the wood hereof is yellow and the roote much more giving an excellent yellow dye: divers have accounted it a kinde of mountaine Barbary for the reſemblance thereunto more then unto *Lycium*: but it differeth from the Barbary in that the leaves thereof are greater then of this, and the Barbary hath the berries growing many together in a long cluſter, and this but ſingly one at a place as is before ſaid, and from the true *Lycium* it differeth in the fruit not being round like Pepper, and is not bitter as the berries of moſt ſort of *Lycium* are.

8. *Lycium Creticum alterum.* The other Box thorne of *Candy*.

This other *Candian* buſh riſeth up not above two or three cubits high thicke ſet with branches and thornes, and ſmall leaves upon them, the berries are round, as ſmall as Pepper and blacke when they are ripe, whereof is made an excellent yellow colour.

9. *Lycium legitimum Rauwolfij.* The true Box thorne of *Syria*.

The true Box thorne as *Rauwolfius* ſetteth it forth in the fourth Booke of his journall or Itinerary is a ſmall ſhrubbe having many ſhoots from the rootes, ſet full of thornes and ſmall leaves ſomewhat like unto Sloe leaves or betweene them and Box.

19. *Lycium Indicum creditum Alpino.* The ſuppoſed *Indian* Box thorne.

This Box thorne ſuppoſed to be the right *Lycium Indicum* by *Proſper Alpinus* in his Booke of *Egyptian* plants, ſhooteth from the rootes divers upright wooddy ſtemmes three or foure cubits high, ſet thicke with joynts, at every one whereof come forth both long and ſharpe thornes, and foure or five ſmall long whitiſh greene leaves longer, narrower and whiter then thoſe of the Olive tree: at the joynts likewiſe with the leaves ſtand two or three ſmall whitiſh flowers, very like unto thoſe of the Oriental Iacinth, which turne into ſmall and blacke berries very like unto Wallwort berries of an aſtringent and bitter taſte.

11. *Lycium Indicum putatum Garſia.* *Garſias* ſuppoſed *Indian* Box thorne.

Garcias ab Orta in his firſt booke and tenth Chapter of his *Indian* hiſtory of Drugges ſheweth that the *Indians*, *Perſians* and other nations of *Aſia major*, uſe a certaine juice which they call *Cate* or *Cato*, mixed with *Betre* and *Aſtreca*, as an uſuall familiar junket continually to chew in their mouths, which he thinketh to be *Lycium*, having the

the properties of the true *Lycium*, the juice thereof being drawen forth in the same manner that the ancients did shew the true *Lycium* was made: but the tree as he describeth it doth much differ from that of *Dioscorides* for as *Garcias* saith his is a great tree as bigge as an Ash tree, having fine small leaves thereon like unto Heath or Tamariske (whereas *Dioscorides* saith that his *Lycium* is a shrubbe with leaves like Box, full of thornes and alwayes abiding greene) it beareth flowers but no fruit as the inhabitants reported unto him: the roote of the tree is firme heavy and strong, neyther subject to rottennesse exposed to the weather, nor swimming in the water, and thereupon called by them *Lignum sempervivum*, Evergreene wood.

12. *Agiahalid Ægyptiaca Lycio affinis.* The *Egyptian* tree like unto *Lycium.*

This tree groweth to the height of a wilde Peare tree, having but few armes or branches crooking many wayes in the growing, set with many long and very sharpe thornes and small Box-like leaves with them but somewhat broader, seldome but one and usually two at a joynt, the flowers are small and white like Orientall Iacinths but lesser, where afterwards stand smal blacke round berries both bitter and astringent: the leaves also are somewhat sower and astringent.

The Place.

The first groweth on the *Alpes* of *Liguria* and in *Dalmatia* as *Lugdunensis* saith: the second on Mount *Baldus* and in divers places of *Italy*: the third *Clusius* saith he found neare unto *Complutum* in *Spaine* by the Rivers sides: the fourth *Lobel* saith was brought from *Spaine*: the fift as *Lobel* saith groweth not farre from *Mompelier* neare the River *Lanus*: the sixt as is sayd about *Avignon* and *Carpentoratte* in *France*: the seventh and eight in *Candy* as *Honorius Bellus* setteth it downe in his first Epistle to *Clusius*: the ninth on Mount *Lybanus* and other places in *Syria*: the tenth in *Egypt* by the backes of that arme of *Nilus* that is called *Calig* that runneth into the Sea: the eleventh groweth as *Garcias* saith in many places in the *Indies* where it is of great use: the last *Alpinus* saith hee saw in the garden of a *Turke* in *Cayro* which was brought out of *Ethiopia.*

The Time.

Their times of flowring and fructifying are according to the countries where they grow, some earlier and others later.

The Names.

The Greeke name λύκιον *Lycium* (and πυξακάνθα *Pyxacantha*) is imposed on the dryed juice as well as on the bush, so called as it is thought because it was brought out of *Lycia* and *Cappadocia*, and was of much use in former times but not of later dayes, because what was brought was well knowne and perceived to bee counterfeit, being made of the berries of Privet or of the Honysuckle or Doggeberry fruite or of them all together, and had none of the notes of the true *Lycium* which are these; it is blackish on the outside of the whole cakes or peeces, but being broken of a browniish yellow colour within, and quickly growing blacke againe having no virulent tent, but of a bitter taste altringent withall: the *Indian* kinde which is the best will have a Saffron like colour, and this especiall note the true and best will have, that being put into the fire it will burne and flame, and being quenched it will give a reddish (scumme say some and others a reddish) fume or smoake: but that sophisticate or adulterate *Lycium* which of late dayes hath beene used hath none of these true properties in it: and *Dioscorides* and *Galen* doe both shew that there wanted not impostoris in their time, to counterfeit the true, and would mixe *Amurca*, that is, the Grounds or Lees of oyle with it to make it burne, and with the juice of Wormewood or the Gall of an Oxe to make it bitter, and as *Galen* saith they did so cunningly counterfeit it that it was hard to know the false from the true. The first as the most frequent is thought by divers and *Lugdunensis* standeth mainely for it to be the right, notwithstanding that *Anguillara* saith it is not the right *Lycium* although it be so taken by divers. *Matthiolus* & *Tabermontanus* call it *Lycium*, & *Lugdunensis*, *Lycium Alpinum*, *Dodoneus*, and *Lonicerus Pyxacantha*, *Lobel* in *Adversarijs* setteth forth a *Lycium sive Pyxacantha Narbonensiũ*, which it may be is this, *Bauhinus* calleth it *Lycium Buxifolio*: the second *Matthiolus*, *Lugdunensis* and *Tabermontanus* call *Lycium Italicum*. *Pona* sheweth in his description of *Mons Baldus* that it is the same that *Cusius* calleth *Spina infectoria pumila altera*, and *Bauhinus Lycium facie Pruni sylvestris sive Italicum*: the third *Clusius* calleth *Lycium quorundum*, and saith the *Spaniards* where it grew call it *Tamujos* and *Tamuxos*, and thereof make Broomes and heate their Ovens and Kills, &c. but *Lugdunensis* is much mistaken in thinking this of *Clusius* to be the same that *Lobel* in his Appendix to his Observations calleth *Lycium Hispanicum*, which is my fourth sort here, and hath longer & narrower leaves then that of *Clusius* which hath rounder leaves more like Box and *Bauhinus* observing well the differences calleth the one *Lycium Hispanicum folio buxi*, and the other *Lycium Hispanicum folio oblongo*: the fift *Lobel* in *Adversarijs* calleth *Paliurus alter peregrinus*, but hath mistaken the figure thereof in his *Icones*, putting the figure of *Pyracantha* (that is of *Oxyacantha Dioscoridis* which as he saith hath an ever greene leafe, and is not the Barbary as divers do mistake it) for it, which he setteth downe in his *Adversaria*, but in his *Icones* the said figure of *Pyracantha* is put under both the title of *Paliurus alter peregrinus* and of *Rhamnus tertius Dioscoridis* also, *Bauhinus* not taking it to be any *species* of *Paliurus* calleth it *Lycium latifolium*: the sixt *Lugdunensis* saith *Dalechampius* tooke to be a *Lycium* hee therefore calleth it *Lycium Dalechampij*, and withall saith that some called it *Tinctorium granum*, that is in *French Graine a teindre* and others call it *Graine jaulne* and some *Graine d'Avignon*; *Bauhinus* calleth it *Lycium Gallicum* and may be called *Granum Avenionense*: the seventh *Honorius Bellus* of *Candy* saith it is there called λευζία *Loutzia* of the inhabitants, but he himselfe calleth it *Lycium Creticum*, yet saith also becaus it is not the right *Lycium*, it may be called *Berberis Alpina aut montana*, for *Silverius Todeschinus* reported unto him that he found the very same very frequent on Mount *Lybanus* in *Syria*, *Pona* followeth *Bellus* in his *Italian Baldus*, and calleth it by the same names, *Bauhinus* referreth it rather to the Barbery, making it another *species* thereof and not of *Lycium*: the eighth as *Bellus* saith is also another sort of *Lycium*, and called by the *Candiots* καζυγιὲς *Lazegiri*, and πετρα-μύγδαλα *Petroamygdala hoc est petræa amygdala*, but yet hath no resemblance to our Almond tree: the ninth is called of *Clusius Lycium legitimum Rauwolfij*, and by *Rauwolfius* himselfe *Frutex spinosus peregrinus Araliibus Hadhadh, incolis Zaroa. Bauhinus Lycium Indicum foliis pruni*: the tenth is by *Prosper Alpinus* called *Lycium Indicum creditum*, and saith it is called *Useg* by the *Egyptians*: *Bauhinus* calleth it *Lycium Indicum alterum*: the eleventh is called by *Garcias Cate sive Lycium*, and saith the true is called *Hattych*, which thereupon I have intituled *Lycium Indicum putatum Garcia*, and by *Bauhinus Lycium foliis Ericæ*: the last *Alpinus* saith is called by the *Egyptians Agiahalid* and may not unfitly be accounted a *Lycium*, *Bauhinus* thereupon calleth it *Lycio affinis Ægyptiaca.*

The

The Vertues.

The condenſate juice of *Lycium* is that that onely is to bee uſed, of all the parts of the tree, which was made as *Dioſcorides* ſheweth of the leaves and berries, but *Pliny* ſaith of the roote and branches, which being ſteeped three dayes in water was afterwards boyled and ſtrayned, & then evoporated untill it came to the thicknes of hony, and ſo to be kept as a liquid medicine as *Galen* ſeemeth to intimate, or elſe dryed up to the thickneſſe of *Opium* and made up in that manner into Cakes, which as is ſayd were to be broken to know the goodneſſe: the ſcumme ſaith *Dioſcorides* taken away in the boyling is put with other medicines that ſerve for the eyes, the reſt is put to other uſes, yet the *Lycium* it ſelfe is alſo ſet downe by him, to be effectuall to take away the dimneſſe and filmes that hinder the ſight. It ſtayeth Fluxes of all ſorts both of the belly and humours, as the Laske and Bloody flux, the abundance of Womens courſes, and the whites, bleedings at the mouth or noſe and ſpitting of blood: it is effectuall alſo for all fowle and creeping Cankers, Vlcers and ſores, whether in the mouth throat or other parts of the body, as alſo for the looſeneſſe of the gummes, chappes in the lippes or clefts in the fundament, and at the rootes of the nayles of the hands: but eſpecially for all ſores in the privie parts of man or woman: it is good for the cough being taken with water, as alſo againſt the bitings of a mad Dogge: being put into the eares that runne and matter, it helpeth them: it is good alſo againſt the itch and ſcabbes, and to cleanſe the skinne: it colloureth the haire yellow, and giveth a yellow dye not onely to Leather and skinnes, but ſerveth Dyers alſo and Painters in their workes.

CHAP. XXV.

Rubus. The Bramble.

OF the Brambles there are are divers ſorts, ſome having thornes or prickles upon them, others few or none, ſome growing higher and lower then others, ſome alſo carefully nurſed up in Gardens which are the Raſpies berries of divers ſorts, whereof I have in my former Booke given you the knowledge ſufficiently and ſhall not be here againe deſcribed.

1. *Rubus vulgaris major.* The common Bramble Blacke berry buſh.

The common Bramble or Blacke berry buſh is ſo well knowne that it needeth no deſcription, every one that hath ſeene it being able to ſay that it ſhooteth forth many very long ribbed or ſtraked branches, which although a great part thereof ſtandeth upright, yet by reaſon of the length and weakeneſſe they bend againe downe to the ground, there many times taking roote againe, all of them thicke ſet with ſhort and crooked thornes, and leaves likewiſe at ſeverall places upon long prickly footeſtalkes, three and ſometimes five ſet together, hard and as it were crumpled with ſmall prickes on the middle under rib, of a darke greene colour and grayiſh underneath, which ſeldome fall away allthe winter, untill all the ſharpe froſts be paſt (whereby the countrey men doe obſerve that the extremity of Winter is paſt when they fall off) and that new leaves ſhortly after beginne to ſhoot forth againe: the flowers are many ſet together at the ends of the branches, which conſiſt of five whitiſh leaves like thoſe of the wilde Bryer buſh, and ſometimes daſht with a little Carnation, with ſmall threads in the middle, after which come the fruit every one by it ſelfe, but conſiſting of many graines or Berries as it were ſet together in a round head like a Mulberry, greene at the firſt, reddiſh afterwards, and blacke and ſweete when they are ripe, which elſe are harſh and unpleaſant: the roote groweth great and knottie.

1. *Rubus vulgaris major.*
The Bramble or Blacke buſh.

2. *Rubus minor Chamærubus ſive Humirubus.*
The ſmall low or ground Bramble.

The branches hereof are very ſlender, alwayes lying and trayling upon the ground, never rayſing it ſelfe up as the former doth, and often rooteth as it creepeth, ſet with crooked thornes, but much ſmaller then the other, & with the like leaves and flowers of a pale Roſe colour, and berries but ſmaller, and of a blewiſh blacke colour when they are ripe like unto a Damſon, and as ſweete as the other Blacke berry almoſt, but with leſſer ſappe or juice in then: the roote hereof creepeth about, and from the knotty joynts ſend forth new branches. Of this kinde there is another ſort.

3. *Rubus montanus odoratus.*
Sweet mountaine Bramble or Raſpis.

This mountaine Bramble or Raſpis (for to eyther it may bee referred) hath ſundry long ſtalkes riſing from the roote without any thornes on them, but ſet thicke with ſoft haires, from whence ſhoot forth the broad and large leaves without order, ſet upon long hairy footeſtalkes divided into five parts almoſt to the middle rible, and ſometimes but into three or more, each a little dented about the edges of a very ſweet ſent but falling away in winter: the flowers are ſomewhat large like the Eglantine of a delayed purpliſh violet colour, with divers yellow threads in the middle ſtanding

2. *Chamærubus sive Humirubus.*
The small or low Bramble.

4. *Rubus saxatilis Alpinus.*
The stony Bramble or Rocke Raspis.

6. *Chamemorus Anglica.*
Our Knot berrie.

7. *Chamemorus Cambro Britannica.*
The welsh Knot berry or *Lancashiere* Cloud berry.

ſtanding at the toppes of the branches, after which come the fruit very like unto Bramble berries but reddiſh as Raſpis but not ſo well relliſhed: the roote ſpreadeth much about under ground.

4. *Rubus tricoccos.* The Deaw berry or Winberry.

The Deaw berry hath ſlender weake branches like the laſt more often lying downe then being raiſed up with fewer prickes and thornes thereon then in the laſt, the leaves likewiſe are uſually but three ſet together, more ſeparate on the branches, yet almoſt as large as it and nearer ſet together on long footſtalkes: the flowers are white and ſmall, the berries uſually conſiſting but of three ſmall berries or graines ſet together in one, yet many times foure or five leſſe ſappie but not leſſe ſweete or blew then the other: the roote hereof creepeth under ground more then the laſt.

5. *Rubus ſaxatilis Alpinus.* The ſtony Bramble or Rocke Raſpis.

This ſmall low plant which by *Cluſius* is more fitly referred to the Raſpis then the Bramble hath divers ſlender reddiſh twiggy hairy branches little more then a foote high, without any thorne at all on them, ſet here and there with rough leaves upon footſtalkes three alwayes joyned together and dented about the edges of a very harſh and binding taſte: the flowers ſtand at the toppes of the branches three or foure together conſiſting of foure and ſome of five leaves a peece, of a pale or whitiſh Roſe colour which afterwards turne into ſmall fruit, compoſed of three foure or five graines or berries ſet together greater then eyther in the Raſpis or Bramble of a reddiſh colour when they are ripe, almoſt tranſparent, full of a moſt pleaſant ſweete and acid juice gratefull to the palate, having in each of them a white rough kernell or ſtone: the roote creepeth all about and ſhooteth forth ſundry branches from the joynts as they creepe.

6. *Chamæmorus Anglica.* Our Knotberry.

The Knotberry riſeth up with ſlender browniſh ſtalks not a foot high ſet with foure or five large leaves one above another at ſeverall winged joynts, each of them divided into five parts, and each of them ſomewhat deepely jagged and dented alſo round about the edges, rough and as it were crumpled each upon a long footſtalke, which at the joynts have two ſmall peeces like eares ſet thereat; each ſtalke being furniſhed at the top with one flower made of five round pointed leaves of a darke purple colour, after which followeth a large berry like unto a Mulberry of divers graines ſet together, of a reddiſh colour when it is ripe and of a ſowriſh ſweet taſte, the roote creepeth much and farre ſhooting forth ſmall fibres at the knotty joynts whereby it is faſtned in the ground and from thence divers new ſhoots for ſtalkes.

7. *Chamæmorus Cambro-Britanica ſive Lancaſtrenſe Vaccinium nubis.*
The Welſh Knotberry or *Lancaſhire* Cloud berry.

This ſmall and low Bramble that ſcarſe appeareth above the ground moſſe among which and the blacke bērried Heath, &c. it groweth hath ſmall creeping rootes running under ground, and ſhooting forth here and there faire large leaves almoſt round a little divided as it were into five parts, and a little unevenly dented about the edges, being ſomewhat rough and full of veines of a darke greene colour on the upper ſide and paler underneath, as alſo ſome ſlender ſtalkes with two or three the like but leſſer leaves on them, and at the toppe a purpliſh ſmall Roſe-like flower which changeth into a Raſpis-like fruit, in ſome ſmaller in others greater conſiſting of ſundry berries ſet together, ſometimes more and ſometimes leſſer, of a pale reddiſh Orenge colour taſting reaſonable well, although not ſo good as a Raſpis.

8. *Chamæmorus Norwegica.* The Knotberry of *Norway*.

This Knotberry of *Norway* is very like unto our firſt Knotberry, having many ſlender browniſh twigges riſing not much above a foote high, whereon are ſet divers broad leaves upon long footſtalkes more round then the firſt and parted into three or more ſhort diviſions, each ſnipped or dented about the edges, and having 2. great ribs on the underſide with divers ſmall veines from them to the edges: from the toppes of the ſtalkes riſe divers flowers, each upon a long footſtalke compoſed of five white leaves for the moſt part, with divers white threads tipt with yellow in the middle: after which follow the fruite, of the bigneſſe of a Strawberry, ſome reddiſh and others more pale, of a ſoft pulpy ſubſtance ſomewhat clammy, yet not unpleaſant with ſmall kernells therein.

9. *Chamæmorus Norwegica altera.* Another *Norway* berry.

The likeneſſe of the leaves of this ſmall buſh unto the laſt which are very like unto thoſe of the Riſes or red Currant hath cauſed the name to be joyned thereunto, the ſtalkes are of a like ſhortneſſe, of a blackiſh colour whoſe leaves are broad, and cut in ſomewhat more deepely into ſundry parts, the berries ſtand at the toppes of the ſtalkes many cluſtering together as it were in a tuft every one upon a ſhort ſtalke, red when they are ripe and ſomewhat tart in taſte.

The Place.

The firſt is frequent every where: the ſecond groweth ſometimes by woods and hedge ſides and ſometimes in the middle of fields in many places in this Kingdome, the third groweth on the hills and higher grounds: the fourth is well knowne in the North parts of this land, as *Cheſhire*, *Lancaſhire*, & *Yorkeſhire*: the fift in ſtony and rocky places, both in the Ile of *Thanet* and other places of *Kent*, as alſo in *Huntington* and *Northamptonſhire*: the ſixt groweth on the high hills in *Lancaſhire* and *Yorkeſhire*, the one called *Ingleborough* the other *Pendle* the two higheſt hills in *England*: the ſeventh was firſt made knowne unto us by *Thomas Hasket* a painefull Chirurgion and Simpliſt of *Lancaſhire*, who gave us a rude draught thereof, but Doctor *Lobel* going both into *Wales* and the Shires neare thereunto found it there growing, and on *Ingleborough* hill in *Lancaſhire*, as Mr. *Bradſhangh* a Gentleman of the Countrydid likewiſe and ſent it up to us, where the people call the fruit cloud berry, becauſe the hill ſeemeth as it were continually covered with clouds: and the two laſt are declared by their titles to grow naturally in *Norway*.

The Time.

All theſe flower about *July* and their berries are ripe in the end of *Auguſt* or beginning of *September*.

The Names.

The Bramble is called in Greeke *Βατὸς Batus*, the Latines call it *Rubus* and *Sentis*. *Theophraſtus* hath three ſorts *Batos Rubus*, *Chamæbatos Humilis rubus*, or *Humirubus* and *Cynoſbatos Rubus caninus* or *Canis rubus*. *Pliny* hath three alſo but in a different manner: the two firſt ſorts of *Theophaſtus* are generally knowne of all but of the third there is ſome controverſie, for *Tragus* maketh the *Spina appendix* or *Oxyacanthus* our white thorne or Hawtherne to bee *Cynoſbatos*, and ſo doth *Dodonæus* alſo. *Cordus*, *Lacuna*, *Mercatus* and others thinke the *Roſa*

canina

Camina or *Sylveſtris* to bee it, *Pliny* as I thinke being the author of that opinion, *l.14 c.13.* where he ſaith there is another kinde of *Rubus* whereon a Roſe groweth called *Cynos batos* by *Dioſcorides* growing in hedges with other Brambles; againe *Pliny lib.16.cap.27.* ſaith thus, *Rubi Mora ferunt & in alioginere ſimitudinem Roſæ quæ vocatur Cynoſbatos*, but in *lib.15.cap.2.* hee deſcribeth *Cynobatos* to have a leafe like unto a mans footeſtep, bearing a blacke fruit or Grape, in whoſe kernell there is a nerve or ſinew whereof it was called *Neuroſpactos*; but *Matthiolus* contradicteth them and ſheweth that *Pliny* in ſetting downe the wilde Roſes calleth one by a peculiar name *Cynorhodos Roſa Canina* and not *Cynoſbatos Camirubus*, and the deſcription of *Dioſcorides* (ſaith he) ſheweth he meant no ſort of Roſe for elſe it had beene eaſie for him to have ſaid *Cynoſbatos* is like a wilde Roſe, but he compareth the leaves to Myrtle leaves, and the fruit to be like Olive ſtones wherein lyeth downe hurtfull to the windpipe by ſticking thereto if it ſhould be drunke, but ſpeaketh of no ſeeds or kernells to lye in that Downe but ſaith the fruit being dryed and drunke in wine doth bind the belly. *Theophraſtus lib.3.cap.18.* ſaith *Cynoſbatos* beareth a reddiſh fruit like unto a Pomegarnet, and a leafe not unlike to *Agnus caſtus*: *Serapio* ſpeaketh of *Cynoſbatos Caninus Rubus* among the other ſorts of Brambles, whereby it is plaine as he ſaith that *Cynorhodon*, the wilde or dogge Roſe doth much differ from *Cynoſbatos* the dogge Bramble, and yet *Lugdunenſis* in contrarying *Matthiolus* his reaſons ſtriveth by finding fault with the text both of *Dioſcorides* and *Theophraſtus* and amending them as he thinketh fit, to reconcile them and make the *Cynoſbatos* to be the wilde or Sweet Bryer but very unhandſomly in my opinion. There is little variation of names among writers concerning the two firſt, but of the third and fourth I doe not finde that any hath written being buſhes more peculiar to this Land then others: the fift *Cluſius* calleth *Rubus ſaxatilis ſive petræus ſive Alpinus*. *Geſner in hortis* calleth it *Rubus Alpinus humilis*, *Thalius Rubus minimus* and *Bauhinus Chamærubus ſaxatilis*: the ſixt and the two laſt are mentioned by *Cluſius* by the names of *Chamæmorus Anglica*, *Norwegica altera* as they are in their titles: the ſeventh hath a name or title given it as is fitteſt to expreſſe it, and to put all out of doubt concerning *Gerards* Cloud berry as hee hath expreſſed it from the rude draught of Maſter *Hoskets* doing as it is very likely, but the more exact figure is here exhibited. The *Arabians* call the Bramble *Buleich* and *Haleicho*, the *Italians Rovo*, the *Spaniards*, *Carca* (*Sarſa*) the *French Ronce*, the *Germans Brombeer Bremen* and *Bramen*. *Braemen* alſo, and wee in *Engliſh* Bramble or Blacke-berry buſh: the fruit or berries are called in Greeke *βάτος* as *Galen* ſaith which ſome have made *Vatina* in Latine, *Mora rubi*, but in the Apothecaries ſhoppes *Mora bati*, and of ſome *Mora buſſi*, the berries of the Mulberry tree being called by them *Mora ſelſi*.

The Vertues.

Galen lib.6. ſimpl.med. ſaith that the buddes, leaves flowers, fruit and roote of the Bramble are all of a great binding quality but yet ſomewhat in a differing manner, for the buddes, leaves and branches while they are freſh and greene have a cold earthly quality joyned with a warme watery ſubſtance, but little binding, and therefore they are then of good uſe in the Vlcers and putride ſores of the mouth and throate, and for the Quinſie, and likewiſe to heale other freſh wounds and ſores but the fruit when it is ripe becauſe it is ſweet hath a temperate warming juice therein, whereby and by that ſmall aſtriction is in it it is not unpleaſant to be eaten, but being not yet ripe it is of an exceeding cold and earthly ſubſtance, ſower and very aſtringent, and being kept doe more ſtrongly bind then when they are freſh: the flowers are of the ſame propertie that the unripe fruit is of, both of them are very profitable for the Blooddy flux, Laskes and the weakeneſſe of the parts comming thereby, and is alſo a fit remedy againſt the ſpitting of blood: the roote alſo beſide the binding quality therein hath a thinne eſſence whereby it is available, eyther the decoction or the powder taken to breake and drive forth gravell and the Stone in the Reynes and Kidneyes: the leaves of Brambles as well greene as dry are excellent good for lotions, for the ſores in the mouth and ſecret parts: the decoction of them and of the branches when they are dryed doe binde the belly much more, and is good for women when their conſes come downe too abundantly: the berries ſaith *Pliny* or the flowers are a powerfull remedy againſt the moſt violent poyſon of the Preſter or Dipſas (which are moſt violent Serpents) the Scorpion and other venemous Serpents. as well drunke as outwardly applied, and helpeth alſo the ſores of the fundament, and the painefull and bleeding Piles: the juice of the berries hereof mixed with that of Mulberries maketh the medicine more effectuall to bind and to helpe fretting or eating ſores and Vlcers whereſoever, and is good for the ſtomacke, the ſores in the mouth with the looſeneſſe of the gummes and teeth: the ſame being taken alone or mixed with ſome Hipociſtis and Hony ſaith *Pliny* is a remedy for choller when it gnaweth the ſtomacke which ſome call hartburning, and is good alſo againſt the paſſions of the heart and fainings: the diſtilled water of the branches leaves and flowers, or of the fruit is as ſweete as that of Violets, and is very effectuall beſides the facilitie and pleaſantneſſe in taking, in all hot fevers or diſtemperatures of heate in the body, the head, eyes, and other parts, and for all the purpoſes aforeſaid: the leaves of Brambles boyled in lye and the head waſhed therewith doth heale the itch, the mattering and running ſores thereof, and maketh the haire blacke: the powder of the leaves ſtrewed on cancrous and running Vlcers doth wonderfully helpe to heale them. Some uſe to condenſate the juice of the leaves and ſome the juice of the berries to keepe for their uſe all the yeare for the purpoſes aforeſaid: the other ſorts are very neare in qualitie unto it and therefore worke the ſame effects no doubt: but the *Norway* Knotberry is much commended againſt the Scorbute or Scurvey, and other crude putrid and melancholy diſeaſes wherewith thoſe Northerly people are much afflicted, which *Cluſius* out of *Hierus* Epiſtle declareth at large, and the manner of the cure of a number infected therewith as well in Winter as in Sommer, whereunto I refer them that would underſtand it more fully.

CHAP. XXVI.

Roſæ ſylveſtres. Wilde Roſes or Bryer buſhes.

HAving given you the knowledge of all or moſt of the manured Roſes in my former Booke and with them ſome of the wilder kindes alſo as the Sweet bryer or Eglantine, the evergreene Roſe which is very like thereunto, and the great Apple Roſe which ſhall not be further related here, I am to ſhew you all the reſt in this Chapter.

1. *Roſa*

Roſa Damaſcena.
The Damaske.

1. *Roſa ſylveſtris inodora ſive Canina.*
The ordinary wilde Bryer buſh.

1. *Roſa ſylveſtris inodora ſive Canina.* The ordinary wilde Bryer buſh.

The wilde Bryer buſh groweth of it ſelfe in the hedges very high, with upright hard wooddy ſtemmes covered with a grayiſh barke eſpecially the old ones, ſet with ſharpe thornes up to the toppes but not ſo thicke as the ſweete Bryer, having divers leaves ſomewhat larger thereon and not ſo greene on the upperſide nor ſo grayiſh underneath as the other, the middle ribbe whereof hath divers ſmall crooked thornes and without any ſent at all, the flowers ſtand at the toppes of the branches divers ſet together, of a whitiſh bluſh colour, made of five round pointed leaves ſomewhat longer then the Sweet bryer or Eglantine Roſe, ſtanding in ſuch like huskes as they or other Roſes doe: after the flowers are paſt come the fruit ſomewhat long and round, of a yellowiſh red colour or reddiſh yellow colour when it is ripe, having a ſoft ſweetiſh pulpe under the skinne, and ſeedes lying therein alſo, which berries are much devoured by the poorer ſort of women and children that eate them gladly: the roote runneth deepe and farre in the ground growing ſomewhat great. Vpon this Roſe as well as upon the Eglantine is often found a burre or ball of browne threads, and I have often ſeene it alſo upon the greater Apple Roſe which is extant in my former Booke. *Roſarum pi'ula ſive Spongiola Plinio.*

2. *Roſa ſylveſtris odorato carneo flore.* The wilde bluſh Bryer Roſe.

This wild Bryer Roſe is ſo like the former that it is hardly diſcerned from it, eyther for the height of the ſtem or ſtore of thornes or ſmalneſſe of the leaves but onely for the flowers which are ſomewhat larger, and of a deeper bluſh or pale purple colour ſomewhat ſweet withall.

3. *Roſa ſylveſtris Ruſſica.* The wild bryer of *Muſcovia*.

This wild bryer hath ſundry reddiſh yellow ſtalkes riſing from the roote ſpotted or rather bunched out as it were with bliſters in divers places with thornes ſet thereon like a Bryer or wilde Roſe; the leaves are not many but ſmall like the wilde hedge Bryer or rather ſmaller, and turning red in Summer: the Roſes are ſingle and ſmall of a deepe incarnate colour.

4. *Roſa ſylveſtris Virginenſis.* The *Virginia* Bryer Roſe.

The *Virginia* Bryer Roſe hath divers as great ſtemmes and branches as any other Roſe, whoſe young are greene and the elder grayiſh, ſet with many ſmall prickes and a few great thornes among them, the leaves are very greene and ſhining ſmall and almoſt round, many ſet on a middle ribbe one againſt another ſomewhat like unto the ſingle yellow Roſe: the flowers ſtand at the toppes of the branches conſiſting of five ſmall leaves, of a pale purple or deepe incarnate colour like unto thoſe of the ſweet brier, which fall away quickly as they and others doe.

5. *Roſa campeſtris flore albo odoro.* The ſingle ſweete white Roſe.

This ſingle Bryer Roſe hath wooddy ſtemmes about two cubits high, ſet as thicke with ſharpe thornes as eyther the common wilde Bryer or Eglantine is, and ſet with the like leaves but not ſo greene, at the tops of whoſe greene branches ſtand uſually but one flower a peece, conſiſting of five white leaves reaſonable large and of a ſweete ſent, with divers yellow threads in the middle: in their places come ſuch like round and ſhort heads or

5. *Rosa Campestris flore albo odoro.*
The single sweete wilde Rose.

6. *Rosa sylvestris Austriaca flore phœniceo.*
The Vermillion Rose of *Austria*.

8. *Rosa Pimpinellæ sive Pomifera vulgaris.*
The common Burnet Rose or Pimpernell Rose.

10. *Rosa simplex pumila sine spina.*
The single dwarfe Rose without thornes.

berries as are in other Roſes, but are blacke when they are ripe and not red, with white ſeedes lying in flockes of downe as others doe.

6. *Roſa ſylveſtris Auſtriaca flore phœniceo.* The Vermillion Roſe of *Auſtria.*

The younger branches of this Roſe are ſlender and reddiſh, the elder browniſh gray, ſet with divers thornes but not very thicke great or ſharpe: the leaves are ſomewhat larger then thoſe of the ſingle yellow Roſe, elſe not much unlike: the flowers are ſingle and as large as of that yellow Roſe whereof I take it to bee a *ſpecies* but differing in colour for this is of an excellent Orenge tawny colour, with an eye of Vermillion caſt over it, and of a paler yellow on the outſide, after which ſucceede the fruite.

7. *Roſa pumila rubra Auſtriaca.* The ſingle dwarfe red Roſe of *Auſtria.*

This dwarfe Roſe groweth not much above halfe a yard high, with ſlender greene ſtemmes, ſet with few or no thornes below, but furniſhed up higher with many, having whitiſh greene leaves upon them like the ordinary red Roſe and grayiſh underneath five or ſeven ſet together upon a ſtalke: at the toppes of the branches come forth very great bearded huskes, wherein ſtand large flowers made of five leaves a peece, ſomewhat ſweet, red at the firſt but decaying with ſtanding, growing much more pale before they fall away, with yellow threads in the middle, after which come the fruit which are red as the others but greater then any of thoſe before declared, formed ſomewhat more like unto a peare then others.

8. *Roſa Pimpinella ſive Pomifera minor.* The ſmall Burnet Roſe or Pimpinell Roſe

This ſmall Roſe ſeldome riſeth above a foote high being of two ſorts, whereof the one hath but few thornes on the ſtalkes, and the other full of ſmall thornes (both which are oftentimes found in one ground, but the thorny more frequent) ſet with long winged ſtalkes of leaves, being many ſmall round greeniſh leaves ſet one againſt another upon the ſtalke finely dented about the edges, ſeeming like unto a Burnet leafe for the forme and number ſet together: the flowers are ſingle ſmall and white without any ſent, after which come ſmall round heads but blacke when they are ripe full of ſeede as in other Roſes.

9. *Roſa pumila campeſtris alba.* The Dwarfe ſingle white Roſe.

This is one of the ſmalleſt Roſes ſcarſe riſing a foote above ground, being ſet with ſmall thornes and leaves according to the proportion of the plant and the wildneſſe of the kind, the flowers are white and ſmall giving heads and ſeede like the reſt: the roote creepeth about more then others.

10. *Roſa ſimplex pumila ſine ſpina.* The ſingle Dwarfe Roſe without thornes.

This Dwarfe Roſe alſo groweth very low, even almoſt upon the ground with greene ſtalkes without any thorne thereon, ſet with ſmall winged leaves, ſo ſmall that they ſeeme ſcarſe to be leaves of a Roſe: the flower is ſmall and of a pale reddiſh colour and ſingle, in ſome places very ſweete, and in others little or nothing, flowring alſo in ſome places both in the Spring and Autumne.

The Place.

The two firſt grow in the hedges of our Land every where almoſt, yet the ſecond not ſo frequent as the firſt: the third came from *Muſcovy*: the fourth from *Virginia*: the fift from *Germany* in ſundry places: the ſixt and ſeventh from *Auſtria*: the eight is found in divers places of our owne Land both in barren heathy grounds, and by woods and hedges ſides: the ninth on ſome of the hills among the *Switzers*, and the laſt neare unto *Lyons* in *France* upon *Pilats* hill there.

The Time.

Some of theſe Roſes flower earlier then others, for ſome come in *May* others not untill *June* when other Roſes doe.

The Names.

The Roſe is called in Greeke ῥόδον *Rhodon quod largum odoris effluvium emittat*, from the great ſweetneſſe therein as *Plutarch* ſaith, in Latine *Roſa*; *Theophraſtus* and *Pliny* have very diligently obſerved the ſeverall differences and varieties in their times, *Theophraſtus* in generall termes and in the number of the leaves, ſome few ſome many, in the thornes in the colour and ſent, and *Pliny* by ſeverall names, yet not expreſſing all their colours, which divers authors formerly have appropriated to thoſe Roſes were extant with them: but if I ſhall undertake the taske to ſhew their correſpondencie with ours herein, as I ſhall endeavour in declaring my opinion to ſhew the likelieſt and agree with them in ſome of them, ſo I ſhall (how free from errour I leave to others to ſcanne) diſſent from them in others: but firſt becauſe I intend to make *Pliny* my author to comment upon I thinke it fit to ſet downe the text of *Pliny* in order as it lyeth *lib.* 21. *cap* 4. The Romans (ſaith he) have in greateſt account the *Præneſtina* and *Campana*, ſome have added unto them the *Mileſia* which hath the reddeſt colour not exceeding a dozen leaves, next hereunto is the *Trachynia* not ſo red, then the *Alabandica* more vile or of leſſe eſteeme with whitiſh leaves: the meaneſt (*viliſſima ſed ut alij legunt utiliſſima*) with very many but very ſmall, even the ſmalleſt leaves is *Spineola*. there is a kind thereof called *Centifolia*, and a little after he ſaith there is alſo one that wee call *Græca*, and the *Græcians Lychnis* growing but in moiſt places never having above five leaves, of the bigneſſe of the Violet without any ſent; another is called *Græcula*, with leaves as it were cloſed or alwayes ready to open, but openeth not unleſſe it be pulled open having the broadeſt leaves: Another hath a Mallow-like ſtemme and leaves like the Olive tree, called *Moſchenton*, among theſe is that which beareth in Autumne of a middle ſize, called *Coroneola*; all are without ſent ſave the *Coroneola* and that which groweth on a Bramble, Thus farre *Pliny*. Now let us ſee how aptly other authors have fitted thē Roſes of theſe times unto thoſe of *Pliny*, and firſt for the *Præneſtina* it is generally taken to be our Damaske Roſe, yet *Lugdunenſis* ſaith it is the red Roſe, among which is the *Mileſia*, which as hee and *Camerarius* ſay the *French* call *Roſe de Provins*. The *Campana* is generally held to be our great white Roſe. The *Mileſia* is generally held to be the beſt red Roſe, the deepe colour that *Pliny* ſaith it hath, being a true note to know it by, and is called by many in *Germany Roſa fina* as *Camerarius* ſaith, becauſe it keepeth both colour and ſent beſt when it is dryed, whereof as hee ſaith there is both ſingle and double. Some take our Veluet Roſe to be it; firſt becauſe the colour is deepe though the ſent be ſmall, and it never exceedeth a dozen leaves. The *Trachynia* is our pale red Roſe which *Lugdunenſis* ſaith the *French* call *Roſe incarnate*, but *Camerarius in horto* ſaith it is a purple Roſe of a deepe or blackiſh red colour with a pale violet colour mixt therewith, ſome *Germans* he ſaith call it *Kolroſen*, and differeth little from the *Mileſia* but that it is greater; but ſurely ſo deepe a red colour as *Camerarius* alotteth unto it cannot agree unto *Pliny* his *Trachynia* which as he ſaith is *minus rubens* of a paler red colour, and therefore I thinke it is the worſer ſort of our red Roſe, whoſe

colour commeth farre short of that deepe or excellent red colour is in the best red Rose. The *Alabandica* with whitish leaves and of lesse esteeme *Camerarius* taketh it to be the *Rosa Canina* (but *Lugdunensis* sheweth that with the auncients the *Alabandica Spineola* and *Centifolia* were accounted to be flowers the thickest of leaves) and may best agree unto the smaller white Rose as I thinke: but *Bauhinus* referreth it to the *Rosa sylvestris odorata flore multiplici* our double Eglantine Rose, but this Rose is not of so small esteeme as *Pliny* saith the *Alabandica* is. The *Spineola* or as others have it *Spinosa*, but *Hermolaus Barbarus* thinketh it should be rather *Spermonia*, or as *Camerarius* saith others did thinke it should be read *Sycionia*, but *Bauhinus* hath *Sycibica* is the *Cinamomea altera*, the double Cinamon Rose, which he saith was usually called with them *Veneta*, & of others *Provincialis*, being an early Rose with small but thicke flowers of a pale red colour, and of a sweete red colour in the middle and sweet of sent. The *Centifolia* saith *Pliny* is a kind thereof which divers since the knowledge of the great Holland Rose have referred it thereunto, but in that it is sayd to be without sent: *Camerarius* and others take it to be the white Rose called also of *Pliny lacteola*. The *Lychnis* of the Grecians and the *Græca* of the Latines, *Gesner* taketh it to bee the singie Cinamon Rose; *Lugdunensis* taketh it as others also doe as hee saith to be that red Rose that the *French* call *Rose de damas ronge*, that is, *Damascena rubra*, but I thinke that *Pliny* did meane our single red Rose *Campion* which is *Lychnis* indeede. The *Græcula* as *Camerarius* saith agreeth best to that sort of red Rose which he calleth *Rubicunda* and *Rosa Saccharina*, because it doth never fully open, and is of so red a colour that is fittest to make Conserve and Sugar of Roses withall, and thereupon the *Germanes* call it *Zuicker rosen*, *Lugdunensis* saith by many mens opinions it is *Rosæ Damascenæ genus*, which the *French* call *Roses de damos incarnates* and openeth not the flowers unlesse they be pulled open, having a smell like Cinamon, *Bauhinus* taketh it to bee the *Holosericea* of *Lobel*, yet calleth it himselfe *Rosa rubra pallidior*. *Clusius* taketh it to bee the *Alba minor* thus variable are mens opinions, for the *Holosericea* although it have as large leaves as most, yet it keepeth not close but bloweth fully open, and although the *Alba minor* bee continually closed and never fully open, yet it hath no such large leaves as the *Græcula Plinij* should have. The *Moschenton* some take to bee the Muske Rose because the stalkes are greener then in other Roses, like unto a Mallow and that the name doth the nearest concurre therewith, but this hath not Olive like leaves, and therefore it is much doubted of by divers as *Lugdunensis* saith, and taketh that the name commeth not from Muske which was not knowne in *Pliny* his time, but hee rather thinketh it tooke the name from μόσχος because it riseth with many stemmes, or else from μόσχος *quod malleolis pangatur*, because it was planted as well by slippes as Vines are, as by rootes, some as hee saith put it among the *Damascenæ*, that is, the wilde hedge Roses (yet *Lugdunensis* understandeth the Muske Rose by *Rosa Damascene* whose barke is more greene then others) but some reade the leaves to bee smooth, that is, λεία and not ἐλαία of an Olive. The *Coronola* that beareth in Autume is generally held by all writers to bee the double Muske Rose which commeth onely at that time, and is very sweete: the *Italians* call it *Rosa Moschetta* and the *French Rose Mosquette* and *Muscadelle*. The *Cynorrhodon* of *Pliny* is taken by all writers to bee the *Rosa sylvestris Canina*, our wild Bryer or Heptree, and therefore *Tragus* and *Dodonæus* because they would not confound *Cynosbatos* with *Cynorrhodon*, the descriptions being so different both in *Dioscorides* and *Theophrastus*, referred the *Cynosbatos* as I said in the Chapter before to the white thorne or Hawthorne, and the *Cynorrhodon* to the wilde Rose which agreeth thereunto, and yet many even to this day doe referre the *Cynosbatos* to the wilde Rose. The parts of the Rose are sufficiently knowne to all as the huskes, the beards, the leaves, the nayles and threads in the middle which wee very foolishy call the seedes, and the Apothecaries *Anthera Rosarum* from the Greeke word ἀνθὴ τῶν ῥοδῶν *flores rosarum* but called more properly by divers *capillamenta rosarum*: for *Anthera* by *Galen*, *Celsus*, *Paulus*, *Ætius* and others is the name of a compounded medicine appointed for divers parts as *Antheræ Stomachicæ &c.* some in the forme of powders & some when they were made up with hony, still holding the same name, not taken from the flowers of Roses, whereof in many of them there was none put in, but from the lively colour of the ingredients whereof the compound medicine was made. Another errour in my opinion is generall and needeth to be amended, which is that the nailes of the Damask Rose are not cut or clipped away, that are used in the infusion to make Syrupe with as it is used in making the Conserve: for it is well knowne that the nailes of the Roses of all sorts are more binding then the other parts of the Roses, and being put together must needs abate of the purging qualitie in the rest of the Roses, so that the Syrupe made of Roses *refectis unguibus* will be more strong in working then that which is made with them as the usuall manner is. There is likewise another errour of long continuance among Phisitians and Apothecaries that call that ball of threads *Bedeguar* that groweth upon the Bryers of both sorts as I sayd before, for *Bedeguar* is a kinde of Thistle as I have shewed before: *Pliny* calleth it *Spongiola* and wee in *English* Bryer balls. It is too lamentably knowne in this Land, the civill warres betweene the houses of the two brethren *John* of *Gaunt* Duke of *Lancaster*, and *Edmond* of *Langley* Duke of *Yorke* the one making a red Rose his cognisance for them and their followers, the other a white: but it is sayd that before this division, there was seene at *Longleete* a white Rose tree to beare on the one side faire white Roses, and on the other side red, prognosticating as it were both the division and uniting of both these families, which may be as true as that a white Hen with a sprigge of Bayes in the mouth, lighted into the lappe of *Livia Augusta* foretokening the Empire to her posteritie, and the body to wither when the brood of that Hen failed. The various denominations of these wilde sorts of Roses here expressed, according to our Moderne writers is as followeth. The first is not mentioned by *Bauhinus* in his *Pinax* among all his wilde Roses, as though none of the wilde Bryar Roses had in them any sweete sent, but *Lugdunensis* doth remember it in fol. 126. by the name of *Rosa sylvestris quæ Cynorrhodon a Plinio dicitur*: the second is the *Rosa sylvestris* of *Matthiolus*, *Anguilara*, *Gesner in hortis*, *Dodonæus* and *Tabermontanus*, the *Rosa Canina odorata* and *sylvestris* of *Lobel*, *Rosa Canina* of *Camerrius*, *Cynorrhodos seu Rosa Canina* of *Thalius*, *Cynosbatos præcocior* and *Cynorrhodos* of *Cordus* upon *Dioscorides*, *Sentis canis* and *Cynosbatos* of *Brunfelsius*: the third the fourth and the sixt are remembred by no author before: the fift is *Clusius* his fift *Rosa campestris odora*, and is the *species nona* or *Rosa Dunensis* of *Dodonæus* and the *Cynorrhodon Polyacanthos* of *Lugdunensis*, which he describeth in folio 125. for hee hath another *Cynorrhodon Polyacanthon Dalechampij* in folio 127. which is about a foot high, and hath a small red flower, *Bauhinus* calleth it *Rosa campestris spinosissima flore albo odoro*: the seventh is the *Rosa sexta* and *pumila* of *Clusius* which *Bauhinus* calleth *Rosa pumila rubens*: the eight is the *Rosa sylvestris pomifera* of *Lobel* and *Lugdunensis* called also *Rosa Pimpinella* by divers, *Thalius* calleth it *Cynorrhodi species*, *Tabermontanus Rosa arvina*, and *Bauhinus* calleth it *Rosa pomifera minor* (for the *Pomifera major* I have set forth in my former booke:) the ninth

Cordus

Cordus upon *Dioscorides* mentioneth in the first Booke and 24. Chapter, *Cynosbatos* and *Cynorrhodos*, being his third sort, saying it is the least and may be called *Chamerhodos* and is called by the *Germanes Erdrosen*, *Bauhinus* calleth it *Rosa campestris repens alba*: the last is taken by *Lugdunensis* to bee *Rosa Graca sive Lychnis Græcorum Plinij*, and if it be not so, yet it may fitly as he saith be called *Cynorrhodon lene*. *Bauhinus* calleth it *Rosa campestris spinis carens biflora*. A Lecture of much moralitie might be read upon the Rose, the parts delivered by many authors both Greekes and Latines all which to insert in this place is not my minde, onely I will recite a few of many to give you a taste of the plenty and excellencie.

Vt Rosa mane viget, tamen & mox vespere languit,
Sic modo qui fuimus, cras levis umbra sumus. And againe,
Vidi ego mane Rosam solis cum lumine nasci,
Et vidi rursum sole cadente mori.

The miserably infatuated Turkes will not suffer a Rose leafe to lye upon the ground, or any to tread on them in honour of their Mahomet, from whose sweat they are perswaded the Rose sprang up; somewhat like unto the old Pagans, who held the Rose which formerly was white to become red from the blood of *Venus*, falling thereon from her foote hurt by a thorne, as shee ran among the bushes to helpe her *Adonis*. *Philostratus* dedicateth the Rose to *Cupid* whom it doth represent in every part. It is fresh young and delicate as *Cupid*, it is crowned with gold yellow haires, it beareth thornes as darts and leaves as wings, the Crimson beauty of the flowers as his glory and dignitie, neither the Rose nor *Cupid* keepeth any time, and besides this he calleth the Rose the light of the earth, the faire bushie toppe of the spring, the fire of love, the lightning of the Land. *Anacreon* his Greeke verses latined by *Stephanus* are sufficiently knowne being these,

Rosa bonos, decusque florum: *Rosis puer Cytheris.*
Rosa aura, amorque veris: *Caput implicat coronis*
Rosa cælitus est voluptas. *Charitum choros frequentans.*
The Vertues.

Because I have spoken so much of the manured Roses in shewing their denominations, I thinke it not impertinent also before I entreate of the qualities of the wild sorts, to set downe the properties and vertues of the Garden kinds somewhat more amply then I have delivered them in my former book. Both the white and the red Roses are cooling and drying, yet the white is taken to exceede the red in both those properties, but is seldome used inwardly in any medicine: the red as *Galen* saith hath a watery substance in it, and a warme joyned with two other qualities, that is, an astringent and a bitter: the flowers thereof (which wee call the seedes, but rather the yellow threads in the middle) doe binde more then the Rose it selfe and more drying also. *Mesues* sheweth that the Rose is cold in the first degree and dry in the second, compounded of divers parts or substances which yet may be separated, namely a watery meane substance and an earthly drying, an ayrie substance likewise sweet and aromaticall, and an hot also, whereof commeth the bitternesse, the rednesse, perfection and forme, and yet the force of the heate is stronger, which hath caused the forme and rednesse then that which causeth the bitternesse, for being dryed that bitternesse vanisheth when the other two doe abide: the bitternesse therefore in the Roses when they are fresh, especially the juice purgeth choller and watery humours (which qualitie the Greeke authours it seemeth knew not) but, being dryed and that heate that caused the bitternesse being consumed they then have a stopping and astringent power. Those also that are not full blowen doe both coole and binde more then those that are full blowne and the white Roses more then the red. The decoction of red Roses made with wine and used is very good for the head-ache and paines in the eyes eares throate and gums, the fundament also, the lower bowels and the matrix being bathed or put into them: the same decoction with the Roses remaining in them is profitably applyed to the region of the heart to ease the inflammations therein, as also Saint *Anthonies* fire and all other diseases of the stomacke: being dryed and beaten to powder and taken in steeled wine or water doe helpe to stay womens courses, they serve also for the eyes being mixed with such other medicines that serve for that purpose, and are sometimes put into those compositions that are called *Anthera* as is before said. The yellow threads in the middle of the red Roses especially (which as I said bee erroniously called the Rose seedes) being powdered and drunke in the distilled water of Quinses, stayeth the abundance of womens courses, and doth wonderfully stay and helpe the defluxions of rheume upon the gummes and teeth, and preserveth them from corruption, and fastneth them being loose if they bee washed and gargled therewith, and some Vinegar of Squilles added thereto: the heads with seed being used in powder or in a decoction stayeth the Laske and the spitting of blood. Red Roses doe strengthen the heart, the Stomacke and Liver, and the retentive faculties: they mitigate the paines that arise of heate, asswage inflammations procure sleepe and rest, stay womens courses both white and red and the *Gonorrhea* the running of the reines and the fluxes of the belly: the juice of them doth purge and clense the body from choller and flegme: the huskes of the Roses with the beards and the stalkes of the Roses are binding and cooling and the distilled water of eyther of them is good for the heate and rednesse in the eyes, to stay and dry up the rheumes and watering of them. Of the red Roses are usually made many compositions all serving to sundry good uses which are these. Electuary of Roses, Conserve both moist and dry which is more usually called Sugar of Roses, Syrupe of dryed Roses and Hony of Roses: the cordiall powder called *Diorrhodon Abbatis* and *Aromaticum rosarum*: the distilled water of Roses, Vinegar of Roses, ointment and oyle of Roses: and the Rose leaves dryed which although no composition, yet is of very great use and effect to be last of all spoken. To entreate of them all exactly I doe not entend for so a pretty volume of it selfe might be composed, I will therfore only give you a hint of every one of them, and referre the more ample declaration of them to those that would entreat onely of them. The Electuary is purging, whereof two or three drams of it selfe taken in some convenient liquor, is a competent purgation for any of weake constitution, but may bee encreased unto six drammes, according to the qualitie and strength of the patient: this purgeth choller without any trouble, and is good in hot Fevers, in paines of the head arising from hot and chollericke humors and heate in the eyes, the laundies also and joynt aches proceeding from hot humors. The moyst conserve is of much use both binding and cordiall, for untill it be about two yeare old it is more binding then cordiall, but afterwards it is more cordiall then binding: some of the yonger conserve taken with *Mithridatum* mixed together is good for those that are troubled with the distillations of rheume from the braine into the nose, and defluxions of rheume into the

eyes, as alſo for fluxes and Laskes of the belly, and being mixed with the ſame powder of Maſticke is very good for the running of the reines, and for other looſeneſſe of humors in the body: The old conſerve mixed with *Diarrhodon Abbatis* or *Aromaticum roſarum* is a very good cordiall againſt faintings, ſwownings and weakeneſſe and tremblings of the heart, it ſtrengthneth alſo both them and a weake ſtomacke, helpeth digeſtion, ſtayeth caſting, and is a very good preſervative in the time of infection. The dry Conſerve which is called Sugar of Roſes is a very good Cordiall to ſtrengthen the heart and ſpirits, as alſo to ſtay deſluxions. The Syrupe of dryed red Roſes ſtrengthneth a relaxed ſtomacke given to caſting, cooleth an overheated Liver and the blood in Agues comforteth the heart and reſiſteth putrefaction and infection, and helpeth to ſtay Laskes and fluxes. Hony of Roſes is much uſed in gargles and lotions to waſh ſores eyther in the mouth, throate, or other parts, both to cleanſe and heale them, and ſtay the fluxes of humors falling upon them hindering their heating, it is uſed alſo in gliſters both to coole and cleanſe. The cordiall powders called *Diarrhodon Abbatis* and *Aromaticum Roſarum* doth comfort and ſtrengthen the heart and ſtomacke, procureth an appetite, helpeth digeſtion, ſtayeth caſting, and is very good for thoſe that have ſlippery bowels to ſtrengthen and confirme them, and to conſume and dry up their moiſture and ſlipperineſſe. Red Roſe water is well knowne and of familiar uſe in all occaſions about the ſicke and of better uſe then Damaske Roſe water, being cooling and cordiall, refreſhing and quickning the weake and faint ſpirits, eyther uſed in meates or brothes, to waſh the temples or to ſmell unto at the noſe, or elſe by the ſweete vapours thereof out of a perfuming pot, or caſt on a hot fireſhovell, it is alſo of much uſe againſt the redneſſe and inflammations in the eyes to bathe them therewith, and the temples of the head alſo againſt paine and ache therein: Vinegar of Roſes is of much uſe alſo for the ſame purpoſes of paine and ache, and diſquietneſſe in the head, as alſo to procure reſt and ſleepe, if ſome thereof and Roſewater together be uſed to ſmell unto, or the noſe and temples moiſtned therewith, but more uſually to moiſten a peece of a red Roſe cake cut fit for the purpoſe, and heated betweene a double folded cloth with a little beaten Nutmeg and Poppy ſeede, ſtrewed on that ſide ſhall lye next the forehead and temples, and ſo bound thereto for all night. The oyntment of Roſes is much uſed againſt heate and inflammations in the head to annoint the forehead and temples and being mixed with ſome *Populeon* to procure reſt, as alſo it is uſed for the heate of the Liver, of the backe and reines, and to coole and heale puſhes wheales and other red pimples riſing in the face or other parts. Oyle of Roſes is not only uſed by it ſelfe, to coole any hot ſwellings or inflammations and to binde and ſtay fluxes of humors unto ſores, but is put alſo into many other compoſitions both oyntments and plaiſters that are cooling and binding, and reſtraining the flux of humors. The dryed leaves of the red Roſes are uſed both inwardly and outwardly both cooling, binding, and cordiall for with them are made both *Aromaticum roſarum Diarrhodon Abbatis* and *Saccharum roſarum*, each of whoſe properties are before declared: Roſe leaves and Mints heated and applyed outwardly to the ſtomacke ſtayeth caſtings and ſtrengthneth a weake ſtomacke very much, and applied as an Epitheme or fomentation to the region of the Liver and Heart doth much coole and temper the diſtemperature in them, as alſo in ſtead of a Roſe cake to the head and temples to quiet the overhot ſpirits, which will ſuffer no ſleepe or reſt to faſten on the ſicke patient. Of the Damaske Roſes are not made ſo many medicines or compoſitions, for beſide the Conſerve and Preſerve, the Syrupe and Hony of thoſe Roſes (each whereof is called *Solutive*) the water and the diſtilled oyle or ſpirit which ſerveth more for outward perfumes then inward Phyſicke, as the dryed leaves to fill ſweete bagges and the like, I know not any other uſe made of them, and yet there is by many times much more of them ſpent and uſed then of red Roſes, ſo much hath pleaſure outſtripped neceſſary uſe The Syrupe of Damask Roſes is both ſimple and compound and made with *Agaricke*: the ſimple ſolutive Syrupe is a familiar ſafe and gentle eaſie medicine, purging choller taken from one ounce or two unto three or foure, yet this is remarkable and wonderfull herein, that the diſtilled water of this Syrupe ſhould notably binde the belly: the Syrupe of Roſes with *Agaricke* is more ſtrong and effectuall in working then the ſimple Syrupe, for one ounce thereof by it ſelfe will open the body more then of the other, and worketh as much on flegme as choller: the compound Syrupe is more forceable in working on melancholicke humors, and availeable againſt the Lepry, Itch, Tetters, &c. and the French diſeaſe alſo. Hony of Roſes ſolutive is made of the ſame infuſion that the Syrupe is made of, and therefore worketh the ſame effect in opening and purging, but becauſe the hony is neither ſo familiar to many or convenient to hot and aguiſh bodies, it is oftener given to flegmaticke then collericke perſons, and is more uſed in Gliſters then potions as the Syrupe made with Sugar is. The Conſerve and Preſerved leaves of theſe Roſes are operative to the ſame effect in gently opening the belly. The ſimple water of the Damaske Roſes is of ſo much uſe for fumes to ſweeten all things as alſo to put into meats and broths, &c. that it hath left almoſt no uſe for any Phyſicall purpoſe, yet it hath beene well obſerved by *Coſtæus* in his commentary upon *Meſues*, that tenne ounces of Damaske Roſe water drunke in the morning doth open and purge the belly, the dryed leaves of the Damaske Roſes ſerve moſt to make ſweete powders, and to fill ſweet bagges or the like, yet the ſame *Coſtæus* in the ſame place ſheweth that the dryed leaves powdered and drunk in the whey of Goats milke worketh to the ſame effect in purging. The Muske Roſes both ſingle and double doe purge more forceable then the Damaske, and the ſingle is held to be ſtronger then the double, for although none of the Greeke writers have made any mention thereof, yet *Meſues* eſpecially of the *Arabians* doth ſet it downe: twenty of the leaves of the ſingle Roſe muſt be taken ſaith *Camerarius*, but more of the double kinde to open the belly and purge the body. The wilde Roſes are few or none of them uſed in Phyſicke, but yet are generally held to come neare unto the nature of the manured Roſes both in the earthy and binding facultie, *Pliny* ſetteth downe in his eighth booke and fourth Chapter that the roote of the wilde Roſe is ſingular good to cure the biting of a mad Dogge, which as he ſaith, (but how wee may beleeve him I know not) was found out by miracle: the fruit of the wilde Brier which are called Heppes being thorough ripe and made into a Conſerve with Sugar according to the manner of divers other fruits, beſides that it is very pleaſant to the taſte, doth gently binde the belly, and ſtayeth deſluxions from the head upon the ſtomacke, and dryeth up the moiſture thereof, and helpeth digeſtion: the pulpe of the Heppes dryed unto a hard conſiſtence like to the juice of Licoris, or ſo dryed that it may bee made into powder and taken in drinke ſtayeth ſpeedily the whites in women. With the fruit Cookes and their Ladies and Miſtreſſes doe know how to prepare many fine diſhes for their tables. The Brier ball is often uſed being made into powder and drunke to breake the Stone to provoke urine when it is ſtopped and to eaſe and helpe the collicke: ſome appoint it to bee burnt and then taken for the ſame purpoſe: in the middle of theſe balles are often found certaine white wormes, which being

being dryed and made into powder and ſome of it drunke, is found by long experience of many to kill and drive forth the Wormes of the belly.

CHAP. XXVII.

Capparis. Capers.

THe Caper tree or buſh that was knowne to *Diaſcorides* and *Theophraſtus* being but one ſort was thorny, but there hath beene ſince ſome other ſorts knowne, both that are and are not thorny, which for affinitie ſake I thinke meete to joyne together, and with the Capers another plant, which for ſome likeneſſe beareth alſo the name of *Capparis fabago* or *leguminoſa*, Beane Capers, not intending to joyne it to the pulſes as ſome might thinke it ſhould be.

1. *Capparis ſpinoſa folio rotundo.* Round leafed thorny Capers.

This Caper ſendeth forth divers long weake trayling wooddy ſtalkes lying round about upon the ground, ſet with crooked thornes like hookes or as the Bramble, at each joynt come forth two round leaves like unto *Aſarum* oppoſite one unto another, from whence ſpringeth alſo a ſmall round head upon a pretty long footſtalke, which is the bud from the flower before it open (and is that ſmall round Caper which wee doe uſually eate at meate) which being then gathered and pickled up with great ſalt, are kept in barrells and brought into other countries, and are taken out of the ſalt afterwards and kept in Vinegar to be ſpent at the table as all know: but when it is open conſiſteth of foure white ſweete ſmelling leaves, with foure other greene ones as the huske wherein they ſtand, having many yellowiſh threads and a long ſtile or peſtle in the middle, which afterwards groweth to bee the fruit, and is long and round like unto an Olive or Acorne when it is ripe (which alſo are brought pickled to us, and are the long Capers which are uſed) wherein are conteined divers hard browne ſeede ſomewhat like unto the kernells of Grapes: the roote is great, white, long and ſomewhat wooddy covered with a thicke barke running and ſpreading much in the ground, ſo that it will quickely ſpread a whole field in the warme countries and make it barren, and is ſomewhat ſharpe and bitter: the ſtalkes periſh in Winter every yeare, and ariſe againe afreſh in the Spring.

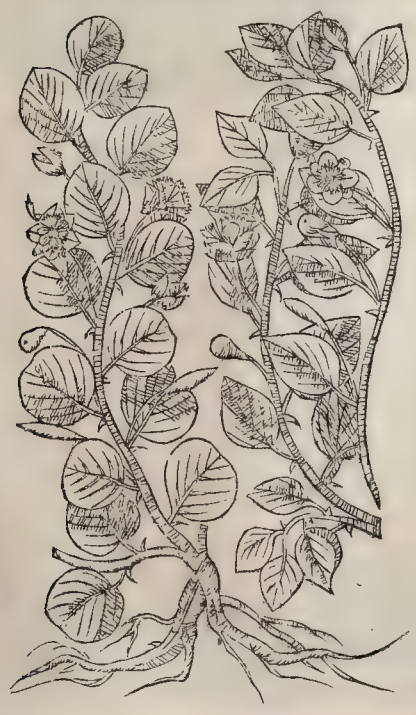
2. *Capparis ſpinoſa folio acuto.* Thorny Capers with pointed leaves.

This other Caper differeth from the former neither in the thorny growing nor in the flowring, nor in any other thing then in the leaves, which with the roundneſſe are pointed at the ends, and this is ſufficient to know it by.

3. *Capparis non ſpinoſa fructu majore.* *Egyptian* Capers without thornes.

The *Egyptian* Caper differeth not much in the manner of growing from the former, but that the ſtalkes grow

1. 2. *Capparis ſpinoſa folio rotundo & acuto.*
Thorny Capers with round and pointed leaves.



5. *Capparis fabago ſive leguminoſa.*
Beane Capers.

greater

greater and more upright without any thornes on them, the leaves are round and ſtand two at a joynt like the former, the buds are greater and ſo are the white flowers in like manner, and the fruit greater then any of the former: this looſeth not the leaves in Winter as the others doe, and herein conſiſt the chiefe differences.

4. *Capparis Arabica non ſpinoſa.* Great Capers of *Arabia.*

The *Arabian* Caper is a ſmall ſhrubbe growing up with many upright ſtemmes without thornes, the leaves, flowers and fruit are greater and larger then the laſt *Egyptian* kinde, the fruit being of the bigneſſe of an Egge or Wallnut with divers ſeeds therein, of a ſharpe and biting taſte as *Dioſcorides* hath noted, and others ſince his time of our later writers.

5. *Capparis ſabago ſive leguminoſa.* Beane Capers.

The Beane Caper riſeth up with divers greene herby and not wooddy ſtalkes like the other, branching forth from the very bottome, at the ſeverall joynts whereof grow two leaves oppoſite one unto another which are alwayes two together at the end of the footeſtalke, being ſomewhat like unto Purſlane leaves but in the poſture and colour reſembling the leaves of Beanes: the flowers come forth ſingly one at a joynt with the leaves, which before they are blowne open are very like unto Caper bloſſomes, being white ſtanding in a greene huske and with many yellow threads in the middle, after which the fruit followeth ſomwhat long and round, and opening into ſeverall parts, wherein is contained ſmall browniſh ſeede: the roote is long and woddy ſhooting forth long ſtrings and branches under ground many wayes.

The Place.

The two firſt ſorts grow naturally in the ſtony places of *Italy*, *Spaine* and ſome parts of *France*, as alſo in moſt of the hot countries Eaſtward, yet that with pointed leaves not ſo frequent as the other. *Theophraſtus* ſaith that it will abide no culture, yet *Pliny* ſheweth that in his time they uſed to plant it in *Italy* upon ridges caſt up, and the deepe trenches filled up with ſtones to keepe in the roots from overſpreading the field or ground where they were planted, or elſe that the ſtones would make them fructifie the better, the third *Bellonius* ſaith groweth in *Egypt* in a looſe ſandy field not far from the Lake *Mareotis* which is about halfe a mile from *Alexandria*; the fourth he alſo found as he ſaith in the clefts of the rockes on mount *Taurus* in *Arabia.*

The Place.

The two firſt ſorts as I ſaid before ſhoot forth their ſtalkes and leaves in the Spring, and their flowers ſhortly after, when as their fruit is not ripe untill the end of *September*: the other two keepe the ſame times of flowring and fructifying, but keeping their old leaves on and ſhooting freſh every Sping: the laſt flowreth and ſeedeth in the end of Sommer.

The Names.

It is called in Greeke κάππαρις and *Capparis* alſo in Latine, *Gaza Theophraſtus* his interpreter calleth it *Inturis*, *Pliny* ſemeth to thinke it was the *Cynosbatos* of *Dioſcorides*, becauſe among the baſtard Greeke names in *Dioſcorides*, *Cynosbatos* is one which hee ſaith was given to the Caper in his time. The firſt is mentioned by moſt writers, but the ſecond but by a few, *Alpinus* in his booke of *Egyptian* plants, and *Bellonius* in his ſecond booke of Obſervations and Chap. 21. maketh mention of the third by the name of *Capparis non ſpinoſa* and *arboreſcens*: the fourth is alſo remembred by *Bellonius* in the ſaid ſecond booke and 66. Chapter, and by *Rauwolfius* in his *Itinerarie*: the laſt is called by all moderne writers *Capparis Leguminoſa*, or *Capparis Fabago*, by *Lugdunenſis Fabago Belgarum*, by the *Syrians* as *Rauwolfius* ſaith *Morgſani*, and taketh it to be the *Andirian* of *Rhaſis* and the *Aldiſrigi* of *Avicen*: *Columna* thinketh it moſt properly to agree unto the *Telephium* of *Dioſcorides*: *Bauhinus* calleth it *Capparis Portulacæ folio*, and ſaith it was called *Peplus* at *Paris*, and therefore *Lugdunenſis* calleth it *Peplus Pariſienſium*; all nations call Capers according to the Greeke and Latine, varying but the accent according to their dialect.

The Vertues.

The Capers, ſuch as come over to us pickled up in ſalt doe nouriſh nothing, yet doe a little move the belly, but being waſhed from the Salt and ſteeped in Vinegar and ſo eaten do ſtirre up the appetite dejected or decayed and doe a little cleanſe the bowells of flegme ſticking to them and avoyd it, as alſo doe helpe to open the obſtructions of the Spleene and Liver: *Galen* ſheweth in *ſeptimo ſimpl. med.* that the Barke of the roote of Capers conſiſteth of various qualities, namely firſt extreme bitter, next ſharpe, then ſower, by the bitterneſſe it cleanſeth, purgeth and cutteth, by the ſharpeneſſe it heateth, cutteth, and digeſteth, and by the ſowerneſſe it contracteth, thickneth and bindeth, and thereupon ſaith it is a medicine above all other availeable for the hardneſſe of the Spleene, whether it be applied outwardly of it ſelfe, or mixed with other things to annoint the place, or the rootes boyled in Vinegar or Oxymell and taken inwardly, or the powder of the roote mixed with the ſaid decoction and taken, for it is certaine that it avoyderh groſſe and viſcous humors, not only by the urine but by the belly alſo, and oftentimes it bringeth away with it congealed and corrupted blood, and thereby giveth much eaſe to thoſe that are troubled with Gouts or Palſies, with the Spleene or paines in the Hippes or Sciatica, weakeneſſe in the Nerves and Sinewes, and for women that have their courſes ſtopped to procure them: it draweth from the head and other parts thoſe offenſive humors that are the originall cauſe of Ruptures, Convulſions and Crampes, and thereby give them much eaſe: the barke of the root of Capers is an eſpeciall remedy to helpe fowle Vlcers, being made into a Pultis and applied, for it cleanſeth and mightily dryeth them, and is alſo good for hard ſwellings and kernells under the eares and the Kings Evill: the fruit is alſo effectuall for the ſaid purpoſes, and ſo are both leaves and ſtalkes, but all of them weaker then the roots: the ſeede bruiſed and heated in a little Vineger and held betweene the teeth eaſeth the tooth-ach: the ſame rootes alſo boyled in oyle and dropped into the eares eaſeth the paines and killeth wormes breeding in them: the leaves and flowers, but eſpecially the barke of the roote ſteeped or boyled in Vinegar cleanſeth the skinne of all morphew, freckles, ſpots or any orher diſcolouring of the skinne whatſoever: the oyle that is made of Capers is of very good uſe againſt the paines of the ſides and Spleene. The *Arabian* ſort is much more ſharpe and almoſt exulcerating, and therefore as *Pliny* well ſaith, it is not fit to uſe ſo violent a ſtranger, better it is to uſe our owne *Europian* kindes. The Beane Caper is uſed by the *Syrians* as *Rauwolfius* ſaith to kill the wormes in children and to drive them forth.

CHAP.

CHAP. XXVIII.

Oxyacantha Dioscoridis quibusdam, id est, Spina acuta seu potius Spina appendix Plinij.
The white Thorne or Hawthorne.

THE Hawthorne hath not beene knowne formerly to be of any more sorts then one, but wee have in our time had the knowledge of two other which shall be presently shewed you.

1. *Spina appendix vulgaris.* The ordinary Hawthorne.

The common Hawthorne groweth up in some places to be a tree of a reasonable height if convenient dressing, pruning and keeping helpe it forward, otherwise it groweth to be but a shrubbe or hedge bush, with divers shoots armes and branches, whereon are set in divers places sharpe thornes and faire shining leaves, somewhat broad, and cut in on the edges into divers parts: the flowers are many standing together, comming forth both at the tops of the branches and upper joynts with the leaves, consisting of five white leaves a peece, with divers white threads in the middle, tipt with red, and of a very pleasant sweete sent, after which come berries somewhat long, with the roundnesse of a lively red colour when they are fully ripe and somewhat sweete in taste, conteining within them divers white seedes lying in a flocky or downie substance which make it harsh in tasting, and if it should bee eaten it would sticke to the throate and hurt the winde pipe: the roote groweth farre and deepe.

1. *Spina appendix vulgaris.*
The ordinary Hawthorne tree.

2. *Spina acuta humilior.* The low Hawthorne.

The low Hawthorne never groweth so high or great as the former, the leaves are smaller but longer divided on the edges in the same manner: the flowers also are white and sweete and grow in tufts or clusters, but the fruit that followeth is yellow tending to a Saffron colour, in other things it differeth not from the other.

3. *Spina acuta biflora Britanica.*
Englands Hawthorne.

We have another sort of Hawthorne growing in divers places of our Land well knowne to those that dwell about the places where they grow, yet not greatly regarded or wondered at by them nor yet by many of those that have seene them growing: but I doe not thinke fit that it should be so slightly passed over or so smally respected, for I suppose it a strange worke of nature, or of the God of nature rather, to cause such a tree being in all parts thereof like unto the common Hawthorne, to blossome twice every yeare, the one time usually in *May* as all others of the kind doe, the other about Christmas, eyther somewhat before or somewhat after, according to the temperature of the Winter at that time, for if the Winter before bee milde without either great frosts or other hard weather, it will be in blossome white all over as in *May*, sometimes in *November*, or else in *December*, but if it bee hard and sharpe weather it will not blossome untill *January* that the hard weather be over: it beareth also after these flowers are past greene berries, even in the Winter before any greene leaves doe appeare or blossomes in *May*, so that it will have both ripe fruit and greene at one and the same time upon the tree: there hath not beene observed any other difference betweene this kind and the ordinary Hawthorne. Some might thinke as it hath beene disputed among divers that this happeneth, by reason of some hot springes that take their course by the rootes of this tree, which reason I grant hath some appearance of likelihood, but wisely scanned and considered, is too light I thinke to hold weight, for how should one tree only blossome in a place, and none of all the other trees in the same tract or compasse of the same springes running; and besides this there are of these trees in divers places of the Land, as in *Rumney* Marsh in *Whey street*, as it is vulgarly called, but should bee rather High street, where it standeth in a moorish ground though upon a banke beaten with cold and Northerly blasts, and exposed to the furious winds on all sides, having no shelter or defence, but standing in a flat and open soyle, where I thinke no hot spring eyther doth or is likely to breake forth or runne neare it: let the wise and judicious scan it throughly, if this come to passe by the nature of the soyle and springs, or the naturall kinde of the tree.

The Place.

The first groweth every where in the hedges and borders of fields and woods: the second in *Germany*: the last at *Glastenbury Abbey*, and as is before said in *High street* or *Whey street* in *Rumney* Marsh, and neare unto *Nantwiche* also in *Cheshire* by a place called white greene, which tooke the name as it was thought from the white bushes of thornes which there they call greenes.

The Time.

The time of these to flower is specified to be ordinarily in *May* and extraordinarily about Christmas, sometimes a little before and sometimes a little after: the fruit is ripe on the ordinary trees in *September*, and doe hang on them all the Winter as meate for birds, or untill the frosts doe make them fall.

The

The Names.

Very many (as *Matthiolus, Lacuna, Turner, Bellonius, Lobel, Dodonæus, Camerarius, Cæsalpinus, Rauwolfius, Italus, Tabermontanus* and some other) doe take this Thorne to be Ὀξυάκανθα *Oxyacantha* of *Dioscorides* which hee describeth to be like the Peare-tree but lesser, and very thorny, bearing a berry like unto those of the Myrtle, but red, full and easie to breake, having a stone or Kernell within it, some also thinke that it is μυρσίνη of *Dioscorides*, others take it to be the Ὀξυάκανθος *Oxyacanthus* of *Galen*, which he likewise saith is like unto the wilde Peare-tree in forme, and not unlike it in qualitie, so that the ones masculine the others faminine are but one bush or tree, by the judgement of many the best Herbarists although some take them to bee divers, as *Camerarius* who doth make the Barbery bush to be the *Oxyacanthos* of *Galen*, and not the *Oxyacantha* of *Dioscorides*, and so doe also *Cordus* upon *Dioscorides* and *Tabermontanus, Hermolaus* and *Ruellius* likewise doe take the Barbery to be *Oxyacantha*, and so doe *Fuchsius, Tragus, Cornarius*, and some other whom *Matthiolus* justly gainesayeth, for there is no likenesse in the Barbery excepting the thornes (and yet in them there is a difference) unto *Oxyacantha*, being neither in forme of body like the wilde Peare, nor in the fruit like unto a Myrtle, dry and fryable easie to breake, the Barbery being moyst and full of juice. *Tragus* saith that some tooke the Hawthorne to bee *Arbutus*. But *Theophrastus* his *Oxyacántha* is neither Barbery nor Hawthorne, which in his first Booke and 15. Chapter hee putteth among those trees that are ever greene, which cannot be said of eyther Barbery or Hawthorne, for that in no place or countrey they are knowne to keepe their leaves, but to loose them in Winter, but by the judgement of the best and most expert Herbarists in our times, the *Pyracantha* as I have declared in my former booke is the true *Oxyacantha* both of *Dioscorides* although hee hath not mentioned any sempiternitie of leaves, and *Theophrastus* also agreeing thereto in all things: Some there be also that would make the *Spina appendix Plinij* to bee the Barbery bush as *Lugdunensis*, but *Clusius* is against that opinion for that therein there are these two doubts, first that *Plinie* if hee had meant the Barbery by his *Spina appendix* would not have forgotten the three thornes that grow together in the Barbery which is eminent enough therein: and next hee would not have forgotten the yellow colour, both in the barke of the branches and rootes: but the most judicious of these later times, among whom is *Gesner in hortis* and *Clusius in historia* have determined that *Spina Appendix Plinij*, which sometimes also he calleth *Spina* simply, can be no other thorne then this Hawthorne, which *Tragus* and *Lonicerus* tooke to bee *Cynosbatos Theophrasti*, and *Cordus in historia* calleth it *Sorbus aculeata, Anguilara* Spina *alba vulgo*, and *Spina acuta* as *Dodonæus* doth also. *Bauhinus* placeth it among the Medlars calling it *Mespilus apij folio sylvestris spinosa sive Oxyacantha*, and as a kinde thereof likewise putteth the *Pyracantha*, but in my opinion he had done better and more rightly, to have referred them both to the kinds of Services whereunto they better agree then unto Medlars, in that Services are smaller fruits as these are: the second here expressed is mentioned by *Dodonæus* under the name of *Spina acuta humilior*: the last as a kind peculiar to our owne countrey as I thinke, I have here set forth unto you more exactly then *Gerard*, who onely had a superficiall notion or rather relation thereof. The Hawthorne is called by the *Arabians Amirberis*, by the *Italians* in some places *Bugaio*, and in others *Amperlo*, and *Pan d'orso*, by the *Spaniards Pirlitero*, by the *French A'ubespin* (*Ruellius* saith that the vulgar sort doe call it *Senelle*, yet *Quercetanus* setteth a fruit downe in some of his receipts by the name of *fructus Senellorum* in his *Pharmacopœa restituta* to be *Paliurus* unlesse hee thought the *Paliurus* to be the Hawthorne:) by the *Germans Hagendorn*, by the *Dutch Hagendoren* and by us in *English* Hawthorne, or Hedgethorne, Whitethorne and *May* or *May*-bush, because our ordinary sort seldome or never flowreth before *May* and never after.

The Vertues.

The berries or the seedes in the berries are generally held to be a singular good remedy against the stone, if the powder of them be given to drinke in wine: the same is also reported to bee good for the Dropsie: but whereas divers have attributed hereunto a binding or astringent qualitie *Anguilara* his judgement was (whom *Matthiolus* confuteth) that *Tragus* who saith that the leaves, flowers & fruit are drying and binding, and that if the flowers be steeped three dayes in wine, and afterwards distilled in glasse, the water thereof drunke is a soveraigne remedy for the Plurisie, and for inward tormenting paines: the distilled water of the flowers by an ordinary way stayeth, saith he, the Flux or Laske of the belly: the seeds cleared from the downe bruised and boyled in wine and drunke performeth also the same effect: the said distilled water of the flowers is not onely cooling but drawing also: For it is found by good experience that if clothes or spunges be wet in the sayd water and applyed to any place whereinto thornes, splinters, &c. have entered and bee there abiding it will notably draw them forth: the vertues given by *Galen* unto *Oxyacantha* doe not pertaine hereunto, for saith he the fruit thereof is not sower or harsh, especially when it is ripe, but sweet and therefore more fit to open then to binde the belly, and fitter to bring downe then to stay womens monethly courses: but the last evinceth this errour.

CHAP. XXIX.

Sabina. The Savine tree or bush.

ONe sort of Savine I have expressed and set forth in my former Booke, the figure whereof I here shew you againe, the other sorts shall be exhibited in this Chapter.

1. *Sabina baccifera major.* The greater berried Savine tree.

The greater Savine tree that groweth with us spreadeth not so much as the former Savine doth, but riseth more upright to a mans height (but *Bellonius* saith in *lib. de coniferis* that he saw it as high as an Almond tree on the mountaines *Amanus* and *Olympus* in *Phrygia*) spreading forth armes and branches fully furnished with leaves, which at their first comming forth are somewhat like unto Tamariske leaves, but being growen old they are more like unto the leaves of the Cypresse tree, hard and pricking, and of a darke greene colour with an eye of blew shadowing them of a sent lesse strong and nothing so sharpe as the ordinary: it hath not beene observed to beare any flowers but small round berries like unto Iuniper berries, but greater and of a sharpe taste, blacke when they are ripe with an eye of blew upon them like the Iuniper or the ordinary Savine, which divers have held to be barten, taking their authority from *Pliny*, who also saith that Rosemary beareth no seede both

Sabina vulgaris.
The ordinary Savine Tree.

1. *Sabina baccifera major.*
The greater berried Savine Tree.

both which are found untrue by good experience, as *Fuchsius*, *Cordus*, *Gesner*, *Dodonæus* and *Lugdunensis* doe testifie, yet *Camerarius* saith it is true in one kind that it beareth no fruit, but not in the other, but *Lobel* saith the ordinary doth beare berries although but in a few places and but seldome, and both of them holding their fruit on the branches all the Winter, untill greene ones grow on them, and never loosing their leaves.

2. *Sabina baccata altera.* Gentle Savine with berries.

This other Savine groweth somewhat higher then the last as it groweth in Europe, and almost unto the height of the *Phenician* or Cypresse like Cedar, spreading more slender and weake branches whereon are set small and long leaves, of a more gentle savour then the rest: on the branches among the leaves come forth such like berries as the other, and very like unto Iuniper, blacke also when they are ripe, and but little bitter in taste, not altogether unpleasant.

The Place.

The first groweth in *Candy*, *Misia*, and other those East countries, the second on the mountaine *Taurus*, *Amanus* and *Olympus*: the other upon the mountaines in *Apulia* and *Calabria* of *Naples*, as also on the plaines of the *Alpes* neare unto *Gratianople*.

The Time.

They abide ever greene, and shew their ripe berries not untill the Winter.

The Names.

It is called in Greeke Βρᾶθυ, Βρᾶθος and Βράθεον, *Brathus*, *Brathy* and *Barathron*, in Latine *Sabina* and *Savina* and of some *Savinera*; why *Pliny* should call *Sabina* an herbe all doe much wonder, for all knew and himselfe could not bee ignorant that both sorts hereof mentioned by him were trees or shrubbes and not herbes. *Dodonæus* seemeth to allude unto the Greeke name, where he saith that *Pliny* in his 12. Booke and 19. Chapter mentioneth *Bruta arbor*, and thinketh as divers others did, that *Bruta* was taken from *Brathu* by the transposition of a letter, and is *Pliny* his *Savina altera*, which he saith was called *Cupressus Cretica*: but

2. *Sabina baccata altera.*
Gentle Savine with berries.

Lugdunensis

Lugdunensis denieth that *Bruta arbor Plinij* can be *Thuya prima Massilienſiũ*, the *Oxycedrus* or *Cedrus Lycia* of *Bellonius*, or *Cedrus Phœnicea altera* of *Pliny* and *Theophraſtus* according to *Lobel*, and the *Sabina major Monſpelienſium*, which ſhall be ſhewed in the thirtieth Chapter. *Tragus* reporteth the wonderfull ſuperſtitions uſed in and before his time in his countrey, about the branches of the Savine tree on Palme Sunday, to be conjured or hallowed as they ſay by the Prieſts, and then powerfull to drive away divells, and to keepe thoſe houſes that have it in them ſafe from lightning, and that thoſe leaves that touched the Croſſe or came neareſt thereunto while the Prieſt was in hallowing it, ſhould preſerve them that ſhall weare them (more then the reſt of the ſame branch that did not touch the Croſſe) from charmes or witchcraft, and from the ſnares of the divell, and from the dangers of the edges and points of ſwords and weapons, thus to draw their mindes from truſting in God to truſt unto theſe conjured ſuperſtitious deviſes of men. *Matthiolus* much blameth *Bellonius* that *libro de coniferis arboribus* placed the great Iuniper tree, which he found on the mountaines *Taurus*, *Amanus* and *Olympus* among the reſiniferous trees, but I would faine know if the *Vernix* or *Gum Iuniperi*, be not to be accounted a *Roſſin* as well as *Maſtiche* which is ſo accounted of all: but he is much more to be blamed as he ſaith alſo, for making the ſaid Iuniper tree to be the *Bruta arbor Pliny*. The firſt is *Sabina baccifera* of *Matthiolus*, *Camerarius* and others, *Sabina altera* by *Dodonæus*, *Sabina Cupreſſo ſimilis* by *Cordus* upon *Dioſcorides*, and *Lugdunenſis*, the other is called *Sabina altera baccata* by *Lobel* and *Lugdunenſis*, *Sabinæ alterius alterajcon* by *Dodonæus*, and *Sabina fœmina major* by *Tabermontanus*. The *Arabians* call it *Abbel* but not *Alharur*, the *Italians* and *Spaniards Sabina*, the *French Savinier*, the *Germanes* Sevembaum and Sibenbaum, the *Dutch Savelboom*, and we in *Engliſh* The Savine tree.

The Vertues.

Savinē ſaith *Galen* is hot and dry in the third degree, and of very thin parts, by the ſtrong drying and heating qualities it ſuffereth no conſolidating or glewing propertie to be in it, but by reaſon of the great acrimony therein it digeſteth the more, and hath leſſe bitternes then is in the Cypreſſe: it reſiſteth putrefactions as powerfully as the Cypreſſe, eſpecially if they be of long continuance, and not eaſie to be holpen, for mixed with ſome Hony and applied, it clenſeth the filth of Vlcers, and taketh away their blackneſſe. It breaketh alſo or diſſolveth Carbuncles and Plague ſores: *Matthiolus* ſaith that a dram in powder mixed with three ounces of Niter and two ounces of Hony doth wonderfully helpe thoſe that are ſhort winded: the decoction thereof drunke doth provoke the courſes, and draweth forth the birth and ſecondine, and deſtroyeth the living: the ſame outwardly applyed, or the fumes thereof taken underneath worketh to the ſame effect: the ſaid decoction taken expelleth blood by Vrine, & is profitable for the Kings Evill: it killeth the wormes in children, but it is ſafer to uſe it outwardly and to apply it to the Navell, or to annoint the belly with the oyle of Savine. The powder of the leaves of Savine mixed with Creame, or the greene leaves boyled in Creame and annointed on the heads of children, which have ſcabbes or running ſores or dry ſores, clenſeth them throughly and healeth them, as alſo Saint *Anthonies* fire: the freſh leaves bruiſed and layd upon running and fretting Cankers and the like, killeth and deſtroyeth them: the powder of the leaves uſed with ſome other things, or ſtrewed upon doth helpe thoſe bliſters that riſe on the yard by inordinate luxury, after they have beene bathed with the decoction of the leaves. The diſtilled water thereof is ſingular good to clenſe the skinne from ſpots or markes therein, and other deformities, and helpeth thoſe that have a giddineſſe in their braine: the ſmoake thereof burned cureth Hens that have gotten the pippe, and is effectuall for the Bottes in Horſes or cattell to give it in their drinke: but it muſt bee warily given for feare of danger.

CHAP. XXX.

Iuniperus. The Iuniper Trēe.

HEre are two or three ſorts of Iuniper Trees ſomē greater others leſſer, whereof I meane to entreat in this Chapter and ſhew you their varieties.

1. *Iuniperus vulgaris ſeu minor.* The common Iuniper Tree.

The common Iuniper Tree (in ſome places groweth nothing ſo high as they doe in others, even in our owne Land as well as in *Germany*, but of an exceeding great length in *Italy* and *Spaine* as *Matthiolus* and *Cluſius* ſay, ſo that they doe there make Rafters and Beames for houſes thereof) riſeth up with a ſtemme or ſtocke covered with a reddiſh barke which often cleaveth and falleth away, the wood underneath being ſomewhat yellow hard and very durable (for as *Pliny* ſaith that *Dianaes* temple at *Epheſus* had the Beames and Rafters thereof for the more durabilitie and very ſweet when it is burned,' the coales that are made of the wood being burned and covered with its owne aſhes, keepe fire in them a whole yeare as it is reported) from whence ſpread divers branches ſet with very ſmall and long narrow blewiſh greene leaves, three for the moſt part alwayes together which are almoſt like unto thornes, but not ſo hard or pricking: the blooming is to be perceived like a little yellow duſt falling round about in the Spring of the yeare, after which come ſmall greene berries, not ripening fully untill the ſecond yeare after their firſt comming forth, which then will be blacke with an eye of blew thereon eaſely wiped away with touching, as it is in a ripe Damſon, (ſome ſort is round and of the bigneſſe of a Pepper corne, others as great as Sloes, and ſome a little long withall) ſo that there will bee alwayes upon the bearing trees both greene and ripe berries, wherein are contained ſmall hard ſeede: the root is ſomewhat reddiſh and ſpreadeth many branches: this doth alwayes abide greene, and in the hotter countries of *France*, *Spaine*, *Italy*, *&c.* doth yeeld a certaine hard and dry gumme in ſmall peeces, ſomewhat like unto Maſticke and whitiſh whilē it is freſh and growing yellowiſh by age, not cleaving together like Maſticke when it is chewed but going to powder, and is of much uſe as you ſhall heare by and by. There is another ſort of this Iuniper growing in ſundry parts of this kingdome which bringeth onely yellowiſh threads for flowers, without any berries ſucceeding.

Sterilis.

2. *Iuniperus Alpina.* The low or mountaine Iuniper.

This low Iuniper ſeldome riſeth to be two foote high, but groweth low ſpreading neare the ground, having ſhort and thicke armes and branches as the former, which yet are plyant and eaſie to bend but not to breake: on theſe branches grow the likē three leaves together, but they are ſhorter broader thicker and not ſo much prick-

ing

1. *Iuniperus vulgaris seu minor.*
The common Iuniper tree.

3. *Iuniperus maxima Illyrica.*
The great Sclavonian Iuniper.

ing or sharpe as they, and of the same blewish greene colour underneath but greene above: the fruit or berries are altogether like the other but a little longer, of a sweet sent and sweetish taste at the first but bitter afterwards and unpleasant like the other.

3. *Iuniperus maxima Illyrica.* The great *Sclavonian* Iuniper.

This great Iuniper Tree riseth to the height of a great tree, whose leaves are greater and harder more like unto thornes then the other: the berries likewise are much larger, of the bignesse of an Hasle nut in some places and of an Olive in others somewhat long with the roundnesse, and more blew when it is ripe then the other which is not wiped away, but abideth firmely thereon.

4. *Iuniperus major Americana.* *West Indian* Cedar or Iuniper.

This tree which they of our *English* colonies in the *Bermuda* and *Virginia*, &c. call Cedar groweth very great and high (for I have seene boards of above twentie foote long, and halfe a yard broad brought from the Sommer Ilands) fairely spread with branches, and small short leaves like those of the greater Iuniper growing thereon: the berries are small and blewish not much bigger then our ordinary Iuniper berries: the wood is more red and of a stronger sent both burnt and unburnt then our ordinary Iuniper.

The Place.

The first groweth especially in Woods in *Kent* and sundry other places in the Land: the second groweth on the Rockes and stony places of the *Alpes* as *Clusius* saith: the third groweth on mount *Taurus* in *Syria* as *Bellonius* saith, and neare the Sea shore of the *Venetian* Gulph and *Illyrium* as *Anguilara* saith, and as some say also in Provence of *France*: the last as is said in the *West Indies* in sundry places.

The Time.

In *May* the dustie flowers cover the ground being blowne from the branches, and as I said the berries are not ripe untill they have growne on the bushes two Sommers and a Winter.

The Names.

It is called in Greeke ἄρκευθος and ἄρκευθος, *Arceuthis* and *Arceuthos*, in Latine *Iuniperus sic dictum putant quod Iuniores & novellos fructus pariat antiquis marcescentibus: solam enim fere arborum fœtus suos in biennium prorogare aiunt.* *Dioscorides* and others doe make two sorts or kinds, a greater and a lesser, concerning the greater there is much controversie among many of our moderne writers, about the text which saith, the berries are as great as Wallnuts, which *Marcellus* and *Ruellius* thinke is mistaken, and should be κύαμος as great as a Beane, for there was never any berry seene of halfe the bignesse of a Wallnut: but out of *Greece* some have witnessed to have seene Iuniper berries of the bignesse of a Beane or Hasell nut almost. The berries are called in Greeke ἄρκευθος, *Arceuthides*, and in Latine *Baccæ Iuniperi* or *Grana juniperi*: The gumme that runneth from the tree when it is wounded, is called of some *Vernix* or *Vernia quasi veris ros*, issuing forth in the Spring, as also *Sandaracha Arabum* but not *Græcorum*, for their *Sandaracha* although alike in name yet is quite another thing, even *Auripigmentum rubrum*, otherwise called *Cinabrium minerale*: the Latines call it as I said *Vernix* but *Cornarius* saith that it is falsly apply-

apply to this gum, for *Vernix* is a made thing of *Amber* and Linſeede oyle: for ſaith hee the name *Vernix* is derived from the *Germane* word *Vernſten* or *Berniſten*, which is with them the yellow *Amber* as it commeth from the place where it is gotten, and tooke the name from the propertie therein, that as that ſo this being kindled will burne like a Candle or Torch: *Vernix liquida*, in *Engliſh Varniſhe* is a certaine liquor that Painters, Joyners and others doe uſe to lay upon their workes, and Smithes upon their poliſhed painted Iron workes, to keepe their colours the longer from fading, the beſt whereof for their uſe is made of this gumme of the Iuniper tree and of Linſeede oyle: *Pliny* in his eleventh Booke and ſeventh Chapter mentioneth another *Sandaracha* which is found in Bee-hives, being their foode whereon they live while they worke, and is called *Erithace* (as *Ariſtotle* doth) and *Cerinthus*, but by divers others learned men *Vernix* and *Vernilago*. *Bauhinus* maketh two ſorts of the ordinary Iuniper tree, the one he calleth *Iuniperus vulgaris fruticoſa*, the other *Iuniperus vulgaris arbor*, when as *Cluſius* ſheweth that there is no other difference betweene them, then the largeneſſe of the growing in a hotter climate, in the like manner as the Turpentine and the Storax trees, like ſhrubbes in ſome places and tall trees in others. The ſecond *Cluſius* calleth *Iuniperus Alpina* and *Geſner in hortis Iuniperus minima*: the third is called by *Lobel* in his Obſervations and *Icones*, *Iuniperus maximus Illyricus cærulea bacca*, by *Lugdunenſis Iuniperus major*, and by *Tabermontanus Iuniperus major Illyrica*: the laſt as I ſaid is called Cedar by all our *Engliſh* inhabiting in the *Bermuda*, &c. & with us from them who never ſcanned it ſufficiently, nor knew to give it the true denomination, for all the ſorts of Cedar doe much differ in ſundry particulars from this, and therefore I have preſumed thus to intitle it untill ſome other can give it a truer epithite. *Serapio* calleth it *Habhagar*, the other *Arabians Aronnas* and *Archenas*, the *Italians Ginepro*, the *Spaniards Enebro*, the *French Geneve* and *Genemier*, the *Germanes Weckholderbaum*, and the berries *Weckholder beer vnd Kramer beer*, of Blacke birds who are called in the *Germane* tongue *Kramer vogell* becauſe they feede upon the berries all the Winter long, the *Dutch Genever boom*, and wee in *Engliſh* the Iunipre tree.

The Vertues.

No man ſaith *Tragus* can eaſily ſet downe all the Vertues of the Iuniper tree, preferring the berries before Pepper: the Iuniper it ſelfe both leaves and wood as *Galen* ſaith are hot and dry in the third degree: but the berries although they be in the ſame degree of heate, yet are but in the firſt degree of drineſſe: the gumme is hot and dry in the firſt degree: The leaves and young tender branches of the Iuniper tree, or the juice of them or of the berries, or the berries themſelves taken in wine, are very effectuall againſt the biting of a Viper or Adder, as alſo againſt the Plague or Peſtilence or any other infection or poyſon, the *Germanes* uſe it much, for their Treakle is made of the condenſate juice of the berries, which they commend in all diſeaſes almoſt, both for inward and outward remedies: the ſame alſo is profitable againſt the Strangury and ſtopping of the Vrine, and ſo powerfull againſt the Dropſie, that as *Matthiolus* ſaith hee hath knowne divers to avoyd ſo much water by Vrine by taking foure or five ounces at a time of the Lye made of Iuniper aſhes, that they have beene holpen thereby: it doth alſo provoke womens courſes being ſtayed, and doth helpe the riſing and other paines of the mother: the berries are good for the ſtomacke and to diſſolve the ſwellings and windineſſe thereof: and are likewiſe profitable for the cough and ſhortneſſe of breath, and other diſeaſes of the Cheſt and Lungs and to eaſe the griping paines and torments in the belly, they are alſo prevailent to helpe Ruptures, Convulſions and Crampes: to procure a ſafe and eaſie delivery unto women with child, for which purpoſe *Matthiolus* adviſeth to take ſeven Iuniper, and ſeven Bayberries, halfe a dramme of *Caſſia lignea*, and a dram of Cinamon, theſe being groſſely bruiſed put them into the belly of a Turtle Dove to be roſted therewith, let it be baſted with the fat of an Hen, whereof they are to eate every other evening: The ſcrapings of the wood ſaith *Dioſcorides* being eaten doth kill men, which clauſe both *Matthiolus* and *Tragus* before him finde much fault with, ſeeing it is contrary to the former part of the Text and thruſt thereinto by others, for as he ſaith neither the beſt copies have it therein, neither doe *Galen*, *Paulus Ægineta*, nor *Serapio* who wrote wholly after *Dioſcorides* his Text word for word make any ſuch mention of the properties of the wood, and more ſaith he it is found falſe by tryall made thereof: but *Scaliger* in his 15. Booke and 18. exerciſe, maintaineth the Text of *Dioſcorides*, in that although the decoction of the wood is wholeſome, yet the ſcraping or courſe powder by the drineſſe thereof ſticking to the guts doth ſuffocate, in the ſame manner as *Colocynthis* which to bee rightly prepared muſt bee beaten and finely ſifted leaſt it cleave to the bowells and bliſter them: the berries are very comfortable to the braine and ſtrengthen the memory and ſight, and all the ſenſes and the heart alſo: being eyther drunke in wine or the decoction of them in wine taken: the ſame alſo is good againſt a quartane, and diſſolveth the winde in the belly and in generall is effectuall for all diſeaſes as well outward as inward proceeding of any cold cauſe, if they ſhall take of the berries two or three times a weeke three or foure at a time in wine, which muſt bee gathered in the fit time of the ripeneſſe, moyſtned with and after fairely dryed upon a cloth: the Salt made of the aſhes of the Iuniper wood is a ſingular remedy for the Scurvey, the putrefied and ſpongy gums, and generally reſiſting all putrefaction: The Chymicall oyle drawne from the berries while they are greene is as effectuall if not more to all the purpoſes aforeſaid: there is an oyle alſo drawne out of the Iuniper wood *per deſcenſum* as they call it, which is very good againſt the toothach and for the Goute, Sciatica and reſolution of the Nerves or Sinewes comming of cold. The gumme of Iuniper is uſed like as *Amber* is to ſtay cold rheumaticke diſtillations, defluxions and Catarrhes upon the eyes or Lungs, &c. the fumes thereof upon the burning on coales being taken into a cappe (the head alſo holden in the meane time over the ſaid fumes) at night and to lie covered therewith: or the powder thereof with other things fit for the purpoſe, ſtrewed upon Flax and to be quilted into a cappe to bee worne in the night chiefely, and in the day alſo as neede ſhall require: the ſaid gumme in powder taken in wine doth ſtay vomitings, inward bleedings and ſpitting of blood, womens courſes alſo, and all other the fluxes of the belly, and of the hemorrhoides or piles: the ſame alſo killeth the wormes in children, and mixed with ſome oyle of Roſes and Myrtles healeth the chappes of the fundiment, kibes alſo and chilblanes on the hands and feet: the powder of the gumme mixed with the white of an Egge, and applyed to the forehead ſtayeth the bleeding at the noſe: the ſame alſo burned upon quicke coales, and the fumes thereof taken thorough a funnell upon an aking tooth taketh away the paine: it is effectuall in moiſt Vlcers and Fiſtulaes, and weeping running ſores, to dry up the moiſture in them which hindereth their cure: the liquid Varniſh is an eſpeciall remedy againſt ſcaldings with water or burnings with fire, and to helpe the painefull and bleeding Piles, and Palſie, Crampes, Convulſions of the Nerves and Sinewes: The ſmoake of Iuniper wood being burned, beſides that it yeeldeth a good ſent to perfume any houſe, it is of good uſe in the time of infection, and driveth away all noyſome Serpents, Flies, Waſpes,

Waſpes, &c. the aſhes of the wood or barke made into a Lye with water doth cure all itches, ſcabbes puſtules or other eruptions in the ſkinne, yea and the Lepry alſo if the places be bathed therewith. The *Germanes* Treakle of Iuniper berries is made in this manner. Take what quantitie you will of freſh but ripe Iuniper berries, bruiſe them and boyle them in a reaſonable quantitie of water untill they bee well boyled, ſtraine and preſſe them hard in a preſſe with pulpe and liquor ſet to the fire againe in a glaſed earthen veſſell and evaporate away ſo much of the humiditie, ſtirring of it continually untill it become of the thickneſſe of an Electuary, which then put into pots or glaſſes to be kept for your uſe, whereof a ſmall quantitie taken morning and evening doth wonderfully helpe them that are troubled with the ſtone in the Reines or Kidneyes, with the Chollicke, with the paines of the mother, and the ſtoppings of their courſes, is good againſt Catarrhes and rheumes, the ſhortneſſe of breath and winde, the ſtraightneſſe of the breaſt, the cough, the cruditie rawneſſe, and indiſpoſition of the ſtomacke againſt the Plague and other infectious diſeaſes, for it preſerveth and defendeth the heart and vitall ſpirits from infection and venome, and againſt ſwownings and faintneſſe, the paines, ſwimming and giddineſſe in the head, againſt frenſie alſo and madneſſe, for inflammations and rheumes into the eyes, and preſerving the ſight, deafeneſſe in hearing, and ſtench of the gums mouth or breaſt, helpeth the Dropſie, Jaundies, Falling ſickneſſe, Palſie and Goute, healeth inward Impoſtumes: in briefe it not onely helpeth all diſeaſes wherewith the body is poſſeſſed, but keepeth it in health and free from all diſeaſes. This one thing is memorable thereof if it be credible that *Virgill* ſaith thereof in his tenth *Eclogue*, that the ſhadow of the Iuniper tree is hurtfull both to man and the corne in theſe verſes,

Surgamus, ſolet eſſe gravis cantantibus umbra,
Iuniperi gravis umbra nocent & frugibus umbræ.

CHAP. XXXI.

Oxycedrus minor. The prickly or ſmall Cedar.

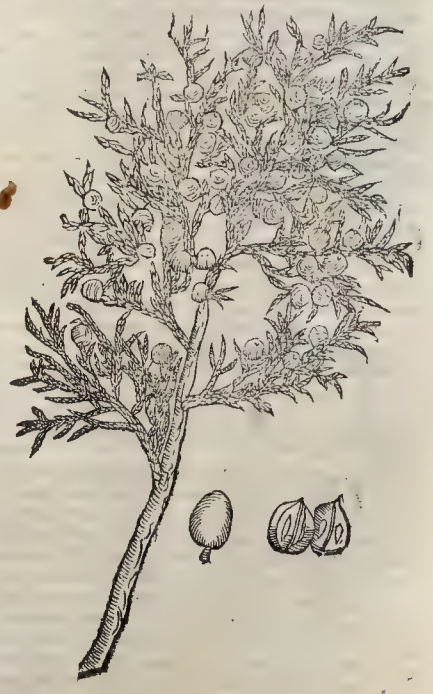
I Doe not intend in this place to ſpeake of the great Cedar, in that it neither hath thornes nor prickly leaves, but of ſome of the lower and leſſer ſorts which are prickly as they follow.

1. *Oxycedrus.* The prickly Cedar.

This prickly Cedar groweth in ſome places to be a tall tree, but moſt uſually not much above a mans height, whoſe body is crooked and bending covered with a ſcabbed or rugged reddiſh oarke, upon the branches grow long and narrow, ſharpe and prickly leaves like unto thoſe of Iuniper but longer and bigger, three for the moſt part ſet together, among the leaves come ſmall yellow flowers which turne into round berries greene at the firſt and yellowiſh after, but of an excellent red colour when they are thorough ripe, larger then Iuniper berries

1. *Oxycedrus.* The prickly Cedar.

2. *Cedrus Phœnicea folio Cupreſſi.* Cypreſſe-like Cedar.



by much as the other Cedars that follow, sometimes growing as great as Hasell nuts, bunched out in divers places, with three or foure small uneven white seedes within them, greater then those in the Iuniper berries, which berries abide on the tree all the Winter, and fall not away untill yonng ones are budded and growne greene.

2. *Cedrus Phœnicea folio Cupressi.* Cypresse-like Cedar.

This other Cedar hath likewise a crooked stemme seldome growing above a mans height spread into many armes and smaller branches covered with a rugged reddish barke, the lower leaves, especially of a young plant before it be fit to beare fruit are long and sharpe pointed, like unto Iuniper leaves but longer, but the upper leaves or when the trees groweth elder doe change their forme and become flat and plaited like unto Cypresse leaves, not sharpe or prickly at all, so that one would thinke verily that seeth them at severall times, that these trees were not of one but of different kinds, which being rubbed smell sweet and resinous: at the end of every branch commeth forth a yellowish flower, which afterwards turneth into a round berry, greene at the first and reddish when it is ripe, being somewhat mellow, tasting more bitter but aromaticall, conteining within it three or foure seeds.

3. *Cedrus Phœnicea minor.* The lesser Cypresse-like Cedar.

This little Cedar is in all things like the last, but lesser both in body and leaves, the fruit also is like thereunto, and reddish when it is ripe, but smaller, even no bigger then Iuniper berries.

The Place.

All these sorts grow as well on the mountaines *Taurus*, *Amanus* and *Olympus*, as neare thē Sea side, and the mountaines not farre from *Mompelier* in *Narbone*, and in *Naples* also, and in *Moravias Matthiolus* saith.

The Time.

They blossome in the Spring of the yeare which soone fall away, the fruit followeth but will not bee ripe untill the next yeare after, the first springing like herein unto the Iuniper.

The Names.

The first is called in Greeke Ὀξυκέδρος ἡ Κέδρος πικρά, *Oxycedrus* and *Cedrus Lycia*, of some *Cedrus baccifera* and *minor Phœnicea* to put a difference betweene it and the great *Cedrus*, which is called *Phœnicea* also, and *conifera* because it chiefly groweth on the hills in *Phœnice*, some also call it *Cedrus Phœnicea folijs Cupressi*. The first is called by *Clusius*, *Lugdunensis*, and *Dodonæus* in his *French* booke *Oxycedrus*, but by him in his Latine worke *Oxycedrus Phœnicea*, by *Matthiolus* and *Tabermontanus Cedrus Phœnicea*, by *Gesner in hortis Cedrus minor* and *Cedrula*, by *Castor Durantes*, *Cedrus minor vel Phœnicea*, by *Anguillara Iuniperi prima species sive Dioscoridis Iuniperus*, by *Lobel Iuniperus major Monspelliensium* and *Oxycarentis sive Iuniperus acuta*, by *Cordus* on *Dioscorides Cedrus magna sive Iuniperus peregrina*, by *Cæsalpinus* as it is likely *Iuniperus montana fructu flavo*, and as likely by *Camerarius*, *Iuniperus major Italica baccis rubris*. I doe not so much wonder at the variable opinions of divers of our later authors (who not knowing or not thoroughly considering each herbe whereof they wrote to compare them exactly by those of the auncients (in that herbarisme or the knowledge of herbes was not so exactly knowne unto them, they living but in the dawning of the light of knowledge) have some of them as you may see here related called that a Iuniper which others afterwards have most truly referred to the *Oxycedrus* of *Galen* and *Theophrastus*, who also as I said before called it *Cedrus Lycia* as *Pliny* also did) as I doe at *Bauhinus* of whom every one did expect in a worke of fortie yeares gathering, a true definition of every plant, that hee should rather make this tree a Iuniper (all the sorts of Iuniper giving blacke or blewish berries which in my opinion is a certaine note to know them from the Cedars that give red berries) and place it among their sorts calling it *Iuniperus major bacca rufescente* then among the Cedars, when as yet he himselfe doth acknowledge it a Cedar, and doth set it downe for the *Oxycedrus Theophrasti* and *Galeni*: the second is variously intituled by divers, *Pliny* calleth it *Cedrus Phœnicea Bellonius Cedrus pumila folijs obtusis* and *Cedrus Phœnicea*, *Matthiolus*, *Gesner in hortis* and *Durantes Oxycedrus Lycia*, *Lobel*, *Cedrus*, *Phœnicea media & alter Dodonæus Oxycedrus folio Cupressi aut Sabina major Monspelliensium* (but the same note that I gave to know Iuniper from Cedar which is the Blacke berries, may serve also for Savine, all the sorts of them likewise giving blacke berries and not red) *Clusius Iuniperus major*, *Lugdunensis Thuja quartū genus*, for which *Clusius* doth justly taxe him for his confident boldnesse to make this and others that beare berries to be *Thuja*, when as *Theophrastus* who onely giveth the description thereof *l. 3. c. 5.* to be like the Cypresse both in leafe and fruit, the tree being of all writers reckoned *inter coniferas* whose fruit as all know is more like unto a small Cone or Pine Apple with scales before it open and separateth then a berry) and the same also as *Bauhinus* thinketh is his first *Thuja* or *Thuja Massiliensium*: for both *Clusius* and he doth note it as a thing fit to be knowne that this *Cedrus Phœnicea* while it is young differeth in leafe from it selfe when it is old, and therefore *Bauhinus* in making two sorts of them when himselfe doth acknowledge them to be but one, doth but fill up roome needelesse. The last *Lobel* calleth *Cedrus Phœnicea minor vel tertia*, and *Bauhinus Cedrus folio Cupressi minor*: The Grecians call the berries of the Cedar tree κέδρεις *Cedrides*, and so doe the Latines also: The *French* call the second *Serbin*, and the first *Cade* as *Lobel* saith, and by burning the greene wood after the manner of making Pitch and Tarre doe make a certaine liquor or Tarre which is very strong and stinking, by them called *Huile de Cade*, but *Lugdunensis* saith that the said Tarre or oyle is made and drawen as well from Iuniper being so ordered, or from Ash, or both the Sabines, or the prickly Cedar as from this. These Cedars also yeeld a certaine Gum somewhat like unto the Gum of Iuniper and brittle also as it is.

The Vertues.

The small Cedars as *Galen* saith are hot and dry almost in the third degree, the berries are sweet as of thē former Iuniper, and in like manner are of small nourishment to be eaten, yet too liberally taken as *Galen* saith they cause headach and raise heate and gnawing in the bowells, especially the two last which doe more heate and dry then the other: the said berries bruised and made up with hony cureth the cough, and being boyled in wine and drunke provoketh urine, helpeth the Strangury and is effectuall in the diseases of the mother the suffocations and stranglings thereof to be drunke upon the fits, and to be injected when it is exulcerated: it is also given to those that are bitten or stung with Serpents or venemous creatures, especially the Sea Hare: the same also stayeth Laskes and fluxes of the Belly, and is of good use in Ruptures, Crampes and Convulsions, swellings and inflammations, and are thought to be no lesse effectuall then Iuniper berries for all thē purposes whereunto they are put, and also to be but a little inferiour to the properties of the great Cedar: for that water which forerunneth the liquid Pitch or Tarre, when the greene wood is burned is called *Cedria* as well as that which commeth from the great

Cedar

Cedar, and is almoſt as ſtrong and powerfull to condite or enbaulme the bodies of the dead, to preſerve them from putrefaction as it: the *huile de cade* or abhominable ſtinking Tarre, is uſed not onely of the Shepherds to cure their Sheepe and Dogges of the mangy, ſcabbes, lice, &c. but helpeth alſo to kill lice, and cure the ſcabbes in childrens heads, and is uſed eyther of it ſelfe alone, or with a little Vinegar to an aking tooth to eaſe the paine, or elſe to breake it or cauſe it to fall out: the ſame alſo is effectuall to clenſe and dry up watering, corrhoding or creeping Vlcers: it is alſo uſed to bee laid upon wood to preſerve it from Wormes, and the ſmell thereof driveth away Mothes and other noyſome Flies.

CHAP. XXXII.

Prunus ſylveſtris. The blacke Thorne or Sloe buſh.

LEt the blacke thorne or Sloe buſh here take up a place, becauſe it is ſo thicke ſtored with thornes. It never groweth to the greatneſſe of a tree but alwayes abideth as an hedge buſh, in ſome places riſing higher then in others, having uſually divers ſtemmes riſing from the rootes, branched forth into greater armes and ſmaller ſprayes, ſtored with ſtrong ſhort and ſharpe thornes, ſet with and beſides the ſmall darke greene leaves finely dented about the edges: the flowers are very white, many ſet on the branches in divers places and not wholly at the toppes, conſiſting of five leaves as all other Plummes and Cherries have, with divers white threads tipt with yellow in the middle, after which follow the fruit, which are as all know, blacke and ſmall when they are ripe, and with the harſhneſſe a little ſweete, but before that time ſo harſh that none can indure to taſte them: theſe are all of one forme, that is round, and of one ſize or bigneſſe in a manner, but to be much bigger or elſe as big as a Bulleis, or to be long with the roundneſſe as a Dampſon or other larger Plum I did never ſee: the roote is great and wooddy, ſpreading under ground and ſhooting forth againe in divers places, if it be not cut and pruined.

Prunus ſylveſtris,
The Blacke thorne or Sloe buſh.

The Place.

It groweth in every place and country, in the hedges and borders of fields, and is for their deviſion a ſure defence.

The Time.

It flowreth early, that is, alwayes in *Aprill* and ſometimes in *March*, ſo ſtrong and hardy it is againſt all the injuries of the weather, but ripeneth the fruit after all other Plummes whatſoever, for it is not fully ripe and fit to be eaten and uſed untill the Autumne froſts have mellowed it.

The Names.

It is called in Greeke κοκκυμήλεα ἀγρία *Coccymelea agria* and ἀγριοκοκκυμηλέα *agriococcymelea quod magritudine & rotunditate coccimala ferat*, and the frut ἀγριοκοκκυμηλὸν *agriococcymelon*: but *Galen* ſaith that they call it in *Aſia* προύμνον *Prumnum*, in Latine *Prunus ſylveſtris* and *Prunellus*. *Virgill quarto Georgicorum* calleth it *Spinus* in the maſculine gender in theſe words,

Et Spinus jam pruna ferentes.

And ſo doth *Servius* and divers other authors ſince their times. The Bulleis is accounted a kind of wild Plumme, of the kinds whereof I have ſpoken in my former booke. The *Italians* call it *Pruno ſalvatico*, the *French Prunier ſauvaga*, *Prunelier* and *Poleſſer*, the *Germanes Schlehendorn* and *Haberſclehen*, the *Dutch Slehendoren* and wee in *Engliſh* Blacke Thorne or Sloe tree, or Buſh.

The Vertues.

All the parts of the Sloe buſh are binding, cooling and drying, and all effectuall to ſtay bleedings at the noſe or mouth or any other place, the Laske of the belly or ſtomack or the Bloody flux, the abundance of womens courſes, and helpeth to eaſe the paine in the ſides, bowells and guts, that come by overmuch ſcowring, to drinke the decoction of the barke of the roote, or more uſually the decoction of the berries eyther freſh or dryed. The Conſerve likewiſe is of very great uſe and moſt familiarly taken for the purpoſes aforeſaid: but the diſtilled water of the flowers firſt ſteeped in Sacke for a night, and drawne therefrom by the heate of a *Balneum*, is a moſt certaine remedy tryed and approoved, to eaſe all manner of gnawings in the ſtomacke, the ſides heart or bowells, or any other griping paines in any of them, to drinke a ſmall quantitie when the extremities of paine are upon them: the leaves alſo are good to make lotions, to gargle and waſh the mouth and throate, wherein is ſwellings, ſores or kernells, and to ſtay the defluxions of rheume to the eyes or other parts, as alſo to coole the heate and inflammations in them, and to eaſe the hot paines of the head, to bathe the forehead and temples therewith. The ſimple deſtilled water of the flowers is very effectuall alſo for the ſaid purpoſes, and ſo is the condenſate or thickned juice of the Sloes: the diſtilled water of the greene berries before they be ripe is uſed alſo for the ſaid effects of cooling binding and ſtaying the flux of blood and humours, and ſome other purpoſes, *quæ ſtudioſe pretereo*. The juice of the fruit of Sloes is taken as a Subſtitute for the juice of *Acacia* in all our Apothecaries ſhoppes, which ſubſtitution although it bee not much to be miſliked, as having one and

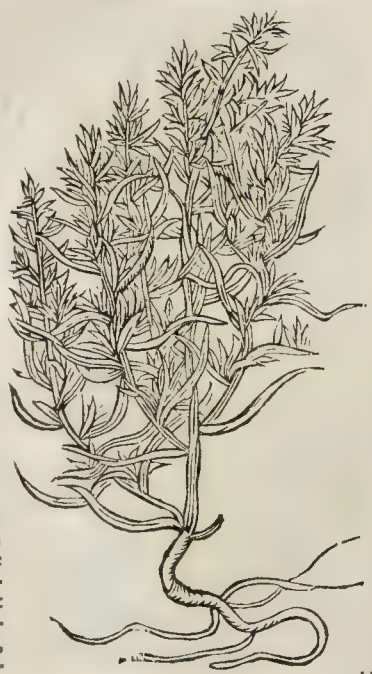
but one qualitie of the *Acacia* in it which is the binding, yet is it deerer in the degree of cooling: hundivers learned men in sundry places and namely the Phisitians of *Padoa* and *Naples* have accounted the condensate juyce of *Sumach* or of *Mirtles*, to be a better substitute answering to the qualities of the *Acacia* in more than the juyce of Sloes doth: for substitutes had neede of much consideration and judgement, not onely to be alike in the first qualities, that is a roote for a roote, a seede for a seede, a juyce or gum, for a juyce or a gum, &c. and not a juyce or gumme in steede of a roote or seede, or contrariwise: but in the second qualities also of a substitute that is in heate and cold, that contraries be not admitted, either of cold for hot, or hot for cold; yea and in the third quality likewise, that they may answere as neere as may be possible, the same degrees that they neither want nor abound in any degree. And although *Galen* did appoint the double quantity of *Cassia* in the stead of *Cinamon* which made *Quintus* to cast into his dish, that by the same rule he might take double the quantity of course bread, in the stead of to much fine, as was appointed to make a medicine; yet *Galens* answere to him standeth good, that the respect of substitutes, standeth not in taking twise so much, of that which is worse in stead of that which is good, but as in the actions of men, when as the strength of one man is not sufficient to beare, lift, or move, a stone or engine, we put two or more to doe it: but there are other substitutes admitted among our Apothecaries, into these two great Antidotes of *Mithradatium* and *Theriaca Andromachi*, which are no way to be allowed or tollerated, nor ever would be in any of the famous Citties of *Italy*, which is to suffer the *Canella alba* (falsly called *Cortea Winterani*) which is the barke of a tree, to be the substitute for *Costus* which is a roote, in one mans dispensation, when as the like was never seene before, and to deny a genuine and right Simple, to be put into another mans composition, because the thing was scant, and not for every one easily to obtaine, nor the price low, that every one might have cheape, and therefore in steade of an aromaticall rosine, use an unctious or fat Oyle, quite contrary to the rules of Art, the rule of substitutes, and the course of other famous and worthy professours in other Countries, who by sparing no cost to obtaine such genuine drugges as are rare, scarsely to be had, and yet of especiall use, have made themselves and their compositions famous through the whole world: whereas others by being too greedy of gaine, and too envious of any others better proceedings than their owne, have used, and still doe, farre meaner things than they should: but *hola*, what hath just anger against the errours in my profession drawne me to utter? it is rather in hope that all will amend being forewarned, than to touch any in particular, that will hereby take himselfe to be taxed, for thereby he shall shew himselfe guilty of the crime, although none doe accuse him.

CHAP. XXXIII.

Tragus sive Tragum Matthioli. The Sea prickely plant.

THis stragling fellow I have followed to the Sea side to bring to your view, and have therefore thrust in the end of this Classis, being neerest to this tribe of prickly plants, although it selfe be somewhat gentle or lesse offensive, whose description is in this manner. It spreadeth divers crooked greene stalkes, variously branched, and the branches foulded one within another, thicke set with small short, and somewhat sharpe, pale greene leaves, three or foure set together, thicke and closing the stalke at the bottome, forming as it were a great joynt, resembling the fruite of the *Caltrope*, in some plants and places the leaves will be twise as long, but in gardens are never so sharpe or prickly, as in the naturall places; at the joynts upwards stand severall small yellowish greene flowers, which afterwards turne into small flat seedes, within a three square prickly huske: the roote is small and long, perishing every yeare utterly, so that if it sow not it selfe, as in the naturall places it doth, it must be new sowne every yeare: the whole plant is almost without any taste, either of heate, or cold, or drying, yet more enclining to heate than cold, as many sea plants doe.

Tragum Matthioli.
The Sea prickly plant.



The Place.

This plant groweth neere the Sea side, not onely in other hot Countries where by the heate of the climate, the branches are harder, and the leaves more sharpe and pricking, but on our owne coasts also in divers places, although nothing so sharpe yet somewhat prickly.

The Time.

It flowreth not usually untill the middle of *July*, and the seede is ripe in the end of *August*.

The Names.

Tragus is πολύσημον *dictio*, a word of many significations, for this is neither the τράγος *Tragus* of *Dioscorides*, which he saith some also called *Scorpius*, nor yet of *Pliny* which hee maketh the *Scorpius* of *Theophrastus*, nor yet the *Tragos Cerealis*, whereof you shall heare further in his place, nor yet the *Tragum* or *Targum vulgare* of *Clusius*, which is our *Dittander*: but a prickly sea plant adjudged by *Lobel* and others, to be a kinde of *Kali*, and call it *Kali spinosum*, which *Mat-*

thiolus

thiolus ſet forth for the right *Tragus* or *Scorpius* of *Dioſcorides*, but confoundeth it with the *Scorpius* (or *Nepo* as *Gæa* tranſlateth it) of *Theophraſtus*: and therefore all others ſince his time call it *Tragus*, or *Tragum Matthioli*, and *Lobel Tragus* in *Probus Matthiola*. *Anguillara* calleth it *Drypis* and ſaith *Tragon non eſt*: *Lobel* hath ſet forth the figure hereof with longer leaves, and *Camerarius* alſo ſaith it did grow with him, then *Matthiolus* or *Lugdunenſis* ſet forh this, yet *Lugdunenſis* in his Booke of Sea plants giveth a figure differing from the former, *viz.* ſtanding with leaves in rowels like *Gallinor* or *Rubia*: but the true *Tragus* of *Dioſcorides* I have ſhewed you before by the name of *Polygonũ bacciferũ minus* or *Vna marina minor*, which by the judgement of moſt the exerciſed in herbariſme doth beſt agree with *Dioſcorides* text in all points. *Bauhinus* in this as he doth in many other places purteth two titles hereunto as if they were two plants, calling it *Kali ſpinoſum cochlantum* and *Kaſi ſpinoſo affinis*, and appropriateth authors unto each, when as himſelfe acknowledgeth they doe amiſſe that make them to bee but one, howſoever the figures doe vary. I have called it in *Engliſh* the Sea prickly plant untill a fitter can bee given.

The Vertues.

I cannot finde or learne of any property phyſicall whereunto this plant is ſerviceable, (onely *Camerarius* ſaith it is uſed as young Aſparagus for a ſallet herbe to be eaten) but ſerveth to contemplate the Creator in his creatures as many other the herbs and plants that grow out of the ground, whereof although we know no uſe in many or not halfe the uſe in moſt, yet he hath not made the leaſt in vaine, and if we would be as induſtrious to ſearch out their facultïes as our forefathers have beene in their times we ſhould know much more then we doe; and ſurely if we did not enjoy their labours, in what a world of darkeneſſe and ignorance ſhould we abide? Let therefore the old adage worke effectually in all *Nonnobis natiſumus* and let every one endeavour to augment the talent that hath beene lent him, not for his owne particular onely, but for the benefit of others, ſo ſhall the ſavour of ſuch a ſweet oyntment ſpread farre, whereof others receiving the ſent as well farre of as neare at hand, perpetuall odour of praiſe will riſe from them and glory will crowne them from whom it commeth.

FELICES

FILICES ET HERBÆ CAPILLARES.

FERNES AND CAPILLARIE HERBES.

CLASSIS DECIMA.

THE TENTH TRIBE.

CHAP. I.

1. *Filix mas vulgaris.* The common Male Fernē.

OF the Male Ferne there is some diversitie as shall bē shewed. Thē Male Fernē sendeth forth divers hard rough unbranched stalkes of winged leaves, naked or bare at the lower end, consisting of many leaves up to the toppes with one at the ēnd, set on both sides thereof, not fully opposite but as it were in the middle betweene two on the contrary side, each leafe not fully devided but deepely nicked in on the edges, all of them of a pale greene colour, hard and dry or without sappe, broadest at the bottome and smaller toward the toppe, on the backe side of whom there are certaine brownish small spots which are the seeds, for by the falling of them young ones are encreased: this and all other sorts of Fernes and Capillarie herbes in this Classis mentioned, have no flowers nor other seeds then such spots, or scales whereby they as I said are encreased, although many have denyed that any of them have eyther flowers or seede, and some have beene reclaimed upon my instance of the place in *Genesis* 1. 11. 12. and so have declared it: the roote hereof is made of many thicke blacke threads descending from a browne scaly thicke head.

1. *Filix mas vulgaris.* The common male Ferne.

2. *Filix mas aculeata.* The prickly Male Ferne.

This other Ferne differeth not from the former, but onely that the winged leaves are not dented in, but whole, having a small pricke at the end of each of them and growing not so high.

The Place.

The first groweth as well on Heathes and open places of hills, as in shadowy places by the sides of fields, reasonable frequent in all countries, but the second groweth very few yet in the like places also.

The Time.

These seldome hold their stalkes with leaves greene in the Winter: but shoote out new from the roote in the Spring which at their first rising are brownish and foulded in round: The time when those heads on the backe of them are ripe and doe fall is Midsomer, and falling on the ground doe spring, for whereby else should it be encreased, seeing God in the beginning appointed every herbe and tree, to have the seede of their kind (and not of another) within them.

The

The Names.

It is called in Greeke ſimply πτερις and πτερον, *pteris* and *pterion*; becauſe the leaves are like unto the wings of birds, *Nicander in Theriacis* calleth it βλῆχνον and βλῆχνιον, in Latine *Filix mas* of moſt authors, yet *Anguilara, Geſner in hortis* and *Cæſalpinus* call it *fœmina*, not onely contrary to all other in our times, but quite contrary alſo to *Theophraſtus* his true diſtinction which he ſheweth is betweene the male and female in his ninth booke and twentieth Chapter in theſe words, *differt fœmina filix a maſcula, quod folium unico artu porrectum hæc habeat, &c.* the ſecond is remembred by *Thalius* and is his third ſort of the male kind, for his ſecond *ſpecies* is but a ſmall difference of the firſt; and by *Bauhinus* in his *Prodromus* as I take it calleth it by the name of *Filix mas aculeata minor*, and it may be alſo his *major*, for he deſcribeth it with little difference. The male Ferne is called by the *Arabians, Sarax*, by the *Italians Felce maſchio*, by the *Spaniards Helecheyorva*, by the *French Fongea* and *Fenchiere maſle*, by the *Germanes Waldtfarres*, by the *Dutch Varren mannekgn.*

The Vertues.

I finde that all authors have appropriated the ſame vertues to the male Ferne that they have to the female, and therefore to avoyd a tautologie or rehearſall of the ſame things againe; I will referre you to the next Chapter for them. Of the aſhes of Ferne is made a kinde of thicke or darke coloured greene glaſſe in ſundry places in *France*, as in the Dutchy of *Mame, &c.* (and in *England* alſo as I have beene told by ſome) out of which they drinke their wine. The ſeede which this and the female Ferne doe beare, and to be gathered onely on Midſommer eve at night with I know not what conjuring words is ſuperſtitiouſly held by divers, not onely Mountebankes and Quackſalvers, but by other learned men (yet it cannot be ſaid but by thoſe that are too ſuperſtitiouſly addicted) to be of ſome ſecret hidden vertue, yet I cannot finde it expreſt what it ſhould be: for *Bauhinus* in his *Synonimies* upon *Matthiolus* ſaith theſe tales are neither fabulous nor ſuperſtitious, which he there ſaith he will ſhew in his Hiſtory: but *Matthiolus, Lugdunenſis* and others declaime againſt ſuch opinion: experience alſo ſheweth that they beare ſeede, although *Theophraſtus, Galen, Dioſcorides* and *Pliny* following him, ſay they neither beare flowers nor ſeede, for if about Midſommer (for then uſually it is ripe) you gather the ſtalkes of Ferne and hang them up on a thread with ſome faire white Paper or cloth under them, you ſhall finde a ſmall duſt to fall from them which is the ſeede, and from them doe ſpring plants of the ſame kindes, and ſuch young plants riſen from the fallen ſeede have beene ſeene growing about the old plants, for as I ſaid before no herbe growing on the earth or in the water (except ſome with double flowers which are encreaſed by the roote) but doe beare ſeede, &c. *Dioſcorides* relateth a great contrarietie in nature betweene the Ferne and the ſeede, that each one will periſh where the other is planted, as if it were by a naturall inſtinct, which thing I thinke happeneth rather from the ſoiles, a Reede not joying in a dry ground nor the Ferne in a wet. *Pliny* in his 24. booke and 11. Chapter ſaith, that the roote of the Reede laid to the Ferne driveth it forth, as the roote of the Ferne in like manner doth the Reede: and *Celſus* before him ſheweth that each of them is a remedy againſt the other, and *Theophraſtus* that ſhewech whereas Corne and other herbes doe delight and are furthered by dung, the Ferne onely periſheth thereby.

CHAP. II.

Filix fœmina. The female Ferne.

OF the female Ferne likewiſe there is ſome diverſitie more then formerly hath beene obſerved by others as you may here ſee.

1. *Filix fœmina vulgaris.*
The common female Ferne.

This Ferne riſeth up with one or two, and ſometimes more almoſt round ſtalkes from the roote ſomewhat higher then the former, and branched with ſuch like winged leaves growing on both ſides therof equally for the moſt part one againſt another, every leafe being leſſer then the male, and more divided or dented yet not ſharpe but round pointed, of as ſtrong a ſmell as the former, and having the like ſpots on the backſide of them which ſtalke if it be cut a ſlope ſomewhat long will in the white pith thereof ſhew ſome marke of a ſplayed Eagle: the roote hereof is long and ſlenderer then the former, of about a fingers thickneſſe and blackiſh for the moſt part creeping under the ground.

2. *Filix fœmina pinnulis dentalis.*
Dented female Ferne.

This other female Ferne hath the ſmall winged leaves which are ſet on each ſide of the middle ribbe, ſomewhat ſharpe pointed, of a ſadder greene colour and narrower then the former, yet ſpotted on the backeſide, but the maine ſtalke is fuller of branches, and not growing up ſo ſtraight nor ſo high, and differeth little in any thing elſe.

3. *Filix fœmina aculeatis pinnulis.*
Sharpe pointed female Ferne.

This ſharpe pointed female Ferne hath the maine ſtalkes about a foote long, branching out into wings each whereof is not dented but whole, ending in a ſmall pricke or point.

1. *Filix fœmina vulgaris.* The common female Ferne.

The

The Place.

The first groweth more frequently than the male on barren heaths, and shady hedge sides, &c. the other two grow rather on moist rockes and in the shaded hills.

The Time.

They flourish at the same and perish in Winter, I meane the leaves.

The Names.

It is call'ed in Greeke Θελυπτερὶς & νυμφαιοπτερὶς *thelypteris* and *nymphæa-pteris* in Latine *Filix fœmina*: the first is generally by most anthors called *Filix fœmina*, yet *Gesner in hortis* calleth it *Mas*, and *Bauhinus* in his *Pinax Filix ramosa pinnulis obtusis non dentatis*: the second is called by *Thalius*, *Filix fœmina altera tenuifolia*: the last is called by *Bauhinus* in his *Pinax*, *Filix ramosa minor pinnulis dentatis*, which *Cordus* in *historia* calleth *Pteridium masculum*, as *Thalius* noteth it likewise, it is called in *Italian Felce fœmina*, in *Spanish Helecho*, and *French Faugiere femelle*, in high *Dutch Grosse Farnkraut*, in low *Dutch Varen Wiffken*, and we in *English* Brak or common Ferne.

The Vertues.

The rootes of both these sorts of Ferne are somewhat bitter with some astriction, being bruised and boyled in Mede or honyed water, and drunke, killeth both the broade and long wormes in the body; the same also abateth the swelling and hardnesse of the spleene: the greene leaves eaten, are sayd to open the belly and moveth it downewards, yet it troubleth the stomacke, and purgeth chollericke and wateriish humours: they are very dangerous to women with childe, by destroying the birth, and provoking aborsement, yet is it but a fable to be any danger unto them to goe or stride over it: for *Lacuna* sheweth that the greeke text is faulty in that word, which bred that errour; yet the use of it procureth barrennesse in them: the rootes being bruised and boyled in oyle or Hogs grease, maketh an oyntment very profitable to heale wounds punctures or prickes in any part; and the powder of them used in fowle Vlcers, dryeth up their malignant moisture, and causeth their speedier healing: the rootes hereof with other things that goe into the oyntment, called *Agrippæ* are appointed as helping hydropicke persons: the fume of Ferne being burned driveth away Serpents, Gnats, and other noisome Creatures that in the Fenny Countries much molest both strangers and inhabitants that lye in bed in the night time, with their faces uncovered. They use in *Warwicke* shire, above any other Country in this Land, in steed of Sope, to wash their clothes, to gather the female Ferne (for that is most frequent with them) about midsomer and to make it up into good bid balls, which when they will use them they burne them in the fire, untill it become blewish, which being then layd by, will dissolve into powder, of it selfe, like unto Lime: foure of these balles being dissolved in warme water is sufficient to wash a whole bucke full of cloathes.

CHAP. III.

Osmunda regalis sive Filix florida. Osmund or Water Ferne.

ALthough this Ferne, doth never grow naturally but in Bogs, wet Moores, and the like watry places, and therefore may fitly challenge to be placed with those of the like nature: yet because I would not transpose it alone, from the rest of this Tribe, let it take his place here with the rest of the Fernes. It shooteth forth in the spring time (for in the winter the leaves perish) divers rough hard stalkes, halfe round and hollowish or flat on the other side, two foote high, having divers branches of

1. *Osmunda regalis sive Filix florida.* Osmund or water Ferne.

Osmundi regalis summitatis cum floribus.

Winged

winged yellowiſh greene leaves on all ſides, each whereof ſtanding one againſt another, are longer narrower and not dented or nicked on the edges as the former, but ſomewhat like to the leaves of *Pollipody*: from the top of ſome of theſe ſtalkes, grow forth a long buſh of ſmall and more yellowiſh greene ſcaly aglets as it were, ſet in the ſame manner on the ſtalkes as the leaves are, which are accounted as the flower and ſeede: the roote is rough thicke and ſcaly, with a white pith in the middeſt which is called the heart thereof.

The Place.

It groweth as I before ſayd on Moores, Bogges, and watery places, in many places of this Land, I tooke a roote thereof for my garden from the bogge on *Hampſteed* Heath, not farre from a ſmall cottage there.

The Time.

It is greene all the Summer, and the roote onely abideth in winter, to ſhoote forth a new in the Spring.

The Names.

It is called in Latine (it hath no Greeke name) *Oſmunda regalis* of the ſingular properties therein: it is alſo called by ſome *Filicaſtrum & Filix florida*, or *floreſcens*, *Filix paluſtris* or *aquatica*, and as *Goſner* ſaith, *Filix Lunaria*, and *Lunaria major* by *Chimiſtes*, by *Ruellius Sideritis forte*, by *Anguilara Filix Mas*, and by *Cordus in hiſtoria Filix latifolia*: it is called in *Italian Oſmunda*, in *French Oſmunde* and *Fougiere aquatique*, in high *Dutch Waſſer Farn* and *Groſſe Farn*, in low *Dutch Groote Varen*, and *Wilt Varen*, ſome in *Engliſh Oſmund* Ferne *Oſmund* the waterman, *Oſmund* royall and S. *Chriſtophers* herbe.

The Vertues.

☞ *Oſmund* is not particularly remembred by the ancients, although it is probable enough they knew it, and comprehended it under the male Ferne, for *Galen* commendeth the roote of Ferne to be very profitable, and therefore the later times added a Royall title unto it, in that it had rather more effectuall vertues than others, and both for inward and outward griefes, as is mentioned in the foregoing Fernes, and is accounted by moſt to be ſingular in woundes, bruiſes and the like, the decoction to be drunke or boyled into an oyntment, or oyle, as a Balſame or Balme, as alſo ſingular good againſt bruiſes and broken bones, or out of joynt; and giveth much eaſe to the Collicke, and Spleneticke diſeaſes, as alſo for ruptures and burſtings.

CHAP. IIII.

1. *Polypodium vulgare.* Common Pollipodie of the Oake.

POllipody is a ſmall herbe conſiſting of nothing but rootes and leaves, having neither ſtalke nor flower, nor ſeede, as it is thought. It hath three or foure leaves, riſing from the roote, every one ſingly by it ſelfe, of about an hand length, which are winged, conſiſting of many ſmall narrow leaves, cut into the middle ribbe, ſtanding on each ſide of the ſtalke, each being large below and ſmaller up to the toppe, very like unto the Oſmund Ferne, not having any dents or notches at all on the edges,

1. *Polypodium vulgare.* Common Pollipody of the Oake.

3. *Polypodium Iluenſe.* Iland Pollipody.

as the Male Ferne hath, of a ſad greene colour on the upper ſide and ſmooth, but on the underſide ſomewhat rough, by reaſon of certaine yellowiſh ſpots, are ſet thereon: the roote is ſmaller than ones little finger, lying a ſlope or creeping along under the upper cruſt of the earth, brownſh on the outſide and greeniſh within, of a certaine ſweetiſh harſhneſſe in the taſte, ſet with certaine rough knags or excreſcences on each ſide thereon, having alſo much moſſineſſe or yellow hayrineſſe upon it, and ſome fibres underneath it, whereby it is nouriſhed.

2. *Polypodium alterum ſeu minus.* Small Pollipodye.

This ſmall Polipodye differeth not from the former, neither in roote or leafe, or markes on the underſide of the leaves, but onely that the roote is ſmaller, and ſlenderer, and the leaves alſo not ſo long or large, and this ſmallneſſe ariſeth rather as I ſuppoſe, from the place where it groweth, than from a diverſity of kinde, for although in ſome places the leaves may ſeeme to be a little waved on the edges, yet it is but accidentall.

3. *Polypodium Iluenſe.* Iland Polypodie.

Thē Iland Polipodie is rather differing from the other, by the nature of the place (as it is ſuppoſed, becauſe the Iland of *Ilua*, bringeth forth many other plants, differing in the forme from thoſe of other places, though not in quality) the ſtalkes riſe up ſometimes with two or three leaves at a joynt or place, and ſometimes but one, ſomewhat hayrie at the bottome of them, each leafe being about a foote long, whoſe middle ribbe is of a blackiſh browne colour, the leaves, or rather the diviſions or parts of the leafe, are more ſeperated one from another, not ſtanding cloſe together as in the former, but diſtant unequally on both ſides, each part alſo being longer and dented on the edges, of a greene colour, and ſmooth on the upper ſide, and ſpotted with a yellowiſh duſt on the underſide, as the former are; the roote is like the other.

4. *Polypodium Indicum.* Indian Polypody.

4. *Polypodium Indicum.*
Indian Polypody.

Cluſius ſetteth forth this in the fourth booke of his *Exoticks*, being brought out of the Eaſt Indies, the certaine place not knowne, by on Doctor *Cole*, who dying in comming home, his Paper booke of herbes came to *Cluſius* his hands, where he found this among the other without name. The roote he ſaith was halfe a foote long and an inch thicke almoſt, rugged browne and long like other Pollipody; it had three large leaves riſing together from it, two of them bigger than the other, and of eleven inches a peece, with a great middle ribbe, and each ſide of it contained five inches in bredth, the edges much divided, and many veines therein. This I thought good to mention here although it is likely it will never grow in theſe Countries, and to ſhew the diverſities of others.

The Place.

Polypodie groweth as well upon old rotten trunkes or ſtumpes of trees, be it Oake, Beech, Haſell, Willow, or any other, as in the woods under them, and upon old Mudde walls, as alſo in moſſie, ſtony, and gravelly places, neere unto woods: the larger groweth where it hath moſt mellow moyſt earth to ſpring in, and the ſlenderer where the place is dry and hard: the beſt is accounted that which groweth upon Oakes onely, but the quantity thereof is ſcarce ſufficient for the generall uſe: the other as is ſayd groweth in the Iſle *Ilua* which is in the *Mediterranean* ſea, the laſt in *India*.

The Time.

It being alwayes greene, and bearing neither flower nor ſeede, as it is thought it may be gathered for uſe at any time, yet it ſhooteth forth greene leaves onely in the ſpring.

The Names.

It is called in Greeke πολυπόδιον *Polypodium* ſo called *a polyporum cirrhis* ſaith *Dioſcorides*, *a cavernoſis acetabulis, ceu cirrhis polyporum* ſaith *Pliny*, *& Filicula quaſi parva filix* and in *Latine Filicularis herba*, *Cato* hath it *Felicula*; of the *Arabians Biſberæ* ſo hath *Serapio*, and *Deſbers & Budrig* by *Avicen*, yet others ſet it down *Aibeig* and *Beſſaigi*: of the *Italians Polypodio*, of the *Spaniards Filipodio*, and *Polipoio*, of the *French Polipode*, of the *Germanes Engelſuſs Dropffwurtz* and *Baumfarm*, of the *Dutch* men *Boomvaren*: in *Engliſh* Oake Ferne, and Wall Ferne, according to their places of growth, but generally Polypodie. The firſt is generally called *Polypodium* of all writers, and is thought by *Lobel* to be the *Herba Radioli* of *Apuleius*: the ſecond *Matthiolus* calleth *Polypodium alterum*, and *Dodonæus Polypodium minus*: the third *Lugdunenſis* ſetteth forth, with the name *Polypodium Iluenſe*; which *Bauhinus* thinketh to be the ſame, which he ſetteſt forth under the name of *Lonchitis aſpera Iluenſis*, and yet *Lugdunenſis* in the deſcription of the *Polypodium Iluenſe*, ſaith that the Iland of *Ilua*, bringing forth many ſtrange rarē plants, as this Polypody, *a Lonchitis aſpera*, and an *Hemionitis* that doe differ from others, ſo that he that ſaw them and ſet them forth, ſaith that they are divers plants, and that it hath the ſame qualities that the other Polypodie hath, but *Lonchitis aſpera* hath no purging quality; but *Bauhinus* in ſo ſaying ſheweth that he never ſaw the living plants, but the effigies onely, and I thinke the figure of the roote if it be truely ſet forth, ſheweth the truth of the matter, for that the one is long and thicke, like unto other Polypodies, and the roote of the *Lonchitis* is ſtringie.

The

The Vertues.

Pollypodie is generally uſed with other opening and mollifying things, to purge the body, for it is held by moſt of our later Phyſitions to be very weake of it ſelfe. *Meſues* who is called the Phiſitions Evangeliſt for the certaintie of his Medicines and the truth of his opinions ſaith, that it dryeth up thinne humours, digeſteth the thicke and tough, and purgeth blacke or burnt choller, and eſpecially tough and thicke flegme, and thinne flegme alſo, even from the joynts (which the inhabitants about the Rivers of *Rheine* and *Moſa* doe finde to be true, as *Dodonæus* relateth it, who by uſing the decoction of Polypody a good while together are freed from thoſe tumors in their hands, feete, knees and joynts wherewith they are much troubled) and is therefore good for thoſe are troubled with Melancholy or Quartaine Agues, eſpecially if it be taken in Whey or Mede, that is honied water, or in Barly water, or the broth of a Chicken with *Epithymum* or with Beetes and Mallowes, it is alſo good for the hardneſſe of the Spleene, and for thoſe prickings or ſtitches that happen in the ſides, as alſo for the cholicke taken any manner of wayes, ſome uſe alſo to put to it ſome ſeedes of Fennell, and Aniſe or Ginger, to correct that *nauſea*, or loathing that he faith it bringeth to the ſtomacke, and to ſtrengthen it the better, yet ſome hold it is ſo free of danger that it bringeth no trouble to the ſtomacke, but is a ſafe and gentle medicine, fit for all ſeaſons and perſons, which daily expecience confirmeth, and yet a greater quantitie may be given in a decoction then he appointeth, even an ounce or more, if there be not Sene or ſome other ſtrong purger put with it: a dramme or two if neede be of the powder of the dryed rootes taken faſting in a cup full of honyed water, worketh gently and for the ſame purpoſes aforeſaid. The diſtilled water both of rootes and leaves is much commended for the quartaine Ague, to be taken many dayes together, as alſo againſt Melancholy, and fearefull or troubleſome ſleepes and dreames; and with ſome Sugar Candy diſſolved therein againſt all the ill affects of the Lungs, as the Cough, ſhortneſſe of breath and wheeſings, and thoſe thinne diſtillations of rheume upon the Lungs, which often turneth into a Conſumption or Tiſicke: Some commend the ſalt made thereof to be mixed with the water; *Tragus* ſaith that a decoction of the Pollypody made with wine, or the rootes themſelves rather as I thinke given unto Hogges preſerveth them from the Plague or Peſtilence, whereunto they are ſubject by purging them therewith, which thing without doubt is effected as hee ſaith, by the purging of flegme, wherewith they are moſt troubled: the freſh rootes beaten ſmall, or ſome in the ſtead thereof take them dry in powder, mixed with hony and applyed to the joynts of any member or part out of his place doth much helpe it: applyed alſo to the noſe cureth the diſeaſe called *Polypus*, which is a peece of fleſh growing therein, that by time and ſufferance ſtoppeth the paſſage of breath through that noſtrill: it helpeth alſo thoſe clefts or chappes, that happen to come betweene the fingers of the hands or toes of the feete.

CHAP. V.

Dryopteris. Oake Ferne.

OF the Oake Fernes there are two ſorts, one ſet forth by *Lobel*, the other by *Dodonæus*, whereof I meane to entreate in this Chapter.

1. *Dryopteris repens.* Creeping Oake Ferne.

This ſmall Ferne ſendeth forth divers ſlender blackiſh ſtalkes little more then halfe a foote high, bearing many ſmall winged leaves each againſt the other, ſomewhat like unto thoſe of the female Ferne but much ſmaller and finer, and of a darkiſh greene colour, the backeſide of whom have not browne but white ſpots on them ſet in a double row, as *Lobel* ſaith which others mention not: the roote is ſmall and blackiſh creeping under the upper cruſt of the earth, with divers ſmall blacke fibres growing from them, and are ſomewhat like unto the rootes of Pollypody but much ſmaller and ſlenderer, of a more auſtere harſh and ſtipticke taſte then Pollypody.

2. *Dryopteris alba.* White Oake Ferne.

This other Ferne groweth not much higher then the former, but the leaves are broader ſhorter & more deepely cut in on the edges, and of a paler greene colour, ſpotted alſo on the backſide of them like unto the male Ferne: the roote is compoſed of many blackiſh threads or fibres iſſuing from a thicke roote.

The Place.

Both theſe ſorts grow in the ſhadowey thicke woods on the mountaines, and ſometimes in the open valleyes neare them, and ſometimes alſo out of the moſſe of old buſhes and other trees.

2. *Dryopteris alba.* White Oake Ferne.

Dryopteris ſive Filix querna repens. Creeping Oake Ferne.

The Time.

They both looſe their leaves in Winter and ſpring up a freſh latē in the Spring.

The Names.

It is called in Greeke Δρυοπτερὶς *Dryopteris*, that is *Filix querna*, yet *Oribaſius* calleth it βρυοπτερὶς *Bryopteris quaſi Filix muſcoſa*, Moſſe Ferne of the growing among the Moſſe on trees, the firſt is ſimply called *Dryopteris* by *Lobel*, *Matthiolus*, *Geſner* and others; *Dryopteris ſive Filix arborea* by *Tragus*, and *Pterion femina* by *Cordus* in his firſt Booke and eighteenth Chapter, and ſo alſo by *Thalius* in *Harcynia ſylva*: but is not the *Filix pumila ſaxatilis prima* of *Cluſius* as I ſhall ſhew you in the next Chapter ſave one, although it ſeeme to bee like it for the rootes ſhew their difference. The other is called *Dryopteris candida* by *Dodonæus*, and as *Lobel* ſaith is the *Adiantum album Plinij*, and of the Shoppes alſo: by *Bauhinus Filicula fontana major ſive Adiantum filicis folio.*

The Vertues.

The firſt as *Lobel* ſaith was in former times uſed by the Apothecaries beyond Sea, in ſtead of Pollypody as not knowing a righter, neyther were they ſhewed by their Phyſitions to forbeare it and uſe any other, but rather appointed by them ſo to do, which as he ſaith ſome affirmed *Rondeletius* to ſay, that in ſtead of a purging quality proper to Pollypody it had a pernitious operation in ſome of his ſicke patients: it is a remedy to take away haires as *Dioſcorides* ſaith, if the rootes and leaves bee bruiſed together and applyed after ſweating. *Matthiolus* ſaith that the rootes in powder with a little ſalt and Branne is given to Horſes for the wormes. The other ſort is moderate in taſte, ſomewhat drying, and therefore may ſafely be uſed in ſtead of the true *Adiantum* or Maidenhaire, as it is uſuall now a dayes. *Lobel* ſaith that the laſt ſorts was ſafely uſed in the Apothecaries ſhoppes of divers countries for *Adiantum album* and *nigrum*.

CHAP. VI.

Lonchitis aſpera. Rough Splenewort.

OF theſe Spleneworts there are divers ſorts deſcribed by divers authors as ſhall be ſhewed, and firſt of the greater kinde of *Matthiolus*.

1. *Lonchitis aſpera major Matthioli.* The greater rough Splenewort.

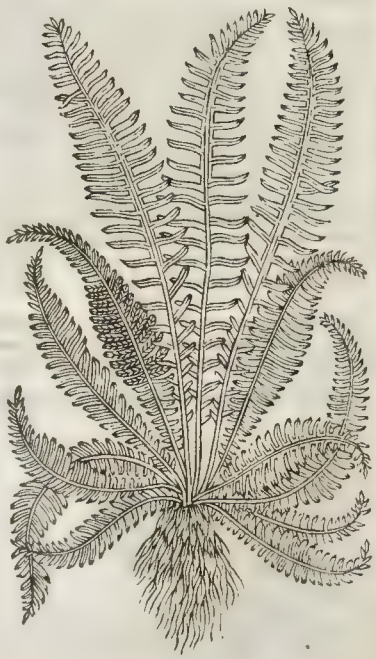
This greater Splenewort hath divers ſtalkes of leaves ſomewhat like unto Miltwaſt but nearer unto Pollypody, about a ſpanne long cut on both ſides with uneven diviſions, dented about the edges with ſharpe points, and rough on both ſides without ſuch ſpots on the backes of them as Pollypody and Miltwaſte have: the roote is compoſed of many reddiſh ſtrings or fibres like as Harts tongue is.

2. *Lonchitis aſpera minor.* The ſmaller rough Splenewort.

The leſſer Spleenewort is ſomewhat like unto the former, but that the divided leaves ſet on each ſide of the ſoft browniſh ſtalkes are narrower and longer, each ſeparated from other, but not fully to the middle ribbe: in

1. *Lonchitis aſper a major Matthioli.*
The greatet rough Splenewort.

2. *Lonchitis aſper a minor.*
The ſmaller rough Splenewort.



the

the middle of those outer leaves, rise up other bigger and blacker stalkes of narrower leaves, like unto them, but fully separated, and so finely dented about the edges that they seeme curled with browniſh spots, or scales on the backes of them as in other Fernes: the roote hath a thicke head covered with scales, lying one upon another, with divers fibres at them. There is another of this sort lesser than this, found about *Colchester* in *Essex*, and in other places, growing in the wet borders of fields, and by the hedge sides.

3. *Lonchitis aspera Maranthæ.* Bastard rough Spleneworte.

This bastard Splene wort hath browne rough stalkes a span long, with winged leaves on them, somewhat like unto the female Ferne, but thicker and greater, by much greene on the upperside, and spotted with browne rough scales on the other, like Milt-waſt, the roote is small, composed of many long fibres.

4. *Lonchitis aspera Ilvensis.* Iſland rough Splene worte.

This small Splenewort hath browne stalkes, little above halfe a foote long with leaves set opposite one to another, and each cut in on the edges, but not so deepely as the last, greene on the upperside, and rough with browne scales or dust on the under: the roote is a small bush of blackish fibres.

The Place and *Time.*

The first groweth in the moist Moores of *Italy*, the second and third, in moyst groves both there and in *Germany*, and in some places with us, if my memory faile me not: the last in the Iſland of *Ilua* which is in the *Thirohene* sea, and flowrisheth when others doe.

The Names.

The Greek name from *Dioscorides* is λογχῖτις ἑτέρα ἢ τραχεῖα and so in *Latine Lonchitis altera sive aspera*, for his first *Lonchitis* is scarse knowne: The first is the *Lonchitis aspera major* of *Matthiolus* and others, or *Lonchitis aspera minor* of *Matthiolus*, by *Tragus Asplenum sylvestre*, *Cordus* and *Thalius Struthiopteris*, as if you would say the *Estridges* Ferne for the fine wings of the middle leaves, by *Clusius Lonchitis altera Neotericorum*, this is called Foxe Ferne in many places of this Land: the third is the *Lonchitis Maranthæ*, or *altera Maranthæ* by *Clusius* and others, and *Matthiolus Pseudolonchitis Maranthæ*: the last is remembred by *Lugdunensis*, but *Bauhinus* as I sayd before in the chapter of *Pollipody*, first confoundeth the *Polypodium Ilvense* of *Lugdunensis*, with his *Lonchitis aspera Ilvensis*, making them to be both one plant, and againe maketh the *Lonchitis Maranthæ* to be one with the *Lonchitis aspera Ilvensis* and differing but in greatnesse which I am verily perswaded, differeth from it, although it seeme somewhat to resemble it.

3. *Lonchitis Aspera Maranthæ.*
Bastard rough Splene wort.

Altera minor.

The Vertues.

The dryed leaves of this taken in Vinegar, is held to be good to dissolve the hardnesse of the Spleene, and the greene leaves to be singular good for wounds, and to keepe them from inflammations.

CHAP. VII.

Filix Saxatilis. Small or Stone Ferne.

THe small or Stone *Ferne* also have some diversities as here shall be shewed.

1. *Filix pumila saxatilis prima Clusij.* The first small Stone Ferne of *Clusius.*

This first small Ferne hath a long blacke and slender roote, creeping and spreading a slope, under ground, with a few slender hard fibres thereat, from whence spring divers stalkes a foote high, branched into sundry divided leaves, like unto Female Ferne, but much lesse, more finely divided, and farre tenderer or delicate than they, and spotted on the backe of them like other Fernes.

2. *Filix pumila saxatilis altera Clusij.* The second Stone Ferne of *Clusius.*

This other small Ferne hath divers straight round stalkes, greene at the first, but blackish being full growne, about an hand breadth high, shooting forth leaves from the middle upwards, with divisions on both sides, like unto the Male Ferne, but much lesse and finer, spotted on the backe of them as the former: the roote from a head such as the Male Ferne hath, sendeth forth many blacke heads, threads, or fibres.

3. *Filix saxatilis foliis non serratis.* Small Stone Ferne with whole leaves.

This is small and groweth somewhat like the Male Ferne, but the leaves are not dented, but whole like unto the water Ferne.

1. 2. *Filix pumila ſaxatilis prima & ſecunda Cluſii.*
The firſt and ſecond ſtone Ferne of *Cluſius*.

5. *Filix ſaxatilis baccifera Americana.*
Berry bearing Ferne of *America*.

4. *Filix ſaxatilis criſpa.* Small curled Stone Fernē.

This ſmall curld Ferne hath a roote compoſed of many blackiſh threds or fibres, growing from above, whencē ſpring up ſmall ſtalkes, ſcarce an hand breadth high, ſet on both ſides with tender ſoft ſtrings of very ſmall leaves ſo finely divided and dented, that they ſeeme curld, of a darke greene colour upwards, and paler below towards the bottome, having reddiſh or browniſh duſt-like ſpots on the backeſides as the Miltwaſte hath, the figure hereof is by chance left out, you ſhall finde it in the Appendix.

5. *Filix ſaxatilis baccifera.* Berry bearing Ferne of *America*.

This Ferne of *America* riſeth up with ſundry long, round, hard ſtalkes of winged leaves, each leafe conſiſting of many parts as it were, or cut in deepely on both edges into many diviſions, and of a freſh greene colour, having in ſundry places, all along of the middle rib on the backe ſide of them, ſmall round ſeede like berries ſet, greene at the firſt, but blacke and ſweetiſh being ripe, which then are ſo eaſily gathered that a ſmall touch with the hand, or the ſhaking of the ſtalkes with the winde, will cauſe them to fall on the ground, where they will ſoone take roote and grow: the roote is compoſed of many browne fibres, ſomewhat harſh in taſte: the leaves dye downe at the end of *Autumne*, and ſpring up new in *Aprill*, the berries being ripe about Saint *Iames* tide.

6. *Filicula fontana.* Small rocke Ferne.

This ſmall Ferne groweth low, buſhing with many very ſmall and darke greene leaves, reſembling the common ſort, but much leſſe than any of thoſe before.

7. *Chamæ filix marina Anglica.* The ſmall *Engliſh* Sea Ferne.

This ſmall Sea Ferne from a thicke browniſh roote, compoſed of a multitude of threads, riſe diverſe bright ſhining blackiſh ſtalkes, two or three inches high, whereon are placed many rough, thicke, ſhining, blackiſh, greene leaves, after the manner of the Male Ferne, finely ſnipt about the edges, and with browniſh markes on the backe of them as other Fernes have.

8. *Filix ſaxatilis Tragi.* Naked ſtone Ferne.

This ſtone Ferne from a thicke tufted roote, ſendeth forth many hard and rough ſtalkes, bare or naked without leaves, with ſome ſpots on them as other Fernes have, and onely forked at the toppes, into two or three ſhort parts, bowing or bending downe their heads, it agreeth, ſaith *Tragus*, with Ferne in ſmell and taſte.

The Place.

Theſe all doe grow in rockey and ſtony places, and the ſixt, ſeaventh, and eighth kinde as *Lobel* ſaith neere thē ſea in *Cornewall*, in moyſt rockie places.

The Time.

They flower with the reſt of the Fernes.

The

7. *Filix marina Anglica.*
The ſmall *Engliſh* Sea Ferne.

8. *Filix ſaxatilis Tragi.*
Naked ſtone Ferne.

The Names.

The firſt here ſet downe, is the firſt *Filix pumila ſaxatilis* of *Cluſius*, according to his deſcription, but the ſecond figure doth anſwere thereunto, and not the firſt, as you may obſerve by the creeping rootes in the ſecond figure, which he that onely regardeth the figure, and doth not compare the deſcription therewith, may ſoone bee deceived, and this tranſpoſition *Bauhinus* obſerved well, although he doth not ſpeake of it, but onely entituleth it *Filix ſaxatilis romoſa nigris maculis punctis*, and queſtioneth if it be not the *Filicula candida* of *Geſner* in *appendice*: the ſecond is the ſecond of *Cluſius* by the former name, and by *Bauhinus Filix ſaxatilis non ramoſa nigris maculis punctata*, and queſtioneth if it be not the *Filicula ſaxatilis* of *Camerarius*; but the firſt figure in *Cluſius* is ſet forth like the female branched Ferne: the third is the third *Filix petræa fœmina* of *Tabermontanus*, and called by *Bauhinus* as it is in the title: the fourth is the *Filix ſaxatilis criſpa* of *Pona*, in the deſcription of Mount *Baldus*: the fift is mentioned by *Cornutus* among his *Canada* plants, which Mr. *Iohn Tradeſcant* the younger, brought home with him from *Virginia*, this preſent yeare, 1628. preſently after the death of his father: the ſixt is the *Filicula fontana* of *Tabermontanus*: the ſeventh is the *Chamæ filix marina Anglica* of *Lobel*: and the laſt is the *Holoſtium alterum* of *Lobel*, and the *Holoſtium petræum* of *Tabermontanus*, *Tragus* calleth it *Filix nuda ſive ſaxatilis*, and *Thalius Adianthum* ἀκρόστιχον *ſeu furcatum*, and *Bauhinus* thereupon *Filix ſaxatilis corniculata*: but why he ſhould referre it alſo to the *Muſcus corniculatus* of *Tabermontanus* and *Gerard*, being different plants I know not.

The Vertues.

The faculties of theſe Fernes may be referred to the former.

CHAP. VIII.

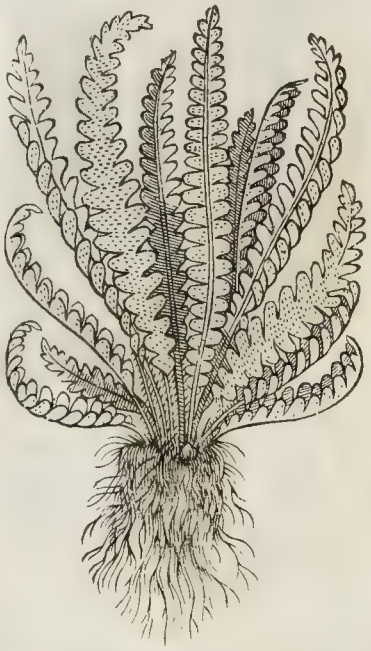
Aſplenum ſive Ceterach. Smooth Splene-worte, or Milt-waſte.

THe ſmooth Splenewort (I ſo call it in regard of the former which is rough) from a blacke threddy and buſhy roote, ſendeth forth many long ſingle leaves, cut in on both ſides, into round dents, even almoſt to the middle ribbe, which is not ſo hard as that of *Pollipodye*, each diviſion being not alwayes ſet oppoſite unto the other, but betweene each, ſmooth and of a light greene on the upper-ſide, and with a darke yellowiſh roughneſſe on the backe, foulding or rowling it ſelfe inward, at the firſt ſpringing up, as many other Fernes doe, and therein reſembleth that Beare Worme that anglers uſe.

The Place and *Time.*

It groweth as well upon ſtone walls, as moyſt and ſhadowie places, in many places of this Land, as about *Briſtow*, and other the Weſt parts plentifully, as alſo on *Framingham* Caſtle, on *Beckensfeild* Church in *Barkeſhire*, *Strowde* in *Kent*, and elſe where, and like Pollipody, abideth greene in the winter.

Asplenum sive Ceterach.
Smooth Spleenewort or Miltwaste.



The Names.

It is called in Greeke ἀσπλήνιον and σπλήνιον *Asplenum* and *Splenium quod splenem juvat*, which it holdeth also in Latine, in Greeke also σκολοπένδριον, *Scolopendrium*, & *Scolopendra* in Latine from the likeneſſe of the Worme ſo called as I ſayd before: *Theophraſtus* calleth it πλάτυξ and not πλήτυζ as it is in the vulgar copies, as alſo ἡμιόνιον *Hemionum* which *Galen* tranſlateth *Mula herba* in the Apothecaries ſhoppes *Ceterach* from the *Arabians*, in the *Antidotarium Bononienſe* it is called *Digiti citrini*: the Apothecaries and Phyſitions in former times held the Harts-tongue to be the true *Scolopendrium* of the ancients, but that errour is now ſufficiently manifeſted and left, as theirs alſo who held formerly that *Aſplenum* was not *Ceterach*: it is called of the later *Arabians* and *Moores Scolopendrium*, of the *Italians Aſpléno* and *Scolopendria*, and *herba inodorata*, of the *Spaniards Doradilha*, of the *French Ceterac*, of the *Germanes Steynfarn*, of the *Dutch Steenvaren* and *Miltcruit*, in *Engliſh* Spleenewort, Miltwaſt and Scale-Ferne.

The Vertues.

It was and is generally uſed againſt the infirmities of the Spleene, and as *Vitruvius* ſaith, the Swine in *Candy* where it grew by feeding thereon were found to be without Spleenes, when as others that did not eate thereof had them as the reſt: it helpeth the Strangury or piſſing by droppes, and waſteth the Stone in the Bladder, and is good againſt the Yellow Jaundies and the hicket: but the uſe of it in women hindereth conception. *Matthiolus* ſaith that if a dramme of the duſt that is on the backe of the leaves, be mixed with halfe a dram of Amber in powder, and taken with the juice of Purſlane or Plantaine it will helpe the running of the Raines ſpeedily, and that the herbe and roote being boyled and taken helpeth all melancholicke diſeaſes, and thoſe eſpecially which riſe from the *French* diſeaſe. *Camerarius* ſaith that the diſtilled water thereof being drunke is very effectuall againſt the Stone both in the Reines and Bladder; and that the Lye that is made of the aſhes thereof being drunke for ſome time together helpeth Spleneticke perſons: it is uſed in outward remedies alſo for the ſame purpoſe.

CHAP. IX.

1. *Phyllitis ſive Lingua Cervina vulgaris.*
Ordinary Harts-tongue.

1. *Phyllitis ſive Lingua Cervina vulgaris.*
Ordinary Harts-tongue.

OVr ordinary Harts-tongue hath divers leaves riſing from the roote, every one ſeverall, which as the laſt and other Fernes fold themſelves in the firſt ſpringing and ſpreading, when they are full growne are about a foote long, ſmooth and greene above but hard or with little ſappe in them, and ſtraked on the backe atwhart, on both ſides of the middle ribbe, with ſmall and ſomewhat long browniſh markes, the bottomes of the leaves are a little bowed on each ſide of the middle ribbe, ſomewhat narrow with the length, and ſomewhat ſmall at the end: the roote is of many blacke threads foulded or interlaced together. Some doe make two ſorts hereof, and diſtinguiſh them into *latifolia* and *anguſtifolia*.

2. *Phyllitis lacinata.* Iagged Harts-tongue.

This Harts differeth in no other thing from the former then in the diviſion of the toppes of the leaves which are diverſly as it were torne or jagged, ſome leaves much and ſome little, according to the place of growing and time of abiding.

3. *Phyllitis ramoſa Alpino.*
Branched Harts-tongue according to *Alpinus*.

The rootes hereof are ſomewhat wooddy with the blacke fibres thereat, ſhooting forth many ſlender broad ſtalkes, of leaves two cubits long, a little downy at the bottome, divided into many long and narrow leaves, dented about the edges, ſet one againſt another with an odde one at the end, each reſembling the heads of a Iaveling, marked thicke with ſtraight lines

on

Phyllitis laciniata.
Iagged Harts tongue or Finger-Ferne.

3. *Phyllitis ramosa Alpino.*
Branched Harts-tongue according to *Alpinus*.

on both sides unto the middle ribbe: the whole plant is without sent, but of an austere taste, conteining some heate which is not presently felt but continueth long.

The Place and *Time.*

They are greene all the Winter but spring new leaves every yeare.

The Names.

It is called in Greeke φυλλὶς *Phyllitis quasi foliosa*, in Latine also *Phyllitis* and *Lingua cervina*, and in former times in the Apothecaries shoppes *Scolopendrium*, as I said in the foregoing Chapter: in all other Europian Dialects they follow the Latine name; wee in *English* call the former Harts-tongue, and the other Iagged Harts-tongue and Finger-Ferne, in some places *Gerard* calleth it Finger Harts-tongue; the last is onely remembred by *Alpinus lib. de exoticis* by the name of *Phyllitis ramosa*.

The Vertues.

Harts-tongue is much commended against the hardnesse and stoppings of the Spleene and Liver also; and against the heate of the Liver and Stomacke, it is very good likewise against Lasks and the Blooddy flix: divers doe also commend the distilled water thereof to bee taken against the passions of the heart, and to stay the hicket, and to helpe the falling of the Pallate, to stay the bleeding of the gums if the mouth be gargled therewith, *Dioscorides* saith it is good against the sting or bitings of Serpents.

CHAP. X.

Hemionitis. Mules Ferne.

THere is some varietie in this plant as in the former, and although some doe conjoyne them, yet for the diversitie of their forme I have thought good to separate them.

1. *Hemionitis major.* The greater Mules Ferne.

This herbe doth much resemble Harts-tongue both in forme and colour but that it is somewhat broader or larger, and that the leaves being broadest below have a large hollow bowing like unto an halfe Moone on each side of the middle ribe, and the strakes on the backe of them are more aslope.

2. *Hemionitis altera seu minor.* The lesser Mules Ferne.

Lobel saith that he found on Saint *Vincents* Rocke not farre from *Bristow* in a hollow cave or hole, a smaller kinde hereof whose leaves exceeded not the breadth of three fingers, not hard nor rough but smooth and gentle, and

and without any markes on the backside of them, yet with a hollow roundnesse at the bottome of them as the former, and besides somewhat unevenly dented about the edges: the roots were very small and threaddy quickly withering. *Clusius* saith that *Lobel* having sent him some of those plants, after hee had kept them in a pot because of their tendernesse, two yeares they changed their forme into the jagged Harts-horne, whereof he much mervailed, for afterwards as he saith when he came into *England*, hee gathered with his owne hands in the same place the like plants, which there held the forme of *Hemionitis*.

3. *Hemionitis peregrina Clusij.*
Strange Mules Ferne.

This differeth from the first in no other thing but in the bottomes of the leaves, which have a small eare or peece of leafe set on each side of the arched or hollowed bottomes.

4. *Hemionitis Ilvensis Dalechampij multifido folio.*
Mules Ferne with divided leaves.

This kinde of *Hemionitis* (if it pertaine thereto) hath sundry stalkes of leaves, rising from a tuft of blacke short haires or fibres, each whereof is about a foote long, divided into seven or nine parts, two or three couple standing lowest, one set against another, and the three uppermost a little rising above them, each of these leaves are long narrow and pointed, and somewhat dented about the edges with an eminent middle ribbe: these have no markes on the backes of them as the others of this kinde have.

The Place and Time.

The naturall places of all these are shadowy rockes and moist hollow places where little heate of Sunne commeth, and are greene all the yeare as the former Harts-tongue.

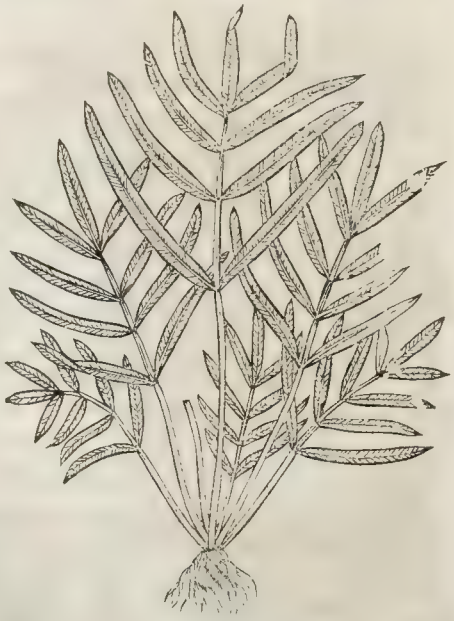
The Names.

It is called in Greek ἡμιονῖτις *Hemionitis* & σπλήνιον *Splenium*, the former *quasi mularia* and *Splenium volunt quod ejus folium medicorum splenia, nimirum oblongas plagulas figura imitetur*. The

1. *Hemionitis major.* The greater Mules Ferne.

3. *Hemionitis peregrina Clusij.*
Strange Mules Ferne.

4. *Hemionitis Ilvensis Dale. hampij multifido folio.*
Mules Ferne with divi[illegible] leaves.



first

first is called *vulgaris* by *Bauhinus* and *vera* by *Clusius*, the second is called by *Lobel Hemionitis sive sterilis*, and by *Lugdunensis Hemionitis minor Pena*: the third is the *Hemionitis peregrina* of *Clusius*, *Lobel. Dodonæus* and others since them: the last as *Lugdunensis* saith growing in the Iland called *Ilva*, was called of certaine Herbarists *Hemionitis altera Dalechampij*.

The Vertues.

It is especially good for the Spleene, and may fitly be used in the stead of the Harts-tongue going before to all the uses it serveth for.

CHAP. XI.

Adianthum. Maidenhaire.

THere be divers herbes accounted to be Maidenhaires by divers authors, one whereof I have set forth unto you before by the name of *Dryopteris candida Dodonæi*, which is most usuall in the higher and lower *Germany* and with us: some others I shall shew you in this Chapter and the rest in the following.

1. *Adianthum verum seu Capillus Veneris verus.* The true Maidenhaire.

The true Maidenhaire according to *Dioscorides* his description is a fine small low herbe not above a span high, whose stalkes are smaller, finer, redder and more shining then those of *Trichomanes* or our common *English* Maidenhaire, whereon are placed delicate fine leaves without order on both sides one above another, somewhat like unto the lower leaves of *Coriander*, or like the leaves of Anise but larger, cut in unequally on the edges and spotted on the backe with very small browne markes scarse to bee discerned, the roote is a number of blackish browne threads.

2. *Adianthum nigrum vulgare.* Common blacke Maidenhaire.

This Maidenhaire differeth little or nothing from the *Dryopteris* (or rather *Omopteris*) *candida Dodonæi*, set forth in the Chapter of *Dryopteris* before, but that the stalkes of this are blacker, and the leaves of a sadder greene, whereas that is greener and paler, so that eyther that might fitly be joyned to this or this of that, the rest of the description needeth not againe to be repeated.

3. *Adianthum fruticosum Americanum.* Forraine or strange Maidenhaire.

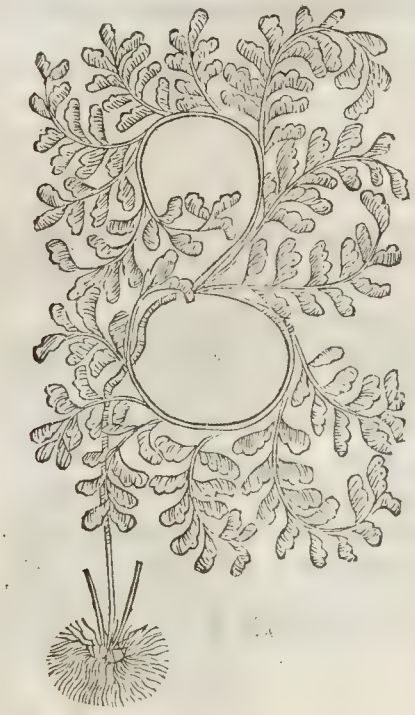
This strange Maiden haire groweth up like unto a Ferne, with a slender blackish browne stalke branched forth into others, where abouts on each side stand from 12. to 20. fresh greene leaves, small and somewhat long joyned together by their small footestalke, somewhat like unto the first true Maidenhaire, but cut in on the outside at

1. *Adianthum verum seu Capillus Veneris verus.*
The true Maidenhaire.

2. *Adianthum nigrum vulgare.*
Common blacke Maidenhaire.

the

3. *Adiantum fruticosum Americanum.*
Forraigne or strange Maidenhaire.



4. *Ruta muraria sive Salvia vite.*
Wall Rue.

the toppes of the leaves onely and not at the bottome. One very like unto this if it be not the same hath Mr. *John Tradescant* the younger brought out of *Virginia* presently upon the death of his father, whose long stalkes have many fine fresh greene leaves a little dented or cut in on the one side and plaine on the other, spotted underneath with browne speckes.

4. *Ruta muraria sive Salvia vite.* Wall-Rue, or ordinary white Maidenhaire.

This small herbe is generally accounted one of the Capillarie herbes or Maidenhaires, and that not of the least account, I must therefore joyne it unto them with this description: it hath very fine pale greene stalkes almost as fine as haires, set confusedly with divers pale greene leaves on very short footestalkes, somewhat neare unto the colour of garden Rue, and not differing much in forme but somewhat more like unto the true *Adianthum* being more and more diversly cut in on the edges and thicker, smooth on the upper part and spotted finely on the under.

The Place and Time.

All these sorts grow both upon stone walls and by the sides of Rockes or gravelly Springs, and other shadowy and moist places: the first in no place so plentifully as *Pena* and *Lobel* say then about *Mompelier* in *Narbone* of *France*; some have reported that it is found in *Glocestershire*: the last is found in many places of this Land, as at *Dartford* and the bridge at *Ashford* in *Kent*, at *Beckonsfield* in *Buckinghamshire*, at *Wolley* in *Huntingtonshire*, on *Framingham* Castle in *Suffolke*, on the Church walls at *Mayfield* in *Sussex*, and on the Rockes neare *Weston super mare* in *Sommersetshire*, and are greene in Winter as well as Summer.

The Names.

It is caled in Greeke, Ἄδιαντον *Adiantum, quod a διαίνειν in aquis non madescat*, the leafe is not wetted with water (which by tryall is found untrue) but *Nicander* his Greeke verses doth shew rather, that the raine resteth not on them, which rendred in Latine are thus,

Impollutum Adiantum quod denso imbre cadente,
Destillans tenuis folijs non insidet humor.

Dioscorides calleth it also πολύτριχον *Polytrichum, quasi multicomum, quod capillos multos & densos faciat, & Apuleius Callitrichon quasi pulchricomum, quod capillos tingit pulchrioresque reddit*: it is called also *Capillus Veneris* in Latine, *a speciosis reddendis capillis*: and by divers other names as *Cincinnalis, Terræ capillus, Supercilium terræ & Crinita*, The first is called *Adiantum* by *Matthiolus* and many others, and although some give another figure and entitle it *Syriacum*, yet it is but one and the same herbe, and *species*. though somewhat larger, in that countrey, *Lobel* calleth it *Capillus veneris verus*, and *Cordus* on *Dioscorides Adiantum nigrum*: the second is the *Onopteris nigra Dodonei* and *Adiantum pulchrum Lugdunensi simile* of *Thalius*: the third *Bauhinus* hath mentioned in his *Prodromus*: the last *Tragus* calleth *Capillus Veneris*, and *Brunfelsius Saxifraga major* and so doth *Fuchsius*, *Matthiolus* first called it *Ruta muraria*, and afterwards tooke it to bee *Paronychia Dioscoridis*, *Cordus* calleth it *Adiantum album*,

Dodonæus

Dodonæus Ruta muraria, and *Lobel* and *Lugdunenſis Salvia vitæ*, and many call it *Adiantum album*, white Maidenhaire.

The Vertues.

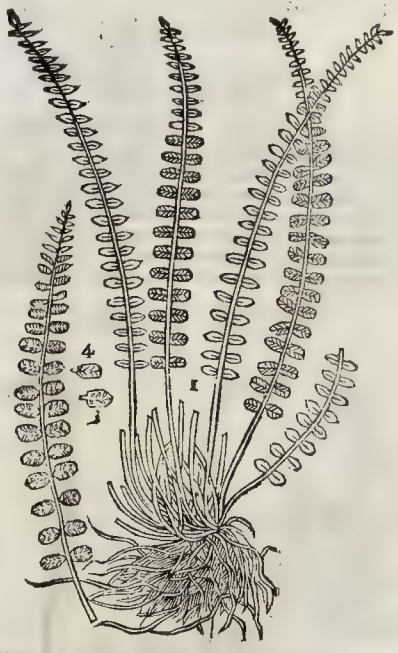
Maidenhaire is of ſingular good uſe againſt the diſeaſes of the Breaſt the Liver and Reines eſpecially, yet much conducing to others: the decoction of the herbe drunke helpeth thoſe that are troubled with the Cough, ſhortneſſe of breath, the yellow Iaundies, the diſeaſes of the Spleene, ſtopping of urine, helpeth exceedingly to breake the Stone, provoketh womens courſes and ſtayeth both bleedings and fluxes of the ſtomacke and belly, eſpecially when the herbe is dry for being greene by the thinneſſe of the parts, it looſeneth the belly, and cauſeth choller and flegme to be voyded both from the Stomacke and Liver, and by freeing the ſtomacke by ſpitting it out wonderfully clenſeth the Lungs, and by rectifying the Liver and Blood cauſeth a good colour to the whole body, and expelleth thoſe diſeaſes that breede by the obſtructions of the Liver or Spleene: it is alſo ſaid to reſiſt and to cure the bitings of venemous creatures: the herbe boiled in oyle of Camomill diſſolveth knots, alayeth ſwellings and dryeth up moiſt Vlcers, the Lye made thereof is ſingular good to clenſe the head from ſcurfe, and eyther dry or running ſores, ſtayeth the falling or ſhedding of the haire, and cauſeth them to grow thicke, faire, and well coloured, for which purpoſe ſome boyle it in wine, putting ſome ſmalledge ſeede thereto, and afterwards ſome oyle. The Wall Rue is held by thoſe of judgement and experience to bee as effectuall a Capillarie herbe as any whatſoever, being of the ſame temperature, and therefore both boldly and ſafely uſe it in the ſtead of any of the other that is not at hand: For experience hath ſhewed that it is very effectuall for the cough and diſeaſes of the Lungs, for the ſtopping of the Vrine and to breake and expell the Stone and therefore divers have placed it among the Saxifrages, and briefely as availeable as the former Maidenhaire for all the uſes there expreſſed and beſides helpeth the burſtings in children, for *Matthiolus* ſaith that he hath knowne divers holpen by taking the powder of the herbe in drinke for forty dayes together.

CHAP. XII.

Trichomanes. Engliſh Maidenhaire.

OVr common Maidenhaire doth from a number of hard blacke fibres ſend forth a great many blackiſh ſhining brittle ſtalkes hardly a ſpanne long, in many not halfe ſo long, on each ſide ſet very thicke with ſmall round darke greene leaves and ſpotted on the backe of them like *Ceterach* and other ſmall Fernes.

Trichomanes. Engliſh Maidenhaire.



The Place and Time.

It groweth much upon old ſtone walls in the weſt parts and *Wales*, in *Kent* and divers other places of this Land, it joyeth likewiſe to grow by Springs and Wells, and other Rocky moiſt and ſhadowy places, and is greene alwayes.

The Names.

It is called in Greeke Τείχομανες *Trichomanes quod rara cute fluentem capillum explet*, for μανὸς is *rarum* and τρίχα *capillum*, *Gaza* tranſlateth it *Filicula*, *Fidicula* as ſome have it: the Apothecaries beyond the Sea did uſe to call it *Polytricum* and *Capillaris*, wee uſually call it in Latine *Trichomanes*, and in *Engliſh* common Maidenhaire.

The Vertues.

This Maidenhaire in our Land being more plentifull then the reſt, is of more uſe and of as good effect as any of the former, and ſerveth well for all the ſaid purpoſes, but eſpecially againſt the ſtopping and dropping of Vrine and thoſe that have the Stone in the Kidneyes, and both ſtayeth the ſhedding of the haire and cauſeth it to grow thicke.

CHAP. XIII.

Polytrichum aureum. Golden Maidenhaire.

ALthough there be divers authors that reckon theſe herbes amongſt the Moſſes, and ſo call them, yet there bee againe others as authenticall that put them among the Capillarie herbes, and ſo doe I at this time alſo.

1. *Polytrichum aureum majus*. The greater Golden Maidenhaire.

This ſmall herbe hath a company of ſmall browniſh red haires to make up the forme of leaves, growing about the ground from the roote, and in the middle of them in Sommer riſe ſmall ſtalkes of the ſame colour, ſet with very,

very fine yellowish greene haires on them, and bearing a small gold yellow head lesser then a Wheate Corne, standing in a great huske, the roote is very small and threaddy.

2. *Polytrichum minus & minimum.*

The two lesser sorts of Golden Maidenhaire.

These two other sorts are very like the former, but that the stalkes grow not to much more then halfe the height, the one of them being lesser then the other.

The Place and Time.

The first groweth usually on bogges and moorish places, and also on dry places that are shadowy, where the second groweth likewise on *Hampstead-Heath*.

The Names.

The two first are called by many *Polytrichum aureum*, of some *Adiantum aureum*, of *Thalius Adiantum ἀφυλλος*, of others *Muscus capillaris*, and *Bauhinus Polytrichum aureum*, making three sorts *majus, medium & minus* as *Thalius* doth, but I thinke that diversitie rather riseth from the place then nature of the plant. *Fuchsius* taketh it to bee *Polytrichum Apulei*.

The Vertues.

The Golden Maidenhaire is of a temperature betweene heate and cold yet it dryeth rarifieth and digesteth: it helpeth to expectorate tough flegme from the Chest and Lungs no lesse then the other Maidenhaires being boyled and drunke: it also provoketh urine, and helpeth to expell the stone, is profitable for Splenetricke persons and those that have the Falling sickneſſe, the herbe boyled in water or Lye, and the head washed therewith strengthneth the rootes of the haire, stayeth it from shedding, and causeth them to grow thicke where they are thin: briefely it is held to be as effectuall as any of the maidenhaires, many other incredible things are reported hereof which are rather superstitious and therefore I forbeare to relate them,

Polytrichum aureum majus & minus.
Golden Maidenhaire the greater and the lesser.

CHAP. XIIII.

1. *Ros solis sive Rerella vel Rosa solis.*
Sundew or Rosa solis.

LEt mee place this plant with the rest being usually reckoned among the number of the Capillarie herbes for the neareneſſe unto them, being of high esteeme formerly, and tell you that it hath divers small round hollow leaves, somewhat greenish, but full of certaine red haires that make them seeme red, every one standing upon its owne footstalke reddish hairy likewise, the leaves have this wonderfull propertie that they are continually moist in the hottest

1. *Ros Solis sive Rorella vel Rosa solis major & minor.*
Sundew or Rosa solis the greater and the lesser.

2. *Ros solis sylvestris longifolius.* Long leafed Rosa solis.

day,

day, yea the hotter the Sunne ſhineth on them the moiſter they are, with a certaine ſlimineſſe that will riſe into threads or rope as wee uſually ſay, the ſmall haires alwayes holding this moiſture: among theſe leaves riſe up ſmall ſlender ſtalkes, reddiſh alſo, three or foure fingers high, bearing divers ſmall white knoppes one above another which are the flowers, after which in the heads are certaine ſmall ſeede: the roote is a few ſmall haires. Some have made a greater and leſſer but I thinke it needeth not, yet I have expreſſed the varietie if there be any.

2. *Ros Solis ſylveſtris longifolius.* Long leafed Roſa ſolis.

This was ſent me by Mr. *Zanthe Silliard* an Apothecarie of *Dublin* in *Ireland*, which ſort wee have growing by *Elleſtmere* in *Shropſhire* by the way ſides (the report of Mr. Doctor *Coote*) whoſe largeneſſe and longneſſe of the leaves ſhew the difference.

The Place and Time.

They grow uſually on bogs and wet places, and ſometimes in moiſt woods, and flower in *Iune*, the leaves being fitteſt then to be gathered.

The Names.

It is of our later writers called *Ros ſolis* and *Rorella*, and *Rorida* by *Lobel*, and by ſome *Salſirora*, and corruptly Roſa ſolis as wee in *Engliſh* doe: the *Germanes* call it *Sundew*, the *Dutch Loopicheruyt*, that is, Luſtwort, becauſe if Sheepe feede thereon they will goe to Ramme: yet in the North of our Land they call it the red rotte, becauſe as they thinke their Sheepe feeding thereon runne to rotte, ſome call it alſo Moore-graſſe.

The Vertues.

It is in taſte ſharpe and quicke, yet a little acide drying and binding: it is accounted good to helpe thoſe that are troubled with ſalt rheume diſtilling on their Lungs, which by waſting them breedeth a Conſumption, and therefore the diſtilled water thereof in wine is held profitable for ſuch to drinke, which water will bee of a gold yellow colour: the ſame water alſo is held to be good for all other diſeaſes of the Lungs whether it bee Tiſicke, wheeſing, ſhortneſſe of breath, or the Cough, as alſo to heale the Vlcers that happen in the Lungs, the ſame water is accounted to comfort the heart and fainting ſpirits: divers have much controverted theſe opinions, becauſe the leaves being applyed to the outward skinne will raiſe bliſters, but ſo will many other things, and yet are not dangerous to be taken inwardly ſo it be with diſcretion. Wee have an uſuall drinke made hereof by many with *aqua vitæ*, and ſundry ſpices frequently uſed in qualmes and paſſions of the heart, without any offence or danger that ever I heard of, but rather to good effect and purpoſe.

LEGVMINA PVLSES.

CLASSIS VNDECIMA.

THE ELEVENTH TRIBE.

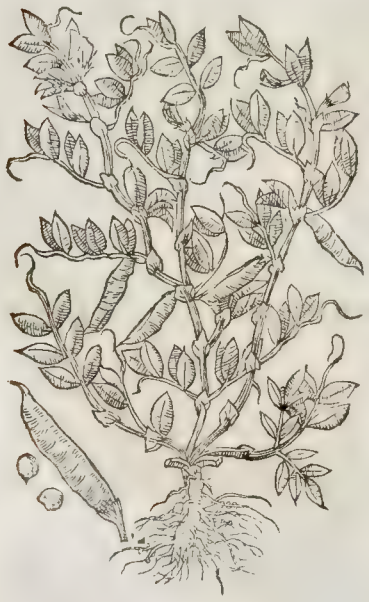
CHAP. I.

INtending to ſhew you a little world of Pulſes, let me for your better apprhenſion, and my more methodicall declaration, divide them into two principall or primary heads; that is, firſt into ſuch kindes, as either have claſpers, whereby to clime upon what ſtake, tree, &c. ſtandeth next it, or without claſpers, twine or winde themſelves about ſtakes, &c. or any other ſtandeth neare thereby. And ſecondly, into ſuch kindes as have no claſpers, doe either ſtand more upright of themſelves, or bend downewards or lie upon the ground, whereunto I will adjoyne the kindes of Trefoiles, as neareſt in neighbour hood unto them, with ſome *Medicas* and *Scorpioides*.

1. *Faba minor ſylveſtris.* The common wilde Beane.

This common wilde Beane groweth upright like the Garden Beane, and leaneth not downe, yet being thicke

1. *Faba minor ſylveſtris.* The common wilde Beane.



2. *Faba ſylveſtris græcorum, ſive Faba veterum.* The old Greekiſh Beane.

ſowne

ſowne the ſmall tendrells at the ends of the ſtalkes and branches ſuſtaine them the better: it hath leaves like unto the Garden Beane, without any dents on the edges, but ſmaller, more at a joynt, and growing cloſer: the flowers ſtand alſo more at a joynt, more purpliſh and leſſer: the cods ſucceeding them, are long and round, ſmaller than the garden kinde, ſtanding upright, within which are ſmall round beanes, ſome paler or blacker than others when they are ripe: the roote periſheth yearely. Of this kinde there are ſome bigger or leſſer than others.

2. *Faba ſylveſtris Græcorum ſive Faba veterum.* The old Greekiſh Beane.

This Greekiſh Beane ſhooteth forth two or three long flat ſtalkes, with two edges, lying or running on the ground, if it have nothing whereon it may rampe or riſe, which branch out on every ſide in to ſtalkes of leaves foure uſually ſet thereon by two and two, with a diſtance betweene them, like unto the Garden Beane, and each branch ending in a long claſper: the flowers are ſet ſingly at the joynts of the branches under the leaves, and are of a dead or fallen purple colour, with ſome paleneſſe at the bottome of them: after which ſucceede long and ſomewhat flat pods, with two ſharpe edges and dented about, a little hooked or bowing, greene at the firſt, but blacke and hard when they are ripe, wherein are contained foure or five or more round ſeede as bigge as Peaſe, and very blacke, ſo that one may well ſay they are rather Peaſe than Beanes; the roote groweth not deepe, nor farre with ſome ſtrings or long fibres thereat, dying yearely.

3. *Faba veterum ſerratis foliis.* The Greeke Beane with dented leaves.

We have had another difference hereof ſent us by this name, which onely ſetteth forth the diſtinction betweene them little differing in any thing elſe.

The Place.

The firſt (whereſoever it is wilde we know not) we ſow it generally through the Land, to ſerve horſes for their foode; the other groweth naturally in *Spaine* from whence *Guilloum Boel* ſent me ſeedes.

The Time.

Theſe flower in *July*, and their fruit is ripe a moneth or more after.

The Names.

This Beane is called Κύαμος ἄγριος in Greeke, and *Faba ſylveſtris* in Latine, and ἵππειος in Greeke is added unto the other, and *Faba Græca* in Latine to diſtinguiſh it from the *Ægyptia, a feracitate dicta*, ſay ſome. There hath beene much diſputation and alteration among our later Writers concerning the *Faba veterum* or *antiquorum Græcorum*, ſome referring the delineations thereof to our Garden Beane, but with more words than needed, for the ancients compariſon of the ſeede unto that of *Lotus*, *Terebinthus*, and the berries of *Taxus* doth evince all their words and reaſons, whereof I doe not intend to ſay any more here; for *Lobel* and *Lugdunenſis* have ſhewed the errours and miſtakings: the firſt here ſet downe, is the *Bona ſive Phaſelus minor* by *Dodonæus*, *Faba minor* by *Lobel*, and *Faba ſylveſtris* by *Matthiolus*, *Camerarius*, *Lugdunenſis*, and others: the other is the *Bona ſive Faſelus ſylveſtris* by *Dodonæus*, *Faba Græcorum ſylveſtris* by *Lobel*, *Piſa nigra* by *Camerarius*, and *Vicia Romana* by him alſo: Our later Herbariſts call it uſually *Faba veterum*, or *Græcorum*; and *Lugdunenſis Phaſiolus ſylveſtris*. Many worthy families among the ancient *Romanes* had their names from Beanes and Peaſe; and no doubt firſt roſe from their predeceſſours, ſowing and ſelling of them, as *Fabius Porcius*, *Quintus Fabius Maximus*, or from other accidents, as *Piſo*, *Cicero*, and divers others; and the uſe to number with Beanes doth continue among the *Venetians* to this day: it was alſo an uſuall cuſtome in former times in *Italy*, and other places adjacent to chuſe their Governors by caſting Beanes into a Baſon, the affirming party caſting in a white Beane, thoſe denying a blacke one; and from hence came the manner of choiſe of officers in many places by the billeting boxe to put in certaine bullets, the greater number in a partition carrying the choiſe.

The Vertues.

The Garden Beanes are with us more uſed for foode than for Phyſicke, yet the leſſer alſo in many other countries is uſed with a little Wheate and Rie to make them bread, and being greene nouriſh more than when they are drie but are more windy, and eaten after they have beene dried or fried engender leſſe winde, but are then of harder digeſtion: the diſtilled water of the flowers of garden Beanes is uſed of many to cleanſe the face and skinne, and to take away both ſpots and wrinckles, the ſame doth the meale or flower of it, as well as of the ſmall: the water diſtilled from the greene huskes, is held to be very effectuall againſt the ſtone, and to provoke urine: Beane-flower is uſed in pultiſſes that do aſſwage inflammations riſing upon wounds, as alſo the ſwelling of the cods or of womens breaſts cauſed by the curding of their milke, or by inflammations, and repreſſeth their milke, and keepeth backe children from growing too forward being laid to the ſhare: if the flower of Beanes and Fenugreeke be mixed with hony, and applied to felons, biles, blew markes by blowes or bruiſes, and the impoſtumes in the kernells of the eares; it helpeth them all, and with Roſe leaves, Frankinſenſe, and the white of an egge laid to the eyes that ſwell or grow out helpeth them, as alſo the watering of them, or ſtripes upon them, if it be uſed with wine: if a Beane be parted into two, the skinne being taken away, and then laid on the place where a Leech hath beene ſet that bleedeth too much, it ſtaieth the bleeding: Beane-flower boiled to a pultiſſe with wine and vineger, and ſome oyle put thereto, ceaſeth both paine and ſwelling of the cods: if fried Beanes be boiled with Garlike, and daily taken as meate, it helpeth inveterate coughes almoſt paſt cure, the hoarſeneſſe of the voyce, and the impoſtumes in the breaſt: the huskes of them boiled a good while in water, that is to the thirds ſtaieth the laske: the aſhes of the huskes made up with old hogges greaſe, helpeth the old paines, contuſions and wounds of the ſinewes, the Sciatica alſo and the Gout. What hath beene ſpoken of the greater, is alſo effectuall to the leſſer Beane without more repetition. The *Faba veterum* is without doubt that true Beane which *Dioſcorides*, *Galen*, and other Greeke authors intended when they ſet downe all the remedies they ſet downe of it; and therefore although we uſe our ordinary Beane-flower for all the purpoſes, and to good effect, yet theirs is the moſt proper, which vertues every one may trie as they ſee cauſe.

CHAP. II.

Phaſiolus. The *French* or Kedney-Beane.

I Have in my former Booke giving you the knowledge of the ordinary *Phaſiolus*, or Garden *French*-Beanes of divers colours, but there are ſundrie other ſorts, ſome mentioned by *Cluſius*, and ſome by others; whereof with thoſe wee have ſeene our ſelves, wee entend to give you in this Chapter a briefe view.

1. *Phaſiolus flore coccineo.* The Scarlet flowred French-Beane.

The Scarlet Beane riſeth up with ſundry branches twining about ſtakes that are ſet for it to runne thereon, ſtill turning contrary to the Sunne, having three leaves on a foote ſtalke, as in other of the ſame kinde: the flowers are for faſhion like unto the reſt, but are many more ſet together, and of a moſt orient ſcarlet colour: the Beanes are larger than the ordinary kinde, and of a deepe purple turning to be blacke when it is ripe and drie; the roote periſheth like the reſt in Winter with us.

2. *Phaſiolus ſiliqua hirſuta.* The hairy Kidney-Beane called in *Zurrate* where it groweth *Couhage*.

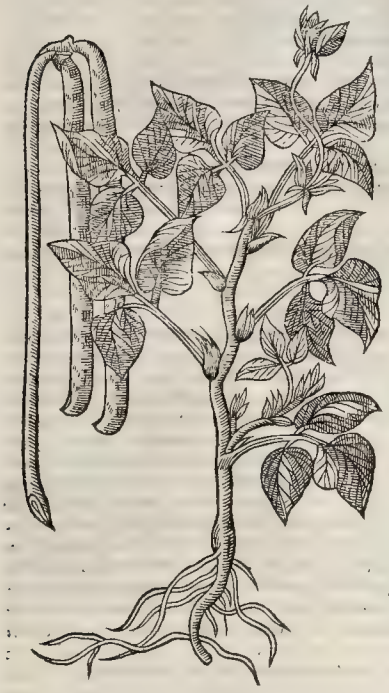
We have had an other of this kinde brought us out of the *Eaſt Indies*, which being planted, was in ſhew like the former, but came not to perfection, the unkindly ſeaſon not ſuffering it to ſhew the flower, but the cods which were brought, ſome were ſmaller, ſhorter, and rounder than our garden kinde, others much longer, and many growing together as it were in cluſters, and covered all over with a browne ſhort hairineſſe, ſo fine, that if any of it be rubbed or fall on the backe of ones hand, or other tender parts of the skin, it will cauſe a kind of itching, but not ſtrong nor long enduring, but paſſing quickly away without either danger or harme, the Beanes were ſmaller then the ordinary, and of a ſhining blacke colour. There are ſundry other ſtrange ſorts of Kidney-Beanes, whereof *Cluſius* maketh mention: the firſt, (as moſt of the reſt) groweth up with winding ſtalkes and branches, and with three leaves ſet together on long foote ſtalkes, and many white flowers in cluſters, after which ſucceede much broader and ſhorter cods, with white Kidney-like Beanes in them, ſpotted with blacke lines. His ſecond ſort is not much differing in forme or colour of flower from the former, but that it is ſomewhat paler, and the Beanes are very white, ſmaller, and more full or ſwelling than the ordinary white kinde. A third ſort is ſomewhat reddiſh at the end of the foote ſtalkes, the flowers ſtand by couples being larger, pale on the outſide, and of a blewiſh purple within, ſucceeded by reddiſh Beanes, thicke and ſhort, and ſomewhat full and round. A fift ſort hath reddiſh greene ſtalkes, and ſmaller darke greene leaves; the flowers were great and many, of a yellowiſh colour, the Beanes were ſmaller, contained in ſhorter and narrower cods,

1. *Phaſeolus Indicus flore coccineo.*
The Scarlet flowred *French* Beane.

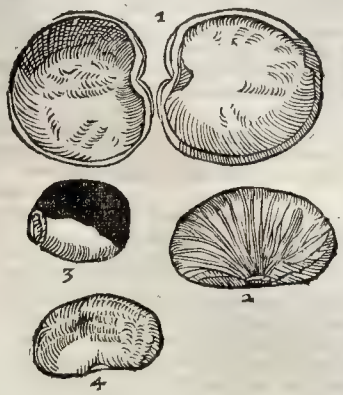
Phaſeolus fructu diverſo vel parvo & nigro albis venis.
French or Kidney Beanes of divers ſorts.

and

4. *Phaſeolus erectus.* Vpright Kidney Beanes.

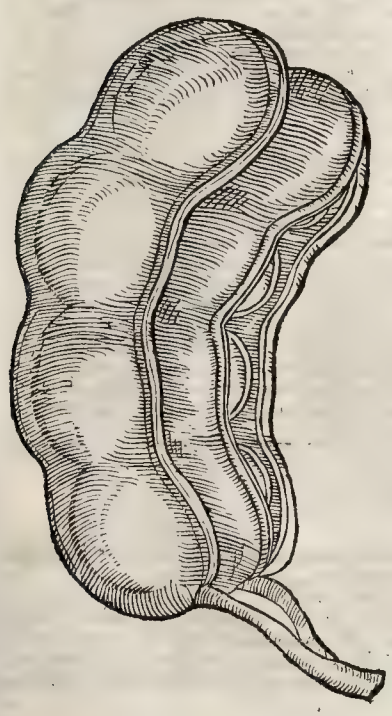


1. *Phaſeoli Americani Purgantes.* 2. *Lati magni albi.* 3. *Ægyptij.* 4. *Braſiliani.*
Foure ſorts of Outlandiſh Beanes.



Phaſeoli parvi ex America.
Small Kidney Beanes of *America.*

Phaſeolus Braſilianus magnus. A great *Braſill* Beane.



and ſhort, and ſomewhat full and round. A fift ſort hath reddiſh greene ſtalkes, and ſmaller darke greene leaves, the flowers were great, and many of a yellowiſh colour, the Beanes were ſmaller, contained in ſhorter and narrower cods, and of a darker colour. A ſixt had narrower leaves, with ſmaller reddiſh Beanes, & flatter than the other. A ſeventh grew not ſo high as the ordinary, or his firſt, the leaves were as narrow as the laſt, and the flowers white, the cods ſhort and yellowiſh being ripe, with white Beanes in them ſpotted or ſtriped, to the length or athwart, more great or leſſe in ſome than in others, and in ſome all blacke, with a few white lines in them, or elſe parted halfe white and halfe blacke. An eight in leaves and white flowers was like his firſt, and the Beanes not ſo white as the ordinary, and ſometimes ſpotted, either directly or confuſedly, or becomming blacke wholly. A ninth had great white Beanes ſpotted with reddiſh veines. A tenth had purpliſh flowers, whoſe hoods were darker, and various coloured Beanes turning blacke in broad flat and browniſh cods. An eleventh had blacke lines or veines running in the reddiſh Beanes diverſly marked. The Beanes of the twelfth were of a paler red, with blacke ſtripes on them. The thirteenth wee have had from *Braſill* the leaſt ſort that ever was ſeene; for although it hath the ſame forme of three leaves, & twining it ſelfe, yet are the Beanes blacke ſhining, and leſſer than Tares by the halfe. Another had large white flowers, ſlender cods, and white Beanes with blacke ſpots. Another, the leaſt of many whoſe Beanes were ſmaller than Peaſe and round. Divers others might be ſet forth, but that divers of them came not to maturitie, moſt of them that ſprang had twining branches: yet ſome grew upright, whereof the fourth ſort had ſhort and firme ſtalkes, not needing any

thing touphold it, and not above a foote high, whose trefoile leaves had shorter foote stalkes, the flowers were white, and the fruit either white, with a blacke spot, or reddish or pale, or else of a shining swartish colour, which kind, as it is most likely, is the *Phaſiolus*, or *Phaſeolus Cordi*, which he describeth in the 143. *folio* of his Annotations upon *Dioſcorides*, and in the 127. *folio* of his History of Plants, although he doth a little vary from himselfe in one of these two places. There hath come likewise unto us and others, both from *Africa*, *Braſill*, the *East* and *West Indies*, *Virginia*, *&c.* Sundry other sorts and varieties which were endlesse to recite, or at least useſſe, but onely to behold and contemplate the wonderfull workes of the Creator in those his creatures: *Lobel* also maketh mention in the 395. *page* of his *Adverſaria* of many rare varieties of these kindes of Beanes that the Lady *Killegrew* shewed him, which were taken up, and yearely gathered on the sea coasts of *Cornwall*, where it is not knowne that ever any shippe was wracked, but as it is thought were driven thither by the windes from the coasts of *America*; for the inhabitants thereabouts doe yearely gather new sorts, some floating on the waters, others raked from under the sandes of the shoare.

The Place and Time.

The first here described grew in the *West Indies*, and first grew with Mr. *Tradeſcant*, yearely flowring in the usuall Season, and giving ripe fruit: the second here described came from the *Magols* countrie in the *East Indies*, and onely sprang up with us, but continued not.

The Names.

Dioſcorides calleth this σμίλαξ κηπαία *Smilax hortenſis quod Smilacis modo conſcendit*; *Theophraſtus* and others Δολιχὸς, or as some write it Δολιχὸς, *Dolichus*, or *Dolicus*, which many Latine Authours follow: some also λοβὸς and λόβιον *propter ſiliquarum longitudinem*. Some also take it to be *Dioſcorides* his φασηόλος, or as *Galen* writeth it φασηόλι, whereof there hath beene much controversie among former Writers, as *Matthiolus* against *Manardus*, that thought the *Phaſiolus* of *Dioſcorides* to be *Ervilia*, and the *Smilax hortenſis* to be the ordinary *Phaſiolus*, as it is now adayes so called, which opinion, howsoever *Matthiolus* contradicteth, and would force his owne, which was *Cordus* his also for the truest; that the ordinary white Kidney Beanes were the *Phaſioli* of *Dioſcorides*, (which can no wayes stand with reason, seeing *Dioſcorides* setteth his *Phaſiolus* among those Pulses that grow wilde, and besides saith, that they are hard of digestion, and move vomiting, which is not proper to these kindes, but to many wilde sorts of Pulses, and in the Chapter of *Spartium frutex*, compareth the seedes thereof to those of *Phaſiolus*, and that his *Smilax hortenſis* was the other discolored sorts of Kidney Beanes, but they are as well for forme as in effect in my judgement the same. Another doubt there is with some, whether *Theophraſtus* his *Dolichus* and *Dioſcorides* his *Smilax hortenſis* be but one or divers; but *Galen in primo aliemetorum* hath decided that long agoe, where he saith, that because *Theophraſtus* saith his *Dolichus* needeth long poles or stakes to uphold it that it may prosper, he surely delineateth these *Phaſioli*, or *Dioſcorides* his *Smilax hortenſis*: so that you see it is without doubt that *Smilax hortenſis*, *Dolichus*, and our ordinary *Phaſeolus* to be all one: *Ætius* also in his first Booke saith the same, for assuredly *Dioſcorides* his *Phaſiolus* is the same with *Galen* his *Phaſelus*, which in the same Booke he joyneth with *Ochras* speaking of *Phaſeolus* afterwards, and *Lobel* taketh it to be that Pulse, which is called by *Lugdunenſis Phaſiolus ſylvarum*, and by *Cluſius Orobus Pannonicus*: *Cordus* in the places before mentioned maketh *Phaſelus* and *Phaſiolus* to be but one kinde of plant, and differing from *Phaſeolus*, which mounteth upon poles, the *Phaſelus* not rising: *Virgil* and *Columella* doe both make mention of *Phaſelus* as of a small and vile Pulse: *Virgil* in *Georg. ſecundo*, in these words, *Seu pinguem Viciam ſeres, vilemue Phaſelum. Dodonæus* maketh our ordinary garden Beane to be *Phaſelus major*, and the wilde kinde to be *Phaſelus minor*, and saith without doubt they are the right: but by his leave they are not right, wherein I referre me to others judgement, considering what I have here before written, and especially in that the Lentill-like seedes of *Spartium frutex*, are by *Dioſcorides* compared to those of *Phaſiolus*, when as the lesser blacke Beanes are farre bigger than any *Spaniſh* broome seede, or the pods comparable.

The Vertues.

The Kidney Beanes that are nursed up with us of all sorts, and come to maturity, being of easie digestion, and hot and moist in the first degree, doe move the belly, provoke urine, enlarge the breast that is streightened with shortnesse of breath, engender sperme, incite venery, especially if Sugar, Pepper, Genger and Galanga be added thereto: for they are well knowne to most to be a familiar dish of meate taken while they are young, boyled, and stewed, or fried, & some Verjuice put to them, and spice strewed thereon: *Matthiolus* saith, that if the greene pods be chewed in ones mouth, and applied to any place that is bitten by an horse it will helpe: he also sheweth that the *Italian* dames made a water or *fucus* for their faces of the pods and seedes of these Beanes, with a fresh gourd, crummes of bread, and Goates milke, &c. distilled. The fish called *Scarus* (which is somewhat like a *Berbell*) as *Bellonius* doth set it downe in the eight Chapter of his first Booke of Observations is much delighted to feede upon the leaves of this *Phaſeolus* or French-Beanes, and that therefore the Greekes of *Candy* that dwell neare *Milopotamo* and *Cigalinas*, where this fish doth abundantly breede betweene the rockes, doe use to put the leaves of this Beane into their Weeles, or Bow-nets, as a baite for this fish, knowing that they can hardly be taken by line or hooke but onely with this herbe, and therefore in their Language they call it *Scarovotamo*.

CHAP. III.

Piſum. Peaſe.

OF all the sorts of Garden Peaſe, I have spoken sufficiently in my former Booke, there remaineth now that I should shew you here the wilde kindes which are these.

1. *Piſum ſylveſtre primum.* The first wilde Peaſe.

This wilde Peaſe doth little differ from the manured, either in ramping cornered stalkes, or in the broad stiffe greene leaves, two alwayes being set at a joynt, and sixe or more lesser ones on the branches, which end in a clasper, the flowers are white, many standing on a foote stalke together, which turne into so many cods, each much smaller than the manured, and the seede within, farre lesse also, and of no pleasant taste; the roote is

as bigge as ones finger, and long, with many ſmall fibres thereat.

2. *Piſum ſylveſtre alterum.* The other wilde Peaſe.

The branches of this other are ſcarce halfe a foote long, with broader and ſhorter leaves on them, but like the former, and more pale, the Peaſe and cods, likewiſe not differing in forme but much leſſe, the roote abiding many yeares. Of this kinde there is another found to grow ſomewhat larger.

3. *Piſum ſylveſtre nigrum maculatum Baticum. Spaniſh* blacke ſpotted wilde Peaſe.

This *Spaniſh* Peaſe is in many things like the firſt, but that it is leſſer, and the flowers are of a pale yellowiſh greene colour, the Peaſe being of a darkeeolour, ſpotted with very blacke ſpots like velvet: the roote periſheth every yeare.

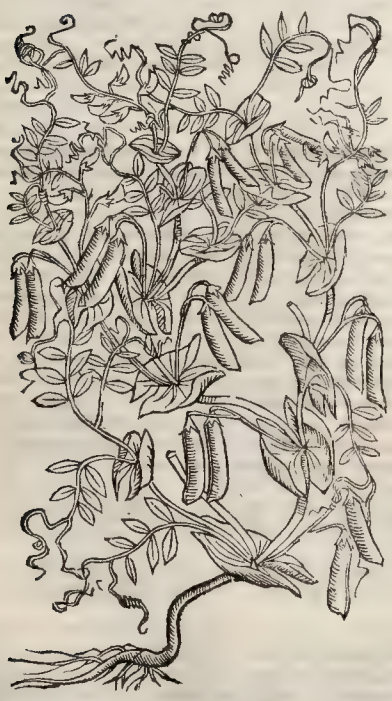
4. *Piſum ſpontaneum maritimum Anglicum.* Wilde *Engliſh* ſea Peaſe.

This Sea Peaſe differeth not much from the ſecond ſort of wilde Peaſe, but is ſomewhat greater, and bearing many flowers together in a tuft, mixt of purple and aſh colour: the ſucceeding huskes are ſmall and long, the roote is living.

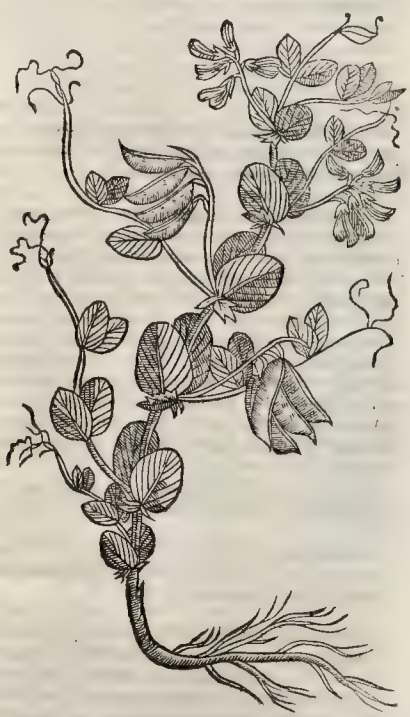
5. *Piſum alind maritimum Britanicum. Suffolke* Sea Peaſe.

This kinde of Sea Peaſe hath a ſtalke of a trianguler forme full of joynts, bending to the ground, with two leaves at every joynt, branched forth in divers places with winged leaves at them, conſiſting of tenne or twelve darke greene leaves, ſet by couples on a middle ribbe, with a ſmall claſper at the end, each leafe being not much unlike unto the Sea Purſlane: the flowers grow towards the toppes of the branches, eight or tenne ſet together in a cluſter, upon a ſmall long ſtalke, which both for forme and colour are very like to the wilde Peaſe, but with a whiteneſſe in the middle when it is full blowen, the fruit that followeth is leſſer than the common field Peaſe, containing eight or tenne Peaſe in a cod, each whereof hath the whiteneſſe called the eye, compaſſing halfe the Peaſe like a ſemicircle, which being ripe and drie, are of a darkiſh colour: the roote runneth downe incredible deepe into the ground, and ſpreading infinitely therein, even two fathome deepe, at the leaſt, within the very ſtones and baich of the Sea (yet about a yard or more deepe, there is found ſome ſand wherein it ſpreadoth) and is not great but ſlender pliant and flexible, not ſweete, but bitter as the whole plant is, and the Peaſe alſo: the old ſtalkes die every yeare, and from the old head will ſhoote many long white tendrells like the roote of the ſmall Bindeweede whereby it encreaſeth wonderfully, and not by the ſeede, as I am perſwaded, for that the ſhingle forbiddeth their growth falling thereon, in not having any nouriſhment or moiſture of ſand, before one digge two or three foote deepe, and the birds for the moſt part devoure them up. I have alſo put ſome of the Peaſe into the ground of my Garden, but none would ſpring.

1. *Piſum ſylveſtre primum.*
The firſt wilde Peale.



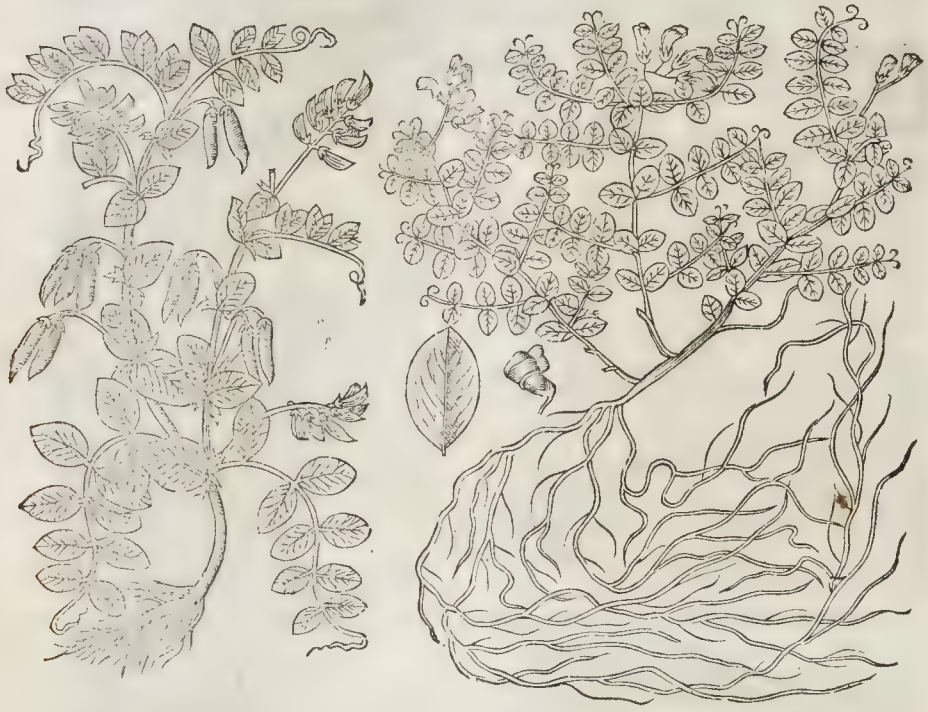
3. *Piſum ſylveſtre nigrum Baticum maculatum.*
The *Spaniſh* blacke ſpotted wilde Peaſe.



The

4. *Pisum spontaneum maritimum Anglicum.*
Wilde *English* Sea peaſe.

5. *Pisum aliud maritimum Britannicum.*
Another *Engliſh* Sea Peaſe.



The Place.

The firſt is often found in ſundry places of this Land: the ſecond on the chalkie hills at *Kings Hay* in *Kent*, not farre from the *Thames*, and the larger ſort hereof in ſome barren fields in *Eſſex*: the third in *Spaine*: the fourth in *Kent* alſo neere *Rumney*: the laſt was firſt made knowne in the yeare 1555 being the third yeare of Queene Mary to the Country dwelling thereabouts, that is betweene *Orford* & *Alborough*, where it grew upon the baich of the ſea, where nothing, no not graſſe was ever ſeene to grow, and by the dearth of that yeare the people in neceſſitie of foode, ſearching every where to take what came next to hand (for as it is ſaid many were forced at that time to make their bread of Acornes) gathered many quarters full of theſe Peaſe to ſerve their uſe; yet did the neighbouring people acknowledge that they had obſerved and knowne them to grow there of long time before that deare yeare. Mr. *Stow* in his Cronicle, and Mr. *Camden* in his *Britanica*, *pag.* 354. make mention of theſe Peaſe, but both ſtumble at one ſtone, that theſe might come thither by ſome ſhipwracke, which cannot be ſo: and Mr. *Stow* more eſpecially in ſaying the rootes are great and ſweete, for that it is *ſui generis*, a ſpeciall kinde differing from all other of that kinde; and as it is probable naturall only to thoſe places about the Sea ſhoare, for it is found alſo at Rie, at *Pemſie* in *Suſſex*, at *Gilford* in *Kent* over againſt the *Comber*, and at *Ingolne Milles* in *Lincholne* ſhire: Mr. *John Argent* Dr. of Phyſicke, of the Colledge in *London*, brought from thence alſo the whole plant, ſuch as you ſee is here figured, which he gave to Dr. *Lobel* in his life time, to be inſerted in his Workes, but he prevented by death failing to performe it, I have by purchaſing his Workes with my money here ſupplied.

The Time.

Theſe flower and beare their fruit with the later kinde of Field Peaſe; but the laſt flowereth in the end of *July*, and hath both blowne flowers, and ripe cods in the end of *Auguſt*, and bloſſomes alſo not halfe forward to blow.

The Name.

Peaſe are called in Greeke πίσον, in Latine *Piſum*; the names in their titles are ſufficient to diſtinguiſh them, for except the firſt, none of theſe have beene mentioned by any former Author: the *Italians* call them *Piſelli*; the *French De pois*, the *Germanes Erbſe*.

The Vertues.

Peaſe are leſſe windy than Beanes, but paſſe not forth of the body ſo ſoone as they: if the wilde kinde be boyled in Lye, and the head waſhed therewith, it clenſeth it from ſcurffe and ſcabbes: the ſame alſo clenſeth the skin of ſpots: the meale of them, and Barley mixed with honey and uſed, healeth foule ulcers; and the meale boiled in water with Vetches, breaketh tumours, and eaſeth their paines being applied. *Camerarius* ſaith, that in *Francfort*, they call it *Daringicht kraut*, and uſe to take ſome of the Peaſe againſt the collicke: and apply the herbe outwardly and give it their cattle alſo for the ſame purpoſe, that is, if they vent much.

CHAP.

CHAP. IIII.

Lathyrus. The great wilde Cicheling or Peaſe everlaſting.

OF this kind of Pulſe called *Cathyrus* there are two ſpecificall differences, the one that continuē in their roote, and periſheth not, the other annuall periſhing continually after ſeede time: many of the living ſorts I will intreat in this Chapter, and of the annualls in the next.

1. *Lathyrus major perennis.* The greater Peaſe everlaſting.

This kind of Peaſe ſendeth forth many long flat trayling ſtalkes, winged on both ſides which muſt be ſuſtained, divided into ſundry branches with two leaves at the joynts which are ſomewhat long and not very broad, with ſome claſpers at the ends of the branches, at the joynts likewiſe come forth pretty long ſtalkes with five or ſix or more Peaſe-like bloſſomes, of a fine paſe purpliſh red colour, and of a fine ſmell, after which ſucceede ſmall long and hard whitiſh cods, with ſmall round blackiſh ſeede in them, the roote groweth great, blacke and rugged on the outſide and runneth downe deepe into the ground. This is that which *Lobel* calleth *Lathyrus latiore folio*, and hath beene found wilde in divers places with us.

2. *Lathyrus anguſtifolius.* Narrow leafed wild Cicheling.

This differeth not in durability, forme of growing, or colour of flowers from the former, but in having ſomewhat paler flowers and in the greene leaves which are narrower then they.

3. *Lathyrus ſylveſtris Dodonei.* The wilde Cicheling of *Dodonæus.*

This hath longer winged ſtalkes and ſomewhat larger leaves, but ſhorter claſpers then the laſt, the flowers are of a deepe purple, and the cods are long and ſlender, with ſmall hard round ſeeds within them: the roote is long and abideth.

4. *Lathyrus arvenſis ſive Terræ glandes.* Peaſe Earth-nuts.

Theſe Earth-nuts have divers weake and ſmall ſquare ſtalkes running upon the ground foure or five foote long the leaves are ſmall uſually two ſet together upon a branch with a claſper at the end of each, taking hold of what ſtandeth next to it: the flowers come forth from the joynts towards the toppes of the ſtalkes upon long footeſtalkes, many growing together being narrow, and of a deepe reddiſh purple, ſomewhat bright, the cods that ſucceede them are ſmall and long with ſmall round ſeedes in them, the roores are tuberous, blacke and ſmall faſtned to long ſtrings, which ſpread much under ground, in taſte ſomewhat like to a dry Cheſnut. *Bauhinus* maketh it and the next to be both one plant.

5. *Lathyrus ſylveſtris ligneſior.* Our Wood Earth-nuts.

This creeping wilde Peaſe-nut hath not onely greater, longer and harder rootes almoſt wooddy then the

1. *Lathyrus major perennis.*
The greater Peaſe everlaſting.

4. *Lathyrus arvenſis ſive Terræ glandes.*
Peaſe Earth-nuts.

former

5. *Lathyrus sylvestris lignosior.* Our Wood Earth-nut.

6. *Terræ glandes Americanæ sive Virginianæ.* *Virginia* Earth-nuts.

former, but the crested ſtalkes alſo are harder and lye on the ground with foure ſmooth long and narrow leaves uſually, and ſometimes five on a branch, ſmalleſt at both ends, and one claſper at the end: the flowers are purple or crimſon, and the cods are narrow long and ſomewhat browne in the beginning, and paler as they grow older, within which are ſmall round ſeede no bigger then a Vetch or rather leſſe, and of a wan colour, this is the *Aſtragalus Silvaticus Thalij.*

6. *Terræ glandes Americanæ ſive Virginianæ.* *Virginia* Earth-nuts.

Let me adjoyne this plant to theſe two later ſorts for the rootes ſake, whereunto in forme they are moſt like, although differing in the greene long leaves which are many ſet on both ſides of a middle ſtalke, the maine ſtalke it ſelfe winding it ſelfe upon any thing ſtandeth next unto it, and riſing from a tuberous browne roote, which multiplyeth it ſelfe into ſundry others: at the joynts of the ſtalkes with the leaves and in other places of the ſtalkes likewiſe come forth the flowers many ſtanding together ſpike-faſhion, of a ſullen bluſh colour made almoſt like hoods, which fall away with us not bearing any fruit, and the leaves and ſtalkes periſhing before Winter, new raiſing themſelves in the Spring.

7. *Lathyrus ſylveſtris flore luteo.* Tarè everlaſting.

This ramping wilde Vetch or Tare as the country people call it, becauſe it is the moſt pernicious herbe that can grow on the earth, for corne or any other good herbe that it ſhall grow by, killing and ſtrangling them: it groweth ſomewhat like unto the firſt but the leaves are ſmaller, the flowers are yellow many upon a ſtalke and after ſmall round cods with blackiſh ſmall ſeede in them: the roote is ſmall and rough running infinitely under ground not to be deſtroyed.

The Place and *Time.*

The firſt and ſecond are uſually cheriſhed in Gardens for the beauty of the flowers as I ſaid in my former booke, and likewiſe hath beene found wilde with us as is before ſaid, if it be not the third which is entituled of *Dodonæus*, the fourth is ſaid by *Gerard* to grow in many places with us as *Hamſted, Coume* Parke, &c. but we rather thinke it was the next, for the rootes of thoſe wee have hitherto found in our woods and hedges ſides have beene more wooddy then the other ſorts, which growing in our Gardens wee have ſeene to be more tender, and came to us from beyond Sea: the laſt is found oftener then men would have it, being a plague to Field or Orchard whereinto it once getteth: they all flower from the end of *July* to the end of *Auguſt.*

The Names.

This Pulſe the Greekes call Λαθύρος *Lathyrus*, but is diverſly called by divers moderne writers in Latine, for ſome call it *Lathyrus ſive Cucircula* and by *Bauhinus Cicercula*, by others *Lathyris* as *Lobel*, &c. but unfitly for *Lathyris* is generally taken for Spurge, againe *Aracus* or *Cicera* as *Dodonæus*, yet *Tabermontanus* to put a difference betweene them calleth them *Lathyris leguminoſa*: *Matthiolus* calleth the firſt *Chymenum, Cæſalpinus Ervilium, Tragus Piſum Græcorum, Fuchſius Ervum ſylveſtre*: The fourth is called *Apios* by *Fuchſius* and *Tragus*, but *Pſeudoapios* by *Matthiolus*, *Chamæ balanus* by *Dodonæus* and *Tabermontanus*, *Terræ glandes* by *Lobel* and *Pena*, *Glandes*

Glandes terreſtres by *Cluſius*, and *Arachidna Theophraſti* by *Columna*, who ſaith hee can finde none come ſo neare that of *Theophraſtus* as this: the laſt is called by *Dodonæus* in the Chapter of *Terræ glandes Legumen terræ glandibus ſimile*, by *Thalius Lathyrus ſylveſtris floribus luteus*, and *Bauhinus* addeth thereunto *foliis Vicie*, the reſt are ſpecified with their deſcriptions.

The Vertues.

Galen ſaith that *Lathyrus* is in ſubſtance much like to *Ervilia* and *Phaſelus*, and that the countrey people in his countrey of *Aſia* did uſe them not onely as they of *Alexandria* and other Cities did their *Phaſeli* and *Ervilia*, but made them into a pultage as they did Lentills, but ſaith hee it is of a thicker conſiſtence then they and therefore nouriſheth more.

CHAP. V.

Lathyrus annuus, Yearely or Annuall Cichelings.

THe other ſorts of *Lathyrus* which are annuall as I ſaid before in the deviſion of *Lathyus* in the former Chapter, I reſerved to be here ſet together diſtinct from the former.

1. *Lathyrus annuus major Beticus*. The great *Spaniſh* annuall Cicheling.

This hath two or three flat ſtalkes a yard long or more welted as it were with skinnes or filmes on both edges, having two ſmall leaves at each joynt where ſhoote forth the branches, bearing two reaſonable long and broad leaves about the middle thereof one againſt another, with a twining claſper running out betweene them, the flowers ſtand ſingly upon long footſtalkes, of a deeper purple colour but leſſer then the Garden kinde firſt deſcribed in the laſt Chapter, after which ſucceede long pale coloured cods very like unto them as the ſeede within them is likewiſe: the roote is ſmall not running deepe nor growing great but periſheth every yeare.

2. *Lathyrus Beticus elegans ſiliquis Orobi*. *Spaniſh* partie coloured Cichelings.

This ſpringeth up into divers branches a fadom long, with ſuch like welts or skinny membranes on both ſides, at every joynt whereof come forth long leaves divided at the toppe into two other ſmaller leaves, and higher upwards, ſet with ſix leaves on both ſides, and on the middle betweene them commeth forth a ſmall claſping tendrell whereby it catcheth hold of every thing ſtandeth next unto it, at the joynts likewiſe come forth the flowers, either one or two at the moſt upon long footſtalkes like unto the other of his kind, the upper leafe of a fine Crimſon or Orenge colour, and the other in the middle of a perfect white: after the flower is paſt commeth the fruit in long pods, every ſeede bunching out like the pods of Orobus and as bigge almoſt as the ſmaller Peaſe.

3. *Lathyrus major ſiliqua brevi*. The greater ſhort codded Cicheling.

This in manner of growing differeth little from the former, onely the flower hath the inner leaves white

2. *Lathyrus Beticus elegans ſiliquis Orobi.*
Spaniſh partie coloured Cichelings.

3. *Lathyrus major ſiliqua brevi.*
The greater ſhort codded Cicheling.

and the outer somewhat purplish: the cods that follow are thicke and short, with small round blackish Pease within them.

4. *Lathyrus minor siliqua brevi.*
The lesser short codded Cicheling.

Lathyrus parvus alter.

The difference betweene this and the last consisteth more in the smallnesse then in any other thing saving that the cods hereof have a little roughnesse on them. Wee have another smaller then the last agreeing in most things else saving the cod which is longer and smaller.

5. *Lathyrus major angustissimo folio.*
Grasse leafed Cicheling.

The stalke hereof is slender and weake, the leaves long and narrower then grasse, sometimes two and sometimes three together: the flowers stand each upon a stalke of a blewish purple and sometimes reddish, the fruit is small and blackish contained in small short coddes, crooked at the ends.

6. *Lathyrus minor angustissimo folio.*
Fennell-like leafed Cicheling.

This is smaller weaker and tenderer in all parts then the last, the leaves are as small thin and long as Fennell, the coddes and seede are like the last onely the flowers are of a pale reddish colour.

7. *Lathyrus palustris Lusitanicus.*
Spanish Marsh Cichelings.

This in the beginning differeth little from the first but that the flowers stand usually two together, the outer leafe of a bright purple and the middlemost of a pale purple: the cods are slenderer and as long as the first, of a pale colour with small spotted Pease within them turning blacke when they are dry.

8. *Lathyrus Baticus flore luteo.* Yellow *Spanish* Cicheling.

8. *Lathyrus Baticus flore luteo.*
Yellow *Spanish* Cicheling.

This *Spanish* kind is in bignesse, forme of stalkes and leaves like the first of these here set downe, onely the flowers are all yellow with purple veines in them, after which follow cods very like, and of the same bignesse with the first, but the Pease are smaller and rougher, or as it were netted.

The Place and *Time.*

All these sorts except the sixt (which I found in clensing of Anneseede to use) grow in *Spaine*, and from thence were brought with a number of other rare seedes besides by *Guillaume Boel* and imparted to Mr. *Coys* of *Stabbers* in *Essex* in love, as a lover of rare plants, but to me of debt, for going into *Spaine* almost wholly on my charge hee brought mee little else for my mony, but while I beate the bush another catcheth and eateth the bird: so while I with care and cost sowed them yearely hoping first to publish them, another that never saw them unlesse in my Garden, nor knew of them but by a collaterall friend, prevents me whom they knew had their descriptions ready for the Presse.

The Names.

Their severall names are expressed in their titles, none of them being published before, except you may referre the fift unto *Bauhinus* his *Lathyrus major angustissimo folio*, described in his *Prodromus* whereunto it is most like.

The Vertues.

I have not understood that they serve for meate or medicines to any of the people where they are naturall: but utterly neglected and should never have beene further knowen, as it in like manner falleth out in all countries unlesse a cunning curious searcher, such as this *Boel* was, happen to pry carefully over the coasts of them.

CHAP. VI.

Cicercula. Winged or cornered Cichelings.

HAve you see divided this Chapter from the two former, (although they may bee and are called *Lathyri* by many good authors) upon good grounds as I take it: for although in growing they are like *Lathyrus*, yet some of them have their cods winged, and others not winged, and all have square or cornered Pease within them: I thinke therefore these formes doe argue a specificall diversitie fit to be distinguished, being all annuall also.

1. *Cicercula sive Lathyrus sativus flore albo.* White flowred winged Cicheling.

This Cicheling hath weake winged stalkes trayling on the ground if they be not helped like as all the former have, with two small leaves at the joynts and two other narrower leaves likewise on the branches which end in divided claspers, the flowers are white that stand on long footstalkes, and after them somewhat flat and short cods with two little narrow filmes all along the backe of them, the seede within them is somewhat larger then the wild sorts, flat white and cornered: the roote is small and fibrous perishing every yeare.

2. *Cicercula flore purpureo.* Blackish purple winged Cichelings.

This other is in manner of growing like the former, the flowers onely and the fruit declare the difference, for the

the flowers are of a darke dead purple, and the cods that follow are ſmall and with filmes at their backes like the laſt, the ſeede within them are cornered but of a darke colour almoſt blacke.

3. *Cicercula Bætica & Egyptiaca Cluſij.*
Blew flowred Cichelings.

This alſo differeth in nothing from the former but in that it hath larger leaves and the flowers pale, blew on the outſide and the inner leaves more blew, the cods are ſmall and almoſt round winged at the backe like the former, wherein lye browne cornered ſeede.

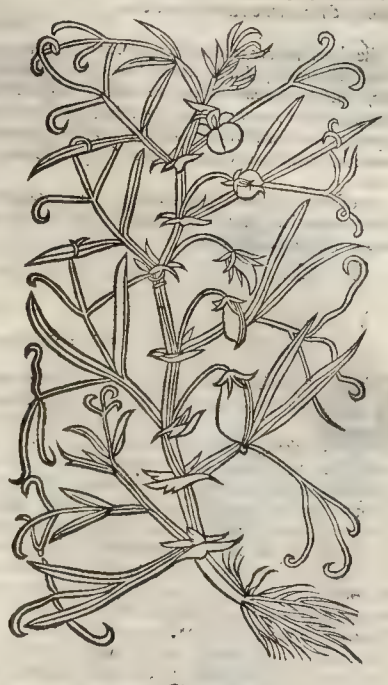
4. *Cicercula flore rubente.*
Red flowred winged Chichelings.

The manner of the growing hereof is in all things like the former, but that the greene leaves are narrower and longer then the laſt, and the flowers are of a kind of dead Orenge colour after which follow ſomewhat ſhort round cods with browniſh cornered ſeede.

5. *Circercula ſive Lathyrus Beticus dumetorum.*
Spaniſh baſh Cichelings.

Vnto theſe kinds of Cichelings let me adde this as comming nearer unto them then unto Vetches, for this hath divers long weake ſtalkes with filmes on the edges, at the joynts are two ſmall leaves, and from betweene them come forth the branches, having divers ſmall darke greene leaves ſet on them, ſomewhat round at the ends, ſometimes three on a ſide and ſometimes but two, yet not alwayes one againſt another, from the boſome of the ſtalke and the branch commeth forth uſually two flowers on a long footeſtalke the upper leafe being reddiſh and the other purpliſh, after which come long ſmooth cods without any filme at the backe having within them round but depreſſed or ſomewhat flat ſeede of a browniſh colour.

1. 2. *Cicercula flore albo vel purpureo.*
Winged Cichelings with white or blackiſh purple flowers.



4. *Cicercula flore rubente.*
Red flowred Cichelings.

3. *Cicercula Bætica ſive Ægyptiaca Cluſij.*
Blew flowred Cicheling.

The Place and Time.

All these sorts were brought us out of *Spaine* although they grow in other countries also: they flower and beare ripe fruit when the former doe.

The Names.

The three first are remembred by our moderne writers, *Dodonæus* calling the former *Aracus sive Lathyrus minor* and *Cicercula*, *Lobel Lathyris angustiore gramineo folio*, *Camerarius Lathyrus flore albo*, *Lacuna* called it *Ervum*, *Fuchsius Ervum album sativum*, by *Tragus Pisum Græcorum sativum*, and by *Cordus* on *Dioscorides Phaseolus minor*, *aliquibus Ervum anguloſum*: the second *Dodonæus* calleth *Aracus sive Cicera*, and *Camerarius Lathyrus flore purpureo*: the third *Clusius* calleth *Cicercula Ægyptiaca*, and *Camerarius Aracus Hiſpanicus sive Lathyrus Ægyptiacus*: the fourth was called by *Boel Lathyrus Bæticus flore miniato*, and the last by him also *Lathyrus Bæticus Dumetorum*.

The Vertues.

All of them as *Boel* saith are eaten by the poore people in *Spaine* in the want of bread, for where these are food seldome doe they taste of any bread of Corn: they are all of a compact substance, and therefore nouriſh more but are hardlyer concocted.

CHAP. VII.

Ochrus sive Ervilia. Winged wilde Peaſe.

OF this kinde of Pulſe I have onely seene and nourſed up with me two sorts much differing in the manner of growing and fruit from any of the other Pulſes as shall be shewed.

1. *Ervilia ſtore & fructu albo.* The white winged wild Peaſe.

This kind of Peaſe hath two or three ſtalkes at the moſt which are broad and flat, welted or winged at the sides with some what long leaves shooting from them small at the setting to the ſtalke and broader to the end, as it were growing from the middle ribbe of the other, at the toppe whereof ſtandeth two or three twining claſpers: this never shooteth forth any branches that ever I could see, but the leaves from almoſt the bottomes of the ſtalkes upwards are parted as it were at the toppe of them into one or two ſmaller leaves, or rather one or two ſmaller leaves grow at the toppe of them with the claſpers between them, at the foote of these leaves come forth ſingle flowers, like the former *Cicheling*, wholly white which turne into ſmall round and long cods, with ſmall crooked points at the ends, and ſilmes at the backes, wherein are conteined ſmall round whitiſh peaſe, somewhat bitter, the roote is ſmall and long, with some fibres which wholly periſh yearely.

1. *Ochrus ſive Ervilia flore & fructu albo.* The white wilde winged Peaſe.

2. *Ervilia altera.* The blackiſh winged wilde Peaſe.

This other differeth in nothing from the former, but in the flowers which are tending to a reddiſh purple, and the Peaſe in the Cods, which are more duskie declining to a blacke.

The Place and Time.

These we onely nurſe up in our Gardens, having received them from friends, that are lovers of rarities, yet *Lobel* saith they grow naturally in *Lombardie*, they flower and give ripe fruite from the middle of *July* to the end of *Auguſt*.

The Names.

That which *Theophraſtus in quarto de cauſis plant.* 2. calleth ὄχρος *Ochrus*, *Gaza* tranſlateth *Cicera*: but by *Pliny lib.* 18. *c.* 7. *Ervilia*, by which name it is uſually called in these later times by moſt Herbariſts, *Lobel* saith it seemeth to be ſo called *quaſi eruenda & ejicienda*; *Matthiolus* calleth it *Aracus niger* but erroniouſly; *Dodonæus* calleth it *Ervilia ſylveſtris*, *Lobel Ochrus ſylveſtris ſive Ervilia*, and *Lugdunenſis* saith the Herbariſts in his time called it *Cicer ervinum*, the other hath not beene mentioned by any before.

The Vertues.

We finde that *Galen* writeth *in lib. alimentorum* that *Ochrus* hath a meane or middle property, betweene thoſe that be of good & bad nouriſhment, and between thoſe that are of eaſie and hard digeſtion, breeding and not breeding wind, and nouriſhing much or little, and not of any ſpeciall quality: in these later times, it is held to have a drawing, digeſting, cutting and cleanſing faculty, for it is moderately hot and moyſt and a little bitter withall, whereby it is availeable to purge the Liver Spleene and Reines, and to cleanſe the skinne from morphew, ſcurfe, lepry and running tetters, it diſſolveth hard tumors in the cods, and healeth Impoſtumes and foule ſores being uſed with hony.

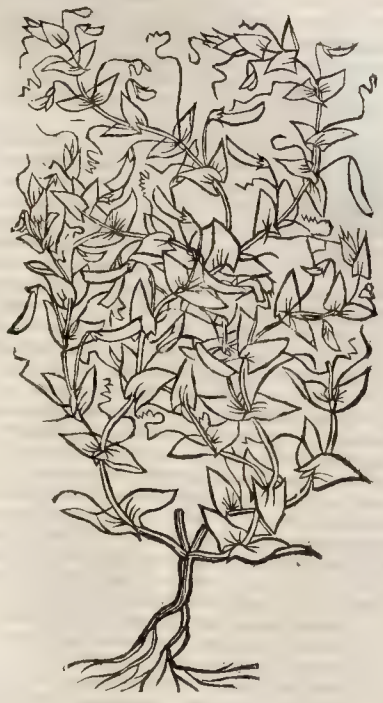
CHAP.

CHAP. VIII.

Aphaca. The yellow wilde Vetch.

I Have thought it fitteſt to place this Pulſe alone by it ſelfe, and before the Lentills, as partakin thereof, not finding any other of the former or following Pulſes, to be anſwerable thereunto, and therefore take the deſcription thereof here in this manner. It riſeth up higher than Lentills, with many weake ſlender and cornered ſtalkes full of joynts, with ſmall leaves at them ſet by couples cloſe together untill they be well growne, which then ſtand more ſeparate in ſunder, each whereof is broad at the bottome, as it were cloſing the ſtalke, and ſmall at the end, ſomewhat like unto the ſmall Bindeweede leaves branching upwards, and every one ending in a ſmall claſper, the flowers come forth at the joynts of the leaves, and claſpers with them, from the middle upwards, of a pale yellowiſh colour, and afterwards ſmall and ſomewhat flat cods, longer than thoſe of Lentills, wherein lie foure or five hard blacke round flattiſh ſhining ſeede, the roote is ſmall and long, with many fibres and endureth not, periſhing every yeare.

Aphaca. The yellow wilde Vetch.



The Place and Time.

It groweth in divers corne fields in *Kent*, and elſe where, flowreth in *July*, and the ſeede is ripe in *Auguſt*.

The Names.

It is generally held to be the Ἄφακη *Aphaca* of *Dioſcorides*, *Galen*, and *Pliny*, the name being derived from the Peaſe and the Lentill, both which it doth in ſome parts reſemble, but not that of *Theophraſtus*, which is accounted *inter intubacea*, but that *in* 8. *Hiſt. Plant. c.* 5. among Lentills, Peaſe, and other Pulſe, it is taken alſo by *Lugdunenſis* to be his Ὀρόβαγχη *Orobanche lib.* 5. *canſarum c.* 22. that groweth among *Orobus* and ſtrangleth it, *Anguilara* and *Camerarius* take it to be his *vicia pisine*. *Dodonæus* and *Lobel* call it *Aphaca Dioſcoridis*, *Lugdunenſis Orobanche legumen*, becauſe he acknowledgeth another *Orobanche*, *Tabermontanus Elatina tertia*, and *Bauhinus Vicia lutea foliis convolvuli minoris*.

The Vertues.

Dioſcorides ſaith that it hath an aſtringent propertie, and that therefore being parched, broken and boiled, after the manner of Lentills, they ſtay the fluxes, both of the ſtomacke and belly. *Galen* ſaith it is binding as the Lentill, & is uſed to be eaten as the Lentill: but it is hardlier digeſted, yet it drieth more powerfully, and healeth moderately, which aſtringent qualitie, ſaith *Dodonæus*, wee have found true by our owne experience in this *Aphaca*.

CHAP. IX.

Lens Lentills.

THere are three ſorts hereof, a greater, a leſſer, and a ſpotted one, as ſhall be declared.

1. *Lens major.* The greater Lentill

The greater Lentill hath ſundry ſlender weake branches ſomewhat hard, two foote long, from whence ſhoote forth at ſeverall paces long ſtalkes, of ſmall winged leaves, that is, many on each ſide of a middle rib, without any odde one at the end; for the middle ribbe of each ſtalk endeth in a ſmall claſper: the flowers are ſmall, and riſe from betweene the leaves and the ſtalkes, two for the moſt part at the end of a long foote ſtalke, of a ſad reddiſh purple colour, ſomewhat like to thoſe of Vetches, after which emoe ſmall ſhort, and ſomewhat flat cods, within which are contained two or three flat round ſmooth ſeede, of a pale yellowiſh aſhcolour: the roote is fibrous, and periſheth yearely.

2. *Lens minor.* The leſſer Lentill.

This other is leſſer both in ſtalke, leaves, and ſeede, the flowers are more pale, and the ſeede in the cods is whiter, wherein conſiſteth the whole difference.

3. *Lens maculat.* Spotted Lentills.

This likewiſe ſheweth little difference from the laſt in any thing, but the ſeede which is blackiſh, ſpotted with blacker ſpots.

The Place and *Time*

Theſe 2. former even beyond the ſeaes, are onely ſowne in the fields as other manured Pulſes are, and ſo are they in

some countries in our land, especially the smaller sort, which is every where, the more pleasant and acceptable, but the greater doth very hardly come to maturitie with us, if the season be not kindly and drie: the last is wilde in *Portugall.*

The Names.

It is called in Greeke φακὸς and φακὴ, *Phacos*, and in Latine *Lens* and *Lenticula*, *Pliny* saith, *lib.* 18. *cap.* 12. that the *Etymon* thereof seemeth to be taken, *quasi lenis dicta sit, lenitatis; significationem habeat, & æquanimitatem fieri vescantibus ea.* The *Arabians* call it *Hades*; the *Italians Lenticchia*, the *Spaniards Lenteias*, the *French Lentille*, the *Germanes Linsen*, and so doe the *Dutch* also, and wee in *English* Lentills, but the country people in *Hampshire*, and other countries, where they sow it in their fields for their cattles foode, call it Tills, leaving out the Lent, as thinking that word agreeth not with the matter, *Ita sus Minervam.*

The Vertues.

Galen saith, that Lentills hold a meane betweene heate and cold, yet doe they drie in the second degree, the outer skinne being binding, and the inner meate also, yet a little harsh and bindeth the body, but the outer skinne much more: it is, saith he, of contrary qualities, for the decoction thereof doth not binde, but loosen the body, and therefore they that would have it to binde, cast away the first water, and use the second, which staieth laskes, and strengtheneth the stomacke and all the inward parts. Lentills husked, saith hee, lose with their shells, the strength of binding, and the other qualities that follow it, and then nourish more than those that are not husked, yet so gvie they a thicke and evill nourishment, and slowly passe away, neither doe they stay fluxes and disenteries as those that are not husked. *Galen* further setteth forth the qualities hereof: largely to eate the broth of Lentills, saith he, breedeth the Leprosie and cankers, for grosse thicke meate, is fit to breede the melancholike humour, and therefore it is profitably given to those that are of a waterie dispotition, and evill affected thereby: but is utterly forbidden to those that have dry constitutions: it is also hurtfull to the sight dulling it by drying up the moisture, and is not convenient for women that want their conrses, but rather for them that have them in too much abundance. *Dioscorides* further addeth, it breedeth troublesome dreames, and is hurtfull to the head, the lungs, and the sinewes: with other binding herbes, as Purslaine, red Beetes, Mirtles, dried Roses, Pomegranat rindes, Medlers, Services, &c. taken with vinegar, it is the more powerfull to binde and stay laskes and fluxes: the decoction thereof with wheate flower applied easeth the gout, used with hony it closeth up the lippes of woundes, and cleanseth foule sores: being boyled in vinegar it dissolveth knots and kernells; and being boiled with Quinses, Mellilot, and a little Rosewater put thereto, it helpeth the inflammations of the eyes and fundament, but for the chappes thereof which neede a stronger medicine, it is boiled with dried Roses and Pomegranate rindes, adding a little hony to it: it likewise staieth those creeping cankers that are ready to turne to a gangreene, putting thereto some sea-water, and so it is good for wheales, and running or watering sores, S. *Anthonies* fire, kibes, &c. being used with vinegar: it is good also for womens breasts, that by abundance of milke have it crudled within them, if it be boyled in sea-water and applied to them: the decoction thereof is a good lotion for ulcers, either in the mouth, privie parts, or fundament, adding a few Rose-leaves and Quinses.

Lens major vel minor. The greater or lesser Lentill.

CHAP. X.

Aracus sive Cicera. Wilde Cichling Pease.

I Have two sorts of Pulses to bring to your consideration, better agreeing with this title, in my judgement than any other, let them of better learning and knowledge judge of them.

1. *Aracus major Baticus.* The greater *Spanish* wilde Cicheling Pease.

This greater Pease spreadeth on the ground, with divers square hairy, and crested stalkes, sometimes a yard long or more, at the severall joynts whereof, grow many darke greene hairy pointed leaves, on each side of a middle ribbe, which endeth in a clasper like the former Lentills or Vetches, at the foote of the leaves come forth single flowers on very short foote stalkes, of a duskie whitish purple colour, with deeper purple veines therein and of a deeper purple at the bottome of the upperleaves next to the stalkes, which when they are past, there come in their places short, thicke, and almost round blackish cods, covered with a short hairinesse thereon, within which lie three or foure round blackish seede or Pease, almost like unto blackish velvet as bigge as the *cicercula*, but not cornered: the roote is small and fibrous, and perisheth yearely.

2. *Aracus minor Lusitanicus.* The lesser wilde Cicheling Pease.

This other agreeth much with the former, but lesser in all parts, and nothing hairy; the flowers are of a pale white

white in my Garden, or whitiſh yellow colour in others, and the cods, ſmooth, ſmaller, not hairy, with ſmaller and blackiſh coloured Peaſe within them: the roote hereof periſheth likewiſe.

The Place and Time.

Both theſe Pulſes were brought and ſent me among other ſeedes by *Boel* before mentioned: the firſt out of *Spaine*, and the other out of *Portugall*, and flowred in the end of *July*, giving their ſeede in *Auguſt* and *September*: but as he ſaid, he gathered the ripe ſeede in *Aprill* and *May*, in the naturall places.

The Names.

Galen in putting a difference betweene ἄρακος and ἀγριόκυαμος, *Aracus*, and ἄρακος, *Arachus*, the one with κ, the other with χ, (and ſaith that *Arachus* is a wild weede or plague in corne, and that they picke it out of the corne, and caſt it away as they doe *Securidica*, the hatchet Fetch: and *Theoph.* 8. *Hiſt. c.* 10. ſaith alſo that it is a hard and rough thing growing among Lentills; but of *Aracus* hee ſpeaketh, *lib. de alimentorum facultate*, in an other place) giveth me occaſion to referre theſe Pulſes thereunto, eſpecially becauſe judicious Authors have rendered it *Cicera* in Latine; and *Columella* ſaith that *Cicera* differeth not from *Cicercula* in taſte, but in colour, becauſe *Cicera* is darker or blacker than *Cicercula* and *Palladius* alſo in *Martio* ſaith the ſame thing: but *Arachus* which is rendred *Cracca* in Latine, is more like a Vetch, both in growing and in bearing many flowers in a ſpike at the toppe, which this doth not: thus have I endeavoured to diſtinguiſh theſe plants, which I finde ſo many learned Writers before me have confounded, but *Dodonæus* his *Aracus* or *Cicera*, as I have ſhewed you before, pertaineth to an other kinde: the firſt of theſe came to me from *Boel*, by the name is in the title, to whoſe opinion I wholly encline, having often found him in our naturall ſearch for ſimples in ſundry places to be one of ſingular judgement and experience; the other hee ſent me out of *Portugall*, where he had the knowledge of it by *Nunnez Brandon*, a lover of rare plants, and therefore according to his title of *Legumen pallidum*, he added *Nony Brandony*, by which name it hath beene knowne to others, and I now thinke fit to referre it to the other.

The Vertues.

Wee have yet learned nothing concerning their faculties.

4. *Aracus minor Luſitanicus.*
The leſſer wilde Cicheling Peaſe.

CHAP. XI.

1. *Arachidna Cretica.* Vnder ground *Candy* Cicheling Peaſe.

THis pulſe (which for the wonderfull growing thereof hath amazed ſome, and made them ſearch if it were not mentioned in any former author (as I ſhall ſhew you by and by) riſeth up with divers ſtalkes, about a foote high, having on them both winged leaves, that is, eight or tenne ſet on both ſides, of a middle ribbe, ending in a claſper, very like unto Lentills or Vetches, very variable or differing one from another, for ſome of them are ſmall and pointed, others a little round, and ſome ſtalkes will have but two leaves, either round or pointed, and others will have foure: the flowers are of a reddiſh purple, ſtanding ſingly at the ioynts, which afterwards yeeld ſmall long cods bigger than thoſe of Vetches, wherein lie foure or five hard round, and very blacke ſeede: the roote is compoſed of many ſmall pods, as it were like unto Lentill cods, hanging by ſmall ſtrings, wherein is contained in ſome one ſeede, in others two, in ſome very blacke, in others pale, and in others of differing colours, or partly coloured; each whereof being planted a new will ſpring and beare a plant like the mother.

2. *Arachus ſub terra ſiliquifera Luſitanica.* *Portugall* underground Peaſe or Cichelings.

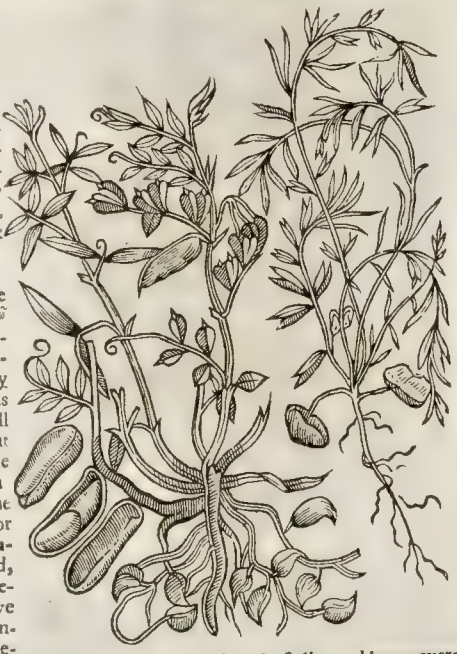
Somewhat like unto the former have we received from *Portugall* another ſort hereof, whoſe ſlender branches riſing not much above a foote high, lying for the moſt part upon the ground, had many ſmall narrow leaves ſet thereon without order up to the toppes, where and with the leaves alſo come forth ſmall reddiſh flowers which turne into ſmall & long cods, containing ſmall round ſeed within them: the roote ſhooteth downright with many fibres thereat, and at the head of the roote, as alſo at the other parts ſpring thicke and ſhort whitiſh pods, eſpecially while they abide under ground, but changing darker afterwards, containing within them one or two ſeedes at the moſt, bigger by much than thoſe in the pods above ground, and ſomewhat ſpeckled.

3. *Arachus ὑπόγαιος Americanus.* Vnderground Cicheling of *America* or *Indian* Earthnuts.

The *Indian* Earth-nuts (the figure whereof, I give you together as they are termed to us by them that have brought them us) are very likely to grow from ſuch like plants as are formerly deſcribed, not onely by the name but by the ſight and taſte of the thing it ſelfe, for wee have not yet ſeene the face thereof above ground, yet the fruit, or Peaſe-cods (as I may ſo call it) is farre larger, whoſe outer huſke is thicke and ſomewhat long, round

at both ends, or a little hooked at the lower end, of a fullen whitish colour on the outside, striped, and as it were wrinckled, bunching out into two parts, where the two nuts (for they are bigger than any Filberd kernell) or Pease doe lie joyning close one unto another, being somewhat long, with the roundnesse firme and solide, and of a darke reddish colour on the out side, and white within tasting sweet like a Nut, but more oily.

1. 2. 3. *Arachidna Cretica Honorij Belli: Sub terra siliquifera Lusitanica, & Americana magna.*
Vnder ground Pease or Cichelings of *Candy*, *Portugall*, and a great kinde of *America*.



The Place and Time.

The first was sent out of *Candy* by *Honorius Bellus*, who found it growing there among corne & Pulse, unto *Ioannes Pona* of *Verona*, who set it forth in the description of *Mount Baldus*, and flowred in the end of Summer, as the second did that was sent us from *Lisbone* by *Beolius*, and the last groweth in most places of *America*, as well to the South, as West parts thereof, both on the maine and Ilands.

The Names.

The first is truely taken by *Bellus*, aforesaid, to be the *Arachidna* (or *Arachydna* as *Columna* hath it) or τὸ δεμνοειδὲς, *Aracoides*, or *Araco similis* of *Theophrastus* mentioned in his first Booke and eleaventh Chapter, no other plant yet knowne, agreeing so rightly thereunto, and describeth it, but the fruit groweth as much neere under the ground joyning to the small fibres thereof as above: and yet he there saith also, that neither of them beare any leafe, nor any thing like leaves: which how this can stand with sence and reason I know not, and therefore many doe suspect the text to be faultie, or else he is contrary to himselfe, for he saith they beare no lesse fruit under ground than above, and then they must beare fruit above ground, which how it can be without leaves I see not, for I never read, heard, or saw, that any plant bore fruit above ground without stalkes and leaves; the comparison unto *Aracus* also carrying the more probabilitie: but surely he was misinformed by those that gathered the rootes with the fruit on them when the stalkes and leaves were withered and gone, he never seeing the plant, as it is likely, or gathering it himselfe: the etimologie also of the name being composed of Ἀ ἐρ χ & and ὑπόγειον, *Aracus* and *hudnon*, which is *tuber*, confirmeth a suppofall in me, that he meant this underground fruit was like the fruit of the foregoing *Aracus* above ground, and such like is the under ground fruit hereof in cods with pease in them: but *Columna* maketh the *Terræ glandes* before declared to be rather this *Arachydna*, both from the solid rootes under ground, and the likenesse of the plant unto *Aracus*: and surely it may be that both these were meant by *Theophrastus*, for he maketh two sorts, and both alike in bearing fruit under gound, that is, *Arachidna* and *Araco similis*, or *Aracoides*: and we have also two plants, as I here shew you, *Aracus* before this, and *Arachus* after it, unto which they may be referred: the other two sorts are entituled as I thinke it fittest for them: the *Candiots*, as *Bellus* saith, call the first ἀγριόφακοι, *Agriophaci*; the second was sent me by the name of *Lathyrus sub terra siliquifera*; the last is generally called by our *English* Sea-men that goe into those parts Earth-nuts, erroniously enough, as they doe most other things that they there meete with.

The Vertues.

There is no propertie found out wherewith this is invested that we can understand of as yet.

CHAP. XII.

Arachus sive Cracca. Wild Vetches or Tares.

OF these wilde Vetche there is a greater and a lesser knowne differing from the manured kinde, or those referred thereunto, whereunto I adjoyne another stranger.

1. *Arachus sive Cracca major.* The greater wilde Vetch or Tare.

This greater kind of wilde Vetch hath a few slender crested stalkes lying on the ground, if it finde nothing whereon to rampe, or take hold of; at the joynts come forth winged leaves, that is, many set on both sides of a middle ribbe ending in a clasper, but lesser than those of Lentills, or the manured Vetch; the flowers are purple like the Vetch, and grow usually but one at a joynt, after which come small long blacke cods, lesser than Vetches, and so is the seede within them, but round, and not flat as Vetches are: the roote is small and perisheth.

2. *Arachus sive Cracca minor.* The lesser wilde Vetch or Tare.

This other wild Vetch differeth in no other thing from the former but in smalnesse, except that this hath whitish flowers standing in tufts at the toppes of the stalkes, and the cods that follow are shorter and somewhat hairy, and the seede within whitish: the roote hereof hath small whitish kernells hanging among the fibres.

3. *Arachus*

1. *Arachus seu Cracca major.*
The greater wilde Veten or Tare.

3. *Arachus Indicus sive Africanus.*
Corall beades of *Guiney.*

3. *Arachus Indicus sive Africanus.* Corall beades of *Guiney.*

This brave plant too tender for our climate groweth like the former but with more store of leaves and flowers and fruit, ten or twelve growing together in thicke, short and rough browniſh red cods, the Peaſe within being roundiſh and as red ſhining as if they were poliſhed Corall beads, but with a blacke ſpot on the one ſide as hard almoſt as a ſtone, and enduring being ſtrong for braceletsa long time. *Lobel* long before *Cluſius* ſet out this plant, whoſe pod with the ſeede being miſſet is in the next Chapter.

The Place and *Time.*

Both theſe ſorts are often found in the fields among Corne, where they will in a rainy time quickly overſpread and choke the Corne or any other herbe it groweth by, they flower in *Inly* and giveth ſeede preſently after, the other came out of *Africa* towards the *Indies.*

The Names.

This is rightly adjudged to be ἄεγχος *Arachus* of *Galen* and the other old *Grecian* writers, and hath his name according to his nature, for as *Lobel* defineth it as ἄεγὶς *quaſi peſtes perniciesque leguminoſæ frugis unde* ἄεγχος: The two firſt are generally called by all authors *Aracus* or *Cracca* except *Tragus* who calleth them *Vicia major* and *minor*, or *quarta* and *quinta*, and *Dodonæus* that thinketh it may be that kind of Pulſe growing among Corne which the Greekes call ἄεγὰς *Arachus*, and conteſteth againſt *Fuchſius* and others that called it *Cracca* the eſpeciall note ſaith he of difference from the other ſorts of *Vicia* is that this ſeede is exquiſite round and all other ſorts of *Fetches* ſomewhat flat: the laſt is mentioned by *Cluſius* in his fourth booke of Exoticks and 15. Chapter by the name of *Vicia Africana*, and *Lobel Piſum Coccineum Americum.*

The Vertues.

The properties of theſe are referred to the other ſorts of Fetches and therefore I ſhall put you over to the end of the next Chapter to be informed thereof to avoyd a double recitall of one and the ſame thing, onely this is a certaine knowne Pulſe to Doves wherewith they are much delighted, and although they be wild, yet where the Dove houſes are ſerved herewith they alſo will reſort and become tame with the reſt, and therefore ſome countrey people knowing it ſow ſome fields therewith to ſerve to that uſe.

CHAP. XIII.

Vicia. Vetches or Tares.

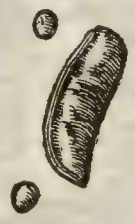
THe Vetches are of divers ſorts, ſome manured or ſowen, others wild growing in woods or hedges beſides thoſe before ſpecified which ſhall be declared in this Chapter.

1. *Vicia vulgaris ſativa.* The manured Vetch or Tare.

The manured Vetch or Tare hath divers ſquare ſtalkes riſing ſomerimes two foote high, entangling themſelves one with another that they ſtand in the field without neede of any other proppe, the leaves

leaves are winged thicker set together then the former wild kind, or set on both sides of the middle ribbe, the end whereof runneth out into a divided clasper and are larger also then they: the flowers stand two together and are long and narrow of a darke purple colour, the cods that succeede them are long and somewhat broad, wherein lye five or six flat blackish seede and in some grayish: the roote is stringy and perisheth every yeare.

Siliqua cum semine Aracli Indici rubri.
The pod and seede of the red *Indian* Vetch or Corall beade.



2. *Vicia sativa alba.* The white manured Vetch.

This other differeth not from the former in growing but is tenderer, the leaves not so thicke and the flowers and fruit more white.

3. *Vicia maxima dumetorum.*
The great wilde Vetch of the hedges.

This great Vetch groweth like the former, but is larger both in number and size of the leaves: the flowers likewise are somewhat large but shorter and more wan or pale, the cods succeeding are shorter also and blacke and so are the seedes within them.

4. *Vicia sylvestris alba.* White wild Vetches.

The white Vetch groweth in forme like the other but the winged leaves have a hoary downe upon them, the flowers are white with darke purple veines running through them, the seede is flat as the other but the roote hereof liveth as many of the wild kindes doe.

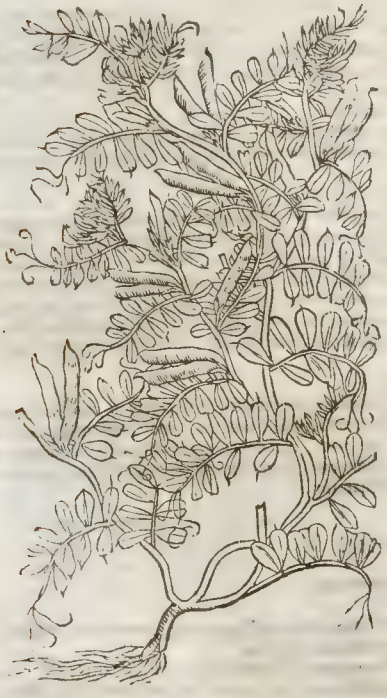
5. *Vicia multiflora sive spicata.* Tufted Vetches.

The tufted Vetches hath such like trayling branches as the other have but weaker, the winged leaves are more in number 12. 20. or more on a ribbe, longer and narrower then the former, and standing more upright, and not alwayes set opposite one to another but unequally, the flowers likewise that stand upon the long naked footstalkes are more in number sometimes twentie together but smaller, somewhat like unto the flowers of *Onobrychis* Cocks head, and of a bright blewish purple colour, and sometimes of a darke purple with some white in them, the cods succeeding are long and the seede blacke within them: the roote creepeth under ground farre about, shooting new branches every yeare for the old ones perish.

6. *Vicia sylvestris vulgaris.* Strangle Tare or Tyne.

The Strangle Tare groweth like the former Tares but is rougher both in leaves and stalkes, it is smaller also and not so high, the flowers are purple and the cods blacke, small and long with many small seedes within them: it riseth every yeare of it owne sowing, and choketh the Corne or any other herbe it groweth neare.

1. *Vicia vulgaris sativa.*
The manured Vetch or Tare.



4. *Vicia sylvestris flore albo.*
White wild Vetches.

The

e Place and *Time.*

The first two sorts are sowen in fields as Beanes and Peaſe to serve for cattells foode, both in our owne Land and others, whereof in neceſſitie the poore are forced to make their bread, and are sowen and reaped when the other Pulſes are: Some of the other wilde kinds are also found in woods and moiſt ground with us, among hedges and buſhes; but the *Indian* kind as Mr. *Gerard* tooke it to be in *Germany* as it is likely.

The Names.

Galen his Βικιον *Bicium* of the *Aſians* his countrey people is generally taken to be *Vicia* of the Latines, *a vinciendo* as *Varro* will have it: thoſe of *Athens* called it ὀλυρον and ϰυαμον *Syracum* and *Cyamum*: the first is called *Aphace* by *Matthiolus* and both it and the second ſpecially were formerly taken for *Orobus* by the Apothecaries, and the other learned and Doctors both in the upper and lower *Germany* as *Brunfelſius* and *Tragus* doe ſhew, and trope over hither alſo, untill they being reformed beyond Sea by getting the true *Orobus*, or at leaſt that which is neareſt thereto, hath made both them & us to forſake the old errour and joy in the true; the white one being moſt likely that Pulſe which *Gerard* had by the name of *Piſum Indicum*, & is ſet forth by the name of *Vicia Indica fructu albo* in the new *Gerard*: the third is called by *Bauhinus Vicia maxima dumetorũ*, and I doe ſo too, but others *Cracca major*, and *Os mundi*, and becauſe *Galen* joyneth *Aphaca* with *Vicia*, divers did follow him and call it *Aphaca*: but *Tragus* calleth it *Vicia ſylveſtris altera*: the fourth is that which *Cluſius* calleth *Vicia ſylveſtris flore albo*, & the fift he alſo calleth *Vicia ſylveſtris flore ſpicato*, and is the ſame both with *Dodonæus* his *Galega altera*, and *ſylveſtris Germanica*, which *Bauhinus* calleth *Multiflora*, and the ſame alſo with his *Vicia Onobrychidis flore*, as any that ſhall reade their ſeverall deſcriptions and compare them may ſee, it may alſo bee called *Vicia ſylveſtris nemorum* the wilde wood Vetch: the laſt is called by *Matthiolus Vicia* as it is indeede the worſt of all, but not the great or manured one. The *Italians* call it *Veccia*, the *French Veſce*, and the wild kindes *Veſce ſauvage* and *Veſceron*; the *Germanes Wecken* and the wild kind *Waldt Wecken*, and the greateſt S. *Chriſtoffelz kraut*, the *Dutch Witten*, and wee in *Engliſh* Vetches, Fetches, Tares and the wilde kind Tine.

The Vertues.

If theſe be eaten by men (as *Galen* ſaith in time of dearth as ſome did when they were greene) they yeeld a thicke clammy nouriſhment, are hard of diſgeſtion, and bind the belly, and therefore fit to breede melancholy, the meale thereof is uſed with other things to ſtay running Vlcers and Cankers that are ready to Gangrene: and made into a Pultis and layd on the belly they binde a laske.

CHAP. XIIII.

Lupinus. The flat Beane or Lupine.

HAving finiſhed the number of climing or ramping Pulſes, it remaineth to ſhew you the reſt which have no claſpers and firſt to begin with the Lupine or flat Beane, for the great Garden Beane which ſhould ſtand in the fore front I have ſhewed you in my former Worke with the greater and ſmaller blew and yellow Lupine, yet I thinke it not amiſſe to give you ſome of their Figures here.

1. *Lupinus ſativus albus.* The great white Lupine.

The great white Lupine riſeth up with a ſtrong upright round hollow ſoft or woolly ſtalke ſet confuſedly with divers ſoft woolly leaves upon long footſtalkes, each being divided into five, ſeaven or nine ſeverall parts, narrow long and ſoft, greeniſh on the upper ſide and woolly underneath: the maine ſtalke divideth it ſelfe into two parts, after the flowers are growen from the uppermoſt joynt, and are like unto the great Garden Beane but wholly white without any ſpot, the branches flowring after the firſt flowers have given ſlender long ſoft or woolly cods, leſſer then of the Garden Beane, conteining within them foure or five flat white Beanes ſomewhat yellowiſh within and very bitter in taſte: the roote is ſomewhat long and hard with divers fibres annexed thereto periſhing yearely.

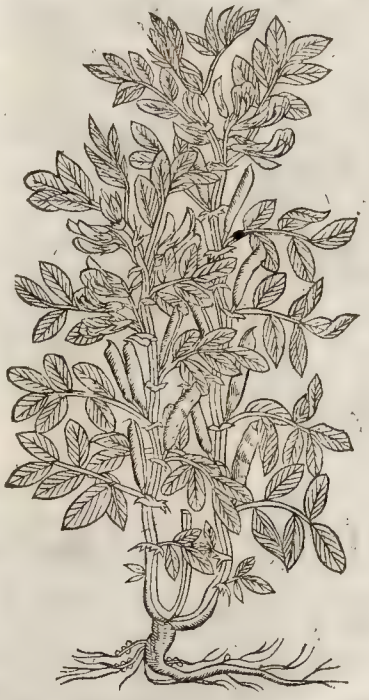
2. *Lupinus alter albus.* The ſpotted white Lupine.

This other Lupine differeth from the former in the greatneſſe and in the flower which is ſpotted with blew, on the head of the innermoſt leaves, and the hollow of the uppermoſt.

3. *Lupinus minimus cæruleus.*
The ſmalleſt blew Lupine.

This ſmall Lupine is very like unto the former blew Lupine ſet forth in my former Booke, in the manner of growing being little or nothing woolly alſo but ſmaller both ſtalkes and leaves, the flowers likewiſe are wholly blew, as they, or very ſeldome with a white ſpot in it: the ſeede is ſmaller likewiſe and a little ſpotted.

Faba major hortenſis. Our ordinary Garden Beane.



4. *Lupinus*

2. *Lupinus luteo.* The yellow Lupine.

1. *Lupinus sativus albus.* The great white Lupine.

2. *Lupinus minimus cæruleus.*
The smallest blew Lupine.

6. *Lupinus medius cæruleus.*
A middle sort of the great blew Lupine.

4. *Lupinus Gadenſis marinus flore cæruleo.* The blew Sea Lupine.

This Sea Lupine is ſomewhat like unto the ſmaller blew Lupine deſcribed in my former Booke, but leſſer, or betweene it and the ſmalleſt blew laſt of all deſcribed: the flower is of a moſt excellent blew colour, with ſome white ſpots in them, the ſeede is ſmall and round.

5. *Lupinus Arabicus.* The *Arabian* Lupine.

Having well conſidered this Lupine, I finde that I have deſcribed it among the Cinquefoiles, becauſe the leaves did ſo neere reſemble a Cinquefoile, and comming to me by that name, but ſince that having reade *Pona* his deſcription of *Mons Bauldus* in the *Italian* tongue, I finde it there deſcribed by the name of *Lupino Arabico*, or if you will, *Pentafillo peregrino*; unto either of which it may be referred, but ſeeing it doth more reſemble a Lupine than a Cinquefoile, I have ſo entituled it here, yet referre you to the deſcription thereof in that place, becauſe I would not repeate that there ſet downe, being, as I tooke it growing in my owne Garden, but yet becauſe in ſome things it is defective, as in the cods &c. and might be bettered, I will from *Pona* ſupply it: the leafe doth better reſemble a Lupine leafe, the flowers are more purple than they ſhewed with me; and the middle pointell in themalſo is purple,: the pods are long and pointed at the ends, full of ſmall blacke ſeede and little: this I thought good to advertiſe you, that they are but one plant, although it hath two titles.

6. *Lupinus Indicus medius cæruleus.* A middle ſort of the great blew Lupine.

This ſort of Lupine is very like the greateſt blew Lupine deſcribed in my former Booke, both for the tallneſſe, woollineſſe, and largeneſſe of the leaves, or a little leſſer in all as the flower is alſo, and of as orient a blew colour, with a whitiſh ſpot in the middle, which changeth to be reddiſh before the flower decaieth: the pods likewiſe are woolly, and almoſt as large, and ſo is the ſeede alſo, but ſtill ſmaller, and a little diſcoloured, with a dent or hollowneſſe in the middle.

7. *Lupinus flore carneo.* Bluſh flowred Lupines.

Somewat like unto the laſt is this Lupine alſo, but leſſer and leſſe woolly: the flowers which make the chiefeſt difference, are of a kinde of delaied reddiſh colour, which we uſually call a bluſh: the pods alſo are leſſe woolly and ſmaller, and the ſeede likewiſe.

8. *Lupinus flore obſoleto.*

Wee have had another ſort of *Lupine* ſent us from *Boel* by this name, but periſhing in an intemperate yeare, we can deſcribe it no further.

The Place and *Time.*

Theſe Lupines grow naturally wilde, but wee doe nouriſh them all in Gardens; and doe flower in the end of *July* or in *Auguſt*, in which time, or quickly after the ſeede will be ripe.

The Names.

It is called in Greeke θέρμος *Thermos*, in Latine *Lupinus*; *Pliny* thinking it tooke the name and qualitie from *Lupus*, but I finde no likelihood in that ſuppoſition, and therefore forbeare to expreſſe it any further; the two firſt are ſo called by the Authors that have written of them: the third was brought me by *Boel* out of *Africa*, and the fourth out of *Spaine*, but were both ſo tender, that I onely ſaved a little ſeede the firſt yeare I had them, and have loſt them ſince: the fift is declared in the deſcription: the three laſt have not beene remembred by any before: the *Arabians* call it *Tarmus* or *Tormus*; the *Italians Lupino*, the *Spaniards Entramoſos*, the *French Lupin*, the *Germanes Figbonen*, the *Dutch Vijchboonen* and *Lupines*, from whence came the *Faba ficulnea Germanis* by *Lobel*: and we in *Engliſh* Lupine or flat Beene.

The Vertues.

Lupines by reaſon of their bitterneſſe, do open, digeſt, diſſolve, & clenſe, being ſteeped ſome daies in water, untill they have loſt their bitterneſſe, they may be eaten, & ſo are, as *Galen* ſaith, for neceſſitie, but they breede groſſe and crude humours, are very hard to digeſt, and ſlowly paſſe through the body, yet doe they not binde any fluxe: the ſame being ſo ſteeped, and afterwards dried, beaten, and taken with ſome vinegar, taketh away the loathing of the ſtomacke to meate and provoketh the appetite: the decoction or infuſion of Lupines taken with hony and vinegar killeth the wormes in the belly, but if you mixe Rue and Pepper thereto, you ſhall make it the more effectuall: the meale or pouder taken with hony and vinegar or in drinke doth the ſame: the ſaid decoction taken openeth the obſtructions of the liver and ſpleene, provoketh urine and womens courſes, if it be taken with mirre, and expelleth the dead childe: the decoction of them cleanſeth all ſcabbes, morphew, cankers, tetters, and creeping or running ulcers and ſores, and boyled in lye it clenſeth the head from ulcers, ſcurfe, &c. breeding therein: it alſo clenſeth the face, and taketh away the markes that the Poxe doe leave after their healing, and all other markes, and blacke and blew ſpots in the skinne: and to cleare the face, and make it more amiable, many women doe uſe the meale of Lupines mingled with the gall of a Goate, ſome juyce of Lemonds, and a little *Alumen ſaccharinum*, made into a forme of a ſoft ointment: the meale thereof being boiled in vinegar and applied, taketh away pimples, and ſcattereth the nods or kernells that riſe in the body, and breaketh carbuncles and impoſtumes: the burning of the huskes driveth away Gnats, Flies, &c. whatſoever. The wilde Lupines are ſtronger and more effectuall to all purpoſes.

CHAP. XV.

Cicer ſativum. Garden Cich Peaſe, or Rammes Ciches.

OF the Pulſe called *Cicer*, there are two ſorts, the Garden and the wilde, but although I gave you the deſcription of two or three ſorts of the garden kind, in my former Booke: yet I thinke it not amiſſe to give you the deſcriptions of them here againe, with their properties more amply.

Cicer ſativum ſive arietinum rubrum nigrum vel album.

Garden red, blacke or white, Cich Peaſe, Rammes Ciches, or Cicers.

All the ſorts of Rammes Ciches, bring forth ſtalkes a yard long, whereon doe grow winged leaves that is many

many ſmall and almoſt round leaves dented about the edges, ſet on both ſides of a middle ribbe: at the joynts come forth one or two flowers upon ſhort foote ſtalkes, Peaſe faſhion, either white, or whitiſh, or elſe purpliſh red, lighter, or deeper, according as the Peaſe that follow will be, that are contained in ſmall thicke and ſhort pods, wherein lie one or two Peaſe more uſually, a little pointed at the lower end, and almoſt round at the head, yet a little cornered or ſharpe: the roote is ſmall, and periſheth yearely.

The Place and *Time.*

They are ſowne in Gardens, or the Fields, as Peaſe, both in our owne and other countries, being ſowne later than Peaſe, and are gathered at the ſame time with them, or ſomewhat after.

The Names.

It is called in Greeke ἐρεβίνθος *Erebinthus* and ἀριὸς is added of ſome, becauſe ἀριὸς is *areis*, in Latine *Cicer*, of the *Arabians Chemps Hamos*, or *Alhamos*, of the *Italians Ceci*, of the *Spaniards Gravanſos*, of the *French Ciche*, & *pois Ciche*, & *pois bechu*, of the *Germans Kichem* and *Kicherebs*, of the *Dutch*; and we in *Engliſh* Cicers, Ciches, Rammes Ciches, and Ciche Peaſe: *Dioſcorides*, *Theophraſtus* and *Pliny* doe much vary one from another in ſetting downe the ſorts of theſe *Cicers*, *Dioſcorides* divideth it into *ſativum* & *ſylveſtre*, & of the *ſativum* he nameth *Arentinum* to be the other ſort; *Theophraſtus* ſaith it hath many differences, as in greatneſſe, taſte, colour and forme, as *Arietinum* and *Columbinum*, &c. *Pliny* doth ſomewhat follow *Theophraſtus*, and maketh more ſorts; but to avoid long diſputes and controverſies, wee doe now generally hold but two ſorts of the manured *Cicers*, white and red, or three, at the moſt as *Matthiolus* ſaith white, red, and blacke, but the red changeth blacke with time, and therefore is not differing; *Columbinum* and *Venereum* are all one with the white; and the *Cicer Orobeum* of *Theophraſtus* & *Pliny*, is another plant, as ſhall be ſhewed hereafter: *Matthiolus* ſaith, that the *Germans* heretofore erred much in taking Peaſe to be *Cicer Columbinum*, we have ſhewed before that *Tragus* and others tooke Vetches to be *Cicers*.

Cicer ſativum ſive arietinum nigrum rubrum vel album.
Garden red, blacke, or white Cich Peaſe,
Rammes Ciches, or Cicers.

The Vertues.

Cicers, as *Galen* ſaith, are no leſſe windy meate than Beanes, but yet nouriſh more, they provoke venery, and is thought to increaſe ſperme, and therefore they give it their ſtalion horſes. *Cicers* have in them a more clenſing faculty than beanes, whereby they breake the ſtones gathered in the kidneyes: to drinke the creame of them being boyled in water, is the beſt way, it moveth the belly downeward, provoketh urine, and womans courſes, and increaſeth both milke and ſeede: the decoction of either of them ſaith *Dioſcorides*, made with Roſemary, is good for the Dropſie, and the yellow Iaundiſe, and to eaſe the paines in the ſides, for which purpoſe this medicine is very powerfull: an ounce of *Cicers*, two ounces of *French* barly, and a ſmall handfull of Marſh Mallow rootes, cleane waſhed and cut, being boyled in the broath of a chicken, and foure ounces taken in the morning, and faſting two houres after: the white *Cicers* are uſed more as meate than medicine, yet they have the ſame effect, and is thought more powerfull to encreaſe milke and ſeede: I have knowne it given with good ſucceſſe, to women that were barren through an over hot conſtitution, an orderly courſe proceeding and following the taking thereof. *Dioſcorides* ſaith that *Cicers* are hurtfull to thoſe that have ulcers in their reines or kidnies, or in the bladder. *Plutarch* giveth this note, that no wormes breede in theſe *Cicers*, when as all other pulſes are ſubject to them, and therefore in their nuptiall ceremonies, thoſe were given in an allegoricall ſenſe, of their mutuall incorruptible affections.

CHAP. XVI.

Cicer ſylveſtre. Wilde Cicers.

THe wilde Cicers are of three or foure ſundry ſorts, as ſhall be ſhewed in this Chapter.

1. *Cicer ſylveſtre majus.* The greater wilde *Cicer*.

The greater ſort hath very long winged leaves ſet on the ſtalkes, compoſed of many, every one of them being ſmall, and longer than of the former garden kinde, not dented at all about the edges, and of a ſad greene colour: at the toppes of the ſtalkes come forth many tufts of flowers, thicke ſet together, of a pale yellowiſh colour, almoſt white, after which follow rough skinnie cods, in tufts alſo, each of them ſmall pointed at the end, with in which are contained other ſmall ſmooth huskes, which have many ſmall flat yellow round ſeede, ſo ſaith *Thalius*, but *Lugdunenſis* maketh the firſt of *Dalechampius* to have blackiſh flat ſeede, and not like unto the manured Cicers, and yet I take them to be both one, and that of *Matthiolus* alſo: the

Cicer ſylveſtre majus:
The greater wilde *Cicer*.

5. *Cicer ſylveſtre triphyllum.*
Three leafed wilde *Cicers*.

the roote is hard and wooddy, yet ſpreadeth farre about and living long. There is another ſort in all things like theformer, but much leſſer in every part.

2. *Cicer montanum Lanuginoſum.* The woolly mountaine *Cicer*.

This mountaine *Cicer* hath upright round ſtalkes a foote high, and ſoft or woolly, branching forth into ſmall branches, whereon ſtand winged leaves, tenne or twelve on a ſide of the middle ribbe, with an odde one at the end, each whereof is ſoft or woolly and long like unto the Vetches, ſome broader and narrower then others: on the toppes of the branches ſtand a ſpike of rough pale coloured flowers, and the cods that follow are ſomewhat long and woolly, with a crooked thread at the end of them, and have ſmall blacke ſeede in them.

3. *Cicer montanum ἀκγυλον.* Another mountaine *Cicer* without ſtalke.

This other mountaine *Cicer* hath a root growing deepe if the rocky ground where it groweth hinder it not, from whence ſundry hairy footſtalks of leaves which are 12. or ſomewhat more on a ſide, ſomewhat round yet longer then thoſe of the Garden *Cicer*, the edges of them being hairy, ſome of them being equally, others unequally ſet one againſt another, and an odde one at the end: the flowers grow hard above the roote, being ſomewhat long and pale, and after them come ſwollen cods, having two partitions, full of ſmall yellow ſeede like unto thoſe of the *Medicas* that is Kidney faſhion.

4. *Cicer Alpinum.* Mountaine Ciche Peaſe.

This from a long roote parted below hath the leaves on the ſtalkes like the true *Cicers*, but rounder and dented: the flowes are blewiſh and the cods ſmaller them of the former, being ſomewhat hairy and groweth on mount *Iura*.

5. *Cicer ſylveſtre triphyllum.* Three leafed wild *Cicers*.

The three leaved wilde *Cicer* hath ſtalkes about two foote high divided into ſome branches ſpreading abroad, whereon are ſet upon long footſtalkes one above another, leaves divided into three parts like the wild Trefoile and each of them bigger, thicker and rounder then thoſe of the Garden *Cicer*, a little dented alſo about the edges: the flowers grow two or three together from a long footſtalke at the joynts with the leaves, which are like the Garden *Cicer* flowers but larger: the cods that follow are ſmall like unto the Garden kinde, but ſomewhat flatter, having ſome ſmall leaves at the bottome of them, within which lye much ſmaller ſeede and more flat, and rather like to thoſe of *Cicercula*.

6. *Cicer ſylveſtre alterum triphyllum.* Another three leafed wilde *Cicer*.

This other wild *Cicer* hath a thicke long branched roote, blackiſh without and white within: the ſtalkes are full of branches with leaves like unto *Cicers*, but three alwayes ſet together and no more: the flowers are red and the cods are like unto the other wilde *Cicers* but hairy and ſpotted with red ſpots.

The Place and Time.

All theſe ſorts grow upon hills and in the woods, and ſometimes by the hedges in fields, and flower and give fruit in *July*, *Auguſt* and *September*.

The Names.

The firſt is the *Cicer ſylveſtre* of *Matthiolus*, and ſo called by *Dodonæus*, *Lugdunenſis* and others, being the *Cicer ſylveſtre herbariorum* of *Lobel*, and is alſo the firſt *Cicer ſylveſtre* of *Dalechampius*, and the *Cicer ſylveſtre majus* of *Thalius* as I ſaid before: the leſſer of this kind is *Thalius* his leaſt kind: the ſecond and third bee *Baulinus* out of his *Prodromus*: the fourth is not mentioned by any before: the fift is the *Cicer ſylveſtre verius* of *Lobel*, and called by others *Cicer ſylveſtre alterum*: the laſt is the *Cicer ſylveſtre ſecundum Dalechampij* by *Lugdunenſis*.

The Vertues.

The wild *Cicers* are ſo much more powerfull then thoſe of the Garden, by how much they exceede them in heate and dryneſſe, perceived by their ſharper and more bitter taſte, whereby they doe the more open obſtructions, provoke urine, breake the ſtone, and all thoſe other properties of cutting, opening, digeſting and diſſolving that are attributed to the former, and that both more ſpeedily and more certainly: yet ſaith *Pliny* if they be too largely taken they looſen the belly and cauſe torments and breed wind.

CHAP. XVII.

Orobus. The bitter Vetch.

OF this Pulſe there are properly in my judgement but three ſorts which ſhall be declared in this Chapter: but unto them I will adjoyne that ſmall wild pulſe for the names ſake that is called *Ervum ſylveſtre*, or *Catanance*.

1. *Orobus vulgaris.* The ordinary bitter Vetch.

This ſmall pulſe ſhooteth forth divers weake ſlender branches leaning to the ground, and ſcarſe riſing up about a foote high, beſet on all ſides with many winged leaves, each whereof is very little, and a little longer then round ſet one againſt another as the Cicers, Vetches and divers other Pulſes are, the flowers are ſmall and whitiſh (for I never ſaw any purple) ſtanding ſingly every one by it ſelfe at the joynts with the leaves, after which come ſmall round long pods no bigger then the tagge of a point, bunched out in three or foure parts where the ſeede lyeth, which is almoſt full round ſmall and of a pale colour: the roote is ſmall and periſheth every yeare.

2. *Orobus Creticus.* The better Vetch of *Candy*.

This *Orobus* in the manner of growing is altogether like the former, but whereas *Matthiolus* and others fol-

1. *Orobus vulgaris herbariorum.* The ordinary bitter Vetch.

3. *Cicer Orobum.* Cornered Orobus.

lowing

lowing him say it is lesser, I have alwayes found it to bee rather larger then lesser, yet there is so little difference betweene them, that but for the names sake of *Candy*, I would make them both but one kind without diversitie of *species*.

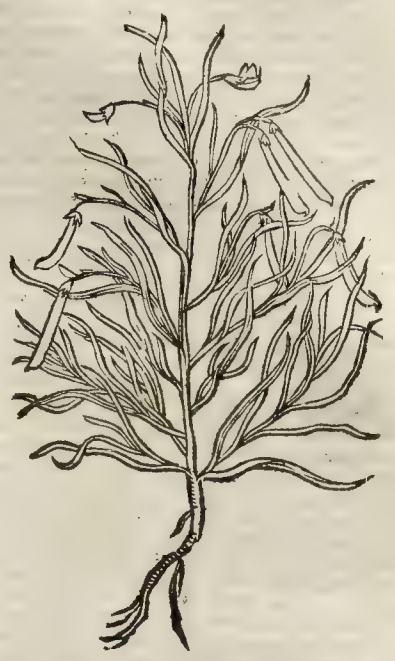
3. *Cicer Orobæum.* Cornered *Orobus.*

Divers would rather make this a *Cicer* than an *Orobus*, and indeede *Lobel* and *Pena* much doubted, whether they should call it the first of *Dioscorides* his *Cicers*, although they were confident that it was *Pliny* his *Cicer*, that was the sweetest and likest to *Orobus*: but I rather referre it to the kinds of *Orobus* from the forme of the cods more like to *Orobus* whose description is thus. It riseth up with a crooked or leaning hollow stalke halfe a yard high and full of joynts set with many leaves on each side of a middle ribbe, which are somewhat long like to those of the Lentill; at the joynts, towards the top come forth long footstalkes, with many flowers set on them close together, which after give long and round cods, bunched out and dented in betweene where the seedes lye twise as bigge as those of *Orobus* a little cornered and not so round, of a pale or yellowish colour and differing little from them but in the darke colour.

4. *Ervum sylvestre sive Catanance.*
Wilde grasse leafed *Orobus.*

This wilde Pulse hath sundry branches rising from the roote neare two foote high especially if it grow in any fertile soile, beset unorderly with many long and narrow darke greene leaves smaller then divers grasses, at the toppes of the stalkes and branches grow pretty large Pease Blossom'd flowers of an orient shining Crimson colour, after which come small slender long and almost round cods, conteining within them divers hard blackish seede: the roote is long and slender, with some fibres thereat, and perisheth every yeare as I ghesse by those that grew in my Garden from the seede sowen, whereof some bore white flowers and then perished towards Winter.

4. *Ervum sylvestre sive Catanance.*
Wild glasse leafed *Orobus.*



The Place and *Time.*

The two first are onely noursed up in Gardens with us, the second being naturall of *Candy*: the third as *Lobel* saith groweth wild in *Narbone* and Province in *France*; the last is usually growing in the fields about the hedges and bushes towards *High-gate*, *Pancras* Church, &c. and are all flowring and seeding in the end of Summer.

The Names.

This is called in Greeke ὄροβος *Orobus* παρὰ τὸ ἐρέπτεσθαι ὑπὸ τῶν βοῶν, *quod boves eo saginentur* as *Galen* saith, in Latine *Ervum* and *Orobus* also: the first is called *Orobus sive Ervum* by *Matthiolus* (who saith it was but lately in his time made knowne in *Italy*) and by most other writers, onely *Dodonæus* calleth it *Cicer sativum* and *Mochus* when as *Mochus* indeede is this *Orobus* but not *Cicer*. *Lobel* calleth it *Orobus receptus herbariorum*, because the generall vote of these later times doth so call it not having found or knowne any truer: the second is called *Orobus Creticus* by *Matthiolus*, as if it differed from the former, but is not so as I have shewed in the discription before: the third is called by *Lobel Cicer Orobæum Theophrasti*, & by *Bauhinus Orobus semine obtuso triangulo*. The last is called *Catanance* by *Gesner in hortis*, by *Dodonæus* in his *French* Herball and *Lugdunensis*: but *Ervum sylvestre* by *Dodonæus* in his Latine *Pemptades* and *Ervum sylvestre herbariorum* by *Lobel*: but why *Bauhinus* should call it *Lathyrus sylvestris minor* I see no cause seeing it is not like any of the other nor hath no claspers as all the other *Lathyri* he there expresseth have, and besides breaketh that order he had proposed to follow, namely to set downe all such Pulses as had claspers in the first place, and then those that had none, and yet this having none is put above among those that have, because he would vary the title if he could by any meanes: It is called by the *Arabians Erbum Keisene* or *Kersene*, by the *Italians Ervo*, by the *Spaniards Iervos*, by the *French Ers*, and wee in *English* may call it the bitter Vetch, for *Pliny* confounds this with *Vicia* the Vetch, and from the quality of bitternesse which the ancients say is in it, although ours have little that can be perceived; or *Orobus* after the Latine if you will.

The Vertues.

Orobus is dry in the second degree and hot in the first, and by the bitternesse cutteth clenseth and openeth obstructions, and was used in *Galens* time as hee saith to be steeped like Lupines (and that was to take out the bitternesse) before they were eaten by men or given to their beasts, and that but in a dearth and great necessitie, because they are not onely very unpleasant to the taste but be of bad nourishment. Wee use saith *Galen* the *Orobus* with Hony as a medicine to cleanse the breast and Lungs of thicke humors that offend them, the manner of the ancients preparation of the meale thereof was in this manner: being steeped in water a good while they after fryed or parched them untill the rindes broke, which then being ground and passed through a boulter they keepe this meale as of great use, both to move the belly downewards and to provoke urine, and to cause them that use it to be of a good colour, yet if it be two largely taken it causeth headach and paines in the belly, and causeth

blooddy urines. *Pliny* saith it is recorded in the Emperour *Augustus* Epistles that he was cured by *Ervum* (whose grieste it is probable was tough flegme, condensate in the Lungs and hard to be avoyded and spit forth) this *Orobus*. *Pliny* saith that good authors doe affirme that if any take *Orobus* fasting every morning it will consume the Spleene: the meale hereof mingled with hony clenseth foule Vlcers, and taketh away the spots freckles and other discolourings of the face or other parts of the body: it suffereth no Cankers, Gangrenes or spreading, eating sores to breede in the body; it molifieth the hardnesse of the breasts, and taken in wine or Vinegar as *Pliny* saith it helpeth the bitings of Serpents and mad dogges and men, and taken with Vinegar it helpeth the strangury, and that disease where one doth oft desire to goe to the stoole but can doe nothing, the said parched meale mixed with hony and taken helpeth those that rellish not their meate, and are hickockly disposed that is ready to fall into the hecticke Feaver or Consumption: a creame made of the meale of them & the places bathed therewith that is troubled with an itch cureth it through the whole body, and made into a plaster with wine will breake Carbuncles if it bee laid thereon: the greene cods stalkes and all before they grow hard, being bruised together juiced and applied to the haire doth colour it blacke.

CHAP. XVIII.

Orobus sylvaticus. Wood or wild *Orobus.*

NExt to the true *Orobus* I thinke good to joyne the wild or wood kindes for the names sake, and because *Clusius* hath expresst divers differences as he found them.

1. *Orobus sylvaticus major purpureus.* The greater purple Wood *Orobus.*

This first kinde that I here propose groweth not much above a foote high, bearing many square stalkes and striped all along: the leaves that are set one by another on each side of a middle ribbe being six, eight or ten in number, are a great deale larger then any *Orobus* namely two or three inches long, and an inch or two broad, with three nerves or sinewes running through them: the flowers grow at the toppes many standing together in fashion of a spike or bush being larger then those of the Vetch, and of a daintie blewish purple colour, and when they begin to fade they will change their colour a little and become more pale, then follow small long slender browne cods with small round seede within them yet sometimes they will be more long then round and variably coloured: the roote is long blacke and hard, bunching forth in some places with some small long strings and fibres fastned thereunto, and liveth many yeares.

2. *Orobus sylvaticus annuus flore albo.* The annuall white wild or wood *Orobus.*

This other wood *Orobus* hath divers straight and straked stalkes a cubit high bearing stalkes of leaves one above another but not opposite, each stalke having foure and sometimes five leaves on them reasonable large and pointed at the end with veines running in them: the flowers grow at the toppe from the uppermost joynts, five or six standing together on a short stalke which looke all one way of a whitish colour: when they are past rise long slender cods like the former, with browniish but larger seede in them then in any of the other sorts: the roote liveth not but perisheth after seede time.

1. *Orobus sylvaticus purpureus major.*
The greater purple Wood *Orobus.*

3. *Orobus sylvaticus angustifolius.*
Narrow leafed Wood *Orobus.*

This narrow leafed sort hath slender but straight crested stalkes a foote high, the leaves stand foure on a stalke by couples and are long and narrow: the flowers grow above on long stalkes many together of a pure white colour: the cods that follow are long and blacke, with somewhat large blacke seede in them: the roote consisteth of five or six long slender tuberous clogs like unto those of the *Asphodill* of *Peony* but smaller, blackish on the outside and white within.

4. *Orobus sylvaticus Venetus.*
The *Venetian* wood *Orobus.*

This *Venetian Orobus* is very like unto the first Wood *Orobus* here described growing in height and forme of leaves neerest thereunto, not having any end leafe on the stalke but of a paler greene colour: the flowers are small and purple like unto them also: the cods are reddish, long and small with round whitish seede in them: the roote is hard and wooddy with many fibres thereat and endureth. There is another of this whose stalkes and leaves are paler and the flower wholly white not differing else.

5. *Orobus Alpinus latifolius.*
Mountaine Wood *Orobus.*

This also is very like unto the first sort, but the leaves are broader and have their end not so sharpe, the flowers hang downe and are an inch long, of a pale yellowish colour, the uppermost being somewhat reddish.

3. *Orobus sylvaticus angustifolius.*
Narrow leafed Wood *Orobus.*

4. *Orobus sylvaticus Venetus.*
The *Venetian* Wood *Orobus.*

The Place and Time.

The three first sorts grow as *Clusius* saith in *Hungary*, *Austria* and the parts neare thereunto: onely the fourth was sent unto *Clusius* as he saith from *Venice*, the fift *Bauhinus* saith hee had from the *Pyrenean* and *Helvetian* hills, they all flower in *Aprill* or *May* and their seede is ripe in *Iune*.

The Names.

All these sorts are referred to the *Orobus*, both from their manner of growing and forme of the seed being round, and therefore *Clusius* called them *Orobus Pannonicus*, and *Bauhinus Orobus sylvaticus* whom I have followed. The first is the first *Orobus Pannonicus* of *Clusius*, which *Thalius* calleth *Orobus sylvestris vernus*, *Lobel* as I take it meaneth this by his *Phaselus*, *Lugdunensis* calleth it *Phaseolus sylvarum*, as is before sayd, *Dodonæus Arachus latifolius*, and *Columna Astragalus*: the second is the fourth of *Clusius* which hee saith may well bee referred to some kind of *Phaselus*, or else some kind of Vetch: the third is *Clusius* his third sort of *Orobus*: the fourth is his *Orobus Venetus*: I doe verily thinke that the fift which is *Bauhinus* his *Orobus Alpinus latifolius*, and *Lugdunensis* his *Galega montana* be all one, the colour of the flowers in each being like, and the rest agreeing or not farre disagreeing from it.

The Vertues.

Clusius hath made no mention that he heard of any propertie did belong unto any of these Pulses among the country people where they grew, but were wholly neglected, yet *Lugdunensis* saith of his *Galega montana* that it was accounted availeable against poysons and the Plague no lesse then the other *Galega*, and that it was good against the falling sickneſſe, and would kill the Wormes.

CHAP. XIX.

Onobrychis. Cockes-head.

VNto this title of *Onobrychis* are referred divers plants by many good authors, the most likely whereof I will comprehend in this Chapter.

1. *Onobrychis vulgaris.* The ordinary Cockes-head.

The ordinary Cockes-head hath divers weake but rough stalkes leaning downewards halfe a yard high, beset with winged leaves, each being longer and more pointed then those of Lentills and whitish underneath, from the toppes of these stalkes rise up other slender stalkes, naked without leaves unto the toppes, where there grow many small flowers in manner of a spike, of a pale reddish colour with some blewnesse among them, after which rise up in their places, round, rough and somewhat flat heads: the root is tough &

Minor. yet liveth and ſhooteth a new every yeare. Of this ſort *Bauhinus* ſetteth forth a leſſer differing not from the former, but in the ſmallneſſe thereof.

2. *Onobrychis ſpicata flore purpureo.* Spiked Cockes-head with purple flowers.

This Cockes-head hath ſuch like weake ſtalkes lying or leaning to the ground, whereon grow winged leaves very like the former, but hairy or hoary: from the joynts riſe other branches with the like leaves on them, and above them riſe up the flowers in a longer ſpike or tuft at the toppe of a naked ſtalke, like in forme unto the other, but of an excellent ſhining purple colour, with many ſmall leaves ſet among them, which turne into ſhort, blacke, and hard heads parted in the middle: the roote liveth as the former.

3. *Onobrychis floribus cæruleis.* Blew flowred Cockes-head.

This third Cockes-head riſeth ſomewhat higher than the former, the leaves are ſmaller and ſhorter pointed: the flowers are fewer, and of a pale blew, and in ſome of a blewiſh purple colour, and beare afterwards ſlender long cods foulded double, wherein lie ſmall blacke ſeede, like unto thoſe of *Medica*.

4 *Onobrychis foliis Vicia longioribus.* Cockes-head with long Fetch leaves.

This Fitchling hath longer and narrower leaves ſomewhat woolly or hoary, and more ſtore ſet on each ſide of the middle ribbe; the flowers ſtand in a large ſpiked head, being more long than others, and ſomewhat reſembling the flowers of three leaved graſſe, of a pale colour, with darke veines in them: the cods that follow are folded like the laſt, but the ſeede which is blacke is cornered or ſquare like Fenegreeke: the roote is wooddy and living.

5. *Onobrychis quarta Cluſij.* Mountaine Cockes-head.

This fift ſort hath likewiſe many winged leaves growing from the ſtalkes, but ſmaller than the reſt, and both ſtalkes and leaves though greene, yet covered with an hoarineſſe: the flowers grow at the tops of bare ſtalkes, as the others doe, but fewer in number, and of a purpliſh blew colour: the cods are long and foulded like the two laſt: the roote is great, thicke and long.

6. *Onobrychis globoſo capite.* Round hēaded Cocks-head.

This ſtrange Cockes-head which *Cluſius* ſaith, hee firſt ſaw in Mr. *Riches* Garden, Queene *Elizabeths* Apothecarie in his time, was very like the laſt, for the ſmallneſſe and hoarineſſe of ſtalkes and leaves, yet the ſtalkes were longer, tough and blackiſh, which lay bare on the ground before it had leaves, and then branched it ſelfe, ſhooting forth at the toppes ſhort ſtalkes an inch long, bearing at the toppes a round head of many flowers ſet together, of a whitiſh colour, ſomewhat like unto thoſe of *Tragacantha*, Goates thorne; after which followed ſmall cods, not bigger than thoſe of *Orobus*, containing one ſeede within, each like Fenugreecke.

7. *Onobrychis clypeata aſpera minor.* The leſſer buckler Fetchling.

The greater ſort hereof is ſet forth in my former Booke, under the title of *Hedyſarum clypeatum*, The red Sattin

1. *Onobrychis vulgaris.*
The ordinary Cockes-head.

2. 5. *Onobrychis ſpicata flore purpureo & quarta Cluſij.*
Spiked Cockes-head with purple flowers, and mountaine Cockes-head.

flowers

3. *Onobrychis floribus cæruleis.*
Blew flowred Cockes head.

9. *Onobrychis minima.*
The leaſt Cockes-head.

flower: but this leſſer groweth very low, not above an hand breadth high; the leaves likewiſe are ſmall and narrow, the flowers are ſmall, and of an excellent crimſon colour, the ſeede veſſells that follow are flat and rough, containing ſmall ſeede within them, the roote is thicke and threaddy.

8. *Onobrychis clypeata levis.*
Small buckler Fetchling

This ſmooth Fetchling riſeth up but with one ſtalke, or two at the moſt a foote high, ſet with joynts, where ſtand winged leaves, conſiſting of many ſmooth long leaves, and an odde one at the end: from the joynts of the leaves, ſpring up ſmall and long ſtalkes, whereon the flowers ſtand in a ſpike faſhion, of a blewiſh purple colour, and have afterwards flat and ſmooth huskes buckler faſhion, three for the moſt part ſtanding one above another, with ſmall ſeede within them.

9. *Onobrychis minima.* The leaſt Cockes-head.

This ſmall plant, *Pena* ſaith, be found on the hills of *Provence*, with a ſmall roote downeward, but thicke at the head, and a thicke barke, having many hairy ſtalkes, two or three inches long, with ſmall leaves on them like unto Lentills or *Aſtragalus*, hoary, hard, and bare towards the toppes, and many ſmall pale yellowiſh white flowers ſet together in a tuft of a drying taſte, like Birds foote. *Lobel* in *Adverſaria* calleth it *Aſtragalus perſimilis palmaris puſilla planta.*

The Place and *Time.*

The firſt groweth under hedges, and ſometimes in the open fields, in divers places of our Land, but all the reſt are ſtrangers and kept in Gardens with us, by them onely that are curious conſervers of rare plants: and flower from the end of *Iune* to the end of *Auguſt*, and the ſeede ripeneth in the meane time.

The Names.

It is generally taken now adayes by all thoſe that are judicious Herbariſts to be the Ὀνόβρυχις *Onobrychis* of *Dioſcorides*, and *Caput gallinaceum* in Latine: the firſt is called *Onobrychis* by *Dodonæus*, *Cluſius*, *Thalius*, and many others, *Geſner in hortis* calleth it *Glaux ſive Onobrychis*, *Lobel Caput gallinaceum Belgarum*, *Lugdunenſis* ſaith it was called *Polygala* by many, the leſſer hereof is called by *Bauhinus in Prodromo Caput gallinaceum minus*: the ſecond here is the firſt *Onobrychis Pannonica* with *Cluſius*, which *Pona* in the deſcription of *Mount Baldus* calleth *Cicer Aſtragaloides*: the third is the ſecond with him: the fourth is his third: the fift is his fourth *Onobrychis*, and the ſixt his fift: the ſeventh is, as I ſaid before. The leſſer ſort of that *Hedyſarum clypeatum* of *Lobel*, that I have ſet forth in my former Booke, being generally ſo called now adayes with moſt; and which *Dodonæus* calleth *Onobrychis altera*; and *Camerarius Securidaca clypeata*; but *Bauhinus* calleth it *Onobrychis clypeata aſperat minor*, as he doth the next, *Onobrychis clypeata levis*: the laſt is called by *Lobel*, as I ſaid, *Aſtragalo planta perſimilis.* The *Italians* callit *Upuparia di Maghi*: the *French Saint foin*: and we in *Engliſh* Cockes-head or Medicke Fetchling.

The Vertues.

Galen ſaith hereof that it hath a power to rarefie and digeſt, and therefore the greene leaves bruiſed and laid as a plaiſter diſperſeth knots, nodes, or kernells in the fleſh, and if when it is drie it be taken in wine; it helpeth the ſtrangury, and being anointed with oyle it provoketh ſweate. *Dioſcorides* and *Pliny* ſaith, the ſame things, and therefore neede not be repeated: it is knowne generally to bē a ſingular foode for cattle to cauſe them to give ſtore of milke.

CHAP.

CHAP. XX.

Aſtragalus. The milke Vetch.

THE knowledge of the true *Aſtragalus* hath troubled moſt of our moderne Writers, many of them having ſet forth divers plants for it, which others have miſliked, and therefore in ſuch a confuſion it is hard to determine of any certaintie, yet the moſt likely I will endeavour to ſhew you here.

1. *Aſtragalus Baticus Cluſij.* The *Spaniſh* milke Vetch of *Cluſius.*

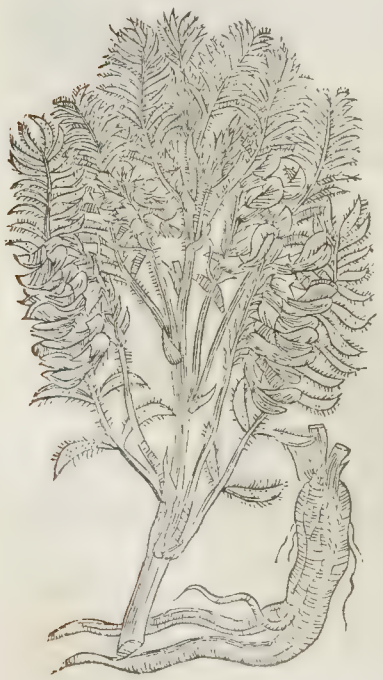
This *Spaniſh* plant hath ſundry ſtalkes afoote high, of the bigneſſe of ones little finger being five cornered or creſted all the lengh of them, hard, ſomewhat reddiſh and hoairy with all: the leaves are woolly or hoary many ſet oneach ſide of a middle ribbe, of an aſtringent taſte at the firſt, and afterwards hot; the flowers ſtand at the tops of long footeſtalkes that ſhoot out from the joynts, and grow into a very long ſpike of large flowers, each as large as of the Beane or *Lupine*, wholly, of a white colour when they are blowne open, but of a browniſh yellow being in the bud: after they are paſt, there follow full ſwollen long cods, of two inches and a halfe long, and one thicke like unto thoſe of the wilde Peaſe, which being ſhaked when they are drie, the round ſeede in them will make a noiſe, and being taſted doe inflame the mouth and tongue mightily: the roote for the ſmallneſſe of the plant is very great, about the length of ones hand, of the thickne of ones arme, and thence branching forth into ſundry other ſmaller ones, rugged and blacke one the out ſide, and whitiſh within hard and wooddy, which when it is drie is harder than an horne.

2. *Aſtragalus marinus Baticus.* The Sea *Spaniſh* milke Vetch.

This Sea *Spaniſh* milke Vetch (which *Boelius* brought me, with very many other things at my charge out of *Spaine*) groweth often upright, and ſometimes leaning downe with one or two round reddiſh ſtalkes, a little hary, ſet with ſundry winged leaves on both ſides of the ſtalkes, one above another, conſiſting of tenne or a dozen ſmall freſh greene leaves, ſomewhat like to thoſe of the leſſer Sicklewort, from betweene the ſtalke & the leaves, and at the toppes of them alſo come forth branches of the like leaves in ſome places, and at others many ſmall pale coloured flowers, which turne into ſo many three ſquare cleare skinned whitiſh cods, the inner edge being thinner, and a little bowing, the other two forming, as it were a backe, dividing it ſelfe into two parts, with divers ſmall hard yellowiſh ſeede within them, almoſt like Fenugreeke ſeede: the roote is ſmall, long, and divided, periſhing yearely with us. I had from *Boelius*, above named, another ſort hereof which he named *Aſtragalus marinus Bæticus ſupinus*, but what other chiefe difference it had from the other, but the leaning to the ground-ward, I know not, for the plant dying with me that roſe from the ſeede, I could not ſo exactly obſerve the varietie, and ſince then could never get of the ſame ſeede againe.

Altera ſupinus.

1. *Aſtragalus Baticus Cluſij.*
The *Spaniſh* milke Vetch of *Cluſius.*



23. *Aſtragalus marinus Baticus.*
Spaniſh Sea milke Vetch.

3. *Aſtra-*

3. *Astragalus Syriacus.*
The milke Vetch of *Syria.*

5. *Astragalus Alpinus claviculatus magno flore.*
Great flowred mountaine milke Vetch.

3. *Astragalus Syriacus.*
Milke Vetch of *Syria.*

The *Syrian* milke Vetch hath such like weake stalkes lying on the ground, or not rising much above it, and winged leaves also, but smaller and shorter: the flowers are larger, and growing into a thicker bush, of an excellent red colour very beautifull, the roote is great and thicke, spreding about.

4. *Astragalus Alpinus.*
Mountaine Milke Vetch.

This hath from a single roote divers slender stalkes sometimes standing upright, and other whiles leaning downe; the leaves are longer, but more sparingly set on the middle ribbe than the Cicers, and not dented at all about the edges, but very neare resembling those of the first wood *Orobus*: the flowers are like to the Vetch or Cicer, of a blewish purple colour: after which come long pods like to Vetches: the roote is tuberous or knobby, blacke and hard, with other such like smaller peeces growing unto it, fastened by long strings, this differeth much from the *Chamæbalanus* or *Terra glandes*, which is accounted by *Columna*, for the true *Arachidna* of *Theophrastus*.

7. *Astragalus purpureus montanus.* The purple mountaine Milke Vetch.

5. *Astragalus Alpinus Claviculatus magno flore.* Great flowred mountaine mike Vetch.

This hath a long thicke, blacke, woddy roote two foote long, with some fibres thereat, divided above into thicke scaly heads, from whence rise sundry long winged small leaves lying on the ground, like unto those of Lentills: the flowers are large and grow many together at the toppes of naked stalkes, of a yellow colour, saith *Lugdunenses* of his, but *Baubinus* saith, that that which grew with him (if it were the same) was of a purple colour; after whom follow small, long, blacke pods, with a small twining thread at the end like a claspers.

6. *Astragalus*

8. *Aſtragaloides herbariorum.*
Baſe Milke Vetch.

9. *Aſtragaloides Helvetia.*
Germane baſe Milke Vetch.

6. *Aſtragalus purpureo cæruleus Hiſpanicus.*
Purple *Spaniſh* Milke Vetch.

The *Spaniards*, ſaith *Cluſius*, held another plant to bē *Aſtragalus* which anſwered thereto in the faculties, but differing in the forme of the roote, it had many ſhort and hard hoarie ſtalkes growing neare the ground, with ſmall winged leaves like unto Cicers or Lentills, all hoary likewiſe, and of an aſtringent taſte: the flowers are ſmall, growing in thicke tufted heads, of a blewiſh purple colour: the roote, ſaith *Cluſius* is uſually but ſingle, and no way agreeing with the roote of *Aſtragalus*.

7. *Aſtragalus purpureus mountanus.*
The purple mountaine milke Vetch.

This milke Vetch hath a great long wooddy roote, with ſome fibres ſet thereat, blackiſh without, and white within, from whence riſe many hard ſtalkes, ſome lying as it were upon the ground, and others ſtanding upright about halfe a foote high, the winged leaves that grow thereon are many, ſmall and hoary, ſtill keeping an equall number, upon every foote ſtalke, ſomewhat reſembling the *Aſtragalus Syriacus* but longer, the ſtalkes are naked or bare of leaves from the middle upward, ſaving a few, that under the tuft of flowers at the toppes are round, and are like unto other Pulſes, of an excellent purple colour, and the ſeede follow in ſmall cods: it flowreth in *May* and *Iune* on the high hills of *Sevena*, but moſt plentifully neere a ſmall towne called *Mernes* in the grove of wood next unto it, *in horto dei*, and the hills neereſt thereto about *Mompelier*: it is utterly without any ſharpe taſte, and but onely a little ſaltiſh that can be felt.

8. *Aſtragaloides herbarcorum.* Baſe milke Vetch.

The baſe milke Vetch riſeth up with ſundry upright hard creſted ſtalkes, a yard high ſet on all ſides with winged leaves foure or five couple againſt the middle ribbe, with an odde one at the end, of a very ſad greene colour, no bigger than thoſe of the Lentills: the flowers ſtand at the toppes of the ſtalkes and branches many ſet together which are ſmall and ſhort, of a dead purpliſh colour turning wanne with ſtanding, and change into ſmall blacke cods almoſt round; but pointed, within which are foure or five ſmall blackiſh ſeede: the roote groweth great and thicke at the head, tough and wooddy, diſcending deepe, and abiding many yeares, but all the ſtalkes periſh every yeare, freſh riſing in the Spring.

9. *Aſtragaloides Helvetie. Germane* baſe milke Vetch.

The ſlender ſtalkes of this plant, that beare many Peaſe bloſſom'd flowers at the toppes of them, are not much above three inches high without any leaves upon them; the leaves themſelves ſtanding ſingly upon long foote ſtalkes, being ſomewhat long, broad, and round pointed, as the figure doth plainely delineate forth.

The Place and *Time.*

None of theſe grow wilde in our Land, that ever I could underſtand, but are nurſed up with thoſe that are curious lover of rare plants: they flower in *July*, and their ſeede is ripe in *Auguſt* or *September*.

The Names.

It is called ἀστράγαλος in Greeke, and *Aſtragalus* in Latine: the firſt is called by *Cluſius Aſtragalus Bæticus*, and by *Lobel* and others *Aſtragalus Luſitanicus Cluſij*, by *Bellus* that ſent it out of *Candy* to *Cluſius*, as it is ſet downe in his fift Epiſtle *Phaſeoli novum genus*, as *Cluſius* in his *Scolea* under it thinketh, which I can not fully evince, not having ſeene either of them (if they be divers as I thinke they be) growing: but *Bellus* there relateth that the ſeede was flat like unto a Kidney Beane, and that the Marriners did eate them while they were greene; and *Cluſius* ſaith of his that the cods are long, and the ſeede round within them, burning and enflaming the mouth, for which cauſe it is probable that *Amatus Luſitanus* called it *Apocynum*: & the *Spaniards Atramoſos de can*, as being fit to kill dogs; ſo that theſe contrarieties doe rather argue them to be divers plants: the ſecond was brought me out of *Spaine* by *Boel*, by the name expreſſed in the title, but came to us alſo from *Leyden*, by the name of *Aſtragalus marinus Pauwij*, either becauſe *Pauwius* the Preſident of the Garden there had it from *Boel*, or from *Spaine*, where *Beel* gathered

gathered it :& is alſo very likely to be the plant, that *Bauhinus* in his *Prodromus* calleth *Glanci Leguminoſæ affinis* being ſent him from *Verona* by *Pona* who called it *Aracus Bæticus*, as by comparing may be ſeene. And likewiſe as I thinke is the *Vicia Seſamacea Apula* of *Columna*: the third is called by *Lobel Aſtragalus Syriacus*, and may be that of *Anguilara* and *Cæſalpinus*, and very probable alſo to be that *Aſtragalus Dioſcoridis* that *Rauwolfius* found in *Syria*,as it is ſet forth by *Lugdunenſis*,and is as he ſaith called *Chriſtiana radix* by the *Germanes*: the fourth is the ſecond *Aſtragalus* of *Cluſius* and called alſo *Alpinus*, which *Pona* calleth *Cicer Aſtragaloides*: *Bauhinus* alſo ſaith it is the *Polygala* of *Camerarius* in his Epitome, but ſurely his figure doth truly expreſſe the *Glaux vulgaris*: the fift is taken by *Bauhinus* to be the *Anthyllis claviculata* of *Lugdunenſis*, and calleth it *Aſtragalus Alpinus magno flore* I adde *claviculata* thereto: the ſixt is the third *Aſtragalus* of *Cluſius*,which ſome as he ſaith called *Onobrychis*, but untruly,and grew for ſome time with him in the Low countries or *Belgia*,with the *Aſtragalus Monſpelienſium* (which we uſually call *Hedyſarum minus*) but periſhed before his going out of the country, and therefore (I beleeve *Cluſius* his judgement herein) could not be the ſame, although ſomewhat like as *Bauhinus* thinketh, nor is it the *Aſtragalus purpureus* of *Lugdunenſis* as *Bauhinus* alſo thought, for that is my ſeventh here ſet downe, *Cluſius* ſaith the *Spaniards* called it *Yerva di Santo Lorenzo*: the eight is the ſecond *Orobus Pannonicus* of *Cluſius*, called by *Dodoneus Aſtragaloides*, and by *Lobel Aſtragaloides altera herbariorum*, but *Bauhinus* not onely maketh it his ſixt *Orobus*, but calleth it alſo *Polygala major Maſſiliotica*, and beſides referreth it to the *Polygala* of *Matthiolus*,which formerly he had called *Aſtragalus*, as alſo to the *Polygala Valentina Cluſii*,but ſurely *Cluſius* would not be ſo variable(as *Bauhinus* ſheweth himſelfe in many places) to call one herbe both *Polygala* and *Orobus*: the ninth is not mentioned by any before: the laſt *Lobel* ſo called as is in the title: but *Bauhinus* maketh it to bee like a kind of *Ferrum aquinum* and calleth it *Ferro equino Gallico affinis*.

The Vertues.

The true *Aſtragalus* is as *Dioſcorides* and *Galen* ſay aſtringent, and that the roote taken in wine ſtayeth the laskē and doth alſo provoke urine, it dryeth and cloſeth up old Vlcers if the powder bee ſtrewed or caſt into them, it doth alſo ſtay bleeding. *Pliny* addeth that it is very profitably uſed againſt the fouleneſſe of the gummes. But *Cluſius* ſaith that the *Portugalls* doe familiarly uſe the ſixt ſort here ſet forth,being firſt dryed in an Oven and powdered,to caſt it into wounds and Vlcers.

CHAP. XXI.

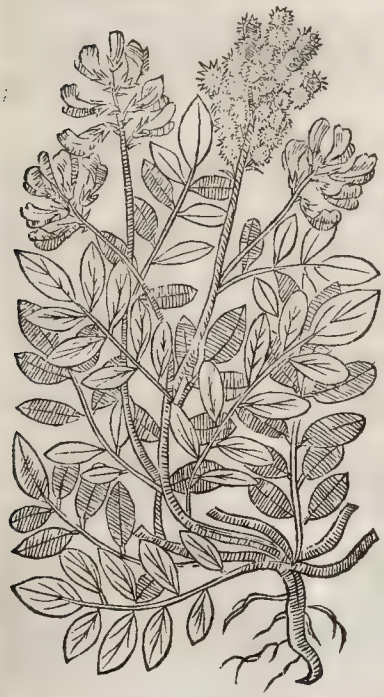
Hedyſarum ſive Securidaca. Hatchet Vetch.

THe ancient writers exhibited but one ſort hereof which is the greater, our later have added divers more as ſhall be declared: that which is uſually called *Hedyſarum clypeatum* I have deſcribed in my former Booke, yet I thought good to give you the figure of it here.

1. *Hedyſarum majus ſive Securidaca vera major.* The greater Hatchet Vetch.

The greater Hatchet Vetch (which is the trueſt the reſt being but ſuppoſed from the likeneſſe) groweth not a-

Hedyſarum clypeatum vulgare.
French Honyſuckle.



1. *Hedyſarum majus ſive Securidaca major vera.*
The greater Hatchet Vetch or Sicklewort.

boye

bove a foote high, with divers winged leaves growing on the ſtalkes, which are weake and not ſtanding upright, each of the leaves is ſmall not very long and round at the end, at the toppe ſtand many ſmall yellow flowers (*Matthiolus* ſaith reddiſh but I thinke he was therein miſtaken as he was alſo in the pods to ſay the ends were blunt) which turne into ſo many long flat thin cods and reddiſh, with a ſmall crooked point: the ſeede is flat and reddiſh within them, ſo lying in them that they may be diſcerned in the cod where they lye, but not like an Hatchet as many have ſet it downe, thinking it therein to agree with *Dioſcorides* his diſcription, for he doth compare the whole cod and not the ſeede thereunto: the root is ſmall and periſheth yearely.

2. *Hedyſarum minus ſive Securidaca minor.*
The leſſer Hatchet Vetch or Sikle-wort.

The leſſer Hatchet Vetch is like unto the former but ſomewhat leſſer, yet not much lower if it grow in any good ground, the flowers grow many together of a pale yellow colour, and after them come ſmall crooked cods bowed as it were almoſt together, wherein lie pale browne ſeedes not fully round but ſquare and leſſer, the roote hereof likewiſe periſheth yearely with us.

2. *Hedyſarum minus.*
The leſſer Hatchet Vetch or Sicklewort.

3. *Securidaca major articulata.*
The greater joynted Hatchet Vetch.

This Plant groweth greater and higher then the two former, and ſo are the winged leaves more in number and ſomewhat larger: from the joynts riſe long ſtalkes with a great many flowers at the toppes of them, ſmelling ſomewhat ſtrong, of bluſh and white mixed together, after which follow long round and not flat cods, a little hooked with divers joynts as it were, or bunched places like the true *Orobus*, wherein lye red ſeede ſomewhat long: the roote creepeth farre abroad and periſheth not.

4. *Securidaca articulata minor.* The leſſer joynted Hatchet Vetch.

This leſſer is like the former, but lower and leſſer in ſtalkes, and fewer alſo in leaves upon the middle rib; the flowers alſo are ſmaller, but as many or more growing together at the toppes of the ſtalkes that riſe from the joynts of the leaves, and are of a pale red or bluſh colour, in their places grow ſmall round heads with crooked toppes much reſembling a Billhooke, ſuch as labouring countrey men doe uſe to cut their hedges withall; wherein lyeth but one ſeede as having but one bunch: the roote is hard and woody ſpreading under ground and endureth long.

5. *Securidaca peregrina Cluſii.* Strange Hetchet Vetch.

This ſtranger groweth lower then any of the former being not a foote high with divers winged ſmall branches, bearing ſome ſuch like leaves on them but ſmaller, and at the toppe ſundry ſmall whitiſh flowers, and after them long broad thin and flat cods waved in on both edges, wherein lye divers flat browne ſeedes: the roote is ſmall and ſtringy periſhing yearely.

6. *Securidaca minima.* The leaſt Hatchet Vetch.

This leaſt ſort hath ſtalkes a foote long ſpread on the ground, having divers leaves ſet on a ſtalke, but the end hath alwayes three ſtanding together, it hath many flowers on a ſtalke: the ſeede is reddiſh and biforked, lying in very ſmall hooked ſhort cods ſtriped overthwart, this groweth by *Mompelier*.

7. *Hedyſarum argenteum Creticum.* White Hatchet Vetch of *Candy*.

This *Candiot* riſeth up with a ſlender ſtalke, branching forth on all ſides and winged ſtalkes of leaves thereon, ſomewhat like to thoſe of the Ciche Peaſe: the flowers grow at the toppes many on a buſh or round tuft together, neare reſembling thoſe of the medow Trefoile, of a white ſilver like colour of a reaſonable good ſent, after the flowers are paſt there ſucceede in their places ſmall ſlender cods, wherein are conteined the ſeede which is ſmall and round: the roote conſiſteth of many ſtrings and fibres which abideth many yeares: and holding greene leaves all the Winter.

8. *Sophera ſive Egyptiaca vitioſa.* The dangerous Hatchet Vetch of *Egypt*.

Honorius Bellus in his fourth Epiſtle to *Cluſius* which is ſet at the end of his *rariorum plantarū hiſtoria*, ſaith that *Alpinus* hath erred in ſetting forth the Figure of this plant (which yet in want of a better I am faine to uſe) in that the leaves on every ſtalke are even without any odde one at the end, and that the pods do grow upright and do not hang downe: It is, ſaith he, a goodly ſhrubby plant, riſing two or three cubits high, ſpreading ſundry branches of winged leaves ſet one againſt another, and cloſing themſelves every night, opening with every mornings Sunne: the flowers are yellow and the pods long and ſlender ſtanding upright and of a fingers length: the roote is wooddy, divers wayes diſperſed under ground but abideth with greene leaves all the Winter, and abideth long with the flowers thereon.

One very like hereunto we have received from *Virginia*, by the name of *Lentills* of *Virginia*, but that this hath at every joynt with the leaves a ſmall harmeleſſe pricke, which quickly falleth away from the lower and elder parts, abiding onely a while on the upper and more tender ſtalkes.

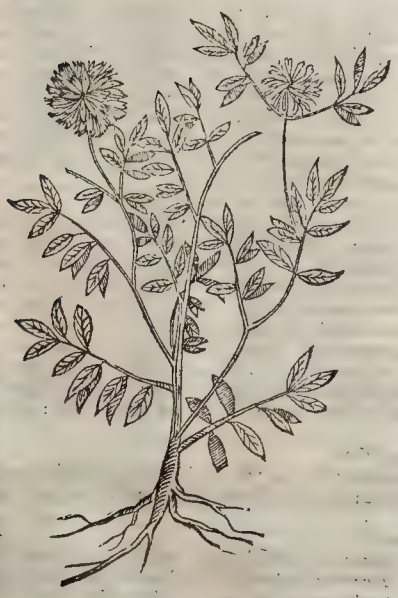
9. *Seſban ſive Securidaca Egyptiaca articulata.* Hatchet Vetch of *Egypt* with long joynted cods.

This kinde of Pulſe groweth ſomewhat like a ſhrubbe in the hotter countries, with ſundry hard and wooddy ſlender

3. 4. *Securidaca articulata major & minor.*
The greater and lesser joynted Hatchet Vetch.

5. *Securidaca peregrina Clusij.* Strange Hatchet Vetch.

7. *Hedysarum argenteum Creticum.*
White Hatchet Vetch of *Candy.*



8. *Sephera sive Securidaca Egyptiaca vitiosa.*
The dangerous Vetch of *Egypt.*

9. *Sesban sive Securidaca Egyptiaca articulata.*
Hatchet Vetch of Egypt with long joynted cods.

10. *Hedysarum triphyllum Americanum.*
Americas Trefoile Hatchet Vetch.

slender stalkes, and many long stalkes of winged leaves like unto a *Securidaca*, yet each of them somewhat longer and narrower: the flowers come forth from the bosome of the stalkes and leaves many clustering together in a long spike of a deepe yellow colour, and succeeded by long joynted cods, conteining many Fennugricke-like seedes therein: the roote spreadeth well under ground, and abides many yeares. This is that Plant which *Clusius* compared his *Anil* unto: or rather was mistaken, the title *Anil* being imposed for *Sesban*; but assuredly by the sight of the true seede of *Anil* received from the *East Indies* so like unto Fennugrick seede, and the growing there-of so like unto this *Sesban* with many winged leaves, compared by *Camerarus* unto those of *Barba Jovis frutex*. and to those of *Sena* by Mr. *Finch*, as it is before set downe where I spake of *Indico*, which is *Nil* or *Anil* of the *Arabians*, this *Sesban* being either a *species* of that *Nil Anil* or *Indico*, or that a *species* of this.

10. *Hedysarum tryphyllum Americanum.* *Americas* Trefoile Hatchet Vetch.

This kinde of Vetch groweth higher in shadowy then in sunny places, with many stalkes a foote or two high, and leaves set thereon, three usually at a place, which are larger then those of *Trifolium bituminosum* and of a reddish greene colour: at the toppes stand the flowers in a long spike, like, but much larger then the flowers of the ordinary Hatchet Vetch, whose uppermost leaves are much redder then the edges and ridges which are pale red, after which come rough crooked pods with reddish veines both above and below, set as it were with joynts, having small seede within them like those of Broome: the roote is a bush of blackish threads or fibres, this hath no scent to commend it, and dyeth downe every Winter rising anew in the Spring: the taste of the greene plant is not so easily perceived to bee hot and dry in the first degree as it is in the dry, having a little purging qualitie therein: for if an ounce of the dryed leaves bee put into a purging decoction it furthereth the purging propertie, causing not onely thinne and whayish humors to be avoided, but those that are tough and clammy also: it doth much helpe likewise to digest cold humors.

The Place and *Time.*

None of these doe grow naturally but onely in curious Gardens with us, yet the third and fourth had neede to be set in some out corner where their running rootes may doe no injury to better herbes, and flower and seede in *July* and *August*.

The Names.

It is called in Greeke ἡδύσαρον *Hedysarum*, and πλέκτον *pelecinum* as *Dioscorides* saith, and in Latine *Securidaca*, for πέλεκυς signifieth *securis* and from thence the name rose, *Turnebus* thinketh it should rather be read *Securiclata*. The first is generally of all writers held to be the true *Hedysarum* of *Dioscorides*, for in his time there were no more knowne, and *Clusius* saith that hee saw Hatchets at *Madrill* in *Spaine* made after the fashion of those cods, that is, thick in the middle where the handle was put in, and thin at both edges: the second also is of all called *Hedysarum minus*, or *Securidaca minor*, yet *Clusius* as I shewed you in the former Chapter giveth the figure hereof for

for his, and calleth it *Astragalus Mompelliacus*: the third *Clusius* referreth to the greater kind, yet differing in the fashion of the cods, and because it is greater then the fourth I have given it the title of greater, it somewhat resembleth the greater *Ornithopodium* of *Dodonæus*, *Camerarius* calleth it *Hedysarum Scorpiurum*, and as *Bauhinus* thinketh it is not much unlike the *Lotus enneaphyllos* of *Dalechampius*: the fourth *Clusius* saith hee had from Dr. *Penny* a Physition of our *London* Colledge, who gathered it neare unto *Geneva* and imparted it to him, thinking it to be the true *Hedysarum* of *Dioscorides*, *Bauhinus* nameth it *Securidaca dumetorum minor pallide cærulea*, when as the flower is blush and not blew: the fift *Clusius* set forth having received it from *Cortusius* by the name of *Scolopendria leguminosa*, *Hedysarum peregrinum* which last title hee kept as fittest, and I have perfited the defect in his description, for if in my former dayes I had thought to have published the fruits of my Garden, I had then beene more curious to have taken the descriptions of a number of Plants, which have perished with me and now I want: the sixt is called *Hedysarum minimum* by *Lugdunensis*: the seventh is mentioned by *Alpinus lib. de exoticis*: the eighth and ninth by him *lib. de plantis Ægypti*: the last is mentioned by *Cornutus* among his *Canada* plants by the name here expressed, onely the eighth and ninth I have rather referred to the *Securidacas* then to the *Galegas* as *Bauhinus* doth, although I acknowledge that not they onely but divers others of them here set downe, and entituled *Hedysarum* or *Securidaca* have little conformitie in their pod or seede unto a *Securis* or Hatchet but more unto a Vetch. It is called in *English* Hatchet Vetch, Axe seede and Axewort.

The Vertues.

All the sorts of *Hedysara* especially the seedes are bitter, and thereby as *Dioscorides* saith of the true or first sort, that it is profitable to the stomacke, and is put into those medicines that expell poyson or venome, and purgeth the obstructions of the intralls and so doe the leaves and stalkes of the greene herbe, *Matthiolus* saith the seedes of both sorts helpe the bitings of venemous creatures, and that they helpe to expectorate both tough and thinne flegme, being taken with a little hony or new wine, and openeth the obstructions of the Liver and Spleene being boyled and drunke, it killeth likewise the wormes in the belly if it be taken with some sweete lye, or in wine with a little Saffron put thereto: the meale of them cleanseth foule Vlcers, and taketh away freckles, spots and the like markes in the skinne. if the said meale bee made up into an ointment with the best hony and often annointed. *Alpinus* saith that the seedes of *Sophera* or the eight were accounted poysonous to men and that the seede of the *Sesban* or ninth were used by the *Egyptians* to strengthen and dry up the over moisture of the stomacke, as also to binde any laske and womens immoderate courses: the *Egyptians* hee saith doe plant hedges herewith to defend their grounds.

CHAP. XXII.

Ferrum equinum, Horse shooe Vetch.

THere are a few small plants that some have referred to those in the foregoing Chapter but for their formes sake being different, I thought good to sever them and set them by themselves.

1. *Ferrum equinum majus.* The greater Horse shooe Vetch.

The greater Horse shooe Vetch hath divers small winged leaves set on small weake stalkes not a foote high, leaning or rather lying on the ground, each leafe being a little long and almost round at the end, and of a whitish greene colour: at the joynts with the leaves come forth flowers single, that is one at a place on every short footstalke, being small and yellow, after which followeth a long flat cod a little bowed but parted at the inner edge into foure, five or six divisions, each being cut in round, somewhat like the Letter C. or as it tooke the name formed like an Horse shooe, wherein lye so many seedes as there are spaces betweene the cuts or divisions, which are small, somewhat long and crooked: the roote is slender, three or foure inches long, white and hard, and liveth divers yeares.

1. *Ferrum equinum majus.*
The greater Horse shooe Vetch.

2. *Ferrum equinum minus.*
The smaller Horse shooe Vetch.

This other is in all things like the former, but lesser by the halfe, the stalkes being not above three or foure inches long and lying close upon the ground, and is a little whiter then the last.

3. *Ferrum equinum polyceraton.*
Many codded Horse shooe Vetch.

This also differeth little in the growing from the last, being almost as small, but herein chiefely consisteth the difference betweene them, that this beareth foure or five flowers and so many cods also together upon a long stalke rising from the joynts, which are a little browner then the former.

4. *Ferrum equinum comosum.*
Bush headed Horse shooe Vetch.

The bush headed Horse shooe Vetch groweth as great as the

first both in ſtalkes and leaves, and full of branches: from the toppes of the ſtalkes and branches onely, and not from the joynts with the leaves as in the former, come long naked ſtalkes almoſt halfe a foote long, bearing and hanging downe about their toppes a buſh of flowers, of a yellowiſh greene at the firſt & of a deeper yellow colour after, with ſome greene veines in them: after they are paſt there follow ſuch crooked and mooned cods as the other, but not very deepely cut in, wherein lye ſeedes like the other, the roote hereof is ſomewhat blackiſh, but as hard and great as the firſt.

2, 3, 4. *Ferri equini diverſæ ſpecies.* Divers ſorts of Horſe ſhooe Vetches.

5. *Ferrum equinum Gallicum.*
The *French* Horſe ſhooe Vetch.

This hath a ſmall ſhort blacke thready roote and diuers weake ſtalkes lying on the ground, with nine leaves uſually ſet together on a footſtalke: the flowers are yellow many growing at the head, which give ſmall ſeede in ſmall crooked hornes.

The Place and Time.

The firſt and ſecond are naturall to our owne Land, being often found upon dry heaths as beyond *Detford* and *Swanes combe* in *Kent* and ſundry other places, the other three in *Italy*, *France*, *&c.* flowring in *Iune* and ſeeding in *Iuly* and *Auguſt*.

The Names.

It hath no Greeke author to ſpeake for it, but being of later invention it is generally called *Ferrum equinum*, after the manner or forme of the cods, in *Italian Sferro cavallo*, and of the Chimicks there and in *Germany*, *Lunaria ſiliquata*, *Matthiolus* calleth the firſt *Securidaca montana* as well as *Ferrum equinum*, *Geſner in hortis* tooke it to be a kinde of *Medica*. *Lugdunenſis* calleth it *Solea equina* and *Tabermontanus Hedyſarum ſive Ferrum equinum*: the ſecond as a leſſer ſort thereof hath his name in his title, *Fabius Columna* calleth the third *Ferrum equinum polyceration*, and the fourth *Ferrum equinum Comoſum* or *Capitatum*, which *Bauhinus* calleth *Ferrum equinum Gallicum*, and as he ſaith is the *Lotus enneaphyllos* of *Dalechampius*, differing but in the ſmallneſſe from the *Germanicum* of *Camerarius*.

The Vertues.

It is wholly bitter as the Hatchet Vetch is, and therefore ſomewhat partaketh of the properties thereof: it is alſo uſed by ſome in wound drinkes, and the juice thereof to make ſalves for wounds.

1. *Ornithopodium majus.* The greater Birds foot.

CHAP. XXIII.

Ornithopodium. Birdes foote.

HEre are two or three ſorts of ſmall herbes called Birds foote, unto which I thinke fit to adjoyne ſome other ſmall plants comming neareſt to the former if not the nature of them in this Chapter together.

1. *Orinthopodium majus.* The greater Birds foote.

This ſmall herbe (although it bee greater then the next) groweth not above a ſpanne high, with many branches ſpread on the ground, ſet with many winges of ſmall leaves, in manner as the laſt Vetches but much ſmaller, the flowers grow upon the branches, many ſmall ones of a pale yellow colour, being ſet at a head together, which after turne into ſo many ſmall jointed cods, well reſembling the clawes of a ſmall Bird, and from thence took the name, with many ſmall round ſeeds in them.

2. *Ornithopodium minus.* The leſſer Birds foote.

2. *Orni-*

2. *Orinthopodium minus.* The leſſer Birds foote.

This is in all things like the former, but leſſe, growing with the branches and leaves in a more comely manner, and this maketh the difference.

3. *Orinthopodium nodoſa radice.* Knotted Birds foote.

This other groweth in all things like the firſt, but a little larger, the flowers are of a pale whitiſh red colour, and the cods diſtinct by joynts as the other, but a little more crooked, and the rootes doe carry many ſmall white knots or kernells among the fibres.

The Place and *Time.*

Theſe grow on Heathes and open untilled places in many places of our Land; and flower and ſeede in the end of Summer.

The Names.

They have their names of *Ornithopodium Pes avis,* according to the forme of their ſmall cods, being like unto ſmall Birds feete, as I ſaid before, and in that one groweth greater than the other, they are made two ſorts: the third *Lugdunenſis* calleth *Orinthopodium tuberoſum Dalechampij,* and ſome, as he ſaith, *Herniaria* from the Propertie.

The Vertues.

The Birds feete have a little drying and binding qualitie in them, and thereby good to be uſed in wound drinkes, as alſo to apply outwardly for the ſame purpoſe; but the laſt, as *Lugdunenſis* ſaith, is found by daily experience to breake the ſtones in the backe or kidneyes, and drive them forth, if the decoction thereof be taken: and that it wonderfully helpeth the rupture, to be uſed both inwardly and outwardly to the place.

CHAP. XXIV.

Plantæ Leguminoſæ aliæ parvæ. Some other ſmall Pulſes.

THere are yet a few other Pulſe-like Plants, which can not well be referred to any other kinde of plant, and therefore thinke fit to ſet them promiſcuouſly in a Chapter together, leaving every one to their owne judgement, unto what *genus* they will referre them.

1. *Anthyllis leguminoſa vulgaris.* The ordinary Kidney Vetch.

This ſmall plant which groweth ſcarſe a foote high, hath many leaves comming from the roote, that are ſomewhat ſmall and long, ſoft pointed and ſappy, greene on the upperſide, and woolly underneath,

1. *Anthyllis leguminoſa vulgaris.* The Ordinary Kidney Vetch.

2. *Anthyllis leguminoſa marina, Betica ſive Auricula muris Camerarij.* Sea Kidney Vetch of *Spaine* or *Candy.*

4. 3. *Anthyllis leguminosa falcata Cretica, & Vesicaria Hispanica.* Crooked Kidney Vetch of Candy, and the bladder Peaſe or Kidney Vetch of *Spaine.*

5. *Stella leguminosa.* The Starre codded Pulſe or Birds foote.

not alwayes ſet orderly juſt one againſt another, but confuſedly, the greateſt and longeſt being at the end which ſome have compared to Lentills leaves, but bigger, (which cõpariſon pleaſeth me as little as the title of *Anthylis*) among the leaves riſe ſoft ſtalkes divided into branches, with the like leaves on them, & at the tops of them a tuft of many ſmall yellowiſh pretty ſweete flowers, and ſometimes white or pale purple, which *Cluſius* ſaith he received from *Alphonſus Pancius* of *Ferrara* formed like thoſe of the meddow Trefoile ſtanding in white hoary huſks: after the flowers are paſt come in the ſaid huſkes ſmall round and a little flat ſeede, very like to the medow Trefoile, but a little redder, and uſually but one in a cod within that huſke: the roote is blackiſh on the cut ſide and white within parted many times into two or three, or more long parts.

2. *Anthyllis leguminoſo marina Bætica vel Cretica ſive Auricula muris Camerarij.*

Sea kidney Vetch of *Spaine* or *Candy.*

Having well conſidered this ſmall plant, whoſe ſeed *Boel* brought me out of *Spaine*, and called it *Anthyllis Bætica marina ſpinoſis ſiliquis*: I find it ſo neere to agree to that which *Camerarius* called *Auricula muris ſimine & leporis foliorum figura*, that I dare ſay it is the ſame: for the leaves are very like the former *Anthyllis*, both for ſite and forme, but a little hoary or woolly, and yellow flowers, within a flat round huſke, a little prickly about the edges, with kidney like ſeede within them: the roote is anuall as it is likely, for it periſhed yearely with me.

3. *Anthyllis leguminoſa veſicaria Hiſpanica.* Bladder Peaſe or Kidney Vetch of *Spaine.*

This ſmall plant groweth low and leaning downe to the ground, with a few leaves next to it, which doe ſometimes conſiſt but of three leaves, but uſually of five, the loweſt whereof are ſmaller than the end leafe that is largeſt, and is ſomewhat broad, and round pointed, and a little hairie withall: on the ſtalkes grow the like leaves, and at the joynts with them come forth three or foure ſomewhat hairy ſoft ſwelling huſkes, and at the toppes of them whitiſh flowers ſcarſe appearing, which being paſt, the ſeede groweth in thoſe huſkes that then are more ſwollen and ſeeme like bladders, wherein uſually are contained two ſmall round peaſe like to thoſe of *Orobus*: the roote is long, ſlender, and annuall. *Camerarius in horto* calleth it *Trifolium Halicacabum*, but ſaith it is rather a *Lotus*: *Proſper Alpinus* in his Booke *De Plantis exoticis*, calleth it *Trifolium veſicarium*; but *Boel* from whom I had it, *Anthyllis Bætica veſicaria.*

4. *Anthyllis falcata Cretica.* Crooked Kidney Vetch of *Candy.*

This Kidney Vetch of *Candy* hath ſundry leaves ſpread upon the ground, every one whereof is very like the longeſt or end leafe of the laſt, from among which riſe up the ſtalkes, beſet at the joynts with leſſer leaves, ſometimes but two at a place, otherwhiles three, foure, or five, ſtanding ſome places cloſe together, reſembling the Trefoile or Cinquefoile leafe, without any footeſtalke to them; and ſome alſo will have the leaves ſeparate on both ſides of the ſtalke, one above and againſt the other: the flowers ſtand three or foure together at the tops of a yellow colour, like thoſe of the horned Claver, after which come crooked cods of a skinny ſubſtance with ſmall ſeede within

6. Glanx Hiſpanica Cluſij.
Cluſius his Spaniſh Milkewort.

7. Scorpioides leguminoſa.
The Scorpion-like Pulſe.

within them: the roote conſiſteth of ſmall ſtrings and fibres: *Alpinus* calleth it *Trifolium falcatum*, but becauſe I finde both this and the laſt better to agree in face with *Anthyllis*, have therefore put them together.

5. Stella Leguminoſa. The ſtarre codded Pulſe or Birds foote.

This ſtarre faſhioned Pulſe groweth alſo about halfe a foote high with upright ſtalkes, whereon are many winged leaves ſet, conſiſting of very ſmall leaves like unto the Birds foote, from the joynts of the ſtalkes with the leaves come a tuft of ſmall pale yellow flowers at the toppes of ſmall prickly fading ſtalkes, which turne into five or ſixe ſmall, long, crooked, pointed cods, ſtanding one againſt another, like unto a ſtarre, from whence roſe the name, but not joynted as the Birds foote, having within them ſmall browniſh ſeede, of the taſte of other Pulſe, but a little clammy with all: the roote is ſmall and yellowiſh.

6. Glanx Hiſpanica Cluſij. Cluſius his *Spaniſh* Milkewort.

The *Spaniſh* Milkewort of *Cluſius* riſeth up with three or foure hoary weake ſtalkes not a foote high, whereon grow many ſoft leaves, made of many ſmall ones ſet together on both ſides of a middle rib, like as thoſe other Pulſes here before, of a greene colour above, and hoary white underneath, and a little bitter in taſte: the ſtalkes are bare towards the toppes, where they beare a ſhort ſpike of flowers ſet cloſe together, each riſing out of a hoary huske, and are of pale blewiſh purple colour, after which come ſhort round pods, with 4. or 5. ſmall round ſeedes within them; the roote is ſmall and threddy.

7. Scorpioides Leguminoſa. The Scorpion like Pulſe.

This alſo is a ſmall Pulſe with winged leaves like the laſt, but rounder: the flowers alſo are ſmall and yellow, ſtanding on long naked ſtalkes, one or two together, which turne into long and flat joynted cods, ending in a ſmall long crooked point, ſomewhat like a Scorpions taile: ſome have taken it to be a *Securidaca*.

The Place and *Time*.

The firſt is found in many places in this Land, and ſo is the fift, if I be not much deceived; the reſt are ſtrangers, their titles declaring it in moſt: they flower towards the end of Summer, and ſeede alſo.

The Names.

Theſe Plants have not beene knowne to any of the ancient Greeke or Latine Authors that we know. The firſt is diverſly named by diverſe of our moderne Writers: *Dodonæus* calleth it *Anthyllis prior*, and *Anthyllis Lentiſimilis*, *Lobel*, *Cluſius*, and others *Anthyllis leguminoſa*, by *Tabermontanus Lagopodium*, by *Thalius Arthetica Saxonum*, by *Geſner in hortis Vulneraria ruſtica* becauſe his Country husbandmen called it *Wundkraut* or *Klein Wundkraut*; and thoſe of *Berne Guichheil*, and *Bauhinus Loto affinis Vulneraria pratenſis*: the ſecond *Camerarius*, as I ſaid, called *Auricula muris*, and *Boel* that brought it us, as it is in the title, and ſo likewiſe the third, which *Camerarius*, as I ſaid, although hee called it *Trifolium Halicacabum*, as *Alpinus* did *Trifolium veſicarium*; yet judged it rather a *Lotus*: the fourth is onely mentioned by *Alpinus*, *lib de exoticis*, by the title of *Trifolium falcatum Creticum* which with the former I have rather thought fit to referre hither: the fift is called by *Lobel Stella leguminoſa*, and as *Bauhinus* thinketh the *Vicia Seſamacea* of *Columna*: but is much miſtaken therein, as I ſhewed you before in the Chapter of *Aſtragalus*: the ſixt is called by *Cluſius Glanx Hiſpanica*, and thinketh that no others ſo called, came ſo neare that of *Dioſcorides* as this: it is very likely to be the *Glanx maritima* of *Alpinus*, *lib. de exoticis*; *Dodonæus* calleth it *Anthyllis altera lentiſimilis*; *Bauhinus* maketh it to be the *Cicer ſylveſtre minus* of *Thalius* or very like it: the ſeventh is called by *Lobel* *Scorpioides leguminoſa*; but both this and the *Stella leguminoſa* are referred by *Bauhinus* to the *Orinthopodia*, calling them *Orinthipodio affines*: *Bauhinus* among the *Polygalas*, doubteth whether *Anguilara* his *Polygala* ſhould not be the *Polygala Valentina prima Cluſij*, which he ſaith hath leaves like Lentills, but fatter, a yellow flower and ſeede in pods, which I thinke more likely to be this *Scorpioides* than any kinde of *Polygala*.

The

The Vertues.

The firſt is of much uſe among the *Germans* for their wounds and hurts, inward and outward, and ſo doe both wayes apply them, whence came their name: *Thalius* alſo ſheweth by his name impoſed thereon, that it was uſed for the gout.

CHAP. XXV.

Fœnum Græcum. Fenugreeke.

THe ancient Writers made but one ſort of Fenugreeke, the latter have added ſome others unto it, and although ſome have ſet them among the Trefoiles, whereunto they are ſomewhat like, yet becauſe *Galen* and others ſay, that they were eaten as Lupines, and the *Egyptians* and others eate the ſeedes yet to this day as Pulſe or meate, and that *Bauhinus* thereupon, as I gueſſe placed them among the Pulſe, I am content to doe ſo likewiſe.

1. *Fœnum Græcum ſativum.* Manured Fenugreeke.

The tame Fenugreeke riſeth up ſometimes but with one, & ſometimes with two or three hollow greene ſtalkes, parted into divers branches, whereon grow at ſeverall ſpaces, many leaves, but three alwayes ſet together on a foote ſtalke, almoſt round at the ends, & a little dented about the ſides, greene above, and grayiſh underneath: from the joynts with the leaves come forth white flowers, and after them crooked flattiſh long hornes, ſmall pointed, with yellowiſh cornered ſeedes within them, ſmelling ſomewhat ſtrong and loathſome; the roote is made of many fibres periſhing ſtill before Winter.

2. *Fœnum græcum ſylveſtre.* Wild Fenugreeke.

This wilde Fenugreeke hath the like one or more ſtalkes branched, the leaves ſtand three together, and are ſomewhat like the former, dented about the edges, the flowers likewiſe are whitiſh, but ſtand more together at the end, and ſo doe the long cods, ſomewhat like unto them, with ſmaller and darker ſeede in them.

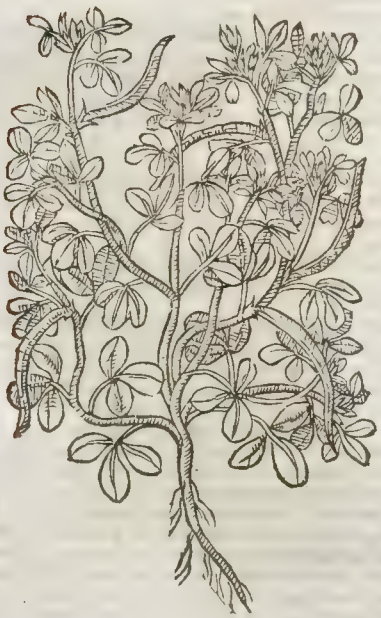
2. *Fœnum græcum alium ſylveſtre.* Another wilde Fenugreeke.

This other Fenugreeke hath but one ſlender ſtalke, ſeldome branched, of a foote high, and ſcalyas it were at the bottome, whereon grow ſuch like leaves as the former, and at the joynts flowers like unto the manured ſtanding ſingle and leſſer, but broader hornes afterwards, more flat, and ending in a ſmall thread, the ſeede within is likewiſe leſſe.

The Place and *Time.*

The firſt is manured every where that I can heare of: the others grow wilde in *Spaine* and other countries: they flower with us in the beginning of *July*, and give their ſeede in the end of *Auguſt* and *September*.

1. *Fœnum græcum ſativum.*
Manured Fenugreeke.



2. *Fœnum Græcum ſylveſtre.*
Wilde Fenugreeke.

The

The Names.

It is alled in Greeke by *Dioscorides* τήλις, and by other Greekes κέρατις and ὄρυκες, but *Theophrastus* calleth it βύκερος, *a cornu, similitudine sive sit capri vel bovis*, the crooked seede vessells being so like unto hornes; in Latine *Fœnumgræcum*, because that, as *Columna* saith, it had two times of sowing, the one before Winter to be fodder for cattle, the other in *February* for seede, and simply calleth it *Siliqua*. *Varro* calleth it *Silicula*; and *Pliny Silicia*; all other now adayes call the first *Fœnumgræcum* or *sativum*; and the second *Fœnumgrecum sylvestre*, and *Bauhinus Fœnumgræcum sylvestre alterum polyceration*; and thinketh it is the *Hedysarum minimum* of *Lugdunensis*: the *Arabians* call it *Olba Hebbe*, and *Helbe*, the *Italians Fiengreco*; the *Spaniards Alfornas*; the *Germanes Bocks-horn*; the *French*, *Dutch*, and *English*, Fenugreeke.

The Vertues.

The seede of Fenugreeke is onely in use with us, the herbe it selfe never used that I know, becaule it is seldome seene growing with us; and as *Galen* saith, is hot in the second degree, and drie in the first; it clenseth, digesteth, dissolveth and mollifieth: the powder of the seede taken with a little hony driveth forth many noysome humors out of the body, mollifieth inward Impostums and Vlcers in the Lungs and breasts, and easeth the griping paines of the intralls, but it doth overturne and breede a loathing in some stomackes, especially if they bee tender, but may well serve to robustious and countrey people invred to strong labour, for I know no Physitions in our dayes doe use it inwardly, yet *Alpinus* saith that the *Egyptian* women doe use to eate the seed, which *Galen* and divers authors said was used in their times (being buried a little in earth to make them sprouts, whereof many Sacke fulls are sold in the markets daily) to make them grow fat. But outwardly applyed it hath many good uses of familiar and daily experience, for the meale thereof heated with Vinegar and applyed outwardly to the Region of the Spleene, doth mollifie and waste the hardnesse thereof, as also other hard tumors and swellings; the decoction thereof mollifieth like wise the hardnesse, and other paines or heate of the mother, and openeth the obstructions of it, if they sit therein as in a bathe, or receive the hot fumes by sitting over it: the decoction thereof clenseth the head and haire from scurfe, dandraffe and the running sores thereof: it helpeth the disease called *tenasmus*, that is an often desire to the stoole without doing any thing, as also the Bloody flux when the excrements smell strong: a Pultis made with the meale thereof and Linseede, and the decoction of Mallowes, and a little oyle or *Axungia* put thereto asswageth the swelling and paines of the cods or privy parts of women, and generally all other swellings and tumors: the same also helpeth the Goute and other joynt aches that come of cold: the Muccilage of the bruised seede steeped in water and strayned forth, boyled in oyle or *axungia* is of much good use for many of the foresaid griefes: the decoction or the muccilage applyed to the forehead with clothes dipped therein stayeth the flux of humors to the eyes, and easeth the paines and inflammations in them: used also in Glisters it is effectuall in the Stone by opening and mollifying the inward parts. *Lobel* saith, that of the seede is made an oyle of more vertue then would be beleeved, to dissolve scirrhous swellings in the intralls, and other hard knots and kernells.

CHAP. XXVI.

Tribulus terrestris. Land Caltrops.

THe Land Caltrops (for that of the water shall bee spoken of in another Classis or Tribe) riseth up with divers small hard branches, with divers winged leaves on them made of many small leaves set on both sides of a middle ribbe like *Orobus*: at the joynts stand singly small pale whitish yellow flowers which turne into small rough prickly heads, of five or six corners, wherein lyeth a small kernell or seede: the roote groweth downewards with many long fibres thereat.

The Place and Time.

It groweth in the sandy fields among Corne beyond Sea, as also among rubbish, and the ruines of buildings and by wall sides; wee finde it many times in our owne Land: it flowreth in *July* and ripeneth in *August*.

The Names.

It is called in Greeke τριβόλος χερσαῖος, and in Latine also *Tribulus terrestris quod siliqua plantæ muricata est*. The *Arabians* call it *Hasach* or *Haserk*, the *Italians Tribolo terrestre*, the *Spaniards Abrojos* and *Abrolhos*, the *French* Saligot *terrestre*, the *Germanes Waldt Kletlin*, the *Dutch* , and wee in *English* Land Caltrops, from the forme of the fruit like those instruments of warre, that were cast in the enemies way to annoy their Horses: but why *Pliny* should account *Tribulus*, *Lolium*, *Cardum* and *Lappa* no lesse then *Rubus*, to bee the diseases of Corne rather then Plagues and faults of the earth, I see no cause; and yet it seemeth it was a generall errour growen strong by tradition in those elder ages, as many other things were about the Metamorphosis of

Tribulus terrestris. Land Caltrops.

herbes &c.

herbes,&c. and *Virgil* ſeemeth to expreſſe the ſame of *Pliny* in theſe verſes,

Lappæque Tribulique, niterque intentia culta,
Infelix Lolium, et ſteriles dominantur Avenæ.

For the Corne was no way otherwiſe hindered or ſpoyled,then as other Weedes would doe by their plentifull growing,to hinder the growth of the Corne,in ſucking away the nouriſhment from the earth that ſhould feede it, but by tearing the Legs of the Reapers; which faults or plagues roſe from the earth wherein the ſeede of them lay hid,ready upon occaſion to ſpring,and not in the Corne, which if it were ſowen in a ground namely a well weeded Garden cleare of ſuch weedes, would have none of them among it.

The Vertues.

The Land Caltrops are of an earthly cold qualitie and thereby aſtringent and hindering the breeding of inflammations and Impoſtumes,and againſt the flux of humors: moreover being of thinne parts it doth much helpe to breake and waſte the Stone in the Kidneyes: a Lotion made therewith healeth all ſores and Vlcers in the mouth, and all corruptions that breede in the gummes and throate: the juice doth clenſe the inflammations and other hot rheumes in the eyes: it likewiſe cureth the venome of the Viper and other poyſons, if a dram thereof bee taken in wine. The *Thracians* ſaith *Pliny* and *Galen* that dwell neare the River *Strimon* did feede their Horſes with the greene herbe, and lived themſelves of the fruit or kernells, making them into a ſweete bread which bound the belly; *Pliny* addeth that the roote being gathered by a caſte perſons doth conſume Nodes and Kernells: the ſeede bound to the ſwollen veines in the Legs,or other parts of the body taketh the ſwellings away, and eaſeth the paines.

CHAP. XXVII.

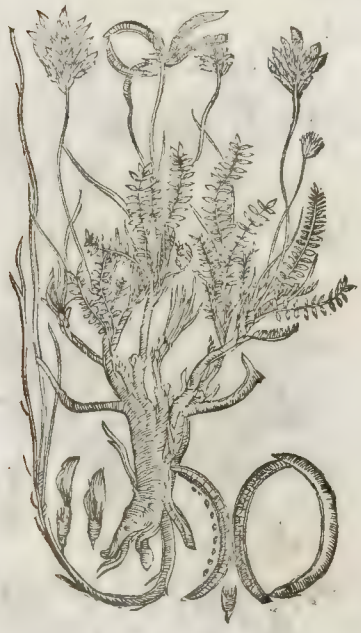
Glaux leguminoſa ſive Glycyrrhiza ſylveſtris. Licoris Vetch.

OF this kinde of wild Licoris we have two or three ſorts to ſet forth unto you, and unto theſe I will adjoyne the other two ſorts of manured Licoris, which ſome good authors have likewiſe reckoned among the Pulſes as I doe here.

1. *Glaux vulgaris leguminoſa.* The moſt common Licoris Vetch.

This kind of Licoris Vetch ſendeth forth many weake round hard ſtalkes trayling on the ground, branched upwards, ſet ſomewhat thicke with winged leaves made of many, ſet on both ſides a middle ribbe, ſomewhat like as the Vetch hath, but much larger and pointed: the flowers come forth at the joynts,at the end of a long ſtalke many together, of a bleake white colour tending to yellow, which turne into crooked cods, con-

1. *Glaux vulgaris leguminoſa.*
The moſt common Licoris Vetch.



3. 4. *Glycyrrhiza vulgaris ſiliquoſa & echinata.*
Codded and rough headed Licoris.

teining

teining two rowes of ſeede, cornered and grayiſh, of the taſte of other Pulſes: the roote is thicke and long, dividing it ſelfe into two or three long ſtrings running very deepe into the ground, ſweete in taſte like unto Licoris, which dyeth not but abideth long, ſhooting forth new branches every yeare in the Spring.

2. *Glaux altera leguminoſa.* Another Licoris Vetch.

This other wilde Licoris hath ſuch like ſtalkes and leaves as the former, but not ſpreading ſo farre, nor leaning downe ſo much, the winged leaves alſo are not ſo large, of a darker greene on the upper ſide, and grav underneath, the flowers are of a purpliſh colour, the cods are browniſh long and round, and the ſeede within them more round: the roote is like the former growing deepe and ſpreading, and as ſweete as the other. *Thalius* ſaith that this is very like true Licoris except in ſome few things.

3. *Glycyrrhiza vulgaris ſiliquata.* Common Licoris.

This Licoris riſeth up with many round wooddy ſtalkes, ſet at ſeverall diſtances with many winged leaves, made of many ſmall long ones ſet on both ſides of a middle ribbe, very well reſembling a young aſh riſen from the ſeede: the flowers appeare at the joynts, after it hath ſtood divers yeares in a place without removing, ſet upon long ſtalkes, many ſet together one above another ſpike faſhion, of a pale blew colour, which turne into long browne, and ſomewhat flat cods, with three or foure ſmall, round hard, ſeedes in them: the roote groweth deepe into the ground, as great as a mans thumbe or more at the head, ſpreading divers long rootes from it, both downewards, and likewiſe ſuckers from the ſides, whereby it will quickly encreaſe, browne without, and yellow within of a ſweete taſte.

4. *Glycyrrhiza echinata.* Rough headed Licoris.

This other Licoris groweth in the ſame manner that the former doth, with the like leaves and flowers, but of a deeper blew colour, and growing for the moſt part at the toppes of the branches, which are followed by rough browne heads, like to the burres of the *Platanus* Plane tree, as *Dioſcorides* compareth them, being many rough cods like thoſe of Lentills, ſet together in a bunch, with one browne flat ſeede in every cod: the roote groweth as deepe as the other, but brancheth not under ground like it, and is of a ſtronger or more bitteriſh ſweete taſte.

The Place and Time.

The firſt groweth in many places about *Cambridge*, in *Claringdon* Parke by *Salisbury*, and *Thrapſtone* in *Northampton ſhire* and many other places of our Land, the other I have not heard hath beene yet found with us, but in *Germany*, &c. The firſt ſort of Licoris is ſaid to grow chiefely in *Germany* about *Noremberg*, the other in *France*, *Spaine*, *Italy* &c. and flower with us late, and ſeede as late, if at all. *Camden* in his *Britania* ſaith, that Licoris groweth wilde at *Worſop* in *Nottingham ſhire*, but I beleeve he was miſtaken therein, for that they of that countrey plant great ſtore in their fields, and thereof make good profit, as we doe in many other places in Gardens.

The Names.

The firſt is called *Glycyrrhiza ſylveſtris* by *Geſner in hortis*, by *Camerarius*, and by *Lugdunenſis*, *Polygalon* by *Cordus* on *Dioſcorides*, and in his Hiſtorie *Polygalon Cordi* by *Thalius*, *Glaux*, and *Glaux vulgaris* by *Lobel* and *Cluſius*, *Fœnumgræcum ſylveſtre* by *Tragus* and *Dodonæus*, & *Hedyſarum glycyrrhizatum* by *Gerard*, and many Herbariſts, and by *Bauhinus Glycyrrhiza ſylveſtris floribus luteo palleſcentibus*: the ſecond is the *Glycyrrhiza ſylveſtris* of *Thalius*, and *alia* of *Camerarius in horto*, by *Lobel Glauca vel Glaux quadam leguminoſa herbariorum*, & by *Bauhinus Glycyrrhiza ſylveſtris altera floribus punicei folly Arachi*: the third is called *Glycyrrhiza Germanica* by ſome, & *Levis*, or *non Echinata* by others, and *ſiliquoſa* by *Lobel* and others, *Dulcis radix* by *Tragus* and *Cordus*, and *Ligneritia* in the Apothecaries ſhops: the laſt is called *Glycyrrhiza echinata Dioſcoridis* by *Lobel* and *Lugdunenſis*: *Glycyrrhiza Italica* by *Geſner* and *Dodonæus*, and ſimply *Glycyrrhiza* by *Matthiolus* and others; *Theophraſtus* calleth it *Herba Scythica*; the Greekes γλυκυρρίζα and ſo the Latines *Glycyrrhiza*, that is, *dulcis radix*, and of ſome *Glycyrrhizon*: of the *Arabians Sus*, of the *Italians Regolitia*, of the *Spaniards Rogoliza*, of the *French Recliſſe*, and *Regaliſſe*, of the *Germanes Suſholtz*, of the *Dutch Suethout*; and we in *Engliſh* Licoris.

The Vertues.

The two ſorts of wilde Licoris are not knowne to be uſed in Phyſicke by any, but are wholly neglected: for the other two ſorts of true Licoris, their properties being both alike, I ſhall not needs to entreate diſtinctly as if the one had ſome other faculties that the other had not, for they are therein both alike, and as *Galen* ſaith, is very familiar to our temperature in that it is ſweete, and having a little aſtriction joyned with it, making it temperate in heate and aſtriction, that it is the neareſt unto our temper, and by both theſe qualities, as he ſaith, it doth leniſie the hoarſeneſſe of the throate, and is helpefull for the ulcers in the bladder; it hath alſo ſome moiſture therein by reaſon of the ſweetneſſe, and thereby good to quench the thirſt: Licoris is often boyled in faire water, with ſome Maidenhaire and Figges, which maketh a good ptiſane drinke, for thoſe that have any dry cough, and to digeſt the flegme, and to expectorate it, or hoarſeneſſe, wheeſing, and ſhortneſſe of breath, and all other griefes of the breaſt and lungs, the tiſſicke or conſumptions cauſed by the diſtillations of ſalt humours on them, which doe waſte and conſume them: it is good alſo in all the paines of the raines, the ſtrangury, and heate of urine. The *Scythians* are ſaid by chewing this in their mouthes, that it keepeth them from thirſt in their long journies through the deſarts for tenne or twelve dayes, and ſtaieth hunger alſo: Licoris boiled in water, with a little Cinamon added to it, ſerveth in ſtead of drinke in many places, eſpecially if it be ſet to worke with barme as beere is, and then tunned up, and will grow cleere, ſtrong, and heady by time as beare will doe: the fine powder of Licoris blowne through a quill into the eyes that have a pinne and webbe, as they call it, or rheumaticke diſtillations into them, doth cleanſe them and helpe them: the juyce of Licoris is as effectuall in all the diſeaſes of the breaſt and longs, the reines and bladder as the decoction: the juyce diſſolved in Roſewater with ſome Gumme Tragacanth, is a fine lohoc or licking medicine for hoarſeneſſe, wheeſings, and all other roughneſſe in the mouth or throat, and to expectorate tough flegme, as alſo to condenſate thinne rheumes, falling on the lungs: our *Engliſh* Licoris is more pleaſant to the taſte, wanting much of that aſtriction is in that which commeth to us from beyond ſea.

The *Galega* or Goates Rue ſhould have taken up his place here, as being proper to this Claſſis, but as you may ſee before, I have drawne it and others into another Claſſis, for the reaſons there ſpecified. There yet remaines a number of Trefoiles to be ſpoken of, as being neareſt to the Pulſes, eſpecially thoſe that are peoperly called *Lotus*

ſiliquoſi,

siliquosi; because their long cods are more eminent to be seene, which shall next follow, and the rest in their order.

CHAP. XXVIII.

1. *Lotus edulis Creticus.* Trefoile Pease of *Candy*.

This Trefoile Pulse or Pease shooteth forth divers slender stalkes set with browniſh greene leaves at severall distances thereon; three alwayes standing on a foote stalke, which are sappy, a little thicke and pointed, the flowers are yellow, but like unto small Pease blossomes, which are followed by round cods, somewhat crooked, and great in comparison of the smallnesse of the plant, wherein lie round Pease of a sweete taste, like unto our ordinary Pease, and while they are young and greene usually sold in their markets, and as much desired of them, as our Pease with us: the whole Plant with stalkes and leaves are a little hairy: the roote is small, thready and annuall growing among their corne, and in the borders of their fields.

2. *Lotus quadripinnatis siliquis.* Square codded Pease.

This kinde of Pulse or Pease I have shewed you in my former booke, that it hath a crimson blossome, and long round cods, with foure filmes, two at one side, and two at another.

3. *Arbus seu Lotus Ægyptica.* The *Egyptian* foure leafed *Lotus*.

This small herbe growing not much above an hand breadth high, hath divers round Trefoile-like leaves growing on the hairy stalke foure most usuall together, at the toppe whereof standeth sundry white flowers, after whom the seede followeth that is like unto Peare kernells in the huskes.

4. *Lotus sylvestris Creticus. Candy* wilde Trefoile.

This wilde Trefoile riseth up with stalkes a foote high, having at each joynt two small leaves, and from thence three other small darke greene leaves, upon very short or no foote stalkes at all; the flowers are small and yellow, comming forth both at the joynts and toppes of the stalkes, usually two together, and so many cods likewise come up in their places, being very small, and long, with seede in them, as small as Mustard-seede: the roote is small and hard, yearely perishing, the whole plant tasteth somewhat like a Pulse, yet with a little bitterens and soureneſse therein which quickly vanish away.

5. *Lotus pratensis Monspelensium.* Smooth codded Trefoile of *Mompelier*.

This riseth up with cornered and jointed stalkes a foote high, with leaves, usually three together, more long than round; the flowers are yellow, growing both at the joynts and toppes of the stalkes, after which come large and long cods, with seedes like Fenigreeke in them: the roote is small and long.

6. *Lotus asperior fruticosus.*
Rough Trefoile of *Mompelier*.

This is like the last, but that the stalkes grow bigger, harder, and rougher, the leaves are narrower and hoary: the flowers are yellow set in hoary huskes smaller than the former, and the seede lesser also.

7. *Lotus fruticosus Granatensis.*
Spanish hoary hard Trefoile.

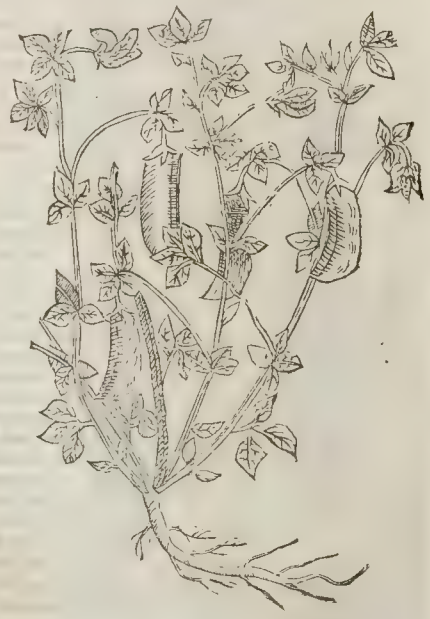
This Trefoile found by *Clusius* in *Granado* & *Valentia* in *Spaine*, and referred by him to the *Oxytryphyllum* of *Scribonius Largus* riseth a cubite high, with many branches, and three leaves alwayes set together, saith *Clusius*, (but sometimes foure saith *Lobel*, if his be the same:) the flowers are small & whitish, many growing in a round tuft together, with small seede, after them contained in small long cods; the roote is somewhat great and thicke, and astringent: Of this he maketh two sorts, one whose stalke is greene and the roote white, growing in moist places; the other with reddish stalkes and branches, and the roote somewhat reddish, wherewith, as he saith, they use in those places to make a syrope of good effect against the bloody flixe.

Alter.

8. *Lotus hæmorrhoidalis major sive Trifolium hæmorrhoidale majus.*
The greater Pile Trefoile.

The greater of these pile Trefoiles, hath a long straight roote, somewhat wooddy, with very few fibres at it, from whence riseth up usually but one stalke a cubite or two high, branched into divers hard weake flexible twigges, and they againe into other small branches, bearing at every joynt five leaves, two whereof stand close to the stalke, each upon a small foote stalke, and the other three rise betweene them, and higher than they upon another foote stalke like a Trefoile, the leaves and stalkes being all hoary, yet in the younger plants, onely the three leave stand together on a stalke

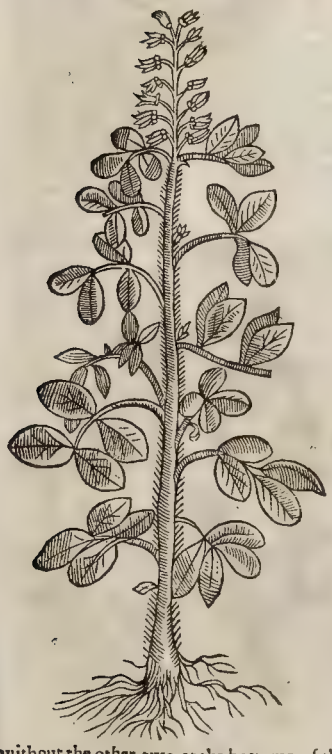
1. *Lotus edulis Creticus.*
Trefoile Pease of *Candy*.



Without

2. *Lotus quadripinnatis ſiliquis.* Square codded Peaſe.

3. *Abſus ſeu Lotus Ægyptiaca.*
The *Egyptian* fourre leafed Lotus.



4. *Lotus ſilveſtris Creticus.*
Candy wilde Trefoil.

without the other two at the bottome of them, the flowers grow many together in a tuft, of a whitiſh red or bluſh colour ſomewhat large, which turne into long and round cods, greater and thicker than the next that followeth, of a blackiſh red colour, ſowewhat ſwollen, and very well repreſenting the hemorrhoidall veine, as it appeareth, ſwollen and fallen downe, from whence it in part tooke the name, and partly alſo from the ſingular propertie it hath to cure the piles, within which are divers ſmall round blacke ſeede.

9. *Trifolium hæmorrhoidale alterum ſive minus ſeu Lotus Dalechampij.* The leſſer pile Trefoile.

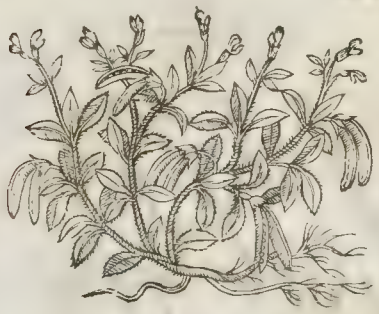
This other leſſer pile Trefoile hath a tall ſtalke, two or three foote high, parted into long branches, with tow ſomewhat large leaves both cloſe ſet to the foote of every branch, and to the joynts where the leaves grow forth, from whence come other leaves, as large as the ordinary Trefoile leaves, three ſtanding together upon a long

foote ſtalke : the flowers grow in tufts at the end of the branches of a light bluſh colour, which are followed by ſmall round and ſhorter pods than the former, with ſuch like ſeede in them : the roote is ſomewhat thicke and wooddy, full of ſtrings, yet yearely dying with us, and hardly, but in a kind yeare giving ripe ſeede.

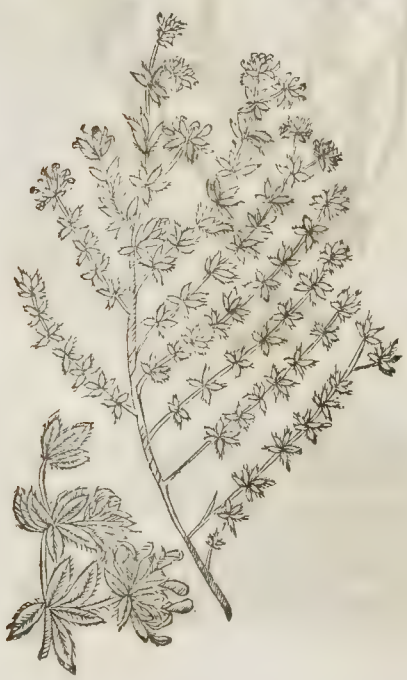
10. *Lotus Corniculatus frutescens.*
Buſh horned Trefoile.

This Trefolie hath ſmall ſmooth and greene ſtalkes a foote high or more, ſpreading many ſhort branches, with three leaves on their foote ſtalkes, being long and very narrow : the flowers are yellow that ſhoote forth at the toppes two or three together, and ſometimes more, after which come thicker and ſhorter cods than the next, ending in a long point, wherein are contained ſmall ſeede ; this is found ſometimes to have broader cods, and ending in a ſhorter point, it groweth about *Mompelier* and in *Italy* alſo, and with us alſo in ſome places.

5. *Lotus prateuſis Monſpelienſi.*
Smooth codded Trefoile of *Mompelier.*



8. *Lotus hæmorrhoidalis major ſive Trifolium hæmorrhoidale majus.*
The greater pile Trefoile.



6. *Lotus aſperior fruticoſus.*
Rough Trefoile of *Mompelier.*

9. *Trifolium hæmorrhoidale alterum minus ſive Lotus Lybyca Dalech.*
The leſſer pile Trefoile.

11. *Lotus*

11. *Lotus corniculatus minor pilosus.* The lesser hairy horned Trefoile.

This other hath slender stalkes, covered with very small reddish haires, the leaves likewise are hairy, small, and sharpe pointed, three on a foote stalke, and two at each joynt, from whence spring the flowers, one or two at the most on a small stalke like an haire, of a deepe yellow, tending to a saffron colour, unto each whereof succeedeth a very slender long cod, with very small seede therein: this likewise is fonnd in the woods and medowes about *Mompelier*, and the hills adjacent, and as frequent with us.

12. *Lotus Corniculatus incanus.* Hoary horned Trefoile.

This groweth low, but with a little larger leaves and flowers, of as deepe a saffrony yellow colour as the other, or rather, with a shadow of crimson on them, growing three or foure together and small long crookedcods following them with round seede in them: this is found also in divers medowes.

13. *Trifolium corniculatum Lusitanicum flore rubro.* Horned Trefoile of *Portugall* with red flowers.

This horned trefoile of *Portugall* hath divers long and narrow leaves, three set together lying on the ground, and so likewise are the lowest upon the stalke that riseth about a cubit high, with others upwards standing eyther single or two at a place very narrow and long: the flowers grow at the toppes of the stalkes and branches one at a place on a short footstalke, composed of five leaves of a deepe red colour, with the shew of a little horne in the middle, which growing greater the flower oftentimes abideth still at the foote of the horne for a good while, which falling away at the last, and the pod growing ripe containeth within it very small browniſh seede: the roote is slender and perisheth, but by the seede that is shed it yearely springeth againe.

The Place and *Time.*

The most of these are declared by their titles, or after their descriptions where they grow, their times of flowring and seeding are in the Summer seasons.

The Names.

Λωτὸς in Greeke and *Lotus* in Latine is of two kindes, for there is *Lotus arbor*, the Lote tree, and there is *Lotus herba* the herbe Lotus, which as *Dioscorides Galen* and *Pliny* doe all agree is a Trefoile or like a Trefoile (and yet not the τετράφυλλον *Trifolium* whereof he had made mention before) and whereof *Dioscorides* and *Galen* make two sorts ἡμερὸς *urbana Lotus* and ἄγριος *sylvestris*: of the *Lotus urbana* as it is generally taken to be I have spoken before in the end of the fift Classis of this Worke: but this kinde of *sylvestris* is more controverted, divers writers supposing that which they bring and shew forth to be the right. The first here expressed was sent by *Honorius Bellus* from *Candy* where the people call it *Hieranzuni*, & *Pona* in his *Italian Baldo* calleth it *Lotopisum* and by *Bauhinus Lotus cretica*: the second is called *Lotus siliquosus rubro flore* by *Clusius*, and *Lotus tetragonolobus* by *Camerarius*, and *Sandalida Cretica* and usually with us *Pisum quadratum*: the third is mentioned by *Alpinus lib. de plantis Ægypti* by the name of *Absus*, which *Bauhinus* calleth *Loto affinis Ægyptiaca*: the fourth the *Italian Pona* calleth *Lotus sylvestris Dioscoridis*, and was sent out of *Candy* for a Melilote, but as he thinketh is the true *Lotus sylvestris* of *Dioscorides*, and is called by *Camerarius Lotus peculiaris siliquosus*, and as he saith by some *Cicer sylvestre* and *Dorychnium* but both erroniously: the fift is the *Lotus pratensis siliquosus* of *Clusius*, called by *Lobel Lotus trifolia pratensis siliquosa Monspelliensium*, and *Lotus trifolia corniculata* by *Gerard*: the sixt is so called by *Lobel* and *Lugdunensis* as is in the title: the seaventh *Clusius* saith he found in the kingdomes of *Granado* and *Valentia*, and is the same or very like unto that *Lobel* and they of *Mompelier* called *Lotus sylvestris*. and by some thought to be the *Oxytriphyllum Scribonij Largi*, but *Lobel* thinketh the *Trifolium bituminosum* to bee the true *Oxytriphyllum* and that this may be the *Oxytriphyllum alterum Scribonij Largi*, *Clusius* also saith hee received this out of *Italy* by the name of *Lotus fruticosus* and that *Plasa* tooke it to bee *Perempsana Arabum*, whereof hee saith there are two sorts, the one with a white and whiter branches, the other with a red roote and reddish branches, which the Moores of *Granado* called in their language *Euzina*, and of the rootes of both which were somewhat great and astringent, but especially of the red, they made a Syrupe singular good for the disenterie or bloody flux: the eight is called *Trifolium Hæmorrhoidale* by those of *Mompelier* for the causes mentioned in the description, whereunto I have added *majus* by the same authority, for they doe account the ninth which is the *Lotus Lybica* of *Dalechampius* to bee the lesser sort of the former: the tenth and eleventh is the 22. and 23. *Trifolium* of *Bauhinus* in his *Prodromus*: the twelfth is usually called with us *Trifolium Corniculatum vulgatissimum*: the last we had from *Boel* in *Portugall* by the name of *Trifolium siliquosum rubrum Lusitanicum.*

The Vertues.

The wilde *Lotus* as *Dioscorides* and *Galen* say is of an heating and drying quality, and thereby effectuall against the paines in the bladder if it be taken of it selfe or with Mallow seede drunke in wine: the powder of the herbe mixed with some Hony and annointed taketh away the markes and blemishes in the face, &c. the eight sort here expressed as I said before is held about *Mompelier* to be of singular good effect against the Piles or Hemorrhoides, for it hath a manifest astringent taste without any manifest heate or acrimony: the usual dose of the dryed herbe (but the seede is much better) made into powder, and the quantitie of a dram or halfe a dram according to the age and disposition of the Patient taken in red wine which effect the learned there knowing have much reasoned the case among themselves, whether it worketh this effect by any hidden propertie, or by the astringent facultie to either of which opinion some have inclined: the *Lotus Lybica* as *Galen* saith is in the second degree of heate, and doth a little clense, the rest have no especiall propertie recorded by any or knowne to us.

CHAP. XXIX.

Trifolia montana. Mountaine Trefoiles.

THe next Trefoiles that are to bee entreated of are those that grow on hills and the dryed grounds, whereof there are sundry varieties.

1. *Trifolium montanum majus purpureum.* The greater purple Mountaine Trefoile.

This greater Trefoile groweth scarse a foote high, with divers leaves thereon which are large and three inches long sometimes, three alwayes together on long footstalkes, sharpe pointed and a little finely snipped about the edges, at the toppes stand large and somewhat long heads of gallant purple flowers, like unto the medow Trefoile but greater: This is also found with longer and narrower leaves, and a longer spiked head of flowers.

1. 2. *Trifolium montanum majus flore purpureo & albo.*
The great purple and white mountaine Trefoile.

4. *Trifolium angustifolium Alpinum.*
Narrow leafed Trefoile of the *Alpes*.

2. *Trifolium montanum majus albo flore.* The grēat white mountainē Trefoile.

The ſtalke hereof is not ſo great or high, the leaves are ſmaller yet ſomewhat long and dented about the ēdges, growing many below, and few and ſmaller on the ſtalke, at the toppe whereof grow one or two ſhort branches, with each a ſpiked head of ſmall white flowers ſomewhat ſweete: the roote is long and about a fingers thickneſſe, browniſh on the outſide and white within, with ſome fibres thereat.

3. *Trifolium montanum obtuſo crenato folio purpuraſcens.* The bluſh mountaine Trefoile.

This Trefoile is fuller of leaves on the ſtalkes then the laſt, which are long and narrow, not ſharpe but round at the ends, and dented round about, but up higher on the ſtalkes they are very narrow, the flowers are fewer that ſtand at the toppes, and of a pale purple colour.

4 *Trifolium auguſtifolium Alpinum.* Narrow leafed Trēfoile of the *Alpes*.

This mountaine Trefoile hath a long roote, ſomewhat hairy or ſcaly toward the toppe, and ending in ſomē long fibres, whitiſh on the outſide and ſomewhat hard and wooddy, of a ſweete bitter taſte like unto Licoris, (from whence ſome have called it *Spaniſh* Licoris: but farre unfitly as moſt of the vulgar appellations bee) from whence riſe divers long ſmall ſlender ſtalkes of leaves bowing downe to the ground, with two or three ſmall narrow ſhreads of leaves on them towards the bottome, and three long narrow leaves at the ends of them, with ſmall dents at the edges ſcantly to be felt, from among theſe leaves riſe one or two naked ſlender ſtalkes three or foure inches high, bearing large flowers as it were in a round ſpike, of an excellent purple crimſon colour ſtanding in five cornered huskes.

5. *Trifolium Alpinum argenteum.* Silver leafed Trefoile of the *Alpes*.

This Silver Trefoile hath a great long reddiſh wooddy roote, ſhooting forth divers great branches with a number of ſmall narrow leaves, three together at the toppes of them next the ground ſtanding on ſhort footſtalkes which are ſoft and of a Silver-like hoarineſſe all over, from among which riſe ſhort ſtalkes not above foure fingers breadth in height, naked untill a little under the flowers they have three leſſer leaves then thoſe below: each ſtalke beareth but one flower, which is not after the faſhion of all other Trefoiles, that is, with Peaſe-like bloſſome (and therefore I the more ſuſpect that this cannot properly be referred to the company of Trefoiles but rather to the *Ranunculi Gerania* or ſome other according as the ſeede ſhall ſhew it to be which wee have not ſeene) but laid open like unto a Crowfoote or Cranes bill, and of a Roſe or Peach colour, with many like coloured threds in the middle tipt with blackiſh pendents ſtanding about a ſmall hoary head.

6. *Trifolium montanum lupulinum.* Hoppe-like Trefoile.

The Hoppe Trefoile riſeth with ſmooth ſlender weake ſtalkes a cubit high, ſet with few leavēs on them, which are ſmall and round pointed for the moſt part, like the common medow trefoile ſtanding ſeverally on their footſtalkes, the flowers ſtand at the toppes, made as it were of browniſh yellow ſcales laid one upon another, very well reſembling the head of an hoppe, whereof it tooke the name, and from whence ſome have called it *Lupulus ſylvaticus* a wilde Hoppe, and groweth as *Bauhinus* ſaith on the hills above *Ilſfeld* in *Germany*, where it is likely *Thalius* alſo found it.

7. *Trifolium*

6. *Trifolium montanum Lupulinum.* Hoppe-like Trefoile.

9. *Trifolium Glycyrrhizites* Licoris Trefoile.

7. *Trifolium saxatile hirsutissimum.* The hairy rocke Trefoile.

The roote of this Trefoile is wooddy and creepeth under ground, with a reddish barke, and is but as it were the stocke of many heads or plants set together, being not above two or three inches high: the leaves are small, soft, woolly, and as it were Silver-like, in forme like a Trefoile, dented about the edges, and standing on short but very hairy footstalkes, among which rise small round heads standing on long stalkes, in the middle of whom rose short and very soft yellow haires; wee have not yet seene any other flower it beareth nor seede: it was gathered on the toppes of the highest of the *Helvetian* mountaines.

8. *Trifolium Scorpioides.* Scorpion-like Trefoile.

The leaves of this Trefoile are not much unlike the first Trefoile, but narrow and endented, the flowers are yellow and grow in a small tuft three or foure together which afterwards beare small crooked cods like a Scorpions taile, or the *Scorpioides leguminosa*. This *Boel* gathered in *Spaine* and with it another like thereunto, but the flowers were of a paler colour. *Flore pallidiore.*

9. *Trifolium Glycyrrhizites.* Licoris Trefoile.

This sweete or Licoris Trefoile hath a great and long deepe spread roote, very like unto Licoris, from the head whereof groweth out sundry short armes halfe a foote long, and divers leaves issuing therefrom, three alwayes together which are somewhat long and narrow, plaine on the edges, and each standing on a short footstalke, from among which rise short stalkes like the medow Trefoile, bearing such a like bush or tuft of purplish flowers: this saith *Lobel* is not that of *Pona* or *Alpinus* yet very like.

The Place and *Time.*

These all grow on hills and mountaines, some in *Spaine*, others in *Germany*, and the last on a hill by *Mompelier* called *Hortus Dei*, they flower and seede in the time that the others doe.

The Names.

Clusius and *Thalius* have made mention of the first and second by the names of *Trifolium majus* and *montanum*: the third is from *Bauhinus*, *Pona* in his *Italian Baldus* mentioneth the fourth, and is so called by *Pona* as it is in the title which *Bauhinus* calleth *flore magno radice dulci*, and by some *Glycyrrhiza Astragaloides*: the fift by that name is in the title; the sixt is called by *Thalius Lupulus sylvaticus*, and *Bauhinus Trifolium montanum lupulinum*, for I take them to be both one: the seaventh *Bauhinus* mentioneth in his *Prodromus*: the eight of both sorts is not mentioned by any before now: they of *Mompelier* call the last *Trifolium dulce montanum*.

The Vertues.

The properties of none of these are recorded by any that have written of them, but it is likely they much participate of the qualities of the former.

CHAP. XXX.

Lagopus, Hares foote.

THe next sort of Trefoiles that are to bee handled is of those whose flowers grow in close spiked heads, called *Lagopus* Hares foote, whereof there are halfe a dozen.

1. *Lagopus maximus flore rubro.* The greatest Hares foote.

This great Hares foote hath divers trefoile leaves rising from a small long threaddy and annuall roote, each standing on a long footstalke being almost round and dented about the edges, very like to the medow trefoile as well in the bignesse as forme, very soft, and of a pale greene colour, among these rise up weake bending stalkes a foot high or more, branched and bearing the like but somewhat longer leaves on them, and at their toppes close spiked heads, with many small flowers round about them, each in a five cornered cuppe of an excellent crimson colour, in which huskes after the flowers are past grow small yellowish round seede, one onely in a huske, whose brims or corners then stand displayed somewhat like unto a starre.

2. *Lagopus major folio pinnato.* The longer headed Hares foote.

The Leaves of this Hares foote are hoary, large, and longer then the former, with divers conspicuous veines in them making them shew like wings, the middle ribbe on the backe of them being somewhat great also: the flowers are like the former both in forme and colour, but the whole head is longer.

3. *Lagopus major angustifolius.* Great Hares foote with very narrow leaves.

This Hares foote hath stalkes a foote high, set with very narrow leaves almost like grasse, yet in some places they are found to be larger, but still long and narrow, three set together, at the toppes whereof grow as large a spiked head of flowers as the first, but the colour of them are paler, and the ends or cornered toppe divisions of the huskes are hard and almost prickly if not wholly. *Lugdunensis* calleth this *Alopecuros Graminea Dalechampij.*

4. *Lagopus angustifolius Hispanicus.* *Spanish* narrow leafed Hares foote.

The *Spanish* Hares foote is one likewise of the greater kind, having a firme straight stalke but slender, with divers branches thereat, with three somewhat long, narrow and pointed hoary leaves, with great ribbes on the backes upon long footstalkes set at each joynt, which are somewhat broad at the bottome of them, compassing the stalke and branches with a little care thereat likewise, the flowers are of a pale red colour set in a long spiked head, but more loose and not so compact as the former: this I had by *Boel* out of *Spaine* by the name of *Tenuifolius*.

1. *Lagopus maximus flore rubro.*
The greatest Hares foote.

2. *Lagopus major folio pinnato.*
The longer headed Hares foot.

5. *Lagopus*

4. 5. *Lagopus angustifolius & sanguineus floris tuberrimi.* Bright red Hares foote.

6. *Lagopus vulgaris.* Common Hares foote.

5. *Lagopus minor flore ruberrimo.* Bright red small Hares foote.

This small Hares foote hath small woolly or soft leaves as small but nothing so long or narrow as the last and groweth little more then halfe a foote high, the spiked head is small but larger then the wilde kind, and the flowers on them are of a most excellent crimson colour, the corners of whose woolly huskes stand out like starres when the seede within them are ripe: this is but annuall perishing yearely as the former: this also came to me out of *Spaine* by the name of *Lagopus pratensis Baticus.*

6. *Lagopus vulgaris.* Common Hares foote.

The common Hares foote is well knowne to be a small plant growing greater and higher in some places and smaller in others, with whitish woolly small trefoile leaves set upon the stalkes, and many branches it hath, the heads at the toppes are small and somewhat long with the roundnesse, composed as it were all of a hairy hoary downinesse, whose flowers in some are of a white in others of a blush colour: it is annuall as the rest, and this is one especiall note of this family of Hares foote, or that beare spiked heads of flowers that they perish yearely, when as the other sorts of Trefoiles that are to follow or that went before are not so: This also I had from *Boel, Supinus,* but grew larger, and another that stood not upright, with many other sorts out of *Spaine* which are perished with me by some unkindly yeares have happened.

The Place and *Time.*

These have beene all found, some in *Italy*, others in *Spaine*, some in *France* and others in *Germany*, but are preserved with us in the Gardens of such as are curious: and the last almost every where in dry grounds in our owne Land, and flourish in the Summer moneths onely.

The Names.

It is called λαγώπους in Greeke, and so likewise *Lagopus* in Latine *a Leporis hirsuto pede* of the hairy foote of an Hare; as also *Lagopodium* and *Pes Leporis Leporis cuminum*, and *Trifolium humile*: *Hippocrates* called it *Lagopyron quasi Triticum Leporinum* because it grew among Corne: the first is called by most writers *Lagopus maximus* & *Lobelij* by *Clusius*, and *Lagopus maximus* or *major folio Trifoly* by *Lobel* himselfe and *Dodonæus*: the second is called by *Lobel Lagopus altera folio pinnato*, which *Clusius* maketh the other sort of his third *Trifolium majus*, *Tragus* called it *Cytisus* and so did *Columella*, *Lonicerus* and *Cordus Trifolium magnum* the commentors on *Mesues* in their *Pandects Pes milvi*: and *Thalius Trifolium spicatum*: the third is called by *Lobel Lagopus altera angustifolia*, and so by others, but as I sayd by *Lugdunensis Alopecuros graminea Dalechampij*: the fourth *Clusius* so calleth as it is in the title: the fift is not remembred by any before: the last is generally called *Laogpus* or with little variation, *Tragus* onely calleth it *Lotus campestris.*

The Vertues.

All the parts of these Hares feete, that is, leaves, stalkes, &c. but especially the spiked heads doe dry and binde, and

and of the firſt ſaith *Lobel* wee have had moſt certaine experience to ſtay Fluxes and Laskes of the belly, being drunke in wine or in water if the patient be feverish, and being bound to the Share it taketh away the inflammations thereof, it is profitable ſaith *Matthiolus* beſides the aforeſaid qualities, to ſtay chollericke belchings of the ſtomacke and paines of the belly, if the heads and ſeede in powder be taken in red wine: the herbe boiled with Mallowes in wine is very good for the paines of the bladder, the heate of urine and ſcalding. The ſeede alſo taken helpeth the ſpitting of blood: the aſhes of the heads being burnt is good to apply to the piles to ſtay their bleedings, and ſome alſo thinke that if the fundament bee but wiped with the herbe it will ſtay their bleeding. *Pena* ſaith that the facultie of drying is ſo powerfull beſides the binding that it wonderfully ſtayeth the running of the Reines: it is alſo profitably uſed in all foule and hollow Vlcers, being firſt cleanſed to raiſe up fleſh in them and to cicatriſe them, and is of great good uſe to helpe burſtings.

CHAP. XXXI.

Trifolia capitulis ſtellatis globoſis, &c. Starry headed, and round headed Trefoiles.

THeſe ſorts of Trefoiles are likeſt to the laſt in their heads chiefely, but they are not ſo cloſely compacted, but ſtand ſomewhat looſer one flower from another.

1. *Trifolium ſtellatum Monſpelienſium.* Starry headed Trefoile of *Mompelier.*

This Trefoile of *Mompelier*, hath a ſmall white long & down-right root, with ſome fibres therat, from whence riſe divers leaves upon long weake hoary foote ſtalkes not ſtanding upright, made of three ſoft hairy and hoary parts, formed ſomewhat like unto an heart, (whereon ſome have raſhly taken it to be *Trifolium cordatum*) and a little dented about the edges, from among which come up three or foure or more low ſtalkes ſeldome a ſpanne high or branched, but naked up to the toppe, where there uſually grow three ſuch like leaves as the lower are, ſet under the head, which is a ſmall round ſpike or umbell, with many long flowers appearing, of a whitiſh red, or fleſh colour, out of woolly or hairy and hoary huskes, every one by it ſelfe, which when they beginne to fade, the whole head becommeth more round, and the huskes ſhew their fine long ſharpe points, whereinto the toppes of them were divided, more apparent laid abroad like a ſtarre, in each whereof is contained one blackiſh flat ſeede: in the place about *Mompelier* where it groweth naturally, it flowreth in *May*, and the ſeede is ripe in *Iune*, but with us it will neither flower nor ſeede of a moneth after.

2. *Trifolium clypeatum argenteum.* Buckler Trefoile with ſilver-like flowers.

This ſmall plant ſpreadeth many branches upon the ground ſet with Trefoile leaves like the common medow Trefoile, every branch bearing at the end divers ſilver like flowers, and long round blacke and flat ſeede like unto the old *Venetian* Bucklers, which are hot and drie in taſte, for which cauſe I ſhould rather make it a Thlaſpi: but in that I have not ſeene the plant, I can ſay no further of it, but give it you as my author *Alpinus* hath ſet it downe.

3. *Trifolium globoſo capite.* Globe or round headed Trefoile.

This round headed *Trefoile* from a long white fibrous and hairy roote, ſendeth forth divers ſlender round ſtalkes a hand breadth high, and ſometimes a foote long divided into branches, ſomewhat hairy beſet with ſmall tripartited leaves, a little hairy, with two ſmall leaves at every joynt, and dented about the edges: the flowers are ſmall and yellow that grow at the toppes, out of the browne ſharpe huskes of the round head.

4. *Trifolium globoſum repens.* The creeping Globe Trefoile.

This other globe Trefoile, whoſe root is ſmall, creeping reddiſh and hairy, hath ſundry weak branches lying upon the ground, three or foure inches long, being ſoft, woolly, and ſomewhat reddiſh, which but few ſmall Trefoile leaves ſet on them, a little waved about the brimmes: the toppes of the ſtalkes and branches are garniſhed with faire round heads, whoſe flowers are of a reddiſh yellow colour, ſtanding in hairy huskes, wherein a ſmall ſeede is contained.

5. *Trifolium fragiferum Friſicum.* Strawberry headed Trefoile of *Friſeland.*

This Trefoile groweth up with divers ſtalkes, and broad pointed Trefoile leaves upon them, dented in the middle like a heart, ſet on long foote ſtalkes, bare towards the tops, and bearing a ſmall round head, with ſmall bluſh flowers, riſing out of the huskes, which are like ſmall bladders made of thin skinnes, which after the flowers are paſt ſwell ſomewhat bigger, and turne downe their brimmes, forming a head like a Strawberry, of many red graines ſet together, but greater, in each huske whereof is contained a few ſmall yellowiſh ſeedes, the rootes ſpread themſelves with many long fibres at them. There is another ſort hereof whoſe head is of a deeper or darker colour; (but I never ſaw any of a violet colour, as *Cluſius* ſaith) and ſo are the flowers alſo in other things little differing from the former: both theſe ſorts *Boel* brought with him out of *Spaine*, in the yeare 1608, and entituled them *Trifolium Veſicarium*, which he gathered there with above two hundred other ſorts of ſeedes, beſides divers other rare plants, dried and laid betweene papers, whereof the ſeedes were not ripe, of all which ſeedes I had my part, and by ſowing them ſaw the faces of a great many excellent plants, but many of them came

Alpinus.

1. 2. *Trifolium ſtellatum Monſpelienſium, & Clypeatum argentrum.*
Starry headed Trefoile of *Mompelier*, & Buckler Trefoile with ſilver-like flowers.

5. 6. *Trifolium fragiferum Friſicum & Luſitanicum tomentoſum.*
Strawbery headed Trefoiles of *Friſland* and *Portugall.*

12. *Spica trifolia feſtucacea mirabilis, & altera.*
The rare ſpiked ruſhie Trefoile.

came not to maturitie with me, and moſt of the other whereof I gathered ripe ſeede one yeare, by unkindly yeares that fell afterwards have periſhed likewiſe.

6. *Trifolium fragiferum Luſitanicum tomentoſum.*
Strawberry headed Trefoile of *Portugall.*

This other hath ſomewhat larger leaves than the laſt, and pointed at the ends: the heads likewiſe at the toppes of the ſtalkes were ſomewhat large and round like the laſt, but all woolly, as it were or hoary: this periſheth yearely, with mee, and Mr. *Tradeſcant*, who had it from *Boel* at *Liſbone*, without bearing us ripe ſeede, and have not ſince procured it from him againe.

7. *Trifolium veſicarium læve.*
Smooth skinny headed Trefoile.

This ſmall Trefoile riſeth little above halfe a foote high, it hath three or foure ſtalkes with ſmall leaves thereon, very ſharpely dented about the edges, with long foote ſtalkes under them, the heads are made of ſmall ſmooth hoary skinnes in faſhion of little bladders, ſet cloſe one unto another, and out of each a ſmall yellow flower, having ſmall round flat ſeede afterwards in them; the roote is ſmall, long white, and fibrous.

8. *Trifolium veſicarium aſperum majus.* The greater rough skinny headed Trefoile.

The leaves hereof are ſomewhat round like the meddow Trefoile growing from the roote, among which come weake ſtalkes two cubits high, upheld by the buſhes that it groweth among bare or naked to the toppes, bearing every one a ſmall round head, covered over with rough threads, made of many ſmall round skinnes like the other, and deeper yellow flowers riſing out of them.

9. *Trifolium veſicarium aſperum minus.* The leſſer skinny headed Trefoile.

The roote hereof groweth aſlope under the ground faſtened therein by many threads: the branches likewiſe creepe upon the ground with bare ſtalkes, two or three inches long growing from them, bearing on each a ſmall round head made in the like manner of many ſmall round greeniſh rough skinnes, out of which the flowers proceede of a reddiſh yellow colour, and within which a ſmall browne ſeede lieth.

10. *Trifolium capitulis Thymi.* Time headed Trefoile.

This Trefoile from a ſmall long white threaddy roote ſendeth forth ſtalkes halfe a handfull long ſpread on the ground, with three ſmall and round pointed leaves dented about the edges, and ſmall round heads on the toppes of them ſomewhat like the heades of Time, whoſe flowers are of a deepe yellow, enclining to red, and being ripe, grow hard containing reddiſh ſeede within them.

11. *Trifolium capitulo oblongo aſpero.* Long rough headed Trefoile.

This rough headed Trefoile hath alſo a long white threaddy roote, and from them many ſtalkes of a foote long, being round ſmooth, and joynted, ſtored with but few round leaves; from the ſeverall joynts grow forth many ſmall yellow flowers ſet together, and after theſe riſe ſomewhat long and round heads, armed, as it were, with crooked ſharpe prickes, which grow hard and rough being ripe, under each whereof is ſet a ſmall leafe, parted into three: the ſeede of this is ſmall as the former.

12. *Spica Trifolia feſtucacea mirabilis & altera.* The rare ſpiked ruſhie Trefoiles.

Theſe rare Trefoiles are like one unto another in nature, but a little differing in face and outward forme, both of them have ſlender long rootes, from whence riſe ſundry reddiſh ſpiked heades, out of which come many fine ruſh-like ſprigges, and from among them, in the one a very few ſmall Trefoile leaves, upon very ſmall long white foote ſtalkes, as fine as haires; in the other a great number of the like ſmall greene Trefoile-like leaves, on ſuch threaddy or haire-like ſtalkes, a little dented about the edges: from among which riſe ſundry flowers on the like ſlender foote ſtalkes, being ſomewhat long, and white, like unto thoſe of the ſtarre Hyacinth ſmelling ſweete while they are freſh, ſtanding in huskes, wherein afterwards grow ſmall, white, round ſeede. I have

placed

placed the figures of them both together, that the diverſitie may the better be obſerved: they are of a drying facultie, as by the taſte may be judged.

The Place and *Time.*

The moſt of theſe grow about *Mompelier* in *France*, others in *Spaine*, as hath beene ſhewed in their deſcriptions, and ſome in *Germany* and *Candy* alſo. which flower and ſeede when the reſt doe.

The Names.

The firſt is called by *Bauhinus Trifolium ſtellatum*, and I have added *Monſpelienſium*, and the figure not extant before: the ſecond by *Alpinus Trifolium clypeatum argenteum*: the third is *Bauhinus* his *Trifolium globoſum ſive capitulo Lagopi rotondiore*: the fourth is ſo called by him, as it is in the title: the fift is mentioned by *Cluſius* in his *Curæ poſteriores*: the ſixt comming among other ſeedes from *Boel*, I have ſo entituled, as it is ſet downe; ſand it may be is a kinde of the ſeventh which *Bauhinus* termeth *Trifolum ſpumoſo capitulo læve*, the eighth and ninth *Bauhinus* calleth *Trifolium Capitulo ſpumoſo aſpero majus & minus*: but I have entituled the *Veſicarium aſperum majus & minus*: the tenth and eleventh are ſo called by *Bauhinus* as they are in their titles: the laſt two ſorts of Ruſhie ſpiked Trefoiles are mentioned by *Alpinus* in his Booke of ſtrange plants, by the names here exhibited.

The Vertues.

I doe not finde any other propertie in Phyſicke that theſe are applied unto, than hath beene before ſpoken, for being all of late invention have had no further triall made of them.

CHAP. XXXII.

Trifola pratenſia, Medow Trefoiles.

OF the Trefoiles that uſually grow in medowes, beſides thoſe that grow in our owne Land; there be others that grow not with us, which are fit to be ſet together.

1. *Trifolium pratenſe vulgare purpureum.*

Common purple medow Trefoile called field Hony-ſuckles.

The medow Trefoile hath many leaves, riſing from the roote, three ſet together, and each almoſt round, among which riſe up ſhort ſtalkes of flowers, not much higher than the leaves, bearing many deepe purpliſh crimſon flowers together in a tuft riſing ſmaller up to the toppe, which turne into little cods with ſmall ſeede in them, the roote ſpreadeth much, and endureth long. Sometimes this is found with halfe round ſpots of white in the leaves.

1. *Trifolium pratenſe vulgare purpureum.*
Common purpl. medow Trefoile, called field Hony-ſuckles.

2. *Trifolium pratenſe album.*
White flowred medow Trefoile.

And

3. *Trifolium pratenſe Salamanticum Cluſij.* Medow Trefoi e of *Salamanca.*

5. *Trifolium luteum minimum.*
The ſmalleſt Trefoil.

6. *Quadrifolium pheum fuſcum.*
Foure leafed or purple Graſſe.

And there is another ſort whoſe leaves are all longer than the former and pointed, the flowers are of a paler purple. Of this ſort likewiſe ſome are ſpotted with blacke ſpots. It is likewiſe ſometimes found, having a tuft of greene leaves on the ſtalkes, which as I take is but accidentall, and rather *Luſus naturæ*, than any ſpeciall ſort. *Alterâ diverſa.*

2. *Trifolium pratenſe album.* White flowred medow Trefoile.

This uſually groweth leſſe than the former, and the flowers are white, and leſſe as the head is alſo, and herein chiefely differeth, yet I have ſeene it ſometimes with longer leaves than in others: but this is not *Cluſius* his *Trifolium primum flore albo*, as *Bauhinus* thinketh, making it the ſame with that of *Matthiolus*, *Dodonæus*, *Lobel*, &c. for that of *Cluſius* riſeth high with few leaves, and ſo doth not this. *Album Cluſii.*

3. *Trifolium pratenſe Salmanticum.* Medow Trefoile of *Salamanca.*

This Trefoile differeth little from the ſecond ſort of the former kinde, but that the leaves are ſmaller according as the climate giveth them, dented about the edges, and with a blackiſh ſpot on them, the branches traile on the ground

ground and from the joynts riſe the ſmall ſtalkes that beare many crimſon red flowers ſmaller then ours and rounder ſet together, the ſmall red ſeede is conteined in thin huskes.

4. *Trifolium pratenſe minus purpureum.* Small purple medow Trefoile.

This ſmall Trefoile hath ſmall hard ſtalkes a foote high, full of branches bearing on ſome three leaves, on other branches and joynts, foure ſmall leaves like a *Lotus*, the flowers grow many together at the toppes of the ſprigs, being very ſmall and in a looſe umbell of a purpliſh red colour; the roote is ſlender white and threddy.

5. *Trifolium luteum minimum.* The ſmalleſt yellow Trefoile.

This ſmall Trefoile hath a few ſlender weake ſtalkes, little bigger then ſmall Ruſhes lying on the ground, whereon grow ſmall Trefoile leaves ſometimes more then three on a ſhort footſtalke, a little dented about the edges: the flowers are ſmall and yellowiſh ſet cloſe and round together, after which follow ſmall blackiſh flat and crooked ſeede, almoſt like a *Medica* in the huskes: the roote is ſmall and threaddy.

6. *Quadrifolium fuſcum.* Fower leafed or purple graſſe.

The purple graſſe ſpreadeth on the ground, the leaves are in ſome three in others foure or five on a ſtalke, of a ſad greene colour, with a ſhadow of darke purple caſt over them, the flowers are white; I never ſaw this but in Gardens where women keepe it with confidence to be good for the Purples in children or others.

The Place and *Time.*

The two firſt ſorts grow every where in our owne Land, the third in *Spaine, Portugall, &c.* the fourth in many of the medowes in *France*, the fift in divers of our medowes here: the laſt onely in Gardens as I ſayd, for the wilde that is thought by ſome to be the ſame is not it, and flower and ſeede in the Sommer.

The Names.

It is properly called τρίφυλλον in Greeke, and *Trifolium* in Latine becauſe three leaves are alwayes joyned together, and it is probable that although *Dioſcorides* doth not peculiarly make a Chapter thereof as he doth of *Lotus*, yethe knew it and made mention thereof, both in deſcribing the *Lotus ſylveſtris*, which as hee ſaith ſome called *Lybica*, as alſo the *Medica* whoſe leaves were like unto the *Lotus trifolia pratenſis*, which ſheweth plainely he knew it by comparing other herbes unto it. There needeth no great explanation of theſe Trefoiles for all authors call them by this peculiar name of *pratenſe* as being moſt common therein: the third is remembred by *Cluſius*, the fourth by *Lugdunenſis*: the fift *Dodonæus* calleth *Trifolium agrarium*, and *Lobel Trifolium luteum minimum*: and the laſt by *Lobel* in his *Adverſaria*: It is called in *Italian Trifoglio*, in *Spaniſh Trebol de prados*, in *French Treffle de pres*: in high *Dutch Wyſenklee*, in low *Dutch Claveren*, and in *Engliſh* Claver or Clover graſſe, and Medow Trefoile or Three leafed graſſe, and of many alſo Hony ſuckles, becauſe Bees feede much on the flowers.

The Vertues.

Medow Trefoile both leaves and flowers are thought to be cooling and binding: but others thinke them to bee of a digeſting and ſuppurating qualitie: but *Dodonæus* who holdeth with the firſt opinion ſaith that they are held to be good to eaſe the griping paines of the guts and to avoyd thoſe ſlimie humours that ſticke unto them if the herbe be boyled and uſed in a Gliſter, which I thinke it cannot doe by any cooling or binding propertie: if the herbe be made into a pultis and applyed to inflammations it will eaſe them: the juice of it dropped into the eyes is a familiar medicine with many countrey people to cleare them of any filme that beginneth to grow over them and to take away the pin and web as they call it growne in them: it alſo allayeth the heate and blood-ſhooting of them. Countrey people alſo in many places doe drinke the juice hereof againſt the biting of an Adder, and having boiled the herbe in water they firſt waſh the place with the decoction, and then lay ſome of the herbe alſo to the hurt place: the herbe alſo boyled in Swines greaſe and ſo made into an ointment is good to apply to the biting of any venemous creature: the herbe alſo bruiſed and heated betweene two Tiles and applyed hot to the Share cauſeth them to make water who had it ſtopped before: it is held likewiſe to be good for wounds, and to take away ſcarres: the decoction of the herbe and flowers with the ſeede and roote taken for ſome time helpeth women that are troubled with the whites: the ſeede and flowers boyled in water, and after made into a Pultis with ſome oyle and applied helpeth hard ſwellings and Impoſtumes.

CHAP. XXXIII.

Trifolia alia. Other ſorts of Trefoiles.

THere are ſome other ſorts of Trefoiles which could not well be placed in any of the former rankes, not in that which muſt follow, and therefore I thought good to place them together in this.

1. *Trifolium falcatum.* Hooked Trefoile.

The leaves hereof are ſmall and like a Trefoile growing on weake ſtalkes ſpreading on the ground, at the joynts with the leaves on all ſides of the ſtalkes and ſo at the toppes, come forth foure or five ſmall yellow flowers ſet upon ſhort footſtalkes, which turne into ſmall crooked cods with very ſmall ſeede in them.

2. *Trifolium odoratum peltatum Creticum.* Sweete buckler Trefoile of *Candy*.

This Trefoile from a long ſlender roote full of fibres ſendeth forth ſmall ſtalkes an handfull high almoſt bare of leaves, having but few below and fewer on them, yet made into three round parted ones, a little dented about the edges, and ſtanding on long footeſtalkes: at the toppes of the ſtalkes grow foure or five ſmall pale yellow flowers ſtanding one above another on ſhort ſtalkes, after which ſucceede yellowiſh flat skinny cods almoſt halfe round with a prick or pointell at the end, with one or two ſmall flat ſeeds within them, which cods while they are young and greene are very ſweete, and eaten by poore people, but when they are full growen and hard are very bitter.

3. *Trifolium Creticum ſpinoſum.* Thorny Trefoile of *Candy*.

The whole plant hereof lyeth ſpread round above the ground, ſending forth divers ſquare ſtalkes about a ſpan long or more, full of joynts and branched out from them, where they are of a greeniſh purple into ſundry branches, having foure ſmall crooked thornes ſtanding at each joynt, two above and two below, at the joynts likewiſe come

2. *Trifolium odoratum peltatum Creticum.*
Sweete Buckler Trefoile of *Candy.*

3. *Trifolium ſpinoſum Creticum.*
Thorny Trefoile of *Candy.*

come forth on both ſides two ſmall ſtalkes of ſmall and long greene leaves of three parts, each ending in a ſmall pricke, with which alſo ſhooteth forth the ſmall ſtalkes with flowers, each one ſingly by it ſelfe, made of five ſmall blewiſh purple leaves ſtanding open like unto the flowers of Pimpernell but greater, with divers threads tipt with yellow and a long ſtile in the middle, after which ſucceede ſmall round heads pointed at the ends, which when it is ripe bendeth and hideth it ſelfe under the leaves, and openeth into five parts, in each whereof lyeth one flat and reddiſh ſeede, the roote is long with many fibres thereat.

The Place and *Time.*

The firſt *Cluſius* ſaith was ſent him by *Gregorius de Reggio* from *Bononia*, whereabouts he found it growing: the ſecond and third were of *Candy*, their time of flouriſhing being in the end of Summer.

The Names.

The names of theſe Trefoiles are expreſſed in their titles as their ſeverall authors have called them, for *Cluſius* as I ſaid made mention of the firſt in the *Appendix altera* unto his Hiſtory, and in his *Curæ poſteriores* and *Bauhinus* of the ſecond in his *Prodromus*. Of the laſt, both *Cluſius* in his Hiſtory, and *Bauhinus* in his *Phytopinax*, *Matthiolus* and *Prodromus* make mention, and ſay it is called *Orbitochorto* in *Candy*, *Cluſius* is much perſwaded that it is the *Tribulus terreſtris* of *Dioſcorides*.

The Vertues.

There is nothing particularly mentioned of theſe Trefoiles what phyſicall propertie they have, but being of the family may be referred unto them.

CHAP. XXXIV.

Trifolium Cochleatum ſive Medica. Snaile Claver or Trefoile.

OF theſe *Medicas* I have given you many varities in my former Booke, but there are ſome other omitted that ſhall be ſhewed in a Table together with thoſe formerly expreſſed, and there are others to be ſpoken of in this place which were not fit for that, and firſt with ſmooth ſhells, and then of thoſe that are prickly.

1. *Fœnum Burgundiacum ſive Medica legitima Dodonæo Cluſio etaliis.*
Snaile Trefoile of *Burgoine.*

This ſnaile Trefoile or Claver hath divers weake greene ſtalkes, with divers ſmall ſad greene Trefoile leaves ſet thereon without order: the flowers grow upon long ſtalkes comming from the joynts and toppes of the branches many cluſtering in a thicke ſhort tuft of a blewiſh purple in thoſe that grow in theſe parts, but in others

of divers and severall colours as more purple neare a violet, or paler blew, or of a browniſh blew, or of mixt blew and yellow colours, parted, and in ſome places of *Spaine* and *Narbone* in *France* with yellow flowers alſo: after which come divers ſmall ſnaile-like round cods ſet together not ſo much twined as many other *Medicas* are wherein lye ſmall pale ſeede: the roote groweth ſomewhat deepe with ſome ſtrings and fibres thereat abiding long.

2. *Trifolium Cochleatum polycarpon ſive Medica racemoſa.* Cluſtering Snaile Trefoile.

This hath branches lying on the ground a foote long and more, ſet with ſmall round Trefoile leaves on pretty large footſtalkes, the flowers come forth at the joynts upon long footſtalkes, ſmall and many cluſtering together and after them ſmall ſnaile-like ſhells a little rough. There is another hereof whoſe leaves are dented, whereas the former is not, and differeth not elſe.

Alterum.

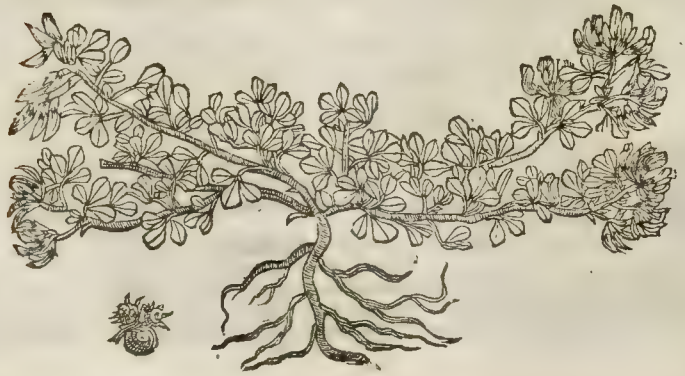
3. *Medica frutescens ſive flavo flore Cluſij.* Wooddy Snaile Claver.

This Snaile Claver hath ſundry hard, round and flexible weake ſtalkes not able to ſtand upright but lying on the ground, a foote long, divided into many branches, whereon grow ſmall long and narrow leaves by three on a long footſtalke, with a thicke middle ribbe on the backe of each, the flowers are ſmall and many together of a

1. *Fænum Burgundiacum ſive Medica legitima & aliæ ſpecies.* Snaile Trefoile of *Burgundy* with other ſorts.

3. *Medica frutescens ſive flavo flore cluſii.* Wooddy Snaile Claver.

4. *Medica marina.* Sea Claver.



yellow

yellow colour and ſomewhat ſweete, which are followed by divers ſmall flat twined cods like unto thoſe of the firſt but ſmaller, with ſmaller ſeede likewiſe in them: the roote is long conſiſting of long ſtrings which abideth long, ſhooting new ſtalkes every yeare.

4. *Medica marina.* Sea Claver.

The Sea Claver hath ſundry hoary trailing branches ſpread on the ground a foote or two long, with many ſmall and very hoary round trefoile leaves on ſhort footſtalkes: the flowers are many ſmall and yellow ſtanding at the ends of the branches and many ſmall writhed ſhells doe follow like unto other ſmall Snaile Clavers the roote is ſomewhat thicke and abideth long.

5. *Medica marina major ſpinoſa.*
Hard and thorny ſheld Sea Claver.

This Claver groweth bigger and greener then the laſt, the flowers are ſmall and yellow comming from the joynts of the branches, and but one at a place which are followed by ſmall hard and round prickly heads, whoſe windings are hardly to bee diſcerned, this periſheth yearely. There is another ſort hereof that differeth onely in the ſmalneſſe, which are the third and fift figure in the generall table of *Medicas*.

6. *Medica Arabica Camerarij ſive Trifolia cordatum.*
Hart Claver of *Arabia*.

This heart Claver hath very ſlender and ſmall weake branches full of joynts, and round greeniſh Trefoile leaves upon long footſtalkes at them, broad at the end and dented in, making the faſhion of a Hart as it is uſually expreſſed, with red ſpots in each of them: the flowers grow two or three together at the end of a ſtalke comming from the joynts ſmall and yellow, which turne into ſmall prickly twining heads like unto other ſmall *Medicas*: the roote is but annuall.

6 *Medica Arabica Camerarij ſive Trifolium cordatum.*
Hart Claver of *Arabia*.

Minor.

7. *Medica echinata parva recta & echinata rotunda ſupina.*
Lugdunenſis his creeping round prickly Claver of two ſorts.

8. *Medica Lunata & altera ſpinoſa.*
Moone Claver and Another thorny one.

7. *Medica echinata rotunda sive Tribulus terrestris minor repens Lugdunensis.*
Creeping round prickly Claver.

This round prickly Claver hath very long branches trayling on the ground, with very small trefoile leaves on them, the flowers are yellow, two or three at the most standing together, which turne into round rough or prickly heads, with small or no shew of twining to be seene on them, the roote is small white and thready. There is another growing more upright and with foure or five such small burres set together, else not differing from it.

Altera recta.

8. *Medica lunata.* Moone Claver.

The leaves hereof are small somewhat like unto the first true Claver, and dented about the edges, the flowers are yellow and the pods very like to those of *Maurantha* his *Cytisus*, but yet is not the same, this being an herbe and that a shrubbe or bush growing high. Other sorts of *Medicas* or Clavers are set downe in my former Booke of flowers, which together with all the other sorts are not there expressed, but since obteined, I have thought good to set in one table, those are not formerly mentioned are these, which *Medica tornata*, &c.

Medicæ tum novem species cum siliqua Scorpioidis leui.
Nine sorts of *Medicas* and a pod of the smooth Scorpion grasse.

9. *Medica tornata major & minoris leuis.*

The greater and lesse smooth *Medica*, turned like a Tun.

These two sorts differ not in their growing from the others but onely in their fruite, the greater whereof standeth singly one at a place, turned like to a Tun, and the lesser hath many together smaller, which two are expressed the two first in the generall Table.

10. *Medica tornata spinosa.*

The Thorny Tun like *Medica*.

This also hath the chiefe difference in the fruit, which is somewhat like a Tun, but a little thorny or more like unto a fine wrought haire button, many together which is the sixt figure in the Table.

The Place and Time.

The first groweth naturally both in many places of *Spaine* and in *France* neare *Mompelier* also, yet is it sowen in many places both there and in other countries, to serve for Hay for their Cattell and Horses and cut it often, for in *Spaine* they have no other hey which feedeth their Horses and maketh them exceeding fat, and so doe they in the Low countries, whereby their Kine give the more abundance of Milke: the others grow some in *France* others in *Spaine* or *Germany*, and some of them also are found in our fields and marshes, as at *Woolwich, Deptford*, &c.

The Names.

The first is taken by the most judicious of our later writers to be the μήδιον of *Dioscorides*, which as *Pliny* saith was brought from the *Medes* into Greece by the *Persian Darius* his warres there, from whence came the name *Medica* as the *Medicum malum* the Pomecitron was also: but now from *Italy* being brought and sowen for the benefit thereof in the fields of *Belgia* and the bordering places, and first in *Burgonie* or *Burgundy* hath altered the old name into *Fœnum Burgundiacum* and of late regained the old name, and called *Medica legitima*, none as it is said better agreeing with *Dioscorides* his description in all things then this: *Gerard* was much deceived in saying that *Lobel* his *Fœnum Burgundiacum* was the *Trifolium cochleatum primum* of *Dodonæus* in his last edition, for it is his *Medica* in the next Chapter following, as any that will compare them shall soone finde: the second is of *Bauhinus* in his *Prodromus*, but we having it growing plentifully in our land doe usually call it *Medica racemosa*: the third *Clusius* calleth *Medica flaue flore*, and *Bauhinus Trifolium sylvestre luteum siliqua cornuta sive Medica frutescens*, and *Tabermontanus Lens major repens* as he saith: the fourth *Clusius* first called *Medica marina* and so doe *Lobel. Camerarius* and others: the fift is of the number of *Boel* his *Spanish Medicas*, whereof wee had a dozen or foureteene sorts: the sixt *Camerarius* calleth *Medica Arabica* and is generally called *Trifolium cordatum*: the two next are *Lugdunensis* his *Tribulus terrestris minor repens* and *rectus*, which *Camerarius* calleth *Medica pusilla*: the two last are lately knowne. The first of these is by *Avicen* and the *Arabians* called *Cot* and *Alfal safat* but corruptly, by the *Spaniards Allafalfega* and *Alfalfes*, but by these of *Castile Mielguas*: by the *French Sainctfoin* and *Foin de Bourgongne*, we call it Medick, Fodder and Snaile Claver, or Trefoile.

The Vertues.

The use of this first herbe was in former times more to feede Cattell then in medicines, for it was held to be so powerfull to fatten their Horses and other beasts that they would stint them to a quantitie for feare of suffocating them, by growing thereby too fat, the greene herbe saith *Dioscorides* hath a cooling propertie, and for that purpose chiefely to be used, yet *Avicen* commendeth the oyle made of Cot or *Alfalsafat* against the tremblings of the heart, *Gesner* saith that a liquor drawen by fire out of the Alfalses of the *Spaniards* is good against the Stone, I suppose he meaneth an oyle drawen out of the seede, as the oyle from Almonds. *Plutarch* in his booke against *Epicurus* reciteth a pretty similitude taken from this *Medica*. Even as (saith he) the seed of *Medica* abideth a long time by reason of his many winding branches creeping on the grounde, and by his sharpe roughnesse, even so greese having fastened his crooked rootes in ones body, cleaveth thereto not for a day or a night, but for many yeares, and is hardly expelled but by other greeses as by stronger nailes. The rest here mentioned in this Chapter are not used against any disease that I know.

CHAP.

CHAP. XXXV.

Scorpioides. Scorpion graſſe or Caterpillers.

BEcauſe theſe plants come neareſt unto the *Medica*, both in their flowers, pods, & ſeedes, although differing in their leaves, yet I thinke I doe not greatly erre to ſet them at the taile of the reſt of the Pulſes, but I have given you the knowledge of two ſorts of theſe Scorpion Graſſes in my former Booke, there remaine three more to be remembred in this Chapter to finiſh this Claſſis of the Pulſes.

1. *Scorpioides Bupleurifolio pluribus corniculis aſperis.* Small ordinary Caterpillers with many cods.

This ſmall Caterpiller alſo groweth in the ſame manner with trailing long branches as the firſt ſmall rough ſort doth, the leaves are likewiſe of a freſh greene colour, and of the ſame faſhion, but ſomewhat leſſer: the flowers alſo are ſmall, and of a deepe yellow, foure or five oftentimes ſtanding together, which are of the ſame bigneſſe and faſhion with the other, but that it hath as many rough crooked cods together as there were flowers, the roote is very ſtringy but annuall.

2. *Scorpioides Bupleurifolio ſiliquis lenibus.* Smooth codded ſmall Caterpillers.

This other is in all things like this former ſort, but that it hath ſeldome two flowers together on a ſtalke, and the wormes that follow as few, being crooked and winding in the very ſame manner, are ſmall and ſmooth, without any roughneſſe at all, & of the ſame pale browne colour that it is, the figure whereof is with the *Medicas*.

3. *Scorpioides Matthioli ſive Portulacæ folio.* *Matthiolus* his Scorpion Graſſe, or with Purſlane leaves.

This Scorpion Graſſe of *Matthiolus* hath divers upright pale greene ſtalkes, and pale greene leaves ſet thereon, each whereof is ſomewhat long, broad, and round pointed like a Purſlane leafe, ſometimes having two ſmall leaves joyned at the bottome of the greater, and oftentimes in many without them; at the toppes of the ſtalkes, and out at the joynts likewiſe ſtand ſmall pale yellow flowers, much reſembling thoſe of *Medica* after which follow ſmall long ſlender and crooked hornes, ſmall at the end, joynted or parted, as it were, all the length of it ſomewhat reſembling the long crooked cod of the *Colutea Scorpioides*, but this is more conſpicuouſly joynted; and of a pale colour, within which lie ſmall long whitiſh yellow ſeede: the roote is long and fibrous, periſhing yearely.

The Place and *Time.*

Both the firſt were brought us out of *Spaine* by *Boel*, as the great one was alſo expreſſed in my former Booke: the laſt *Pena* ſaith groweth neere unto *Mompelier*, as well in their manured fields, as in their Vineyards plentifully.

Scorpioides Bupleurifolio major & minor. The greater and ſmaller rough Caterpillers or Scorpion Graſſe.

3. *Scorpioides Matthioli ſive Portulacæ folio.* *Matthiolus* his Scorpions taile or Caterpillers with Purſlane-like leaves.

The Names.

No author hath made any mention before now of theſe, except the firſt by *Lobel*, who called it *Scorpioides Bupleni folio repens*, & the laſt by *Matthiolus* by the name of *Scorpoides*, & the bare figure without any deſcription, and referred it himſelfe unto the *Scorpioides*, yet as he ſaith, it was controverted in his time by ſome learned men, that from the authoritie of *Nicander* his *Scholiaſte* would have it to be *Telopheum Dioſcoridis*. *Dodonæus* refuſeth that opinion, ſaying, it neither pleaſed him, nor many other learned, yet *Guilandinus*, *Anguilara*, and *Ceſalpinus*, and with them *Bauhinus* hold it to be the true *Telephium* of *Dioſcorides*: *Lobel* putteth it to the queſtion, whether it be that *Telephium* of *Cratevas* or no, and ſeemeth to leane to their opinion, ſaying they are not led thereunto by weake reaſons; yet becauſe *Dioſcorides* giveth to his *Teliphium*, and *Galen* confirmeth it a drying and clenſing qualitie, yet not very hot, and thereby conducing to heale foule ulcers, and the taſte of this pulſe is rather like the medow Trefoiles, I may, as I thinke yet continue it in ſuſpence; but that it ſhould be the *Clymenum* of *Dioſcorides*, as *Columna* ſeemeth to thinke, being in my judgement miſtaken, in making the leaves of this to be like the ſmall Ribwort Plantane, when as the other *Bupleurifolio* commeth neerer thereunto, then this, not having three ribbes to be ſeene in the leaves, I ſee leſſe reaſon, for *Dioſcorides*, ſaith *Clymenum* hath a ſtalke like the Beane, foure ſquare, but ſo hath not this, nor hath it thoſe *Polyperum cirrhi*; but that *Bupleurifolio*, hath indeede ſome reſemblance of theſe rough prickles, but not this which is ſmooth: *Bauhinus* alſo ſeemeth to make two ſorts of this, the other which he referreth to this which is uſually called *Scorpioides Matthioli*: the other he calleth *Scorpioides Portulacæ folio*; but I thinke he can finde no other *Scorpioides Portulacæ folio*, but this of *Matthiolus*, I have given my reaſon, let others correct with better if they can.

The Vertues.

The two firſt ſorts being plants lately made knowne to us, we know of no propertie they have: the laſt is, as I ſaid of the taſte of the Medow Trefoiles, and cannot therefore but be neare of the ſame effects. If it were the *Telephium* of *Dioſcorides*, it ſhould have a propertie in it to clenſe the body from the foule ſcurfe or leproſie: but muſt after ſixe houres that it hath beene annointed, be waſhed away with Barly water, but this herbe hath no ſuch clenſing faculties therein, nor yet to heale up foule ulcers, as is ſpoken before, that the propertie ſhould be in *Telephium* by *Galens* judgement.

CERE-

CEREALIA. CORNES.

CLASSIS DVADECIMA.

THE TWELFTH TRIBE.

CHAP. I.

Triticum, Wheate.

HAving finiſhed the Claſſis of the Pulſes, the next to follow in order unto them is of the *Cerealia*, that is, all the diverſities of graine and Corne, whereunto I will adjoyne with all the ſeverall Pulſages and orderings of them, as the old *Romanes* and *Greekes* uſed them in their times for their foode, as meate or drinke, or for medicine which are *Alica* or *Chondrus Crimnon*, *Tragus*, *Piſana*, *Zythum Curmi*, and the reſt: after which muſt follow the Graſſes (for that all the ſorts of Cornes are the moſt noble and uſefull kindes of Graſſes, and therefore preferred before them) Ruſhes, and Reedes.

To beginne then with the moſt noble Graine of all others, namely Wheate, it is of divers ſorts, ſome with beardes or aulnes, others without, ſome of a white colour, both ſtalke and eare, others with a redder, called red Wheate, and ſome blew or of other colours, ſome flat, others ſquare, ſome with ſingle heads, others with many, ſome with ſingle rowes, others with double; and ſome to be ſowne before Winter, and therefore called Winter corne, others onely in the Spring, called Sommer corne, : to give you ample deſcriptions of every ooe particularly, were to enlarge this Volume, and yet to ſmall purpoſe: I will therefore give you a deſcription of one that may ſerve for a generall explication of all the reſt, with onely ſuch differences as may not be omitted, and yet in as compendious a manner as may be.

1. *Triticum ſpica mutica.* Bare or naked hite Wheate.

The white Wheate riſeth up from the creeping joynted roote, with three or foure or more ſtalkes, with faire broad and long greene glaſſe-like leaves, at every joynt one, & at the fourth joynt uſually commeth forth the long eare or ſpiked head, one likewiſe on a ſtalke without any branches, which while the head ſtandeth upright bloometh ſmall yellow aglets, and when it is full ripe, boweth downe the head a little with the weight thereof, and is ſet with two double rowes of ſeede or corne, wrapped up in divers chaffie ſkins or cotes, and is when it is clenſed of a firme compact ſubſtance, ſumewhat yellowiſh and cleare with all, and is the chiefeſt Wheate of all making the pureſt white bread. We have in ſome countries of this Land another ſort of bearded Wheate, which the country men call a red ſtrowed Lammas; becauſe the ſtalkes are redder, or elſe little difference in the eare.

2. *Triticum ariſtis munitum*, Bearded or red Wheate.

This ſort differeth not in the manner of growing in any reſpects from the other, onely the head hereof is larger and redder than the former, with foure ſides ſeeming to be foure ſquare, and bended alſo: the meare whereof maketh not ſo pure white bread. *Lobel* calleth this *Triticum Loca*, from the *Dutch* appellation, and peradventure may be the *Faror Adoreum* of *Pliny*, &c.

3. *Triticum Lucidum.* Bright eared Wheate.

The eare hereof ſheweth plainely the difference, which is ſomewhat longer and greater, of a right browne blewiſh colour, long and rough, with beardes and aulnes, and the graine harder, and of a browner colour: this kinde is a courſe graine, yeelding much more branne than the former, making alſo a heavier and blacker bread. *Lobel* calleth this *Triticum Loca alterum. Lugdunenſis* ſeemeth to call it *Tragus*, and called, as he ſaith by the *French Bleturgnet*.

4. *Triticum multiplici ſpica*, Double eared Wheate.

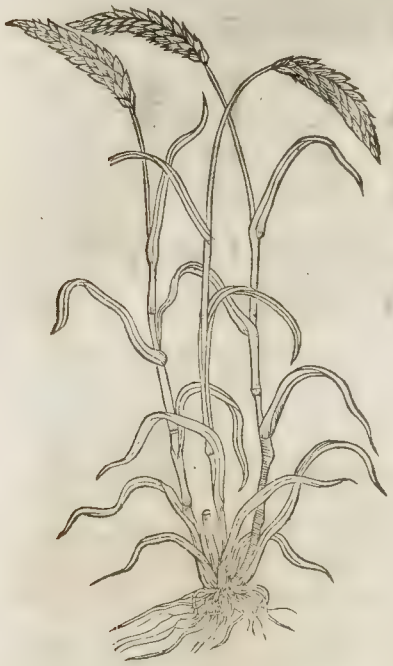
The double eared Wheate is likealſo unto the ſecond ſort, and differeth in the eare, chiefely which is ſhorter, and hath divers other ſmall eares riſing from the ſides of the greater, the beards or aulnes are ſhorter, and ſo is the ſtalke alſo: the graine it ſelfe is looſer and leſſe compact.

5. *Trifolium Creticum.* The wilde Wheate of *Candy*.

The wilde Wheate of *Candy* groweth in ſtalke and leafe like unto ordinary Wheate, the eares are ſomewhat rougher and blacker, the beardes alſo ſhorter, and the cornes leſſer and blunt at one end, more like to Rie than Wheate.

6. *Triticum*

1. *Triticum spica mutica.*
Beare or naked white Wheate.



2. *Triticum aristis munitum.*
Bearded or red Wheate.

3. *Triticum Lucidum.* Bright eared Wheate.

4. *Triticum multiplici spica.*
Double eared Wheate.

5. *Triticum Creticum.*
The wilde Wheate of *Candy.*

6. *Triticum Tripolitanum.*
Tripoly Wheate.

6. *Triticum Tripolitanum.*
Tripoly Wheate.

This Wheate being brought into *England* from *Tripoly*, was ſowne for experience onely to ſee what it would produce, it had ſtalkes two cubits high, with broader leaves than our Wheate, and eares an handfull long, with very long beards, and blackiſh graines like Rie within them. Peradventure this may be the *Zea Theophraſti.*

7. *Triticum trimeſtre.*
Summer Wheate.

This kinde hath narrower eares, longer beards, and ſmaller graines, and is onely to be ſowne and reaped as Barley is with us, yet as it is earlier ſowne in the warmer countries, ſo it will be the ſooner ripe, but will not endure the coldneſſe of our Winters. Wee have other ſeeming diverſities of wheate growing in our owne Land, well knowne in divers countries which they call by ſeverall names, as Duckes-bill Wheate, and Cone Wheate, &c. but I cannot ſay unto which of the Cornes, either of the ancients or of our times they may agree: And I finde that *Lugdunenſis* ſheweth ſome other kindes alſo of red wheate growing in the ſeverall parts of *France* and *Italy*, as namely one ſort growing about *Lyons*, which they call *Blerune*, and *Groſble*, whoſe eares have have no beardes, and whoſe graine is the largeſt and fulleſt of all others, yet not ſo good to make into bread as others, and therefore they there carefully husband it, that when they have hulled it, they boyle into a pultage with milk (as our furmentie pottage is) which they greatly affect, and he there ſaith alſo, that ſome would take it to be the *Far* or *Adoreum* of the old *Romanes*, whereof when it was hulled and boyled they lived for many yeares in the beginning of the citie, as *Liny* ſaith, *Primus antiquis Latio cibus, magno argumento in Adoreis donis ut diximus, pulte autem non pane vixiſſe, longo tempore Romanos manifeſtum eſt, &c.* for they liv ed on Pultage

7. *Triticum trimeſtre.*
Summer VVheate.

and

and not bread for a long time, thus saith *Pliny*: an other is called *Far Clusianum* brought out of *Italy*, which being sowne in fat ground, bare a stalke as high as a man, or higher, with sixe joynts, and as many leaves thereon: the eare an handfull long, the beardes very long and rough, the huskes many thicke and great, that contained a long slender graine, with a deepe furrow, & hard to be thrashed forth, wherof *Pliny* thus saith, it is not to be thrashed as Wheate and Barly, but must be parched as Millet and Panicke is, to be cleansed, and therefore must be sowne with the huskes on it. There is another also which they there call *Froument a six quarres*, that is, Wheate with sixe rowes of corne in an eare, and that in some places of *Savoy* they call it *Ble riguet*, because the eare is the strongest and roughest, and hath sixe rowes, when others have but foure: there is also another kinde of red Wheate about *Matisco* in the moist grounds, whose corne is slender and long, and therefore they call it *Long graine*, whereof for necessitie they make bread, but else they feede their Swine and Pullen therewith, and this may seeme like to *Galen* his *Bryza* of *Thracia*. There are also divers other varieties of Wheate, as *Lugdunensis* saith, with divers Nations which are very hardly knowne by their doubtfull and double significations.

The Place and Time.

Many of these sorts of Cornes have growne with us; but from whence some of them were brought, we know not, saving the double Wheate which groweth about *Lyons*, and that of *Candy*; the double Wheate, Summer Wheate, and that of *Candy*, are to be sowne in the Spring, the rest in Autume, and are reaped in *August*, or the end of *July* at the soonest.

The Names.

It is called in Greeke πυρὸς, in Latine *Triticum quod tritum ex spicis fit*, as *Varro* saith, as also σῖτος, that is, *frumentum a fruendo, id est, vescendo dictum quod culmus extulit ut ait Varro.* The first is generally called by all *Triticum* or *aristis carens*, and some take it to be *Robus*, *Lobel* calleth it *Siligo spica mutica*: the second (as also the other sort thereof) is called *Triticum aristis circumvallatum*, & *Loca* by *Lobel*, but most likely to be the *Robus* of the ancients *a rubore grani*, as this is; *Dodonæus* seemeth to make it *Triticum Typhinum*, and *Typha cerealis*: the third is the *Triticum Loca alterum* of *Lobel*, and set forth to be *Tragus* by *Lugdunensis*, and by others called *Triticum linidum* or *Lucidum*: the fourth is called *Triticum ramosum* by *Pliny*, and *Triticum multiplici spica*, by *Lobel*, but by *Tabermontanus Triticum Typhinum multiplici spica*: the fift *Honorius Belus* sent unto *Clusius* from *Candy* by the name of *Agriostari*, and so *Pona* in his *Italian Baldus* doth call it, and *Frumentum sylvestre Creticum*, but the figure that hee hath thereof doth not, in my minde, answer the description thereof not having any beardes: the sixe wee have called *Triticum Tripolitanum*, of the place from whence it was brought, but as I said, it may, in my minde be referred to *Zea*, as well from the place, as from the greatnesse of the growth: the last is called *Setanium*, and *Triticum trimestre* by *Lobel*. The *Arabians* call it *Henta* and *Hencha*, the *Italians Fourmento*, and *Grano*; the *Spaniards Trigo*; the *French Froument*, the *Germans Weyssen*, the *Dutch Terwe*, and we in *English* Wheate. It cannot but admire mee to reade the conceits of some of the ancients cocerning corne, why some should have beardes and others not, supposing that in a fertile field, the same kind would be without beardes or awnes, & in a leane ground it would have aulnes: and againe, that in a drie time or yeare it would be bearded, and in a moist not: againe, that great windes cause their beards to be broken, which the quieter doe not: and lastly, that the thicke sowing and growing, doth cause them to be without beardes, when the thinner bringeth them. *Galen* also writeth in his first Booke and last Chapter of the faculties of Nourishments, that both he and his aged father, who tooke delight in Husbandry, having sowed both Wheate and Barly very well cleansed from any other seede scattered or mixed among them, of purpose to prove whether they would change their natures into Darnell and Haver grasse; or whether these were naturall seedes of their owne kinde: found that much Darnell rose among the choise Wheate, and but little among the Barly: and that much *Ægilops* or Haver Grasse rose among the Barly, whereby it seemeth he doth confirme that currant opinion, that these and other graines & seed will change into others, either better or worse; but surely I could never meete with that Countrie or Husbandman that could certainely prove it (although some have averred it verbally & earnestly) that there was any such *Metamorphosis*, but that these & such like weedes too many by a great many; do spring up in the Corne fieldes, notwithstanding the greatest industry any man can use, I doe verily beleeve, because of the first curse of God upon the earth: and therefore to cleare the corne, they are faine to weede the fieldes; for the ground it selfe hath so much of the seedes of these weedes inclosed therein, that sowed it selfe before, and were not, nor could not be weeded out throughly, that although every seede were pickt that should be sowne, yet when it is Sprung, it will not want these weedes; and in this one point I doe beleeve was *Galen* and his Father deceived, who although they chose and cleansed their seede, yet they cleansed not sufficiently the field wherein they sowed their seed. And this may also serve for an answer to *Matthiolus* country men of *Anania*, who by tradition had received that opinion, as many also in our Land have, which sheweth the world is still willing to continue the old errors, but no certaine truth of transmutation or transubstantion, or transmigration, call it what you will, of their Barly into Haver-grasse, or wilde Oates: for let any man trie the truth hereof in his Garden that is well weeded before hand, and so continually kept weeded, and having sowne his Barly or Wheate, or any other graine each by it selfe; and so likewise Darnell, Haver-grasse, or any other seede, if he doe not finde the same seedes doe every one keepe their own kind, but degenerate into other kindes, let him then beleeve that opinion, and so will I, but not till then: for the barrennesse or fruitfulnesse, the moisture or drinesse of the earth with such like casually may make any herbe to grow smaller or bigger, which may seeme to be a kinde of change, but yet is no change of nature or kinde; but the alteration of herbes and flowers to be double, or to want a part of the forme from his originall, is but as we call it *Lusus* or *luxus naturæ*, and they will *redire ad ingenium*, as we say, as a man that is borne with some mishape or deformitie, as to have sixe fingers on a hand, to be borne with teeth, and such like, when as neither the parents, nor the succession proveth such continuall: For the word and appointment of God in nature must stand firme, who in the Creation, set this law to the Herbes and Trees that they should have their seede in them according to their owne kinde, and not according to another kinde.

The Vertues.

Galen saith, Wheate is in the first degree of heate, but neither drieth nor moisteneth evidently. yet *Pliny* saith it drieth. To eate the cornes of greene Wheate, saith *Dioscorides*, is hurtfull to the stomacke and breedeth wormes: a plaister made of leavened bread doth more digest, than that which is made of the Wheate it selfe, by reason of the

the leaven and ſalt therein, for leaven hath a power to draw and digeſt that which is farre off, *Pliny* ſaith that *Sextus Pompeius* that was troubled extreamely with the Goute, did put his Legges up to the knees into a great heape of Wheate, and thereby was eaſed often and holpen. *Pliny* ſaith alſo that the Cornes of Wheate toſted upon an Iron pan, and eaten is a pleaſant remedy for thoſe that are chilled with cold: the oyle preſſed from Wheate betweene two thicke plates of Iron or Copper heated, doth heale all dangerous tetters and Ringwormes on the face or chin, or other parts of the body, being uſed warme, and hereby ſaith *Galen* wee have knowne many to bé cured: *Matthiolus* commendeth the ſame oyle to be put into hollow Vlcers to heale them up, the ſame alſo is uſed for the chappes of the hands or feete by reaſon of cold, as alſo to make a rugged skinne ſmooth: the greene Cornes of Wheate being chawed and applyed to the bitten place by a madde Dog helpeth it: ſlices of Wheate bread ſoked in red Roſe water and applyed to the eyes that are hot, red and inflamed, or that are blood-ſhot helpeth them: hot bread applyed for an houre three dayes together, to the throate troubled with kernells or the Kings evill healeth it perfectly: the flower of Wheate mixed with the juice of Henbane doth ſtay the flux of humors to the joynts being layd thereon: the ſaid meale boyled in Vinegar helpeth the ſhrinking of the ſinewes ſaith *Pliny*, and mixed with Vinegar and Hony boyled together healeth all freckles ſpots and pimples on the face: Wheate flower being mixed with the yolke of an Egge, Hony and Turpentine doth draw cleanſe and heale any bile or Plague ſore or any other foule Vlcer, the Branne of Wheate meale is often boyled in the decoction of a ſheepes head, and it given in Gliſters to cleanſe and open the body, and to eaſe the griping paines of the intralls: the ſaid Branne ſteeped in ſharpe Vinegar and then bound in a Linnen cloth and rubbed on thoſe places that have the morphew, ſcurfe, ſcabbe or leproſie will take them away, ſo as the body bee well prepared and purged before; the decoction of the Branne of Wheate or Barly is found of good uſe to bathe thoſe places that are burſten by a Rupture: the ſaid Branne boiled in good Vinegar and applyed to ſwollen breaſts doth helpe them, and ſtayeth all inflammations, it helpeth alſo the bitings of Vipers, and all other venemous creatures. The Leaven of Wheate meale hath a propertie to heate and to draw, and in eſpeciall it rarefieth the hard skins of the feete and hands, as alſo warts and hard knots in the fleſh, being applyed with ſome ſalt: Starch moiſtned with Roſewater and laid to the cods taketh away their itching: the Waters that are made of the pureſt and fineſt volatile flower being put in water and drunke doth ſtay the Laske and Blooddy flux, and is profitably uſed both inwardly and outwardly for the Rupture in children; and boyled with Roſes, dry Figs, and ſome Iujubes maketh a fit Lotion to waſh ſore mouthes or throats, and when the kernells thereof are ſwollen and ſore: the ſame alſo boyled in water unto a thicke gelley and taken, ſtayeth the ſpitting of Blood, and boyled with Mints and Butter it helpeth the hoarſeneſſe of the throate.

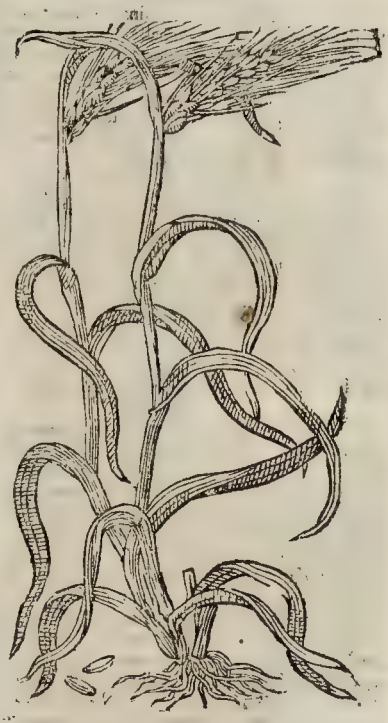
CHAP. II.

Zeopyrum ſive Tritico ſpeltum Lobelij. Baſtard Wheate.

VNto thoſe kindes of wheate I thinke it meete to adde this kinde yet a part by it ſelfe, being as a meane betweene Zea and Wheate, or Wheate and Barley, for as *Galen* ſaith *in* 2. *Aliment.* it groweth in the coldeſt places of *Bithynia*; as alſo neare unto divers cities in the further parts of *Phrygia* which *Homer* alſo ſpeaketh of, and as the name ſo is the nature thereof, for the bread of it is by ſo much worſe then Wheate, by how much it is better then *Bryza* of *Thrace*, thus much is *Galens* relation. *Dodonæus* from *Tragus* hereunto applyeth the figure of a Corne, which as *Tragus* ſaith the *Germanes* call *Kern* and *Drinkelkern*, and is the ſame that *Lugdunenſis* calleth *Zeopyrum gymnocriton*, and *Lobel* taketh to bee that kinde of Graine which is brought from beyond Sea unto us and ſold at the Apothecaries by the name of *Hordeum nudum* or *mundum*, *French* Barley, *Tragus* deſcribing it ſaith thus, it is in ſtalkes, joynts and eares likeſt unto *Zea*, the Corne is not much differing from Wheate, but yet is not encloſed in Huskes as *Zea* is, but is eaſily rubbed forth, and is of a yellowiſh colour like Wheate: it is ſowen ſaith he in certaine places of *Germany*, to ſerve both for bread, & for the Kitchin to boyle in brothes and Tiſanes, for which purpoſes it ſerveth in the ſtead of Barley; *Lugdunenſis* alſo thinketh that this is very like if not the ſame kind of Wheate that *Ruellius* ſaith the *French* call *Scourgeon*, as if it were ſaid *Succurſum* or *Subſidium gentium*, whoſe Graine is ſmall, lanke and of a darke colour.

The Place, Time, Names and Vertues hereof are ſufficiently expreſſed in the deſcription, and therefore there needé no more to be ſaid of it.

Zeopyrum ſive Tritico ſpeltum.
Baſtard wheate.



CHAP.

CHAP. III.

Zea. Greeke Wheate.

THere are ſome other ſorts of Cornes that more properly may be accounted kindes of Wheate, then of any other ſort of Graine, and therefore are to be entreated of before either Rie or Barley in their ſeverall orders, and firſt of that Graine which the ancients called *Zea* a diſtinct Corne differing from others, and by *Dioſcorides* ſaid to be of two ſorts (although *Theophraſtus* and *Galen* have made mention but of one, (which is the *Dicoccos* of *Dioſcorides* as it is thought, the one *Dioſcorides* calleth *Dicoccos* the other *ſimplex* but firſt I thinke good to ſet downe the *Zea* of *Theophraſtus* as he deſcribeth it.

1. *Zea Theophraſti & antiquorum.* The Zea of the antients or Greeke Wheate.

The Greeke Wheate riſeth up with many ſtrong joynted high ſtalkes and leaves on them moſt like unto Wheate the Eare is plenifull in Cornes as *Theophraſtus* ſaith, (bare without beards as *Lobel* and ſome others have thought yet *Lugdunenſis* ſetteth it forth if his bee true *Zea* with beards, for *Theophraſtus* maketh no mention thereof) whoſe Graines are incloſed in many chaffie huskes, being the lighteſt of others which are not ſo eaſily beaten out as wheate, and is very pleaſant to all creatures: the rootes are many, and ſtrongly faſtned in the ground whereby they draw much nouriſhment out of the ground, deſiring a rich ſoile, and thereby quickly draweth forth the heart of the ground. This is the trueſt deſcription of *Theophraſtus* and the ancients *Zea*, eſpecially drawen out of the ninth Chapter of his eighth booke of the hiſtory of Plants. Vnto which of all our graines or of thoſe that the later writers have referred it unto, this may agree thereto in all parts I cannot finde, for neither *Matthiolus* his *Spelta* nor *Lugdunenſis* his *Zea* are naked but bearded, nor can it agree with *Camerarius* his *Zea ſpica mutica*, nor yet with *Tragus* his third *Zea ſpica mutica*, having neither ſtrong nor tall ſtalkes, nor yet many growing from ſuch a buſhie roote as *Theophraſtus* giveth to his, unleſſe it may be ſaid it is degenerated, for *Theophraſtus* in the eighth Chapter of his eighth Booke ſaith that no Corne is ſo apt to be metamorphoſed wholly into others as *Tipha* and *Zea*, but I thinke their tranſmigrations of plants are as likely as their tranſmigrations of foules.

2. *Zea dicoccos ſive Spelta vulgo.* Spelt Wheate or Spelt Corne.

The Spelt Corne is in ſtalke and leafe ſomewhat like unto Wheate but not riſing ſo high, the Eare is ſmaller and not orderly ſet in rowes: the Cornes grow double, that is two together, but not incloſed in one huske as many have thought, but in ſeverall huskes and hardly to be thraſhed out, which then ſomewhat reſemble Wheate: the roote is plentifull in ſtrings and fibres.

2.3. *Zea dicoccos ſpica mutica & monococcos ariſtis munita.* Spelt Wheate and S. *Peters* Corne.

3. *Zea monococcos ſive ſimplex ſive Bryza* S. *Peters* Corne.

This ſpringeth up with a ſingle ſlender and ſhort ſtalke, but firme, bearing a ſmall thinne ſpiked eare, ſet with rough beards like Barley alſo, being as it were flat, with the Cornes ſet onely on two ſides, every one conteined ſingly in a huske, which are as *Tragus* ſaith of a darke red colour, and the Eare alſo, but in ſhape like Wheate or Barley, which maketh blacke bread, and of an ill taſte as *Mneſitheus* told *Galen*.

The Place and *Time.*

The firſt was anciently ſowen in *Greece*, *Aſia* and the Eaſt countries, and accounted by them to bee next in goodneſſe unto the fineſt Wheate, being a Winter Corne: the ſecond is ſowen in many places of *Italy* and *France*, and will abide in a moiſt ground holding firme the Winters injuries, yet proſpereth beſt in a more fruitfull dry ſoile, and is a Winter Corne ſowen in *September* and *October* and reaped in *July*. The laſt is a Summer Corne growing in many places of *Italy*, *&c.* where but in want of better they make no bread of it.

The Names.

It is called in Greeke ζέα and ζείa in Latine alſo *Zea* which *Gaza* tranſlateth *Semen*, taking it as it is likely from *Pliny*, who before him ſaid that *Zea* was *Far* or *Adoreum*, which was called alſo *Semen*, as the moſt ſingular Corne of any other. The ſecond is thought by many to be the *Zea* of *Theophraſtus* and *Galen*, but as I ſaid it is more likely to bee the *Zea* of *Dioſcorides* (for theſe two authors have in many things given names to Plants the one farre differing from the other as may bee knowne by the *Mandragores*, the one ſo farre differing from the other as though they had not lived in one and the ſame countrey or rather in one and the ſame world) and is therefore generally called by moſt writers *Zea dicoccos*, and peradventure was the old *Romanes Far* and *Ador*, or *ſemen Adoreum* of the later *Romanes*, and is now called Spelta: the laſt is variably called by divers. For *Matthiolus* calleth it *Zea ſimplex* and referreth it to *Dioſcorides* his ſecond *Zea*, which moſt do call *Monococcos* and is thought to be that *Briza* of *Galen* which he ſaw in the fields of *Thracia* and *Macedonia* and tooke it to be

be *Zea*, which is a forcible argument in my judgement, that *Zea* is bearded, and called *Spelta* by *Dodonæus*, *Lobel* and *Lugdunenſis*, as alſo by *Tragus* and *Cæſalpinus*, or *Frumentum Monococcum* by *Dodonæus*: the *French* call the ſecond *Eſpeaute*, the *Germanes Spelt*, *Welſche Weyſon*, and *Romſche Weyſen*, and the laſt S. *Peters Korn* and *Ein Korn*, the *Italians Pirra*, and in ſome places *Biadaas*, *Matthiolus* ſaith, and by that name have I received ſuch a Corne out of *Italy* as you ſhall finde it ſet downe at the end of the deſcription of the ſecond ſort of Barley.

The Vertues.

Galen ſaith his *Zea* is in a meane betweene Wheate and Barley, and *Dioſcorides* ſaith it nouriſheth not ſo much as Wheate, yet more then Barley yet is acceptable to the ſtomacke.

CHAP. IIII.

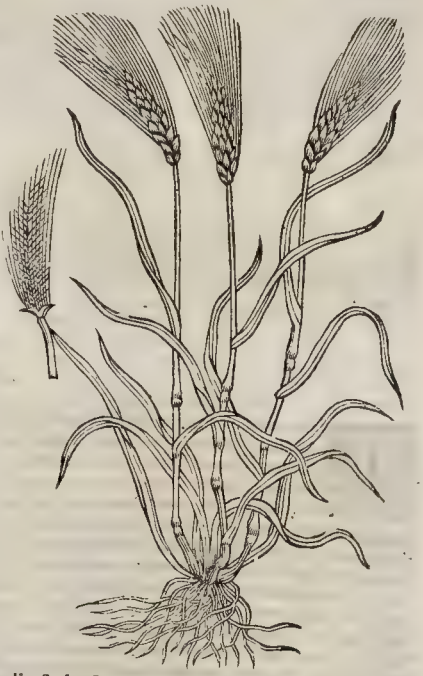
Tipha ſive Triticum Tiphinum. Light Wheate.

THe *Tipha* riſeth up with a ſingle and ſlender ſtalke or ſtraw, the eare is long and round, bearded with long hard ſharpe aunes ſomewhat cloſely ſet together, the graine is ſmall and light but hard, and of a redder colour then Wheate, incloſed in divers chaffie huskes hard to be beaten out: this groweth well in a leane ſoyle and deſireth not a ritch or fat ground as *Zea* doth.

2. *Triticum Tiphinum alterum ſive Hiſpanicum.* *Spaniſh* Light Wheate.

This other light Wheate differeth from the former in theſe particulars, the ſtalkes are ſhorter then Wheate, and ſlenderer, the eare is ſmall and bearded, with long and ſharpe aunes like Barley, the Graine or Corne is ſomewhat like Wheate but leſſer and yellower, and is incloſed but in ſingle huskes eaſie to be beaten out, which ſheweth it to be differing.

1. 2. *Tipha Dodonæi & Triticum Tiphinum Hiſpanicum.* *Dodonæus* his Light Wheate and that of *Spaine*.



The Place and *Time.*

Tragus ſaith that the firſt is moſt ſowen in the mountainous places of *Alſatia* and ſeldome in any other of the countries of *Germany*, and eſpecially becauſe their wilde Swine that will bee feeding upon and deſtroying any other Corne will not touch this or very hardly, becauſe the ſharpe aunes will pricke them, and if they ſhould take much of it, it would quickly hurt them and oftentimes choake them: the other groweth in *Spaine* and in the *Canaries* as *Lugdunenſis* ſaith, for it is often found among the Canary ſeede that is brought from thence, and are both Summer Cornes, that is, ſowen in the Spring and reaped in the end of Summer.

The Names.

It is called is Greeke τίφη and *Tipha* in Latine, but of our later writers *Tipha cerealis* and *Triticum Tiphinum*, that it may bee diſtinguiſhed from the other *Tipha* the mariſh plant called Reede Mace. The firſt is not knowne to any in our Land but remembred by *Dodonæus* and *Tragus* as his third ſort of Wheate: *Lugdunenſis* ſaith that *Dodonæus* is much deceived, in thinking this *Tipha* was that which the French men called *Meteil*, and they of *Lyons de la Meſcla* (that is our Maſlin) being a mixture of Wheate and Rie ſowen together.

The Vertues.

Galen ſheweth that the bread that is made of *Tipha* is pleaſant, and much deſired both by countrey men and citizens, if it be eaten hot, & is better then that which is made of *Olyra*, yet if it grow to be two or three dayes old and then eaten, it will lye heavie on the ſtomacke and hard to bee digeſted: ſome doe thinke that this is the ſweete Corne, that *Homer* ſheweth *Hector* ſpeaking to his Horſes promiſeth to give them, for as it is ſaid it may bee given Horſes without any harme when as Wheate cannot.

CHAP. V.

Olyra. Soft Wheate.

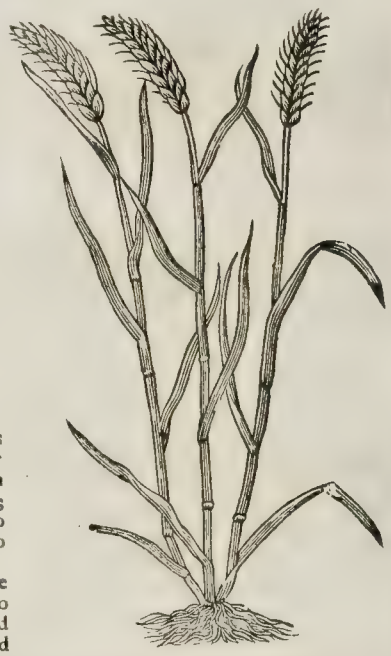
THis ſoft Wheate (or *Amelkern* as *Dodonæus* ſaith the *Germanes* called it) groweth as great and high as wheate, the eare is ſharpely bearded like Barley, whoſe graines or cornes being incloſed in chaffie huskes like unto *Zea*, are being cleanſed like unto Wheate.

The Place and *Time.*

This groweth ſaith *Galen* as well as the other in *Aſia*, &c. and *Pliny* ſaith in *Egypt*, *Syria*, &c. as alſo in *France* and *Italy*, but *Matthiolus* ſaith he knew of none growing there in his time. It is ſaith *Dodonæus* ſowen in divers

places of *Germany*, and is a Summer Corne as many thinke, yet saith himselfe *Olyra* and *Far Clusinum* are Winter Cornes.

Olyra. Soft Wheate.



The Names.

Ὄλυρα in Greeke is called *Olyra* also in Latine, *Gaza* translateth it *Siligo* (which *Pliny* saith maketh the sweetest bread and hee altered it to *Siligo* which maketh the finest white bread) yet *Pliny* doth not say that it is *Siligo*, although *Hermolaus*, *Budæus* and *Ruellius* did so thinke, for *Lugdunensis* saith he can finde no such thing in *Pliny*; who saith it is the *Arinca* of the *Gaules* being proper to their country. *Dodonæus* calleth it *Amyleum frumentum* from the *Germanes Amelkern* as is said before, and thinketh it also to bee the *Far Halicastrum* of *Columella*, and not much to differ in any thing from the *Oriza Germanica* of *Tragus*, who called it also *Far candidum*, and *Tragus cerealis*, thinking *Tragus* to bee a kind of graine of it selfe, when as it is but a kinde of meate or pultage made of Corne, as *Alica*, *Chondrus*, &c. are, as shall bee shewed hereafter. I have rather called it Soft Wheate after the minde of *Theophrastus* who calleth it *prædicto mollior*, then Starch Corne after the *Germane* name.

The Vertues.

It is so neare the propertie of *Tipha* as *Galen* saith that it is in goodnesse next unto Wheate, and that the worst *Olyra* is equall to the best *Tipha* after the bread made of it is a day or two old, but else being eaten hot *Tipha* is farre better then *Olyra*. *Pliny* saith that of *Olyra* is made the sweetest bread; *Bellonius* declareth through all *Turkie* they much delight to eate hot bread or cakes, and some sop them in wine and so eate them.

Having now shewed you all the kindes of Wheate, let me a little enforme you (although not without some trouble to my selfe, but much varietie and discordance among the old writers) of the severall sorts of meates, or pultages, and drinkes made of these kindes of Wheate (for those things that are made of Barley shall be shewed after Barley) which the ancients used for their sustenance and medecines for many hundred yeares, whereof most if not all are quite exiled from use now a dayes, and first of *Far*.

CHAP. VI.

Of *Far*.

THis word *Far* is very variably understood and applyed by the old writers: for first it is taken for a kinde of Wheate or *Zea* as some take it, as *Pliny* sheweth in his 18. Booke and 8. Chapter, where reckoning up the diversities of Wheate, *Vulgatissima* (saith he) *Far quod Adoreum veteres appellavere*, *Siligo*, *Triticum*, *hæc plurimis terris communia*, and in the tenth Chapter of the same Booke bee saith, *Ex Arinca dulcissimus panis*, *ipsa spissior quam Far & majore spica*, *eadem & ponderosior*, and in other places, but I desire with what brevitie I can to shew it. Secondly for the pultage made of that Wheate as *Pliny* in the seventh Chapter of the said eighteenth Booke saith, *Populum Romanum tantum ex farre & frumento trecentis annis usum Varrius tradidit*, *quo tempore nullus fuit Alicæ usus*. Thirdly it is taken for all other kinds of graines themselves as some thinke, or rather as I thinke for the Pultages made of them as by *Columella* appeareth, who hath *Far Adoreum*, *Far Triticeum*, *Far Hordeaceum*, and *Pliny* saith *ex Olyra in Ægypto Far conficitur*. And lastly it is taken for the fine meale of that Wheate called *Far* or *Adoreum*. *Dionisius Halicarnasseus* saith that the old *Romanes* did call their marriages φαρρικία, because the married couple did eate of that *Far* together. Some of our moderne writers have taken *Far* to bee the same with *Alica*, because of the neare manner of their preparations: but as shall be shewed this of *Far* differeth from that: *Archigenes* in *Ætius* setteth downe the manner of the preparation hereof in this manner. The Wheate is steeped a while in water, and being taken from thence is cast into a Morter where it is clensed from the huskes and afterwards layd in the Sun and rubbed with the hands untill it bee fully clensed, which being done it is broken a little grossely, so as every graine may bee broken into foure or five peeces, and being dryed is kept to use after the manner of *Alica* that is boyled. Some also take the greene eares of Wheate and thereof make more pleasant meate and desired then the other. This pultage doth very well retemble our boyled Wheate, which countrey people doe put into dishes when it is hot, and so to bring it to sell in our *London* markets by the name of Dish Wheate, and Bowle Wheate, which being boyled in milke maketh pottage called Furmentie pottage.

CHAP.

CHAP. VII.

Of *Siligo*.

THis also is diversly understood by the ancients, for first it is taken for a kinde of Wheate as *Pliny* saith, *l.*18.*cap.* 9. *Siliginem proprie dixerim Tritici delicias conveniens tractibus humidis*, and againe *cap.* 10. *Siligo nunquã maturescit pariter, &c.* and *Columella* saith that after *Robus*, which is chiefely to be sowen: the second sort saith he is *Siligo*, which is the chiefest for bread: and in another place nameth *Siligo* and *Hordeum* that they can endure *veris tepores*. Secondly it is taken for a faultie or degenerate Wheate, as *Columella* saith, *Omne triticum solo ligneso post tertiam sationem vertiturin Siliginem.* Thirdly it is taken for the finest flower of Wheate both by *Pliny* in divers places, by *Celsus* and *Iuvenall*. By *Pliny* thus, *Iustum est è grano Campaniæ quam vocant castratam, è modio redire sextarios quatuor Siliginis.* And in another place *è Ptisana autem Siliginis sextarios quinque. Celsus* saith *Ex tritico firmissima Siligo deinde Simila, infirmior ex polline, infirmissimus cibarius panis*: where note that *Pollen* is here taken by him to be a courser sort of flower then *Simila*, as *Cibarius panis* is said to be the worst, and *Iuvenall* in his Satyrs saith,

Sed tamen & niveus mollique Siligine factus
Servatur domino.

CHAP. VIII.

Of *Crimnon*.

WEe finde much diversitie recorded of *Crimnon*, first that as *Galen* saith it was wont anciently to be made of Wheate, as *Alica* or *Chondrus* was of *Zea*: then that *Crimnon* of the Græcians, and *Simila* or *Similago* of the Latines is the courser meale of the husked graine called *Far* whereof they made their pultage; againe *Dioscorides* saith *lib.*2. *c.* 83. and 84. that *Crimnon* is the courser meale of *Zea*, and of white Wheate, as also of *Olyra*. It (saith he) nourisheth much, but it is (hardly made some reade, but others) hardly digested, and it bindeth very powerfully, especially if the *Zea* whereof it is made be first parched.

CHAP. IX.

Of *Chondrus* or *Alica*.

XOndros of the Græcians seemeth to take the name *quasi granum* for the excellencie, and *Halica* or *Alica* of the Latins, *ab alendo* from nourishing, for all authors have so translated *Chondrus*, (although *Ægineta* maketh *Chondrus* & *Alica* to be two severall sorts, but he is contradicted by all Latine writers;) & is diversly also understood by the old writers; first for a kind of graine, as *Pliny* in reckoning up the kindes of former Cornes nameth *Millet*, *Panick*, *Lentills*, *Cicers*, *Alica*, and *Galen primo alimentorum* saith *Alica ex genere tritici est*, and *Paulus Ægineta* saith *Chondrus* is like unto Wheate but more glutinous; but more usually for the most excellent meate or pultage that was used in those times: *Dioscorides* saith *Halica* is made of *Zea* called *dicoccos*, *Galen*, *Paulus Ægineta* and *Ætius* shew in many places of their workes that it was made also of Wheate and other sorts of Corne: but that *Far* and *Halica* were different sorts of meate is shewed sufficiently by *Pliny* and others, for *Pliny* saith *lib.*18. *cap.* 8. *Aliud esse Zeam è qua fit Alica, aliud vero Far*, and in the Chapter before, the old *Romanes* lived onely of *Far* made of Wheate 300. yeares, and in the 22. Booke and 25. Chapter he saith that *Halica* was a meate lately knowne, and as he thinketh not in use before the time of *Pompeius magnus*. The manner of making it *Pliny* setteth downe *lib.*18. *cap.* 11. *Alica* saith hee is made of *Zea* first steeped in water, then beaten in a woodden morter, for a stone morter would breake it too much: the best is made by the painefull labour of those that were bound to their pestell (yet the chiefe men had one of Iron) the huske being beaten off it was againe beaten in the same manner, that the naked graine might be broken, and is of three sorts, the smallest, the second and the greatest, yet saith he it had not the whitenesse that commended it untill Chalke were put to it, which gave it colour and tendernesse, and afterwards a fourth part of *Gypsum* (whereof it seemeth that *Pliny* himselfe seemeth to wonder they should added) but it is likely they were washed away before they were used as *Galen* sheweth, that their brothes must bee heedefully observed to bee made of *Alica* being washed. *Dioscorides*, *Galen* and *Pliny* doe much commend the good nourishment it maketh; for saith *Pliny*, no man doubteth but that it is exceeding profitable, whether it bee taken washed with Mede or boyled in broths (which *Galen* calleth *Chondroptisana*) or pottage, and that if the old Græcians had knowne it, they would not have written so much in praise of *Ptisana*. *Dioscorides* saith it nourisheth more then Rice, & bindeth more also, and is more profitable to the stomacke: being boyled in Vinegar and applyed it helpeth the Leprosie, taketh away the ruggednesse of the nailes, and is helpeful in the beginning of a Fistula in the eye, the decoction thereof easeth their paines that have a Laske or the blooddy flux.

CHAP. X.

Of *Athera*.

DIoscorides saith that *Athera* is made of *Zea* finely ground, but is made into a kinde of supping like liquid pappe, and given to Infants, and is also used in pultesses to be applyed outwardly. But there be some authors that affirme it was made also of Wheate, *Olyra* and *Amylum*, and thereupon have set it down that the Booke Binders Paste is this *Athera*.

CHAP. XI.

Of Tragus.

THis also hath beene diversly interpreted by writers, some taking it for a kinde of graine by it selfe, namely the *Triticum lucidum* as is said before, because *Dioscorides* seemeth to say it carrieth a shew of the graine *Alica*, and herein *Galen* also followeth him, but in stead of ὀρύζιον of *Dioscorides* hee hath ὀλύρα when as *Alica* as I shewed you before, is not properly a graine by it selfe but is made of Corne: and *Galen* himselfe in the said Booke *primo Aliment.* saith that *Tragus* is a thing made, and like unto *Alica* of the best *Olyra*, husked as it ought to be, then boyled in water, which being poured away, eyther sweete wine or honied water was put to it, and Pine kernells steeped in water untill they were much swollen: he likewise saith *lib. 1. Hip. de rat. victu in morbis acutis. Ptisanam igitur rectè præferri frumentaceis edulys, pani scilicet, chondro & Zeæ ex qua fit Tragus*: and *Pliny lib. 18. cap. 7. Extritico Tragus ptisanæ conficiendæ vulgata ratio est*. And againe, *Simili modo ex Tritici semine Tragus fit in Campania duntaxat & Ægypto Cassianus Bassianus in Geoponicis lib. 5. cap. 13.* saith it was made of the Wheate of *Alexandria*, which by most authors is *Olyra* (for it there groweth best) steeped and husked, and dryed in the Sunne often untill it were cleane from the shales: whereby wee may plainely see that all sorts of graine were husked, and so ordered into divers manners of meate, and called by divers names according to the graine or countrie: it is hard of digestion as some reade, or as others, it is hardly made, and doth loosen the belly more.

CHAP. XII.

Of Amylum.

THis was made as *Dioscorides* sheweth of Summer Wheate, and also of *Zea*, streeped three dayes and nights till it be soft and tender, the water then powred gently from it, and other fresh water to bee powred on it, and then troden with the feete till all the course huskes be cleane taken away, by letting the finer part passe through a Sive, which then being dryed in the most hot scorching Sun is so kept to be used. *Cato* sheweth that it was made of *Siligo*, *Pliny* saith of all sorts of Wheate as well as of *Siligo*, but the best of Summer Wheate; it was so called saith he because it was made without a Mill. It is used against defluxions into the eyes to heale hollow Vlcers therein, being drunke it stayeth the spitting of blood being put into Milke and taken it helpeth the roughnesse or hoarsenesse of the throate. *Amylum* saith he is made also of *Zea* (and so saith *Cato* also, and of Wheate saith *Pliny*) steeped and washed as is above said: but saith he it hath no use in Physicke: but we use it often for coughes and in defluxions.

CHAP. XIII.

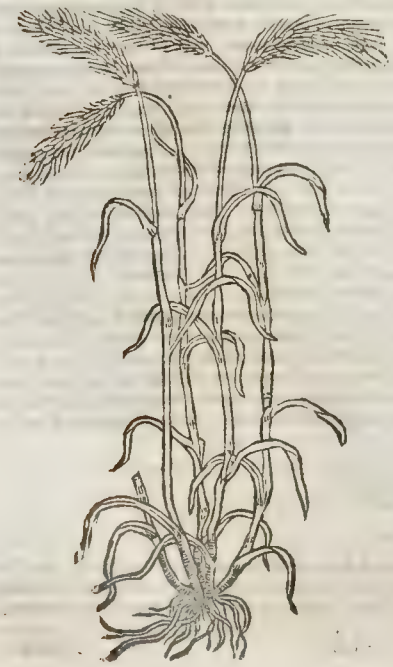
Secale. Rie.

OF this kinde of graine besides the common knowne sort, there is two other remembred, the one by *Tragus*, *Dodonæus* and *Lugdunenses*, the other by *Bauhinus* as you shall presently understand.

Secale vulgatius. Common Rie.

Our common Rie is so well knowne in all the countries of this Land and to the countrey people in especiall who feed most thereon, that I shall seeme as it were but to teach them that wch they know

1. *Secale vulgatius.* Common Rie.



Vstilago Secalina. Burnt Rie.

better

better than I, that is, that it first ſpringeth up ſomewhat reddiſh, which afterwards groweth greene, and bringeth forth divers jointed ſtalkes, ſomewhat higher than Wheate, bearing at their toppes ſmaller eares than Wheate, ſet in ſhort rowes, with ſhorter and ſharper, rougher, and more prickly awnes: the graine within being ſmaller and lancker, and blacker than Wheate, and is not wrapped in huskes like Wheate; but eaſily fallling of it ſelfe out of the eare when it is ripe: while it flowreth the eare ſtandeth upright and being neare ripening it bloweth it downe: the rootes are many, but not ſo thicke buſhing as Wheate, nor conſuming the fertilitie of the ſoyle ſo ſoone as Wheate.

2. *Secale æſtivum ſeu minus.* Small or Summer Rye.

This other Rye groweth lower with fewer ſtalkes, a ſhorter and leſſer eare, yet armed with awnes as the other but fewer; the graine or corne alſo is leſſer, and is ſowne in the Spring onely, and herein conſiſteth the difference.

3. *Secale latifolium.* Rye with great leaves.

This Rie hath whiter ſtalkes then others, round alſo and ſtraked, the leaves that are ſet at the joynts are much larger then the common ſort, being a cubit long and an inch broad, ſomewhat ſharpe or rough about the edges like the ordinary Rie: the eare at the toppe is large and great, ſet with ſharpe long awnes, and as it were dented like the vulgar a full hand breadth, the graine within is alſo like unto Rie, blackiſh but greater then it, being almoſt like Wheate: the roote likewiſe buſheth like the roote of Wheate.

The Place and *Time.*

The firſt is generally ſowen in all theſe Northerne regions and more in *Denmarke*, and thoſe more Northerly parts then elſe where, their climate not ſerving ſo well for Wheate, and ſowne in *October* and *November*, and the ſecond in *Aprill* onely, and are all ripe in *Auguſt* uſually: the laſt is brought out of the Eaſt countries, and *Bauhinus* ſaith he had onely the leaves and the Eare out of *Signor Contarino* his Garden.

The Names.

This hath not found as yet any Greeke Father to name it, but is generally called in Latine *Secale* of *Pliny*, and is his *Farrago* alſo, yet *Farrago* is in many places of him, *Varro*, *Columella*, and others, taken for a greene fodder for cattell, as *Pliny* ſheweth how to make a *Farrago* of Wheate, *Columella* of Barly. *Varro* ſaith, *Farrago* was ſo called, either *quod far ferro cæſum fuit, aut quod primum a Farris ſegete Farrago ſeri cæpta fuit*: but the true *Farrago* is underſtood by the beſt Authors now adayes to be no other things than Barly. *Tragus* and ſome others tooke it to be *Siligo*; *Cordus* on *Dioſcorides* to be *Olyra*; ſome others to be the *Tipha* of *Theophraſtus*, which for diſtinction ſake is called *Typa cerealis*, and becauſe the *Dutch* call it *Rogghe*, therefore *Dodonæus* maketh a Latine name of it, and calleth it *Rogga*: Both in our countrie, and in others, they have a cuſtome to ſow Rye and Wheate neare of equall parts in their fields, which they call Maſſlin, as well in the fields, as in the meale: the *French Meteil* & *du Maſcle*, as I ſaid before, *quaſi Miſcelanea ſeges*; and the country people and meaner ſort with us make it their uſuall bread corne, being better than cleane Rye, and worſe than Wheate. The firſt is remembred by all Authors; the ſecond, both by *Tragus*, who calleth it *Siligo æſtiva*, *Dodonæus Secale æſtivum*, *Lugdunenſis Secale alterum*, and *Bauhinus Secale vernum vel minus*: the laſt is mentioned onely by *Bauhinus*, who calleth it *Secale latifolium*, and ſaith he had it out of the noble *Contareno* his Garden, a *Magnifico* of *Venice*. The *Italians* call it *Segale*; the *Spaniards Centeno*; the *French Secle*, and *Segale*: the *Germanes Rocken*, and the *Dutch*, as I ſaid, *Rogghe*, and we in *Engliſh* Rye.

The Vertues.

Rye is of a more clammy ſubſtance than Wheate, and neither is digeſted ſo quickly, nor nouriſheth ſo well, yet it is accounted to be next in goodneſſe unto Wheate, eſpecially if the corne be ſweete and good, and the bread well fermented and baked, and giveth a ſolide and firme nouriſhment to the body. The medicinable qualities are, it is more digeſting than Wheate, the bread and the leaven thereof ripeneth and breaketh empoſtumes, biles, and other ſores with more ſpeede. The meale of Rye put betweene a double cloth, and moiſtened with a little vinegar, and heated in a pewter-diſh, ſet over a chaffingdiſh of quicke coales, and bound faſt to the head, while it keepeth heate in it, doth much eaſe the continuall paines of the head: the aſhes of Rye ſtraw put into water, and ſuffered therein a day or a night, and the chappes of the hands or feete waſhed therewith, doth heale them, ſaith *Matthiolus*.

CHAP. XIIII.

Hordeum, Barly.

WE have two or three ſorts of Barly growing with us in ſundry parts of the land, which I meane here to ſhew unto you, and with them one other not ſo well knowne unto us.

1. *Hordeum diſtichum.* Beare Barly or common Barly.

The common Barly hath ſhorter and tenderer ſtalkes than Wheate, the leaves are ſhorter, broader and rougher, the eare is ſhort ſet with two rowes of cornes in very good order, each enclo-ſed in a huske, and having a long rough awne or beard thereat, which is greater and longer than Wheate, and whiter alſo, and doth not eaſily, or of it ſelfe fall out of the huske: the roote is great, and ſpreadeth much, having the more ſtore of ſtalkes riſing there from, to ſupply the ſlenderneſſe of the eare.

2. *Hordeum diſtichum minus.* Bigge Barly.

This other differeth not from the former, but that it is ſmaller, both ſtalke, eare, and corne, and is ſowne the lateſt, and reaped with the ſooneſt; ſome doe take this to be *Turkie* Barly, but I ſomewhat doubt that, for having a graine growing in my Garden, taking by ſome to be *Turkie* Barly, which is ſomewhat like this *Hordeum diſtichum*, that is with a ſmall bearded eare of two rowes: the corne it ſelfe was like a Barly, but ſmaller: the huskes was brighter and channelled as it were, or furrowed on the one ſide, and round on the other, the kernell being nearer to a Wheate than a Barly, and eaſily comming forth of the huske; I am more than halfe perſwaded it is the *Zea Monococcos* or *Briza*. We have another ſort hereof likewiſe, whoſe corne is a little ſmaller and whiter,

1. *Hordeum Diſtichon.*
Beare Barly, or common Barly.

2. *Hordeum polyſtichum.*
Square Barly.

called Sprit Barly not differing elſe: if there be a Barly that hath no ailes or awnes ſaith *Lobel*, and ſo doe I, I know it not

3. *Hordeum polyſtichum ſive hybernum.* Winter Barly, or ſquare Barly.

This kinde groweth like the former, both in ſtalkes and eares, differing onely in not having ſo many ſtalkes riſing from the rootes, and that the eares are ſet with more rowes of cornes, in ſome foure, in ſome five or ſixe, and that it is ſowne earlier than the former.

4. *Hordeum hexaſtichum vernum.* Naked or bare Barly.

This other Barly that hath many rowes of cornes in the eare, differeth not from the laſt, but in theſe two particulars, the cornes incloſed in the huskes, have not that skinne on them that the other hath, being lanke ſmall, yellow, and ſhort, almoſt like Wheate, but leſſe, and is ſowne in *Aprill* and not before, and is not ſeene or ſowne by any almoſt in this land.

The Place and *Time.*

The firſt is our uſuall Barley in all the South parts of this Kingdome; the other in the North parts onely; the third is likewiſe reaſonable frequent in our Land; but the laſt, although it be rare, yet we have had and ſowne it in our Gardens, and was ripe in the beginning or middle of *Auguſt*: we have not heard by any, that any kinde of Barly hath beene ſowne before Winter in our Land, although *Lobel* ſaith ſo.

The Names.

It is called in Greeke κρίθη in Latine *Hordeum*: the firſt is generally ſo called as it is in the title: *Tragus* & *Cordus*, *Hordeum minus*, and by *Columella Hordeum Galaticum*, as I thinke, or elſe the ſmaller ſort of this kinde, becauſe it is whiter; the third *Lobel* ſaith is reaſonable frequent in this Land, he meaneth in the Weſt parts where his chiefe reſidence was in his former dayes, for it is ſcarſe ſeene or knowne in the parts about *London*. *Tragus* calleth it *Hordeum majus*. *Cordus hyemale*; and others *polyſtichum*: the laſt is called by *Lobel Hordeum polyſtichum vernum*, & is moſt likely to be that which *Galen* calleth *Gymnocrithon*, that is *Hordeum nudum*, by which name I had it from a friend, and may be alſo the *Cantherinum* of *Columella*, which hee ſaith, the country men called *hexaſtichum*: wee have a ſmall kinde of graine brought from *Germany* to our Druggiſts in great quantitie, termed *French* Barly, and is probable to be this Barly, which *Cordus* ſaith, was firſt ſent them out of *Italy*, having ſixe rowes in the eares, and not much unlike Wheate, but leſſer. *Cordus* hath ſet downe more ſorts hereof, which I thinke fit to ſhew you here: the two ſorts of Barly *Diſtichon* and *Hexaſtichon*, this of ſixe rowes, that of two in the eare, ſaith *Cordus*, is common with us, *fol.* 42. *in Dioſcord.* yet that which hath but two rowes in the eare, maketh a recompence in the roote by the greater number of ſtalkes that riſe from thence, for ſaith he, I have numbred ſixtie ſtalkes and above riſing from the roote of one corne, but it uſually hath twentie, thirty, and fortie ſtalkes; but beſides theſe two,

ſaith

saith he, they have in *Germany* foure other sorts: the first hath the whitest, heaviest, and greatest graine of all the rest, and called by the country men of *Hassia Andachi*: the second beareth a little smaller graine, and hath fewer rowes, and is a *Semestre*, and is therefore called by the *Germanes Winter-gerste*, that is, Winter-Barly: the third is sowne in the Spring, and is ripe in Summer, and therefore they call it *Summer-gerst*, that is Summer Barly: the fourth may properly be called, saith he *Trrmistre*, because it is early, and cut ripe in the third moneth after it is sowne: this they call *Kleine Gersten*, and *Zeytgerste*, or as the *Saxons* doe *Tstgerste*, that is a small Barly, or one for the present: they sow it either three dayes before, or three dayes after *Pentecost*. Thus much *Cordus*. The *Arabians* call it *Xahaer*, or *Shair*, the *Italians Orzz*, the *Spaniards Cevada*; the *French Orge*, the *Germans Garsten*, the *Dutch Gerste* and *Soverion*, as *Lobel* saith; and we in *English* Barly.

The Vertues.

Barly and Wheate are the prime graines of all others, and the most profitable and useful for mans life, both for meate, drinke, and medecine, all the rest being as it were but degenerated from them, and partaking of the one or other of the natures and qualities of them; yea Barly may seeme to contend with Wheate for prioritie, as well as use, for although Wheate be the staffe of our life for bread now adayes in our *Europe*, yet it was not so with the antient *Athenians* in the *Levant*, and other of those parts of the world now, where Barly holdeth a further extent that Wheate; but this place will not permit that ample discourse might be said of it; & howsoever we acknowledge according as the antients have recorded of it, that it nourisheth lesse than Wheate, because it is a drier graine, yet besides the medicinall qualities in it, it maketh more wholsome drinke for our bodies, than what can be made of Wheate alone, which is too sweete, and too much stuffing the body with humours, and puffing it up with loose spungious fat nd flesh, making them that use it unweldy and unfit to follow their necessary affaires; but hereof enough for this place. Barly in all the parts and compositions thereof, except Mault, is more cooling than Wheate, and a little cleansing, being in the first degree of cooling and drying: it provoketh urine, saith *Dioscorides*, it breedeth windinesse, and is adverse to the stomacke; but all the preparations thereof, as Barly water, or creame *Tisane* drinke, or those other things made thereof, doe give great nourishment to macilent and hecticke and diseased persons, or troubled with feavers or agues, and heates in the stomacke, &c. and many of them have beene, and still are received for good nourishment to the healthfull: the preparations, as they were anciently used, and those that are now in use with us, I meane to speake hereafter severally; I onely meane to shew you here how it is otherwise used. A pultis made of Barly-meale or flower boyled with vinegar and hony, and a few drie figges put to them, dissolveth all hard Impostumes, and asswageth inflammations being applied: and being boiled with Melilot and Camomill-flowers; and some Linseede, Fenugreeke, and Rue in powder, and applied warme, it easeth the paines in the sides and stomacke, and the windinesse of the spleene: the meale of Barly and *Psyllium* Flea-wort boiled in water made into a pultis, with hony and oyle of Lillies, applied warme, cureth tumors under the eares, throate, necke, and such like places: a plaister made thereof with Tarre, Waxe, and Oyle, helpeth the hard swellings of the throate, called the Kings Evill: boyled with sharpe vinegar into a pultis, and laid on hot, helpeth the leprosie: being boyled in Red-wine with Pomegranate-rindes, and Mirtills, staieth the laske or other fluxe of the belly: boyled with Vinegar and a Quince, it easeth the hot paines of the gout: Barly-flower, white Salt, Hony, and Vinegar mingled together, is used by divers to take away the itch speedily and certainely: the water distilled from the greene Barly in the end of *May*, is very good for those that have defluxions in the eyes, to stay the humours, and to ease the paines being dropped into them, or white bread laid to steepe therein, and bound thereto: if Barly halfe sodden be given to Hennes, that hardly or seldome lay Egges, it will cause them to lay both greater and more often.

Now I am come to shew you both what hath beene in former times made of Barly, as what is used to be made there famong us in these dayes: first I thinke it fit to speake of those preparations the ancients used, and then of those which we use.

CHAP. XV.

Of Polenta.

Polenta (which may well be called parched Barly) was antiently made after divers manners, for *Pliny* in his 18. Booke and 7. Chapter, sheweth that some Grecians used to make it as well of greene Barly taken out of the eare before it was ripe, steeped in water, and after beaten in a Morter, and washed in Baskets to take away the huskes, then dried in the Sunne, and afterwards steeeped and beaten againe, untill it was throughly clensed, and then dried and ground small, unto twentie pound whereof howsoever made, was put of Linseede, and Coriander seede, of each one pound and a halfe, and about two ounces of salt, all being well bruised, they mingled together. The *Italians* made it of parched Barly, without any moistening, ground small, and those things added thereunto aforesaid, and some Millet seede also. Other *Grecians* saith *Pliny*, made it of Barly moistened for a night, and then dried it, and parched or fryed it the next day, and then ground it. *Galen* commendeth that most that was made of fresh Barly, before it was throughly ripe, and the beardes or awnes over-dry, and but indifferently parched, and addeth nothing else unto it Sundry Nations did use this *Polenta* in stead of bread, and namely the *Cypriots*, who although they had Wheate growing with them, yet most used this. This drieth more than Barly it selfe, and bindeth the belly, being drunke with red wine, and allayeth inflammations; and drunke with water it quencheth thirst: it was often eaten with a little new wine, or sodden wine put unto it as every one liked.

CHAP.

CHAP. XVI.

Maza.

MAza is but *Polenta*, parched Barly moyſtened with ſome liquor, as every one thought meete, for ſome uſed nothing but Water, others put to it both water and oyle together, as *Heſychius* ſaith, and ſome as *Hippocrates* ſheweth, did put ſweete wine to it: and ſome put honey alſo: *Galen* declareth that *Maza* of it ſelfe doth hardlier digeſt in the ſtomacke, and doth trouble the belly with winde, if it abide long therein, but it doth the ſooner paſſe downe if it be much turned, and honey be put to it.

CHAP. XVII.

Of Ptiſana.

PTiſana the moſt prayſed and prayſe-worthy drinke, ſupping or pultage (call it how you will) was uſed anciently to be made of divers ſorts of graine, and not altogether of Barly, for they had their *Chondro Ptiſana* made of *Zea*, *Pyrina Ptiſana* made of Wheate, and *Pliny* ſaith that *Italy* which was abounding in Rice, made *Ptiſana* thereof, which others made of Barly, and *Galen* alſo ſheweth it was made of Pulſe, for he nameth *Phacoptiſana* that is made of Lentills, but *Ptiſana* ſimply without any other addition, is alwayes underſtood of Barley, onely husked for the excellency thereof. The manner of making it is ſet downe by divers authors, as *Pliny*, *Galen*, *Dydimus*, and others, but becauſe *Hippocrates*, who is accounted the Prince of Phyſitions, wrote a whole Treatiſe in prayſe thereof, I will here ſet downe his words of making it fit for meate or medicine. Take, ſaith, he of the beſt Barley, and moyſten it with water, let it ſo reſt for 3. or 4. houres, then put it into a courſe bagge, and beate it with a mallet or peſtell of wood, untill it have caſt off the huskes, which then being waſhed, to take them away, drie it in the Sunne, and keepe it to uſe as occaſion ſerveth as *Polenta*: but to make it *Ptiſana*; it is to be boyled gently in water untill it breake, and that the liquor be thicke like creame, which then is lenifying ſweete and lubricke or ſlippery, and being moderately liquid, quencheth thirſt, it hath no aſtriction, nor moveth perturbations, nor ſwelleth in the ſtomacke, for all the ſwelling is tooke away in the boyling, it ſticketh not in the breaſt or ſtomacke, but by the lubricitie is eaſily digeſted and quencheth thirſt, by the moiſtening qualitie: theſe properties, ſaith *Galen*, recorded by *Hypocrates*, are availeable, both for the ſicke and for the ſound: *Dioſcorides* further addeth; the creame of *Ptiſana*, by reaſon of the boyling, yeeldeth more nouriſhment than *Polenta* that is made of Barly, and is profitable to helpe the ſharpeneſſe and roughneſſe of the throate, and all exulcerations. This was the manner of the ancients *Ptiſana*, for their manner of making and uſing; but our Phyſitions in theſe times uſe onely Barly husked and boyled in water, and then beaten and ſtrained, putting ſome blanched Allmonds or Pompion ſeede, or other cold ſeedes beaten, and ſtrained with ſome Sugar and Roſewater; and this is their moſt uſuall *Tiſane* or Barly creame. Some appoint Barly to be leſſe ſodden, which is called Barly-water, and therewith is made either *Tiſane* drinkes by adding Licoris, Raiſons of the Sunne, Maidenhaire, or the like, for ſuch as are troubled with coughes, ſhortneſſe of breath, &c. or elſe with Almonds or cold ſeedes, make it into an Almond milke, with Suger and Roſewater, or given to hecticke or macilent and weake bodies: the Barly water alone, or made into a Julip with Syrope of Violet, or Lemonds, or the like, is a fit drinke for thoſe that have hot or burning feaver on them, or are otherwiſe diſtempered with heate, or uſed with ſome pectorall Syrupes for the cough, ſhortneſſe of winde, hoarſeneſſe, or the like. There yet remaineth *Zythum*, and *Curmi* of the ancients to be ſpoken of, and both, as *Dioſcorides* ſaith made of Barly, which becauſe wee ſuppoſe in theſe dayes, they did point to our Ale and Beare, which are made with Mault, the ſubſtantiall part of the driukes; I thinke meete firſt to ſpeake of Mault.

CHAP. XVIII.

Byne ſive Maltum. Mault.

Tius onely uſed this word *Byne* which by all is referred to Mault, and as the by manner of making ſet downe by him is ſhewed plainely: *Maltum* is a word made Latine from the *Germans Mauth* and our Mault, both ſignifying one thing, that is, that manner of prepared Barly, as is fit therewith afterwards to ſerve to their uſe, that would make of it either Ale or Beare: the manner of making is as I take it in all countries alike without difference, and ſo well knowne to all that it is in a manner needeleſſe for me to ſet it downe, thereby to enforme any that having ſpent their time wholly thereon as being their profeſſion, can tell better how to enforme me, but as in all the reſt of this Worke, my endeavours are to enforme & ſhew thoſe that not knowing will not refuſe to heare and underſtand, and thus it is Barly is laid in water to ſoake for two or three dayes and nights, which being ſwollen in that time, the water is drained from it, and is afterwardes ſpread equally on the floore of a garner, or ſuch like place that is cloſe, about halfe a foote thicke, and covered with clothes or other things warme, untill it beginne to ſproute ready as it were to grow, (which will be performed within two or three dayes, if the weather be warme, or not very cold, or elſe it will lye longer) then doe they turne it before it grow too hot, two or three times a day for a weeke or tenne dayes, both to coole and to drie it, then doe they bring it to the kill, and there dry it throughly with fire made of ſtraw, or other ſuch like light ſtuffe, to cauſe it to have the ſweeter reliſh, for being dried with bavens or wood, the mault will taſte bitter of the ſmoake and is ſoone perceived in the drinke, which will taſte bittter. This mault before

before it can be uſed, is to be ground a little, and then ſerveth it for the Brewer to uſe. If Mault being ground, be fried and applied in a bagge, or double cloth hot to the ſides or belly, pained with ſtitches or gripings, occaſioned by cold or winde, it giveth much eaſe and helpe, and being made into a pultis, aſſwageth tumors and ſwellings.

CHAP. XIX.

Of Zythum.

THeophraſtus and *Dioſcorides* onely, and no other authors before them, that I can finde, have made mention of *Zythum*, what it is, or whereof it was made, and yet they are ſo ſhort therein, that we rather underſtand this by others relation, which thing ſheweth it was ſo common a drinke there in thoſe places of Greece, &c. that they thought it not worth their labour further to explane it, even as *Diſcorides* hath done the like with many herbes that were moſt common in thoſe times, for he onely ſaith it is a drinke made of Barly and no more: *Diodorus Siculus* ſaith that *Zythum* is a drinke made of Barly, and was uſed in *Galatia* where was neither wine nor oyle: *Pliny* after him hath a little further explained it by ſaying, Of ſundry ſorts of Graine drink is uſed to be made, as *Zythum* in *Egypt*, *Celia* and *Cerea* in *Spaine* (which as it is likely was ſo in *Pliny* his time, and that before their planting of Vines there which hath generally now baniſhed that Barly broth, they now drinking eyther faire water alone or with a little Sugar, or to their water put more or leſſe wine as they deſire to drinke it) *Cereviſia* and other kindes of drinkes in *Gallia*, and other countries, thus ſaith *Pliny*: Now the generall Tenet of our times is that it is the ſame drinke which we now call Beere or Ale, or but varied according to the manner of the countrey where it is made, and a ccording to the goodneſſe, quantitie and diverſitie of the graine whereof it is made, and alſo of the water: for firſt for the water, it is well knowne that there is no Beere can bee made in the low countries by reaſon of their brackiſh water, but will taſte thereof, and be farre inferiour to that is made in *England*; and againe it is obſerved by many, that the water of our River of *Thames* about *London* doth make better and ſtronger drinke (keeping equall propoſition in all things) then that which is made of other Spring or River water elſe where: and for the goodneſſe of the graine and the well ordering and making it into Mault, it is well knowne alſo to make the drinke better or worſe ſtronger or weaker; the diverſities of graine alſo cauſeth diverſitie of drinke: for if it ſhould be made of Wheate alone it would be too thicke, too ſweete and fulſome as I ſaid before, or of Oates alone it would be too poore and thin: and for the quantitie that is all in all to make it mightie & durable, even two or three yeares, or poore and weake not to laſte a moneth. But *Petrus Bellonius* in his ſecond booke of obſervations and 98. Chapter is of opinion that this *Zythum* of the ancient Græcians is the ſame drinke that the Latines called *Poſca* or *Puſca*, wherof *Columella*, *Serapio* and *Avicen* alſo make mention: but differeth as hee ſaith from *Cereviſia* Ale, becauſe it is white like milke, thicke and of a good nouriſhment, and fuming into the head cauſing drunkenneſſe if it bee too largely taken: and this kinde of drinke ſaith hee is uſually ſould in all the cities of *Aſia* in the tappe houſes appointed for it, and generally called with them *Chouſſet*; and to ſtrengthen his opinion alledgeth the place in *Suetonius*, where hee relateth that *Ceſars* bondman that fled from him, was found at *Capua* ſelling *Poſca* in a tappe houſe, and therefore that *Poſca* could not bee *Oxycratum* (which is Vinegar and water) but this *Zythum*, but *Scaliger* in his annotations upon *Bellonius* as they are extant in *Cluſius* his *Exoticks*, ſheweth his manifold errours in this his ſo ſaying: the manner of making this *Chouſſet* of the Turkes I thinke not amiſſe breefely here to ſet downe, that you may ſee the differences of the compoſitions of drinkes in ſeverall places. It is made ſaith he of meale made into paſte and boyled in a great Caudron, and then being made into ſmall balles is caſt into water, which will preſently boyle up of it ſelfe and grow hot without the helpe of any fire, and become a kinde of thicke drinke: The ſpume or yeſt thereof, ſaith he, is white and light, wherewith the *Turkiſh* women uſe to annoint themſelves, eſpecially when they are in bathing, making the rough skinne ſmooth and delicate, and this faculty the ancients attributed unto *Zythum*: and further *Dioſcorides* ſaith, *Zythum* provoketh Vrine but hurteth the reines and the ſinewes, eſpecially the tunicles that cover the braine, it breedeth windineſſe maketh ill blood and humors, and engendreth the falling ſickneſſe.

CHAP. XX.

Of Curmi.

THis likewiſe hath no further relation or explanation from *Dioſcorides*, then that it is alſo a drinke made of Barly and was often uſed for drinke, nor yet by *Pliny* further then as is ſhewed before, that *Cereviſia* was made in *Gallia* and other kindes in other countries. We therefore in theſe times referre this *Curmi* to our Ale as wee did formerly *Zythum* unto Beere, and withall let me ſhew you that Ale was the moſt ancient drinke was made in this Land, whereof the *Welſh Curw* (which is Ale with them in their Language) hath a ſhew of neare correſpondence to *Curmi*, and that our good Ale was better knowne to other nations by the word then by the forme or taſte, but with us became a proverbe, that it would make one have a rich face and noſe (meaning by the red pimples it would raiſe on their faces and noſes that did uſe to ſtand to it and drinke it ſtoutly) yet a ſtranger both ſeeing it and taſting it here in *England* gave his verdict thereon in theſe words, *Nihil ſpiſſius dum bibitur, nihil clarius dum mingitur, unde conſtat multas fæces in ventre reliquit.* But *Cereviſia* which we more properly transferre to Ale is as it ſeemeth by *Pliny*, a word well knowne before his time, and more proper to *Gaule* or *France* then to *Italy*, as the matter it ſelfe alſo was, and which from them as it is likely hath beene transferred to us. This old *Engliſh* drinke hath loſt much of his reputation ſince that *Biera* Beere came in uſe, and nothing ſo much deſired as formerly it was, partly becauſe

our

our Ale in moſt places of this Land now adayes is not ſo well boyled to make it cleane and cleare drinke, being ſo muddy ſweet & fulſome, that many loath it, at leaſt refuſe it for that cauſe, and in eſpeciall becauſe Beere is a clearer drinke and of better reliſh by the boyling, but chiefely that the hoppes make it more durable without ſowring, leſſe fulſome and much more wholſome. It remaineth now that I ſhould ſhew you the properties of Beere and Ale for medecine what diſeaſes they will helpe and what cures they will performe. The graines, that is, the Mault that is left after the drinke is drained therefrom, beſides the fodder it yeldeth for all Cattle or Pullane, are of ſingular good uſe for thoſe that are troubled with lameneſſe in their Legs or Feete, through cold or evill humors fallen into them, or by the ſhrinking and paines in their ſinewes or joynts, if they ſet their Legs up to the knees into a Barrell or Firkin filled with theſe graines while they are hot, or heated againe if they be cold, which will by uſing three or foure times as occaſion requireth, abate both ſwellings and painers and reſtore the joynts and ſinewes to their proper ſtrength. Strong or good Ale ſodden ſo thicke, that as hony it may be ſpread like a ſalve, and applyed warme to the necke or throate troubled with the Kings Evill giveth much eaſe; and ſundry by the uſe thereof have alſo found much comfort for their ſinewes and joynts that have had much paine and weakeneſſe in them; the Yeaſt of Ale ſerveth our white Bakers of London in ſtead of Leaven, to cauſe their bread to riſe as Leven doth, which elſe would be ſad and heavie unfit to bee eaten: Of good Ale likewiſe diſtilled with other herbes, ſeedes, ſpice, as of Balme, Angellica, Aneſſeedes, &c. and divers other the like is made an excellent good *Aqua vitæ* as they call it, or ſtrong Balme water, &c. but of the dregs of Ale or Beere diſtilled the vulgar ſort of *Aqua vitæ* is made. The properties of Beere and Ale are very like, and therefore whatſoever is ſaid of the one may very well be referred to the other, For of them is made Diet Beere or Ale, by putting in Spices or purging things, according as the patients diſeaſe requireth, and as the Phyſitians can appoint.

CHAP. XXI.

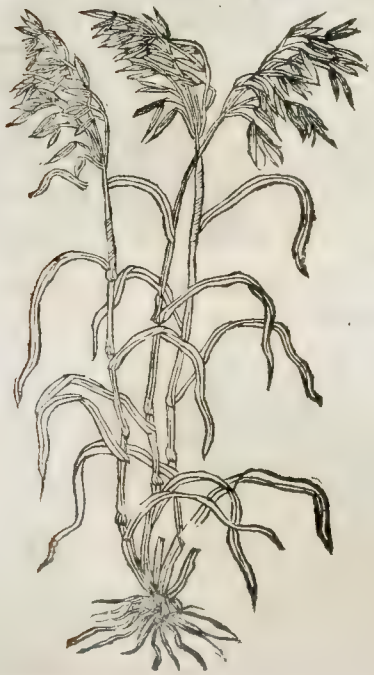
Avena. Oates.

THere are onely two ſorts of Oates that may juſtly challenge any place among the Graines or Cornes which are the ordinary ſowen field Oates, and the naked Oates, for the wild Oates are moſt truly reckoned among the Graſſes.

1. *Avena veſca.* Manured Oates.

The ordinary Oates groweth up with divers tall joynted ſtalkes and leaves ſomewhat reſembling Wheate, bearing at the toppes a large ſpread tuft of many pointed aglets, hanging downe like ſmall winged birds from ſmall thread-like ſtalkes, within every one of which huskes lyeth a ſmall and long round graine, ſomewhat like unto Rie, but longer and more pointed: the roote is ſmall and thready.

1. *Avena veſca.* Manured Oates.



2. *Avena nuda.* Naked Oates.

2. *Avena nuda.* Naked Oates.

The Naked Oates grow in all points like the former, saving that the graine being somewhat smaller and whiter, lyeth not so fast enclosed in the huskes, but is very easily rubbed out with ones hand.

The Place and *Time.*

They are both sowen in our fields in sundry places, yet the naked Oates nothing so frequent, and doe love rather a moist cold ground then either hot or dry, and are usually the first seede is sowen upon these grounds that were woods and stocked up, they are Sommer cornes, that is, sowen in the Spring and mowen in Autumne.

The Names.

It is called in Greeke βρῶμος and βρόμος, and in Latine *Avena* peradventure say some it may come of βρῶμι, *quod cibum significat*, because as *Plinie* saith the people of *Germany* lived hereof: but I am no *Pythagorian* to beleeve *transmigratio animarum*, nor of *Theophrastus* or of *Plinie* his beleefe, that Oates are made of *Zea* as *Theophrastus* saith, or that Barly is changed into Oates as *Pliny* saith, but it is wonderfull that so great learned men in naturall Philosophie should be carried away with such strange and erronious opinions: but these and many more the like were too frequent with most of the old writers, as is plainely seene in many places of their workes. For howsoever there is a *lusus naturæ* many times, and in many things and plants, as by over aboundance or by defect or lacke of the just parts, yet that any one transmutation of one *species* in plants should be into another, I never saw nor can beleeve any can shew, naturally so growing other then casually as before said, unlesse as God of stones can make bread and of water wine, it come miraculously, which if it should so happen supernaturally it, must not be accounted any law or course in nature: but of this enough here, I have spoken else where somewhat more to this effect. All authors that have written of these two graines, doe so little vary their titles of them that they may easily be knowne: the *Arabians* call it *Chartall*, the *Italians Vena*, the *Spaniards Avena* and *Avea*, the *French Avoine*, the *Germanes Habern*, the *Dutch Haver*, and we in *English* Oates and Haver also.

The Vertues.

Oates as *Galen* saith are somewhat cold and drying withall, and thereby doe helpe the laske of the belly, yet is it temperate and nourisheth little, like unto Barly saith *Galen*, but *Pliny* saith the *Germanes* lived thereon which is very true, for to this day they doe so in many places, and even in some countries with us also, as *Lincolneshire*, *Lancashire*, *&c.* they make it not onely their bread corne or make cakes, &c. thereof, but they make it also into Mault, and thereof make their drinke, and are thereby sustained & live in as good health and strength of body, as those that live on Wheate onely, whereby wee may well perceive that it hath a warming qualitie rather then a cold in nourishment, how soever it may have a cooling in medecament. Oatemeale in broth is usually given to binde those that have a Laske of other flux, and with some Sugar is to good effect given to those that have a cough or cold. Whole Oates fryed with bay salt and applyed to the side, takes away the paines of Stitches and winde in the sides or belly, a pultis made of the meale of Oates and some oyle of Bayes put thereto, helpeth the Itch and the Leprosie, as also the Fistulaes of the Fundament, and dissolveth hard Impostumes, the meale of Oates boyled with Vinegar and applyed taketh away freckles and spots in the face or other parts of the body.

I should next unto these graines (if I thought it fitting to make a Chapter as others have done) speake of the burnt Cornes of these severall sorts before specified, but because there is nothing in them that is worth the Description or Place indeede among the rest, being but certaine eares of Corne here and there among the rest that are blasted by casualtie, I thinke them not worthy of more relation then that such are sometimes to be seene, or as our *English* proverbe is to make a long harvest of such bad Corne, yet I think it not amisse to give you the figures of them here.

Ustiligi Tritici & Hordei.
Burnt Wheate and Barley.

CHAP. XXII.

Oryza. Rice.

RIce is numbred among the graines or Cornes that are used for sustenance, and therefore must bee set next to Oates, because it beareth the seede in a sparsed *juba* or tuft, yet in a different manner.

It riseth up with a stronger stalke then Wheate about a yard high, with sundry joynts and a large thicke leafe at each of them like unto the Reede, at the toppe it beareth a spiked tuft spread into branches, whose blooming is said to be purplish, with the seede standing severally on them, enclosed in a hard browne straked huske, and an aune at the

head

head of every one of them which being hulled is very white, of the bigneſſe almoſt of Wheate cornes, blunt at both ends.

The Place and *Time.*

The originall fourſe hereof came out of the Eaſt *Indies*, where it is their chiefeſt if not onely Corne they live upon, and not with them onely but through all *Ethiopia* and *Africa* and from thence hath beene brought into *Syria*, *Egypt*, *Italy*, &c. whereſoever it is ſeene to bee ſowen, and loveth onely to grow in moiſt grounds, or ſuch as may be overflowen in the Summer time, and the waters let out againe, being but a Summer Corne, and is yearely ſowen and gathered in the middle or end of Autumne with us, but twiſe a yeare in divers places of the Eaſt *Indies*, whoſe goodneſſe chiefely conſiſteth in the largeneſſe and whiteneſſe, which the hotter countries onely produce.

The Names.

It is called in Greeke Ὄρυζα, and ſo in Latine *Oryza* by all authors, yet ſome doe call it *Italica* for a difference to the *Oryza Germanica*, (which *Cordus* on *Dioſcorides* ſaith is called *Schwaden* with them, or being a kinde thereof at the leaſt, although leſſer, having the ſame taſte and uſe, and the ſame proportion in ſtalkes, leaves, and ſpikes, with a *juba* like *Milium*, growing alſo in mariſh and plaſhy places as Rice doth) yet *Hermolaus*, *Ruellius* and ſome other have thought it to bee the *Hordeum Galaticum* of *Columella*, but I have ſhewed you what that is in the Chapter of Barly: why *Galen* ſhould account Rice *inter legumina potius quam inter cerealia*, as he did before of Oates, and of Panick afterwards, many doe wonder, ſeeing their formes are ſo different, but himſelfe I thinke rendereth the reaſon, becauſe it was not made into bread as the reſt of the other Cornes are: The *Arabians* call it *Aruz* and *Arzi*, the *Italians Rizo*, the *Spaniards Arroz*, the *French Rys*, the *Germaines Reiſſ*, the *Dutch Rys*, and we Rice.

Oriza. Rice.

The Vertues.

Rice is chiefely uſed medecinally to ſtay the Laskes or fluxes of the ſtomacke as well as of the belly, eſpecially if it be a little parched before it be uſed, and Steele quenched in the milke wherein it ſhall be boyled, being ſomewhat binding and drying: it is thought alſo to encreaſe ſeed, being boyled in milke and ſome Sugar and Cinamon put thereunto: the flower of Rice is of the ſame propertie, and is ſometimes alſo put into cataplaſmes that are applied to repell humors from flowing or falling to the place, and is alſo conveniently applyed to womens breaſts to ſtay inflammations when they begin.

CHAP. XXIII.

Milium. Millet.

OF Millet there are divers ſorts, ſome familiarly growing in Europe others brought out of the more remote countries, as ſhall be declared.

1. *Milium vulgare album.* Common white Millet.

This Millet groweth with many hard joynted tall ſtalkes full of a white Pith, yet ſoft and a little hairy or downy on the outſide, with long and large Reede-like leaves at them compaſſing one another. The toppes of the ſtalkes are furniſhed with a number of whitiſh yellow long ſprigges like feathers, bowing downe their heads, ſet all along with ſmall ſeede incloſed in a whitiſh huske, which being taken forth are of a ſhining pale yellowiſh or whitiſh colour, ſomewhat hard little bigger then the ſeede of Fleawort: the roote buſheth much in the ground but periſheth yearely.

2. *Milium nigrum.* Blacke Millet.

This other Millet differeth little from the former, being ſomewhat leſſe with us, ſaving that as the *juba* or tuft is browniſh, ſo is the ſeede alſo blackiſh and ſhining, very like elſe to the other.

3. *Melica ſive Sorghum.* *Indian* Millet.

This Millet is in all the parts thereof larger, greater and higher then the former, riſing to be five or ſix foot high or more, the ſtalkes are full of joynts and large long leaves at them, the juba or tuft ſtandeth upright and boweth not downe the head as the other, whereon ſtand the ſeede as big but not flat as Lentills ſomewhat round, and eyther whitiſh, yellow, red or blackiſh, hard and ſhining, the roote buſheth more then the other yet periſheth alſo.

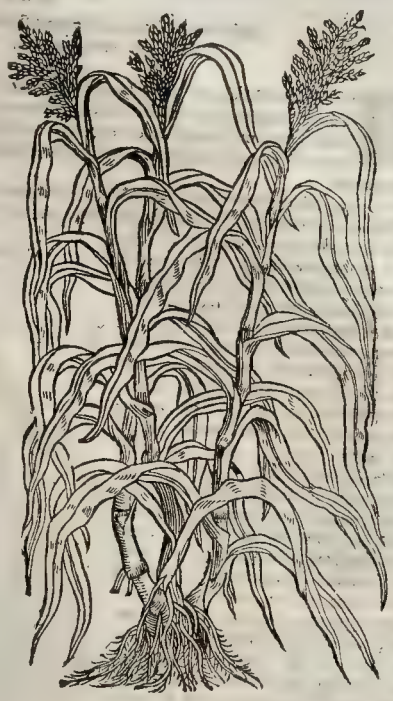
The Place and *Time.*

Millet, of all the ſorts came firſt into *Europe* out of the Eaſterne countries, the two firſt ſorts long before the laſt kinde, and the ſortes of it, and require a ſtrong ground well watered, for they ſoone empoveriſh a ground if it be not ſtill enriched, nor will it proſper in leane drie ſoile; it is to be ſowne in *Aprill*, and the graine in the hotter climates will be ripe in *Auguſt* or *September*.

The

1. 2. *Milium vulgare album vel nigrum:*
Common Millet with white ſeede or blacke.

3. *Melica ſive Sorghum.*
Indian Millet.



The Names.

Κεγχρὶς in Greeke, is called *Milium* in Latine, *a miliaria ſumma derivatum ait Feſtus*, *Galen* calleth it *Paſpales*, and others *Paſpale*, *Varro* thinketh it is *Meline*; but *Dioſcorides* and *Galen* make *Meline* to be *Panicum*. All Authors call the two firſt ſorts *Milium* with their diſtinctions of blacke and white: the laſt is called *Milium Indicum*, by *Matthiolus* and others, and *Saraſenicum* by *Fuchſius*, and *Melica* by *Dodonæus*, *Sorghum* alſo, and *Sorgho Italorum* by *Lobel*, *Geſner* calleth it *Panicum Indicum*, and *Tragus Panicum Dioſcoridis* and *Pliny*, *Bellonius* alſo ſaith that in *Cilicia* they call it *Hareomen* as the *Arabians* doe, whereof they make their Bread or Pultage, and of the ſtalkes their fire in want of other fewell, it is called *Mazzo di Congo* by the *Portugalls* finding it in that Kingdome: the *Arabians* call it *Gegners* and *Giavers*: the *Italians Miglio* and *Sorgho*, the *Spaniards Milho* and *Migo*, the *French Mill* and *Millet*, the *Germanes Hirſe*, the *Dutch Hirs*, and wee is *Engliſh* Millet; and the laſt *Turkie* or *Indian* Millet, and of ſome *Italian* Millet.

The Vertues:

Galen ſaith it cooleth in the firſt degree and dryeth in the third almoſt, and hath withall a little tenuitie of parts: the graine ſaith *Theophraſtus* if it be kept from winde and weather will ever laſt and abide: it is ſometimes made into bread but it is very brittle, not having any tenacitie in it whereby it nouriſheth little, but dryeth up moiſt humors, yet is it much uſed in *Germany* boyled in milke with ſome Sugar put unto it: *Matthiolus* ſaith that at *Verona* the bread thereof is eaten with great delight while it is hot, by reaſon of the ſweeteneſſe, but being old it is hard and utterly unpleaſant: the gruell or pultage ſaith *Dioſcorides* bindeth the belly and provoketh urine: the *Apozeme* made thereof called *Syrupus Ambroſianus*, or as *Wecker* hath it *Syrupus Ambroſij*, taken warme with a little white Wine procureth ſweating mightily, being covered in bed, and is effectuall to coole hot Fevers and to quench thirſt: being put into a bag and fryed hot eaſeth the griping paines of the Collicke and of the ſides if it be applyed, the paines alſo in the joynts and ſinewes: in *Italy* and other places they give the graine to their Pullen and Pigeons to fatten them. The *Indian* Millet ſtalkes ſaith *Matthiolus* are good to helpe thoſe that are troubled with Kernells under the eares or elſe where, in this manner: Take the pith out of ten of the joynts of the ſtalkes of this Millet, which being burned with a new red ſponge, take the powder of them with twelve graines of Pepper, and an ounce of Wheate Paſte or Dowe, all which being made up with a new laid Egge into a cake, let it be baked under the embers, this cake being divided into ſix parts, let the patient take one part of it every other night when the Moone is in the wane as they goe to bed, and not drinke after it that night: this muſt be repeated two or three Moones, and hereby ſaith he hath knowne many to be cured: the red flowers ſaith he taken in red wine to the weight of a dram cureth women of the reds, as the white flowers doth the whites: it is alſo good for all fluxes of the belly.

CHAP. XXIV.

Milium Indicum maximum Maiz dictum, sive Frumentum Indicum, vel Turcicum aliquorum. *Indian* or *Turkie* Wheate.

AS a kinde of Millet although farre greater and differing notably from the former I muſt joyne this graine although ſome have made divers ſorts thereof, yet I cannot perceive any more then two ſpeciall differences, the one beareth eares at the joynts of the ſtalkes, the other at the tops following the flowers: the other differences conſiſt not in any other things then the colours, of the blooming firſt and of the graines afterwards.

1. *Maiz Frumentum Indicum vel Turcicum vulgare.* The uſuall *Indian* or *Turkie* Wheate.

This *Indian* Wheate ſhooteth from the roote which is thicke and buſhie, ſundry ſtrong and tall ſtalkes ſix or eight foote high, as thicke as a mans wreſt if it grow in any ranke ground, full of great joynts with a white pith in the middle of them, the leaves are long, twiſe as large and great as of Millet; at the toppes come forth many feather-like ſprigs, bending downewards like unto the toppe of Millet, which are either white or yellow or blew, as the graines in the eares will prove, which fall away, nothing appearing after them; but while they are in flower at the joynts of the ſtalkes with the leaves, from within two or three of the lower joynts up towards the toppes, come forth the eares one at a joynt wch have many leaves foulded over them ſmalleſt at the toppe, with a ſmall long buſh of threads or haires hanging downe at the ends, which when they are ripe are to bee cut off: which foulds of leaves being taken away, the head appeareth much like unto a long Cone or Pineapple, ſet with ſix or eight or ten rowes of Cornes, orderly and cloſely ſet together, each being almoſt as bigge as a Peaſe not fully round, but flat on the ſides that joyne one unto another, of the ſame colour on the outſide as the bloomings were, hard but brittle and eaſie to bee broken or ground, with a white meale within them ſomewhat dry and not clammy in the chewing. *Lobel* expreſſeth the figure of another ſort as he thinketh becauſe as hee ſaith it grew greater and higher, and the roote grew greater, and with more ſeparate tufts, the roote not differing in any thing elſe: but I thinke it no ſpecificall difference, not underſtanding by any that it is taken for another ſort, and therefore I have omitted it and ſpeake no more thereof.

1. *Milium Indicum maximum Maiz dictum ſive Frumentum Indicum vel Turcicum.* The uſuall *Indian* or *Turkie* Wheate.

2. *Frumentum Indicum alterum ſive minus.* The other leſſer *Indian* Wheate.

This other *Indian* Wheate is like the former both in ſtalkes and leaves, but not halfe ſo high or great, the eares likewiſe are not halfe ſo bigge, of as differing colours as it, but they doe not grow at the joynts of the ſtalkes as the other, but at the toppes following the flowers, which maketh a ſpecificall difference betweene them: the graine it ſelfe is being made into bread not of that nouriſhing qualitie that the greater ſort, is but weaker by much, nor is ſo ſtrong to breede ſo much blood as it.

The Place and *Time.*

The firſt groweth in the Eaſt and Weſt *Indies*, and from both places have beene brought unto us, and have growne with us, and ſometimes borne ripe eares but not alwayes, and will deſire a ſtrong rich ground as the Millet doth, ſowne onely in the Spring and ripe in *September*: The other is a ſtranger, and ſeldome ſeene with us.

The Names.

It is very probable that this graine is that which *Theophraſtus* maketh mention of to grow in *Baſtria*, which he ſaith was reported to be as bigge as Olive ſtones, and *Pliny* following him relateth the ſame thing out of him, but altereth the Olive ſtones into eares of Wheate, which ſheweth how ſubject it is to errour, to goe upon heare-ſay and bare report, for *Theophraſtus* relateth the greatneſſe of the graines but by report, which might increaſe by the way as it did betweene *Theophraſtus* and *Pliny* his time, to be as bigge as Wheate eares, *Matthiolus*, *Dodonæus*, *Lugdunenſis* and others condemne *Fuchſius* for calling it *Frumentum Turcicum*, according to his Countries dialect are found more juſt to be blamed themſelves, for no doubt but this very *Indian* Wheate which plentifully is found

found to grow in all the tract of the West *Indies*, yet not found naturall in any place, but planted every where by the natives, & is the same with *Theophrastus* and *Pliny* their *Frumentum* or *Triticum*, and *Milium Bactrianum Indicum*. They of the West *Indies* call it *Maiz* generally. The last is onely remembred by *Tabermontanus* and *Bauhinus* after him, which *Acosta* saith the *Spaniards* in the *Indies* or the *Indians* call *Moroche*: The drinke made of *Maiz* is generally in the *Indies* called *Chica*, but by some *Acua*.

The Vertues.

Many doe condemne this *Maiz* to be as dry and of as little nourishment as Millet or Panicke, but they doe not as I thinke rightly consider the thing, for although the graine be dry, yet the meale thereof is nothing so dry as of the *Turkie* Millet, but hath in it some clammines, which bindeth the bread close and giveth good nourishment to the body, for wee finde both the Indians and the Christians of all Nations that feede thereon, are nourished thereby in as good manner no doubt, as if they fed on Wheate in the same manner: the sweetnesse also of the bread sheweth the greater power of nourishment in it, and as some doe thinke breedeth thicke blood and humours, able to suffocate at the least to breede obstructions, and therefore will not tinstly be put into cataplasmes that are made to ripen Impostumes: *Acosta* saith that by feeding too much thereon it engenders grosse blood, which breedeth itches and scabbes in those that were not used to it. Of it is made drinke also, both in the *Indies* and our *English* plantations, that will intoxicate as quickly as our strong Beare if it bee made accordingly: but is found to be very effectuall to hinder the breeding of the Stone, so that none are troubled therewith that doe drinke thereof, the leaves thereof are used also to fatten their Horses and cattle.

CHAP. XXV.

Panicum. Panick.

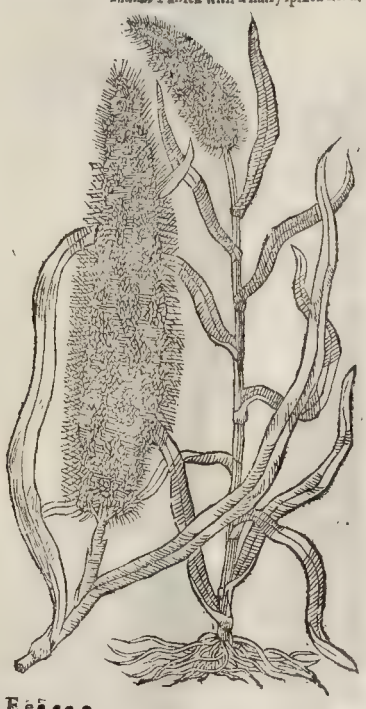
THere is but one sort of manured Panick growing with us in *Europe* howsoever some have set it forth with a larger and lesser spike as the place produced it where it grew, but of *Indian* sorts there are very many brought us continually from the backe of *Africa* and *Ethiopia*, and from *America* also whereof to make any large mention were to small purpose, and but to fill up roome; I will onely give you the descriptions of a couple, the one more frequent the other more rare as they grew with us, with a briefe remembrance of some others.

I. *Panicum album vulgare.* Ordinary Panick.

This Panicke groweth up with a reasonable strong joynted stalke full of pith, but not downie as Millet is, having somewhat large leaves on them greater by much then of Wheate, and very neare unto those of Millet that they can hardly be distinguished, at the toppe of the stalke commeth forth a whitish long round close spike, round at the end, soft, and as it were hairy, with small short branches all the length of it when it is full ripe and opened,

I. *Panicum album vulgare.*
Ordinary Panick.

Panicum Indicum panniculâ villosâ.
Indian Panick with a hairy spiked head.



full of hairy ſoft huskes which include a ſmall white ſeede leſſe then Millet but not ſhining ſo much, the roote is buſhie like unto it but ſmaller and dying yearely.

2. *Panicum Indicum panniculâ villoſâ.*
Indian Panick with a more hairy ſpiked head.

This kinde of Panicke being brought to *Briſtow* from the Weſt *Indies* as *Lobel* ſaith in his time of abiding there, and there ſowen, was like in ſtalke and leafe to the former but greater, and the ſpiked head grew to bee a foote long but more hairy, bending at the toppe a little, ſomewhat like the great *Amaranthus*, or flower Gentle.

3. *Panicum Indicum cæruleum.*
Blew *Indian* Panick.

This blew Panick groweth to the height of a man, with ſtrong and great joynted ſtalkes like unto a Reede, full of ſpongie white pith, which neare the ground are of a ſhining purpliſh blew colour and ſpreadeth ſundry branches with large and long leaves on them compaſſing the ſtalke at the bottome, and thicke ribbes in the middle of them: from the joynts towards the toppe as alſo at the toppes come forth ſhort round Panick-like heads cloſer then the former, of as blewiſh a ſhining purple colour as the ſtalke below, or rather much more orient and freſh, full of hairy huskes, and ſmall long blewiſh round ſeedes in them like unto naked Oates.

There hath beene brought us from ſundry parts both of the Eaſt and Weſt *Indies* by Marriners and Chirurgions divers other ſorts, ſome with white heads as big as ones fiſte, thicke and ſhort, with round white ſeedes, having an hole or dent in every of them. Another whoſe head was a foote long and with a bowing toppe, as hairy as the ſecond ſort. Another that was ſlender a foote and a halfe long, ſmall at the upper and bigger below like unto that *Panicum Americanum* that *Cluſius* hath ſet forth. Wee have had alſo another brave ſpiked head that hath beene bigger then both ones fiſts, and a good ſpan long, the ſtalke being as thicke as ones finger, of a fine whitiſh yellow colour. Many

A kinde of *Indian* Panick, and of a ſtrange Millet.

other

other ſorts we have had and ſeene which not having kept any particular figure or note of them are ſlipt out of our knowledge and remembrance further to deſcribe them, and therefore let this ſuffice to have ſaid ſo much of them: yet having kept the figures of ſome of them I here exhibite them unto you.

The Place and *Time.*

The moſt common is onely ſowen in Europe whereſoever it groweth, and as it is likely came out of the Eaſterne countries towards *India*, from whence have come likewiſe ſome of the other, and the reſt from the Weſt: they are not to be ſowen untill *Aprill*, and unleſſe the yeare be hot the third ſort ſeldome commeth to maturitie, although the firſt oftentimes doth, and doe both require ſtrong fat ground.

The Names.

It is called in Greeke ἕλυμος and *Panicum* in Latine, and μελίνη according to *Dioſcorides* and *Galen*, μελίνος as *Diocles* hath it, which as moſt doe gather is rather deduced from μέλι *quod melleum quidpiam ſignificat* them from μέλας which is blacke, and it may be thereupon *Pliny* calleth it *Melfrugum*, yet *Theophraſtus* ſpeaketh both of *Elymos* and *Meline* as of ſeverall plants. *Pliny* ſaith *Panicum a paniculis dictum fuit*, and putteth it among the Cornes as *Dioſcorides* and *Columella* doe alſo, but *Galen* as is before ſayd among the *Legumina* Pulſes for the reaſons before ſhewed. *Bauhinus* maketh two ſorts of the firſt, the one hee calleth *Germanicum panicula minore* becauſe it may be growing in *Germany*, the head was leſſe which *Tragus*, *Fuchſius*, *Cordus* and others ſet forth, and yet as I ſaid in the beginning they cannot be two different plants: the ſecond is remembred by *Cluſius*, *Dodonæus*, *Lobel*, *Lugdunenſis* and others. The *Arabians* call it *Dochon*, the *Italians Panico*, the *Spaniards Paniſo*, the *French Panis* and *Panic*, the *Germanes Pfenick* and *Heydelpfenick*, the *Dutch Penic*, and we Panick.

The Vertues.

Panick is as Millet cold and dry, and giveth little nouriſhment, and as *Galen* ſaith *Milium* is better to all purpoſes then Panick, ſweeter alſo and eaſier to digeſt, yet ſaith he the countrey people feede thereon being boyled in milke even as they doe Wheate, but ſaith he, that of *Italy* exceedeth ours of *Aſia*: *Ioannes Leo* in his Hiſtory of *Africa* ſaith, that in ſome places thereof they make very fine bread of Panick, of what ſort he mentioneth not: it ſtayeth Fluxes as Milium doth, it is given to Pullen, Pigions and other ſmall birds, but hath no further uſe in Phyſicke then to dry up moiſt and fluxible humors.

CHAP. XXVI.

Tragopyrum. Bucke-wheate.

AS a Complement to finiſh this Hiſtory of Cornes and Graines I muſt ſet this in the laſt place, becauſe although the forme and manner of growing be differing from all the former, yet becauſe the ſeede ſerveth to the ſame uſe, it is reckoned by the later writers deſervedly to bee joyned unto them. It riſeth up with divers round hollow, brittle, reddiſh ſtalkes a yard and more high, ſet with divers leaves each by it ſelfe on a ſtalke, which is broad and round, and byforked at the bottome, ſmall and pointed at the end, ſomewhat reſembling an Ivie leafe but ſofter in handling; at the toppe of the ſtalkes come forth divers cluſters of ſmall white flowers which turne into ſmall triangular blackiſh ſeede, ſomewhat like unto a Beech nut but much leſſer, with a white pulpe within: the roote is ſmall and thready.

Tragopyrum. Buck-wheate.

The Place and *Time.*

It is thought to have beene firſt brought out of *Africa* into *Italy*, but it is now generally ſowen in moſt of theſe Northerne countries, where for the uſe and profit is made of it many fields are ſowen therewith, and that uſually not untill *Aprill*, and is ripe in *Auguſt*, and will not refuſe to grow in an hungry ground, but is held generally to bee as good as a dunging to the ground whereon it is ſowen, the ſtraw thereof alſo being turned in thereto.

The Names.

It is generally taken to be the Ἐρύσιμον, *Eryſimum* of *Theophraſtus*, which *Gaza* tranſlateth *Trionum*, as alſo to bee the *Irio* of *Pliny* ſome to put a difference betweene this *Eryſimum* and the other, call this *Eryſimum cereale*: it is called by *Matthiolus*, and *Lugdunenſis Frumentum Saraſenicum*. *Dodonæus Fegopyrum* and *Tragopyrum*, *Tragotriticum* and *Fagotriticum* as the *Dutch* names doe import *Bockweyde* and *Bueckenweyde*. *Tragus* calleth it *Ocy-*

mum veterum, and *Cluſius* and *Tabermontanus Ocymum cereale*, but *Dodonæus*, and *Lugduenſis* doe mainely contradict that opinion, labouring to prove that the *Ocymum* of *Varro*, *Columella*, and the other Latines is no particular herbe, but rather the name of greene fodder. cut before it grew ripe, to feede cattell and to purge them, or elſe ſeverall ſorts of Pulſe and Oates, mingled together and ſowen to feede them, but *Tragus* proveth it ſubſtantially from *Varro*, that *Ocymum* was ſowen to fatten and purge cattle, and that to be taken while it was in flower, whereby it is evident that it could not be a medley of corne and pulſe ſowen together for the purpoſe, which never are in flower altogether at a time, but ſome particular herbe, and this herbe ſooner then any other, which the ſoone ſpringing of it from the ſeede, which is within three or foure dayes after the ſowing, doth argue the name *Ocymum* to be proper thereunto from ὠκὺς, the Greeke word ſignifying *cito* quickly, from whence *Ocymum* is derived, and the quality anſwerable alſo.

The Vertues.

Buckwheate is a graine that as *Dodonæus* ſaith nouriſheth leſſe, then either Wheate, Rye, or Barly, but more then Millet or Panicke, and the bread or cakes made of the meale of the ſeede doth eaſily digeſt, yet ſome ſay contrary) and quickely paſſe out of the ſtomacke, and giveth ſmall nouriſhment, though not bad, and is withall a little flatulent or windy, yet Country people in divers places of *Germany* and *Italy*. doe feede hereon almoſt as their onely bread graine, and are ſtrong and able perſons following ſtrong labour, for the bread or cakes are pleaſant, and doe ſomewhat preſſe or lye heavy on the ſtomacke, as Millet and ſome other the like will. And both is, and was uſed generally to fatten cattle and poultry, of all ſorts exceedingly, and quickly, yea it is an obſervation among a great many in our owne land, that what cattle or pullaine ſoever is fatted there with, if it be not killed within a ſhort time after they are thus fatted, they will dye of themſelves, being ſuffocated with their owne fat: it provoketh vrine, encreaſeth milke, looſeneth the belly, and being taken in wine, is good for melancholly perſons: the juyce dropped into the eyes, cleareth the ſight.

GRA-

GRAMINA, IVNCI, ET ARVNDINES.

GRASSES, RVSHES, AND REEDES.

CLASSIS DECIMATERTIA.

THE THIRTEENTH TRIBE.

CHAP. I.

Gramina Triticea. Corne-graſſes.

THE next Tribe to be entreated of, is of the ſeverall ſorts of Graſſes, which are almoſt infinite, but becauſe ſome are growing on the Vpland grounds, others in the ſow and mooriſh, ſome in the waters, and others by the ſea ſide, I muſt divide them; and for a more methodicall and orderly proceeding in them, I thinke it fitteſt to ranke them under ſeverall heads, that ſo they may be better expreſſed and apprehended. I will firſt therefore ſet downe thoſe graſſes that are neereſt in likeneſſe unto the Cornes in their ſpiked heads, and after of thoſe that are like the other ſorts of graine, and then of the reſt in their order: but becauſe theſe Graſſes are of ſmall uſe, although of much varietie and curioſitie, I ſhall endeavour to be the briefer in them: and firſt of thoſe Graſſes that reſemble Wheate and Rye.

1. *Gramen latifolium ſpica triticea compacta.* Cloſe eared white Wheate Graſſe.

The ſtalke hereof is about halfe a yard high, ſet with two or three joynts, and faire Wheate like leaves at them a foote long, bearing at the toppes a longer ſpike than Wheate, and broader, made of ſeverall parts like the huskes of corne, but more ſeparated in ſunder, ſhewing it to be a Graſſe and no Corne indeede, yet cloſer than the next, and without any ſhew of beardes or awnes thereon.

2. *Gramen latifolium ſpica triticea divulſa.* Thinne eared red Wheate Graſſe.

This differeth little from the former, but in the ſpike which hath the ſmall parts thereof more ſeparated and ſet on both ſides the ſtalke, and armed every one with a ſmall ſhort beard or awne.

3. *Gramen anguſtifolium ſpica triticea compacta.* Cloſed eared red Wheat-graſſe.

The ſtalke hereof is ſmooth and round, two foote high, ſet with long narrower white leaves, rough and pointed, the ſpike is about a ſpanne long, ſomewhat like unto red Wheate, cloſely ſet, but each of the huskes hath a ſharpe rough awne thereat.

4. *Gramen anguſtifolium ſpica tritici mutiæ ſimili.* Ruſh-leaved white Wheate-Graſſe.

The leaves hereof are long and round like Ruſhes, and pointed at the ends, ſet on the round ſtalkes, a foote and a halfe high, whoſe ſpiked toppe is long and ſlender, without any awnes at the toppes of the huske, and ſomewhat like unto white Wheate, that is without beardes, the roote is white, knottie and creeping.

5. *Gramen ſpica Briza majus.* The greater Spelt-wheate graſſe.

This hath rootes and ſtalkes like unto corne of a mans height, with narrow leaves, the toppes of the ſtalkes have ſundry long ſpikes, about a hand breadth long, ſet on both ſides of them one above another, each whereof is very like a ſmall eare of Wheate, armed with ſmall awnes, but very ſhort.

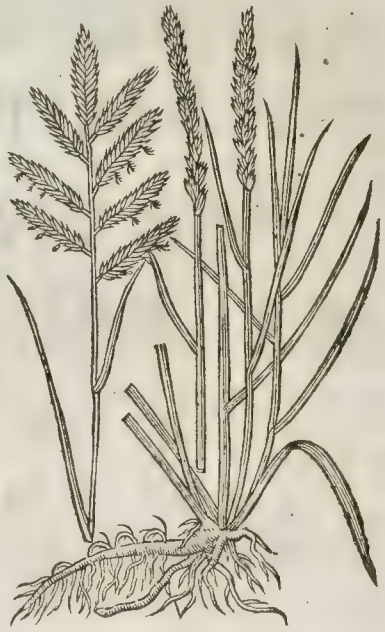
6. *Gramen ſpica Brizæ minus.* The leſſer Spelt Wheate-Graſſe.

This other groweth not above an hand breadth high, with ſmall ſhort, ſoft, and hoary leaves, the toppe hath ſometimes but one, otherwhiles, two or three ſpikes, of an inch long and bearded.

7. *Gramen*

1. 3. *Gramen latifolium, & angustifolium spica tritiçea compacta.*
Close eared white and red Wheate.

4. 5. *Gramen angustifolium spica tritici mutice simi & spica Bryzæ majoris.*
Rush leafed white Wheate Grasse; and the greater Spelt wheate Grasse.



7. *Gramen Secalinum maximum.*
Rye-Grasse, two great sorts.

The stalke hereof riseth sometimes to be two or three foote high, having but few and short leaves thereon; the spike is of two, three or foure inches long, bearded, and very like unto an eare of Rye, but with running rootes and joynted.

Minus. Of this kinde there is a lesser sort also not differing from them before but in the smallnesse, and that the roote is theaddy.

The Place and *Time.*

Most of these grasses have beene found in our owne land, in pastures and corne grounds in *Kent*, not farre from the Thames, and flourish when others doe.

The Names.

Each of these hath the name in the title that *Bauhinus* in his *Prodromus* doth call them by, or with very little varietie which is according to *Lobels* intention.

The Vertues.

We know of no use that these are put to in Physicke, and therefore we can say no more of them.

7. *Gramen Secalinum maximum majus & minus.*
Rye-Grasse of three sorts.

CHAP. II.

Lolium & Gramen loliaceum.
Darnell, and Darnell-Grasse.

BEcause the spiked head of Darnell doth somewhat resemble the spikes of some of the former, I thought it meete to joyne it, and the former.

1. *Lolium album.*
White Darnell.

The Darnell it selfe hath all the Winter long, sundry long fat and rough, leaves (which when the stalke riseth, which

is ſlender and joynted, are narrower but rough ſtill on the toppe, groweth a long ſpike compoſed of many heads ſet one above another, containing two or three huskes, with ſharpe, but ſhort beardes or awnes at the ends, the ſeede is eaſily ſhaked out of the eare, the huske it ſelfe being ſomewhat tough.

2. *Lolium rubrum ſive Phœnix.* Red Darnell.

The leaves hereof are ſhorter and narrower than of Barly, the ſtalkes are reddiſh, ſometimes halfe a foote high, with reddiſh joynts alſo, the ſpike is very like the former, but ſmaller and ſhorter, and ſometimes reddiſh alſo, eſpecially in the drier grounds.

3. *Lolium alterum avenacea gluma.* Another Darnell with Oaten toppes.

This differeth little from the firſt in rootes, leaves, or ſtalkes, but ſomewhat higher, onely the toppes hereof differ in that the ſeverall heades are more like to winged Oaten heades, with ſharpe pointes ſet on ſlender foote ſtalkes.

4. *Phœnix ſimplici & rariſſima gluma.* The ſmalleſt ſingle Darnell-Graſſe.

This is very like the red Darnell, but that it hath very few ſlenderer and ſhorter ſtalkes than it, and the leaves alſo narrower, the ſpiked head hath a few ſingle huskes, ſet very ſparſedly thereon.

5. *Phœnix altera brevioribus denſioribuſque ſpicis.* The greater ſingle Darnell-Graſſe.

The leaves and rootes hereof are like the red Darnell, the ſtalkes grow two cubits high, joynted and ſtraked, the ſpike is thinly ſet with chaffie heades, but they are bigger, rounder, and thicker.

6. *Phœnix aceroſa aculeata.* Small prickly Darnell-Graſſe.

The ſtalkes hereof are five or ſixe inches high, being rough, hard, full of joynts, pointed or prickly at the ends, and with a few ſhort leaves on them, and with all, have ſmall ſhort, rough, and chaffie like tongues, ſharpe at the ends, ſet at the joynts: the rootes are ſmall white threads or fibres.

7. *Phœnix multiplici ſpicata panicula.* Branched Darnell-Graſſe.

This hath ſlender joynted ſtalkes, a cubite or more high, and narrow leaves, the ſpiked head is as it were branched into others, and herein conſiſteth the chiefeſt difference.

8. *Phœnix multiplici ſpica nutante.* Double Darnell-Graſſe with a bowing toppe.

This differeth litt e or nothing from the laſt, but in the ſpiked heades, which are thicker ſet together, and the toppes of them bow downe or turne a little round.

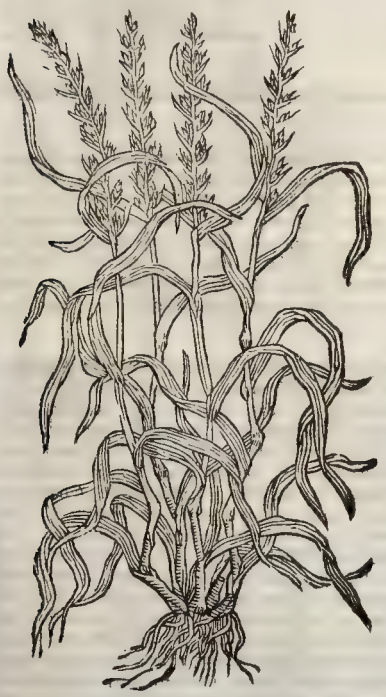
9. *Phœnix paluſtris & longius ſpicata.* Branched Marſh Darnell-Graſſe.

This Darnell-Graſſe from a creeping white joynted roote, with many fibres thereat, ſhooteth forth two or three joynted ſtalkes, two foote high at the leaſt, the ſpiked head is a foote long, branched as the ſeventh is, each branch of a fingers lengh with winged huskes like unto Oates.

The Place and *Time.*

All theſe grow, either in the fieldes of corne, or in the borders and path-wayes of other fieldes that are fallow,

1. *Lolium album.*
VVhite Darnell.



2. *Phœnix ſive Lolium rubrum.*
Red Darnell.

and

3. 5. *Lolium alterum aristacea gluma, & altera brevioribus foliis.*
Darnell with Oaten toppes, and the greater single Darnell-Graſſe.

6. *Phœnix aceroſa aculeata.*
Small prickly Darnell-Graſſe.

7. 8. 9. *Phœnix multiplici ſpicata panicula, & longius ſpicata.*
The two ſorts of branched Darnell-Graſſe, and the double kinde with a double toppe.

and the laſt ſometimes in marſh and wet groundes, as well as in the edges of plowed groundes. *Virgil* calleth it *Infelix Lolium*, becauſe of the harme it did the fieldes.

The Names.

Darnell is called αἶρα in Greeke by moſt Greeke Authors, yet ζιζάνιον by ſome, and *Lolium* in Latine, yet *Pliny* calleth it *Æra*, as well as *Lolium*; and of ſome *Triticum temulentum*, and by *Lonicerus Triticum fatuum*, it is called alſo *Zizania* from the *Arabians* that ſo call it; the *Italians* call it *Gioglio* and *Loglio*; the *Spaniards Taio*, and *Zizania*, the *French Ivraye*, the *Germans Rueweyſſen*; the *Dutch Lulch*, and we in *Engliſh* Rye and Darnell: the ſecond is called κόκκος *Phœnix* by *Dioſcorides*, and ſo divers authors doe call it in Latine, *a ſeminis colore phœniceo*, others call it *Lolium rubrum* to diſtinguiſh it from the former called *Lolium album*. *Dodoneus* from *Pliny* calleth it *Hordeum murinum*, and thereupon the *Germans* call it *Muiſſ Korn*, *Bauhinus* calleth it *Gramen Loliaceum*. All the reſt are entituled according to *Lobel* his intended illuſtrations, and are ſome of them mentioned by *Bauhinus* in his *Pinax* and *Prodromus*.

The Vertues.

Common Darnell, as *Galen* ſaith, is held to be hot in the beginning of the third degree, and drie in the end of the ſecond, it thereby attenuateth, reſolveth, and cleanſeth, it troubleth the braine and ſences, procuring troubleſome dreames, if the ſeedes happen into bread, and if the ſeede happen into drinke, it will cauſe a kinde of giddy drunkenneſſe: the meale of Darnell is very good to ſtay gangreenes, and other ſuch like fretting and eating cankers and putrid ſores: it alſo clenſeth the skinne of all lepryes, morphewes, ringwormes, and the like, if it be uſed with ſalt and raddiſh rootes: and being uſed with quicke brimſtone and vinegar it diſſolveth knots and kernells, and breaketh thoſe that are hard to be diſſolved, being boiled in wine with Pigeons dung and Linſeede: and is profitable for the Sciatica, if it be bathed in the decoction thereof made with water and hony: it is likewiſe thought to helpe conception, if a woman be perfumed with it, and the meale of Barly, Myrrhe, and Francumſenſe; yet *Cornarius* thinketh Darnell is unprofitable to be uſed in ſuffumigations, and therefore addeth the Myrrhe, and Francumſence to the decoction for the Sciatica: Darnell meale applied in a pultis draweth forth ſplinters and broken bones in the fleſh: if the ſeede be caſt into the fire it will cauſe ſuch a manner of ſmoake, that it will make all that are in the roome to fall a coughing, and willingly to depart to be eaſed of the ſmoake: the red Darnell boiled in red wine ſtaieth the laske, and all other fluxes, and womens bloody iſſues, and reſtraineth urine when it paſſeth too ſuddenly from one. Some doe hold that if it be bound unto a woman being put in a crimſon leather, or a ſcarlet cloath, it will ſtay the abundance of the courſes. *Ovid* ſheweth by this verſe, *Et careant lolijs oculis vitiantibus agri*, that it was accounted to be hurtfull to the ſight, and therefore *Plautus* objected to one that was ill ſighted, that he fed on Darnell.

CHAP.

CHAP. III.

Hordeum ſpurium. Way-Barly.

ALthough heretofore there was but one kind of this wilde or Way-Barly knowne yet by the diligent ſearch of others, there are ſome others found, which ſhall be ſhewed together.

1. *Hordeum ſpurium vulgare.* Common Way-Barly.

This hath divers Graſſe-like leaves, but ſomewhat hard, and among them ſundry benty ſtalkes, a foote high, bearing ſmall whitiſh yellow eares, with long and ſomewhat rough beardes, whoſe ſeede within the huskes is lancke and ſmall, the roote is threaddy and periſheth not.

2. *Hordeum ſpontaneum elatius ſive majus.* Great Way-Barly.

This other doth in all things reſemble the former, but that it is greater and taller, and commeth ſo neare unto the former middle Rye-Graſſe, that many have taken it to be the ſame, as the former may well be ſo called alſo.

Hordeum ſpurium ſive ſpontaneum. VVay-Barly.

3. *Hordeum ſpontaneum pumilum,* Dwarfe wild Barly.

This dwarfe kinde groweth ſcarce halfe a foote high, with ſmaller grayiſh leaves than the common ſort, and the ſpike or eare ſo nearely reſembling common Barly, both in the double rowes and beardes, that one would ſurely ſay it was ſowne Barly, but that onely the ſmallneſſe of all the parts contradicted it.

The Place and Time.

The two firſt ſorts are found in ſundry places with us, yet the firſt more uſually than the other, but found by thoſe that are expert upon mudde walles, and at the foote of other walles, and the wayes ſides in the fieldes every where: the laſt was onely found by *Boel* in *Spaine*, and communicated to us.

The Names.

It is generally taken to be *Holcus Plinij* by the beſt Herbaliſts now adayes ſince *Anguilara* firſt ſo called it; and that you may underſtand how *Plinij* deſcribeth his *Holcus*, I will here ſet it downe as it is *lib. 27. cap. 10. Holcus in ſaxis naſcitur ſiccis, ariſtas habet in cacumine tenues, culmo quale Hordeum reſtibile; hæc circa caput adalligata, vel circa lacertum educit è corpore ariſtas, hanc quidam ob id Reſtidain* (others have it *Ariſtidam*) *vocant*: others call it *Hordeum ſpurium* or *ſpontaneum*; and ſome others *Hordeum murinum*: *Thalius* calleth it *Graminis Loliacei 3. genus*; it is called by the *Dutch Haſe coren*, and by us Wall-Barly, Way-Barly, or Way-Bent or Bennet.

The Vertues.

It hath power, as *Plinij* ſaith to draw thornes, &c. out of the fleſh: ſome ſay that it cauſeth haire to grow; but *Lobel* ſaith that the lye thereof maketh haires yellow.

CHAP. IV.

Avena ſterilis & Ægylops. Wilde Oates and Haver-Graſſe.

THere are divers Graſſes that are like unto Oates, ſome more or leſſe, whereof theſe that are neereſt thereto ſhall be ſhewed here in this Chapter, and the reſt in the two next that follow.

1. *Bromos herba ſeu Avena ſterilis.* Common wilde bearded Oates.

The ordinary wilde Oate groweth both in leaves and ſtalke ſomewhat like unto the manured Oates, but that it ſeldome riſeth ſo high, being ſlenderer, ſmaller, and ſofter, the tufted heade is ſpread in the like manner, having ſuch like winged huskes, with longer awnes at the ends of them, but gentle, and not prickly, ſtanding by tender ſmall foote ſtalkes, the ſeede is ſmall and lancke, as though it had no ſubſtance in it: the roote is threaddy.

2. *Avena ſterilis minor.* Small wilde Oates.

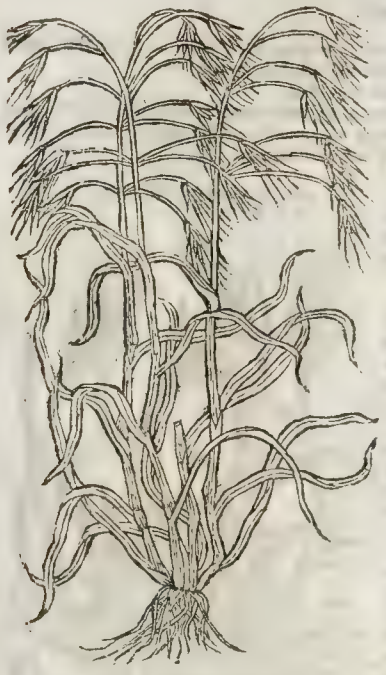
This wilde Oate is very like the former, but leſſer in ſtalke and leafe; the ſparſed toppe conſiſteth of many ſlender long chaffie eares, bearded onely at the ends, and hanging downe their heads with ſmall ſeede on them like the former. Of this kinde there is another that beareth not his Oaten toppe untill the other be paſt. *Serotina.*

3. *Ægylops Narbonenſis. French* Haver-Graſſe.

This Haver-Graſſe hath divers Graſſe-like leaves of a pale greene colour: the ſtalke is joynted in three or foure places with leaves at them, and at the toppes two or three heads, ſet one above another, which are round and ſomewhat long, hard and ſtriped with divers beards at the ends of them, wherein when they are ripe and looke whitiſh lie two or three ſmall graines or ſeede; the roote is compoſed of a ſmall head, with many long fibres growing from it.

4. *Ægylops*

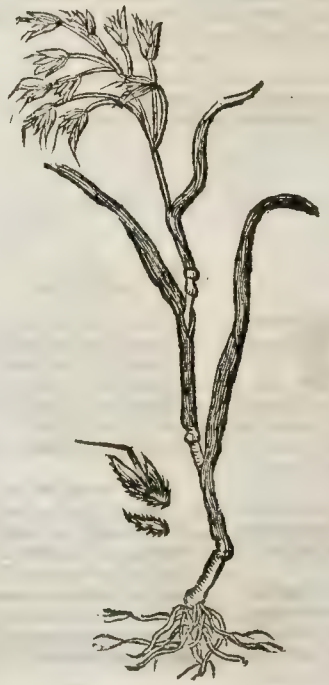
1. *Bromos herba sive Avena sterilis.*
Common wilde bearded Oates.



2. *Avena sterilis minor.*
The small wild Oates.

3. *Festuca sive Ægylops Narbonensis.*
French Haver-graſſe.

4. *Ægylops Bromoides Belgarum.*
Dutch Haver-graſſe.



4. *Ægilops Bromoides Belgarum.* *Dutch* Haver-Graſſe.

This other Haver-Graſſe is very like the laſt, both in ſtalke and leafe, the toppe onely is in part like unto the naked Oate, and in part to the laſt Haver-Graſſe, having ſome beardes ſet at every huske, within which lye long rough browne ſeede: the roote alſo is ſomewhat like the laſt, but the head from whence the fibres proceed, is not ſo conſpicuous.

The Place and Time.

Both the former and the latter, are found in many places with Vs, among Rye and Barley, but the ſecond moſt plentifully by hedge ſides, the third is frequent in *Provence*, and *Narbone* in *France*, among their corne, and are all ripe in *Iuly* and *Auguſt*.

The Names.

The firſt is called in Greeke βρώμος πόα, that is *Avena herba*, to diſtinguiſh it from the graine, or Corne: it is called alſo by *Dodonæus Bromos herba*, and by *Lobel Bromos ſterilis longiſſimus ariſtis*, *Feſtucago* by *Gaza*, and *Feſtuca*, and *Avena fatua*, and *Græca* by others, by *Matthiolus Ægilops*, and by *Tragus*, *Loly primum genus*, according to his deſcription. The ſecond is called by *Lobel*, *Bromos ſterilis altera*, and *Feſtuca altera* by *Dodonæus*, *Tabermontanus* calleth it both *Bromos herba*, and *Syphonium*. The third *Lobel* calleth *Feſtuca ſive Ægilops Narbonenſis*, and thinketh it to be the true *Ægilops* of *Dioſcorides*, and conducing to that ulcer in the eyes, as hee ordaineth it: and by *Matthiolus* and othes, *Ægilops* likewiſe, but by *Cæſalpinus*, *Frumentum ſylveſtre in Sicilia*. The laſt is called by *Lobel*, *Ægilops Bromoides Belgarum*, although hee found it as plentifull in *England*, as the Low Countryes; it is *Dodonæus* his *Feſtuca prior*, and *Thalius* his *Avena ſylveſtris ſive nigra*. The firſt is called by the *Italians Vena vana*, *Vene caſſa*, and *Orzo Salvatico*, by the *French Averon*, by the *Dutch Tdel haver*, and by Vs, Wilde Oates, & powre, or rather Poore Oates. The ſecond is called both by the *Dutch* and us, Dravick, and Dravick Oates.

The Vertues.

Lobel ſaith that he hath often tryed the *Ægilops* to be effectuall, to helpe that Fiſtula or hollow Vlcer that happeneth in the corners of the eyes, ſo called; for it hath a drying quality without ſharpeneſſe, hee alſo ſaith that the ſeede thereof put into drinke procureth a kinde of drunkenneſſe: and that the burnt aſhes of the ſtalkes are good againſt the flegmaticke ſwellings of the Goute, to bathe it with the lye made thereof, it alſo diſſolveth hard tumours and kernels in the fleſh, and aſſwageth the ſwellings in the joynts. *Dodonæus* teacheth to make a medicine for the foule Vlcers in the noſe, by boyling the whole herbe with the roote of the firſt wilde Oates in water, untill a third part be conſumed, which being ſtrained, is to be boyled againe, with as much hony unto the thickeneſſe of a Sirupe, ſome as he ſaith put ſome Aloes in powder to it, and wetting tents there in to be put up into the noſtrils: the ſame herbe alſo he ſaith, being boyled in Wine with ſome dryed Roſes, helpeth aſtinking breath: the reſt are not knowne to be uſed to any Phiſicall uſe.

CHAP. V.

Gramina Avenacea arvorum. The field Oaten Graſſes.

THere are ſome other ſorts of Graſſes reſembling wilde Oates, and called Oate Graſſes, whereof ſome grow in the Fieldes, others on the mountaines, of thoſe that are found in Corne grounds, and other fields, we will ſpeake of in this Chapter, and of the other in the next.

1. *Gramen Bromoides maximum hirtum.* Great hairy Oate Graſſe.

This great Oate Graſſe is all hairy, the ſtalkes and leaves are greater then of Oates, foure or five cubits high, whoſe panicle at the toppe ſpreadeth into many chaffy bearded eares hanging downe their heads, the roote is buſhy, this groweth in the paſtures about *London*, as alſo in *Eſſex*.

2. *Gramen Bromoides ſegetum latiore panicula.* Great Corne Oate Graſſe.

This Corne-Graſſe hath Oate-like ſtalkes, three or foure cubits high, the leaves are ſhorter and narrower, the toppe is ſpread much, divers ſtalkes with chaffye bearded eares in branches, comming forth at a joynt, broadeſt below, and ſpiring ſmall upwards.

3. *Gramen Avenaceum incanum.* Great hoary Oate Graſſe.

This hath ſhort narrow leaves, ſomewhat hairy and a little hoary withall, the ſtalke hath few joynts, the panicle is ſpreade like the laſt but leſſer, and is ſomewhat hoary: This is ſometimes found leſſer, and are both found in *Minus*, the borders of Cornefields, both in *Kent* and *Eſſex*.

4. *Gramen Avenaceum pratenſe.* Medow Oaten Graſſe.

The leaves hereof are many, growing next the roote, long and narrow, the ſtalke is leſſer and lower with ſuch a pannicle at the toppe, but leſſer ſpread and not hoary: this is in many Medowes.

5. *Gramen Avenaceum ſquamoſa gluma.* Scaly eared Oaten Graſſe.

This hath narrow leaves, a little hairy, a ſpanne long, the ſlender ſtalke hath ſuch alike panickle as the laſt, but that the ſcaly eares ſtand ſingle, every one upon his owne ſmall thredlike footeſtalke.

6. *Gramen Avenaceum pinnata longiſcula ſpica.* Winged Oaten Graſſe.

The ſtalke hereof is ſlender, ſometimes higher, and ſometime lower, the leaves are narrower than the laſt, the pannicle is ſomewhat long but ſmall, and not much ſpreade, each part being as it were winged or devided into ſundry peeces, upon one ribbe or footeſtalke.

7. *Gramen Avenaceum filicea panicula Xerampelina.* Red Fernelike Graſſe.

This beareth red ſhining ſtalkes a foote high, the leaves are ſoft and narrow, the pannicle at the toppe, is three or foure inches long, of a whitiſh greene colour, divided into many winged branches many parts being ſet on both ſides of the branch, and each part divided like a Fearne leafe.

8. *Gramen Avenaceum murorum erectum.* Vpright Wall Oaten Graſſe.

This Graſſe groweth upright, a ſpanne and ſometimes a foote high, the leaves are almoſt as ſmall as any Graſſe the ſpiked head is an handbreadth long, ſparſed or divided, each ſmall eare being bearded, the roote is thready: this is often found upon old mud Walles that cloſe in Fieldes.

1, 2. *Gramen Bromoides ſpicatum hirſutum & alterum latiore paniculâ.*
The great hairy and great Corne Oate-Graſſe,

4,5. 6.7, *Gramen Avenaceum pratenſe 3 Avenaceum ſquamoſa gluma: Pinnata longiuſcula ſpica & Filicea paniculâ, &c.*
Medow, ſcaly eared and winged Oaten-Graſſe, and the red Ferne-like Graſſe.

12, 11. *Gramen Avenaceum altero, alteri innatum & exile mollicellis foliis.*
Small Oaten Graſſe, one head ſet on another, and ſmall ſoft Oaten-Graſſe.

9. *Gramen Avenaceum ſupinum arvenſe.*
Low Medow Oaten Graſſe

The leaves hereof are as ſmall as the laſt, an inch, or an inch and a halfe long, the ſtalkes are ſlender and weake, leaning downewards with a few bearded huskes ſpike faſhion at the toppe.

10. *Gramen Avenaceum ſupinum ſiſcu los Secalinis.*
Long winged Oate Graſſe flowring like Rye.

This Graſſe ſpreadeth many ſtalkes not being able to riſe up, of a cubit long, full of joynts, and ſmall ſhort leaves on them, of a whitiſh greene colour, the toppes are furniſhed with foure or five Oate like heads, but more winged and with ſhort aunes, ſomewhat hard and flowring like Rye.

11. *Gramen Avenaceum exile mollicellis foliis.*
Small ſoft leaſed Oaten Graſſe.

This ſmall Graſſe is very like the *Gramen exile durius*, that it may eaſily be miſtaken, and differing from it onely in the leaves, that are longer and ſoft, as the whole plant elſe is not halfe a foote high, and in the ſpiked toppe, whoſe parts are winged.

12. *Gramen Avenaceum altero alteri innatum.*
Small Oaten Graſſe one head ſet on another.

This fine ſmall Graſſe reſembleth well the *Gramen Britanicum maritimum*, having divers haire like leaves and hard, with ſuch like ſpan long ſtalkes, ſome whereof beare their ſmall ſharpe huskes at their toppes onely as others doe, and others out of a tuft of leaves in the middle of the ſtalke, ſendeth forth an other ſhort ſtalke with ſuch like ſharpe huskes on them as the other

The Place and *Time.*

All theſe ſorts grow in the fieldes of this Land, ſome in one place, and ſome in another, as they have beene obſerved either of plowed or fallow grounds, and flower in the Summer ſeaſon.

The

The Names.

Graſſe is called in Greeke ἀγρωστὶς παρὰ τὸν ἀγρὸν, *quod in agris proveniat*, and πόα, *id eſt*, *herba* by *Theophraſtus*, which is common to all herbes: in Latine *Gramen a gradiendo*. The ſeverall names of all theſe Graſſes, are expreſſed in their Titles, as much as is convenient for them, being all of late obſervation, not ſpecified that I know, by any before.

The Vertues.

There is no eſpeciall property knowne to be in any of them but are as yet onely knowne by their face and name.

CHAP. VI.

Gramina Avenacea nemorum & montana. Wood and mountaine Oaten Graſſes.

THE reſt of theſe Graſſes, that doe reſemble Oates ſhall be expreſſed here, whether they be found in Woods or on hills and mountaines, &c.

1. *Gramen montanum Avenaceum Cluſij.* Mountaine Oate Graſſe with hoary huskes.

This hath ſlender joynted ſtalkes a cubit high, with very narrow and long leaves, and at the toppe a long ſpiked head, bowing the head cloſe with woolly ſhort huskes, containing ſeede like unto thoſe of naked Oates, the roote is made of divers long fibres.

2. *Gramen montanum avenaceum alterum.* Mountaine Oate Graſſe, without hoary huskes.

This other differeth not in any thing from the former, but in the ſpiked head, whoſe huskes are not hoary as the other are.

3. *Gramen Avenaceum rariore gluma ſpicatum.* Oate Graſſe of *Denmarke*.

This graſſe hath ſlender weake cleare ſtalkes, a foote high, with long leaves on them, and at their toppe a weake bending ſpiked head, thinnely or ſparſedly ſet with ſmall huskes, containing Oatelike ſeede, the roote is ſtringie, and hairy, running under ground. The like hereunto, but with ruſh-like leaves, and woolly heads, *Bauhinus* calleth *Gramen avenaceum lanuginoſum glumis rarioribus*. *Alterum.*

4. *Gramen avenaceum Xerampelium Danicum.* Red Oate Graſſe of *Denmarke*.

This is ſomewhat like the laſt, but with much lower ſtalkes, cleare and reddiſh, the huskes at the tops of them are more upright and longer, having the like Oateſeede in them. A leſſer ſort hereof was found about *Greene-wich*, in a hungry ſoile. *Alterum.*

1 3. *Gramen montanum Avenaceum, & Avenaceum rariore gluma ſpicatum.* Mountaine Oate Graſſe, and Oate Graſſe of *Denmarke*.

4 5. *Gramen Avenaceum Xerampelium Danicum & Avenaceum locuſtis rubris.* Red Oate Graſſe of *Denmarke*, and Oate Graſſe with red huskes.

6.7. *Gramen glumis varijs, & Bromoides siue Auenaceum nutante coma spicata.*
Party coloured Oate Grasse. And with few seedes.

10. 8. *Gramen Auenaceum villosa gluma, & Auenaceum sylvarum.*
Hairy wood Oaten Grasse, and the other Wood Oaten Grasse.

5. *Gramen auenaceum locustis rubris.* Oate Grasse with red huskes.

The roote hereof is long and white, like unto Quiche Grasse creeping in the ground, having nēxt thē ground narrow short leaues, where the stalke is reddish, but longer up higher, the huskes that are set sparsedly at the tops, all on one side for the most part, are of a darke reddish purple colour, and white within, with small seedes in them.

6 *Gramen glumis varijs.* Particoloured Oatē Grasse.

The leaues hereof are greene, long, and narrow, from among which rise two or three, smooth and brittle naked stalkes, a foote high, bearing a short spike of small huskes of divers colours, the roote is thicke, covered with a rough white barke.

7. *Gramen Bromoides siue Auenaceum paucigranum nutante coma spicata.* Oate Grasse with few seedes.

This is somewhat hairy all over, the leaues are of a sad greene colour, set on stalkes two or three cubits high, and at the toppes a spiked bending head, having seven or eight small long huskes, with few seedes in them, this groweth neere woods sides in many places.

8. *Gramen Auenaceum sylvarum.* Wood Oaten Grasse.

The weake stalkes hereof are halfe a yard high, with soft long narrow leaues on them, and at the tops of them a few short huskes, and open like unto some of the Oate Grasses before: the roote runneth creeping in the ground.

9. *Gramen Auenaceum exile.* Small Wood Oatēn Grasse.

This is slenderer and smaller in all the parts thereof, but standing a little more upright, thē roote hereof is fibrous, and therein differeth most from the other.

10. *Gramen Auenaceum villosa gluma.* Hairy Wood Oaten Grasse.

The stalkes hereof are two cubits high, with small narrow leaues, foure or five inches long, the spiked head hath somewhat long and hairy huskes, distinctly set one above another, this is often found lesse by the halfe, the rootes are threddy and yellowish.

The Place and *Time.*

These doe all grow in Woods, and by Wood sides, on hils and the like places, where they flowrish all the Summer time.

The Names.

The first is remembred by *Clusius*, the fifth, and sixth by *Bauhinus*, the rest haue not beene specified by any other before.

The Vertues.

None of these are used in Phisickē to any purpose that I know.

CHAP.

CHAP. VII.

Gramen Miliaceum. Millet Graſſe.

THere are divers Graſſes, whoſe Featherlike toppes, doe in ſome ſort reſemble the buſhy toppe of Millet, whereof I meane to entreate in this Chapter, and unto them adde one or two other, which are called *Sorghinum*, becauſe they are more like unto *Turkie* or *Indian* Millet then the former.

1. *Gramen Miliaceum vulgare.* Common Millet Graſſe.

The common Millet Graſſe, riſeth up with a joynted ſlender ſtalke, with two or three ſomewhat large leaves thereon, and at the toppe, a buſhy ſpreading tufte of many long Featherlike ſprigges, conſiſting of many ſmall chaffie huskes, within which lye ſmall ſeede, which the ſmall birds greedily devoure: the roote is buſhy and fibrous.

2. *Gramen Miliaceum alterum.* Another Millet Graſſe.

This other Millet Graſſe, hath a ſmall weake ſtalke, a cubit high, with a few narrow leaves, foure or five inches long growing at the bottome, and two or three thereon at the joynts, the featherlike tuft at the toppe is ſpread like the former, but the chaffie huskes are much ſmaller and finer: the roote is fibrous and reddiſh.

3. *Gramen Arundinaceum paniculâ miliaceâ.* A third ſort of Millet Graſſe.

This third ſort hath ſundry reede like leaves, growing from a white fibrous roote, yet ſhorter then the laſt, among which riſeth up a ſtalke or two, about a cubit high, with two joynts thereon towards the toppes, and narrower and longer leaves ſtanding at them, at the toppes whereof ſtandeth ſuch a featherlike toppe as the firſt, of about three inches long.

4. *Gramen Sorghinum.* Indian Millet Graſſe, or Pipe Graſſe.

The Indian Millet Graſſe, which the *Flemmings* call Pipe Graſſe, and *Lobel* thereupon *Gramen Sonorum Flandrorum*, becauſe the boyes there make them pipes of the hollow reedelike ſtalkes, growing halfe a yard high or better, with faire long Lilly-like leaves thereon, and a ſpread ſpiked toppe of many parts above, ſomewhat like unto the Indian Millet, and larger ſeedes therein then in Millet, the roote is fibrous.

5. *Gramen Sorghinum alterum.* Another Indian Millet Graſſe.

This other ſort hath hollow ſtalkes like the laſt, but they are weake, bending downe to the ground, and ſhooting out fibres therein, whereby it rooteth a freſh, having narrow long leaves on them, the ſtalke ſeeming, as it were to runne through them, like to a pipe, and at the toppe ſuch a like ſpread ſpiked head as the former, whoſe huske in the ſeverall parts are ſmaller.

The Place and *Time.*

They doe all grow in Fieldes, and by the hedge ſides, as well in our Land, as in any others, although obſerved

1. *Gramen Miliaceum vulgare.*
Common Millet Graſſe.

4. *Gramen Sorghinum.*
Indian or Turkie Millet Graſſe.

but by few, that are curious in these minutes, and flowrisheth at the same time with the rest.

The Names.

The first is called *Gramen Miliaceum*, by *Lobel* and others, and is the fourth kinde of Grasse by *Dodonæus*, the two next are mentioned by *Bauhinus* onely, in his *Pinax* and *Prodromus*: The fourth is called *Gramen Sorghi effigie* by *Lobel*, and *Gramen sonorum Flandrorum*, as is before said, and is the fifth Grasse by *Dodonæus*, and *Gramen Sorghinum* by *Tabermontanus* and *Gerard*, who calleth it in English Darnell Grasse, but I follow the Latine or *Dutch* name. The last is of *Bauhinus* his relation likewise.

The Vertues.

All these Grasses are neglected, as not usefull in Physicke, and therefore left to the small Birdes to feede upon, as they doe upon many other sorts.

CHAP. VIII.

Gramen Paniceum. Panicke Grasse.

THere be sundry sorts of Grasses that resemble the head of Panicke, some newly, and others longer knowne, some large, some small, all which cannot be comprehended in one Chapter, I must therefore shew you some here, and the rest after them.

1. *Panicum sylvestre herbariorum.* Wild Panicke of *France*.

This Wild Panicke hath some neere resemblance unto Millet, in the spreading of the tufted head, being composed of sundry parts, each neere resembling a Panicke head, and yet called *Milium sylvestre* by some, the joynted stalke with leaves thereon are very like unto Panicke, yet much lesse in all, and therefore is by many likewise referred to Panicke, the roote is fibrous also like unto Panicke.

2. *Panicum sylvestre simplici spica.* Panicke corne Grasse with single eares.

This single Panicke Grasse, hath weaker and smaller stalkes then the former, and scarse rising upright, with shorter leaves on them, the toppes of the stalkes are severally furnished with a spiked rough head, sticking to any garment it toucheth, and small at the toppe full of small whitish seede.

3. *Panicum sylvestre Dalechampij.* Wilde Panicke Grasse of *Dalechampius*.

This Panicke Grasse differeth from the last in that it groweth more upright, two foote high, the stalkes have sundry Grasse like leaves on them, but longer and broader, with one usually under the hairy spiked head, which sticke so fast, to their garments that it toucheth, that it is hardly plucked off. There are two other sorts hereof, *Aka duo.*

1. *Panicum sylvestre herbariorum.* Wilde Panicke of *France*.

4. 2. 3. *Panicum sylvestre aristâ longis, spica simplici, Sylvestre Dalechampij, & ejus varietas.* Bearded, single eared, and wild Panicke Grasse.

the

the one found in our owne Land, which is ſmaller, the other at *Santa Cruz* in *Africa*, which is larger, and with a longer ſpiked head, elſe little differing.

4. *Gramen Paniceum ariſtis longis armatum.* Bearded Panicke Graſſe.

The bearded Panicke Graſſe, hath ſtalkes and leaves, not much unlike to the ſecond ſort of Panicke Graſſe, but larger and taller, having divers browne heades at the tops, one above another, armed with long and ſharpe beardes or awnes like unto corne: the roote conſiſteth of many long fibres.

5. *Gramen Paniceum minus.* The leſſer Panicke Graſſe.

This is leſſer then any of the other before, having low bending ſtalkes a ſpanne long, and ſharpe long leaves thereon, with ſmall long browniſh chaffie ſpiked eares, like unto thoſe of Cockes foote Graſſe, ſet ſparſedly at the toppes.

6. *Gramen Paniceum ſylveſtre Anglicum, & Africum.* Wild Panick Graſſe of England and of Barbary.

We have in divers woods with us, a wilde ſort of Graſſe, whoſe ſpike doth well reſemble the Panickes before, and we have had one like it, brought out from Barbary, differing onely in the largeneſſe thereof, both in leafe and head from our Engliſh.

The place and *Time.*

Theſe Graſſes grow uſually among rubbiſh, and in waſte grounds, and ſometimes alſo in good and manured fieldes, bearing their toppes in Sommer, as others doe.

The Names.

The firſt as I ſaid, is taken by *Cluſius* to be *Milium ſylveſtre*, by *Matthiolus Camerarius* and others called *Panicum ſylveſtre*, and thereupon *Lobel* addeth *herbariorum*, becauſe it was ſo accounted by the moſt. *Cæſalpinus* calleth it *Panicaſtrellæ ſpecies*. *Lugdunenſis* taketh the third to be the *Herba alba Plinij*, and *Tragus* the ſecond to be *Miliaria herba Plinij*, which *Cæſalpinus* calleth *Panicaſtrella*, and *Lobel Panici effigie gramen ſimplici ſpica*. The fourth and fifth, are *Lobels* ſecond and third *Panici effigie gramen*. And the laſt hath not beene mentioned by any before.

The Vertues.

If the ſecond or third, or any of their *ſpecies* be the *herba alba* of *Pliny*, then he ſaith it is hurtfull and dangerous for cattell, but eſpecially for ſheepe to feede thereon: there is nothing elſe recorded of them by any.

CHAP. IX.

Gramen Paniculatum pratenſe. The Medow tufted Graſſe.

OF the kindes of Graſſe that are called *Paniculata*, (that is with ſmall heades like Panicke, or round and long Catkines, called Panickles) there are divers ſorts, ſome growing in the fields and Meddowes, others in the plowed and Corne grounds, a third ſort is diſtinguiſhed by growing on hils and in woods, and a fourth ſort in the moiſt plaſhes of fields, and in the waters: In this Chapter I will firſt ſpeake of

1. 3. *Gramen pratenſe paniculatum molle, & aureum coma nutante.* The ſoft Medow tufted Graſſe, and the golden tufted Graſſe.

2. *Gramen Paniculatum Germanicum odoratum.* Sweete *Dutch* Graſſe with a tufted head.

thoſe

thoſe that grow in the Fieldes and Medowes, and then of the reſt in their order.

1. *Gramen pratenſe paniculatum molle.* The ſoft Medow tufted Graſſe.

This ſoft Medow Graſſe, hath ſundry long and ſomewhat broad ſoft or woolly Graſſe-like leaves, riſing from a ſmall tuft of ſhort white fibres, and from among the leaves riſe up a ſtalke, two or three, about a cubit high, with ſome few leaves upon it, and at the toppe breaketh forth a ſoft woolly ſpiked head, much divided, whoſe bloomings are reddiſh.

2. *Gramen paniculatum Germanicum odoratum.* Sweete Dutch Graſſe with a tufted head.

The roote of this Graſſe doth creepe in the ground, being white, and full of joynts, ſhooting out fibres at every

4. *Gramen pratenſe vulgatius majus.*
The greater ordinary Medow Graſſe.

4. *Gramen pratenſe minus.*
The leſſer tufted Medow Graſſe.

4. *Gramen pratenſe minimum album.*
The leaſt white Medow Graſſe.

4. *Gramen pratenſe minimum rubrum.*
The leaſt red Medow Graſſe.

joynt;

joynt, the ſtalkes are two cubits high, with but few joynts on them, whoſe leaves are almoſt as long, and ſome of them exceede the height of the ſtalkes, being narrow and ſmall at the ends, bearing on each a much more cloſe and nothing ſo much ſpread a Panickle, as the former, and which for the ſweeteneſſe of them, are tyed in ſmall bundles, and laide among garments, or linnen to perfume them.

3. *Gramen paniculatum aureum nutante coma.*
Golden tufted Graſſe.

This golden headed Graſſe hath many long narrow leaves, like unto other ſmall Graſſes: the ſtalkes are a cubit high, with a long tufted toppe, made of ſundry Pannickles or ſpikes bowing downe the head, and of a faire but pale yellowiſh colour: the rootes are many and blacke, ſpreading here and there under ground.

4. *Gramen pratenſe paniculatum majus.*
The greater tufted Medow Graſſe.

This common Medow Graſſe, hath many Graſſe-like leaves and among them ſundry ſtalkes halfe a yard high, bearing a ſparſed tuft at the toppe of them, ſomewhat reſembling the feather-like head of the Water-reede. Hereof there is another leſſer ſort, and two other ſorts ſmaller then they, the one with white tufted tops, and the other with reddiſh tufted heades.

5. *Gramen paniculatum multiplici.*
Medow hard graſſe with manifold tufts.

This riſeth up with divers ſpannelong ſtalkes, joynted, and a little bending downewards, the leaves are ſmall like graſſe, and the tufted head or Panickle is very much divided, and when it is ripe, groweth hard and of a ſad reddiſh colour, the rootes are a thicke buſh of white threds.

The Place and *Time.*

Theſe grow all of them in Fieldes, and Medowes, and are in their perfection in the Sommer time, when others are.

The Names.

The firſt is called by *Lobel*, *Gramen paniculatum molle*, and by *Lugdunenſis*, *Gramen lanoſum Dalechampij*: the ſecond is called by *Bauhinus*, *Gramen paniculatum odoratum*, and *Germanicum* is alſo added, uſually by divers other Herbariſts. and *Gramen Mariæ*, by the Inhabitants where it is natural. The third is called by *Lugdunenſis*, *Gramen aureum Dalechampij*, & by *Bauhinus*, *Gramen paniculæ pendula aurea*: The fourth is called both by *Lobel* and others, *Gramen pratenſe majus vulgatius*, whereof as I ſaid, ſome are in degree leſſer and leſſer then others: the leaſt red ſort, being the *Gramen minimum* of *Lugdunenſis*, which *Bauhinus* maketh the laſt of the *Gramina tremula*, calling it *Gramen minimum paniculis elegantiſſimis*. The laſt *Bauhinus* calleth *Gramen panicula multiplici*, and ſaith that they of *Mompelier* called it *Gramen minus duriuſculum*, and that there is a greater and a leſſer.

5. *Gramen panicula multiplici.*
Medow hard Graſſe, with manifold tufts.

Minus minimaduo alia.

The Vertues.

The Medow Graſſe is of moſt uſe in Phyſicke, next to the Quiche-graſſe, yet the ſeedes of theſe, and not the rootes, as the rootes of the other, and not the ſeedes, ſerve to open the obſtructions of the bowels, and to expell the ſtone, if the decoction thereof be drunke: being uſed outwardly they helpe to diſcuſſe windy ſwellings, and hard tumours, that will hardly be repreſſed or diſſolved, the greene herbe it ſelfe, is never uſed Phyſically that I can learne, but the dryed herbe, when it is made Hay, is boyled in water a good while, and then bound to the jawes of Horſes, or Cattle that are chappefalne by too long abſtinence from meate, and doth preſently helpe them.

CHAP. X.

Gramen Paniculatum arvorum. Corne Graſſes with Panicklēs.

THe next ſort of theſe Panickle Graſſes to be entreated of are thoſe that grow in the Corne fieldēs, or thoſe that have beene plowed, and doe lye Ley.

1. *Gramen arvenſe panicula criſpa.* Curled Panicke Graſſe.

This Graſſe hath deſcending from a threddy root, reddiſh ſcaly heads, and thence riſe narrow Graſſe leaves, and low ſtalkes, bearing a head of many tufts, ſet one above and againſt another, conſiſting of ſoft and curld reddiſh threds, iſſuing from a ſmal huske. I have thought good to adde the figure of that Graſſe that *Lugdunenſis* calleth *Bulboſum Dalechampij*, becauſe *Bauhinus* ſaith it is this, but not well expreſſed, but ſurely I doubt it is another ſort. *Bulboſum Dalechampij.*

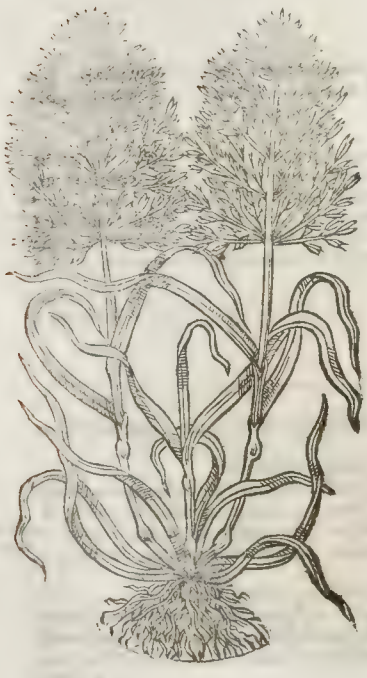
2. *Gramen ſegetum panicula ſpecioſa.* The great Corne Graſſe.

This goodly Graſſe groweth up with a few long ſoft greene leaves, like to thoſe of Miller, ſome below, and others upon the tall ſtiffe, round, ſmooth, greene ſtalke, a yard and a halfe high, bearing a brave tufted toppe, ſpread ound, into many ſlender ſprigges, very like to the tufted head of the Millet graſſe, but more beautifull: the roote, a ſmall tuft of fibres.

3. *Gra-*

1. *Gramen arvense paniculâ crispa.*
Curld Panicke Grasse.

2. *Gramen segetum paniculâ speciosa.*
The faire greene Corne Grasse



3. *Gramen agrorum venti spica.*
The Corne Reede Grasse, or Bent Grasse.

3. *Gramen agrorum venti ſpica.* The Corne Reede-graſſe, or Bent graſſe.

This Feather-like Graſſe ſhooteth forth, joynted tall ſtalkes, and faire leaves, almoſt like the laſt, the toppe of the ſtalke is furniſhed with a long and large tufted head, ſpread like unto ſprigges of feathers, are ſomewhat like common reedes, ſtanding for the moſt part all one way, and hanging downe their heades, and are of a fine browne greene ſhining colour, which are (being fine and ſlender) eaſily ſhaken with the winde.

The Place and *Time.*

Theſe grow in the borders of Corne fields, and grounds that have beene plowed, and flowriſh chiefely in the beginning of Summer.

The Names.

The firſt of theſe is the *Gramen* of *Matthiolus*, the *Gramen minimum Xerampelinum* of *Lobel*, called *Gramen arvenſe panicula criſpa* by *Bauhinus*, and by him taken to be the *Gramen bulboſum Dalechampij* of *Lugdunenſis*, but as ſaid before, I make a *quere* thereof. The ſecond is the *Gramen ſegetum panicula ſpecioſa latiore* of *Lobel*, *Bauhinus* calleth it *altiſſimum panicula ſparſa*. The third is called by *Lobel*, *Agrorum venti ſpica Flandrorũ*, becauſe the *Flemings* call it ſo, and *Gramen agrorum latiore arundinacea comoſa panicula*, as alſo *Triclinarium gramen*, becauſe the ſtalkes being tyed in a row together, one by another ſerveth in the Summer to be ſet in chamber chimneyes, ſtanding upright, when no fire is made therein, to coole, decke up, and refreſh the roome, it is uſually called in Engliſh, Bent-graſſe, and of ſome Windle-ſtrawes, it is the *Gramen Arundinaceum arvenſe* of *Tabermontanus*: and the third *Gramen pratenſe* of *Dodonæus*, but cannot be the *Gramen equinum Geſneri*, as *Bauhinus* thoughdt, for *Camerarius* ſaith it was white and woolly, which this is not.

The Vertues.

The firſt is ſaid to have the like properties unto the Quich graſſe but of the reſt there is no certainty of any good uſe they have in Phyſicke.

CHAP. XI.

Gramen paniculatum montanum. Mountaine tufted Graſſes.

THe *Gramen ſulcatum* or *pictum* ſhould be here numbred with the other Mountaine kindes, but that I have ſhewed it you in my former Booke.

1. *Gramen montanum panicula ſpadicea delicatiore.* The ſoft mountaine Panicke Graſſe.

From a ſmall white roote with ſhort fibres, ſpring up three or foure joynted ſtalkes a foote high, having a few ſmall and ſhort leaves on them, and ſuch likewiſe at the the foote of the ſtalkes, but few in number, at the toppe whereof ſtandeth a browniſh panickle of three inches height, compoſed of many very ſmall huskes. This is ſometimes found growing higher, and with larger Panickles. *Alterum.*

2. *Gramen ſylvaticum paniculatum altiſſimum.* Tall tufted Wood Panicke Graſſe.

The roote of this Graſſe creepeth in the ground, ſet with divers fibres from whence riſe two or three very tall Reede-like ſtalkes, two or three cubits high, bearing faire broad greene leaves on them, like unto *Cyperus*, and at the toppes many ſmall tufted Panickles: both ſtalkes and leaves are ſo tough, that the Country Shepheards make them cloakes therewith againſt the weather, and the Husbandmen make twine ropes, and traces for their Horſes to draw their ploughes.

The Place and *Time.*

The firſt groweth on the hils by *Baſſill*, the other in the Woods by *Mombelgard*.

The Names.

Bauhinus onely hath ſet out theſe by the ſame Names are in their titles.

The Vertues.

There is as little uſe of theſe, as of the former.

CHAP. XII.

Gramen criſtatum & ſpicatum. Creſted and ſpiked Graſſe.

THere are other ſorts of Graſſes that beare Panickles or tufted heads, but they uſually grow in or neere waters, which ſhall be declared in that Claſſis is appropriated to ſuch of that nature and quality. Thoſe that beare creſted or ſpiked heads, are of divers kindes, &c.

1. *Gramen criſtatum lene.* Smooth creſted Graſſe.

The white rootes of this Graſſe do matt themſelves in the ground very much, from whence ſpring up divers ſmooth ſlender ſtalkes, two foote high, with few or no joynts on them, and with ſmall ſhort greene leaves at them: the toppes of the ſtalkes have ſlender long ſpiked heads ſet on them, divided into many parts, each whereof is like unto the creſt of a Bird, whereof it tooke the name, being of a pale yellowiſh greene colour, and ſometime reddiſh, or as *Bauhinus* compareth it to the head of *Criſta galli*, Cockes combe.

2. *Gramen criſtatum ſubhirſutum* Hairy creſted Graſſe.

This other creſted Graſſe, differeth from the former, onely in theſe particulars, the rootes are of a reddiſh yellow colour, lower and ſmaller ſtalkes, a little hairy or Woolly at the bottomes, with longer leaves, and a more ſparſed white head, not ſo finely ſet together, and groweth rather among the hedges and buſhes.

3. *Gramen criſtatum Anglicum.* Engliſh creſted Graſſe.

This kinde hath fewer and longer rootes, not matting and encreaſing in that manner, the ſtalkes are ſtraight with longer and narrower leaves on them, the ſpiked head differeth from it, in being longer and cloſer ſet, and not ſpread into tufts, but as it were into cloſe ſhort huskes, the whole ſpike ſomewhat reſembling a ſmall long Fox-taile Graſſe, this groweth plentifully in many by places neere *Hackney* a little of from *London*.

4. *Gramen*

1,2,3,4. *Gramen cristatum læve, cristatum subhirsutum, Cristatum Anglicum, & spica multiplici.*
Smooth, Hairy, English and double crested Grasses.

5,6,7. *Gramen pratense spica purpurea. Spica flavescente: & spica multiplici.*
Purple, yellow and rough spiked Grasse.

8. *Gramen spicatum folijs Caryophylleis.*
Spiked Medow Grasse with Gilloflower leaves.

9. *Gramen folijs Caryophylleis spica squamata.*
Gilloflower leafed Grasse with a scaly spike.

4. *Gramen cristatum spica multiplici.* Double English crested Grasse.

A variety hereof hath beene found, bearing divers smaller parted spikes from the greater, and not differing in any thing, or very little else.

5. *Gramen pratense Dalechampij spica purpurea.* Purple red spiked Medow grasse of *Dalechampius.*

This Medow Grasse hath a bush of white threds for the roote, with many Grasse-like leaves rising from it, which are both narrower, softer, and greener, having divers short stalks not a foote high, with two or three joynts on them, set with leaves, and at the toppes out of a round skinne or huske, picked at the end, being the uppermost leafe, breaketh forth a thicke, short, and somewhat flat spike, of a brave reddish purple colour.

6. *Gramen pratense spica flavescente.* Yellow spiked Medow grasse.

This other yellow spiked Grasse differeth so little from the last, either in rootes, leaves, taste, or quality, that divers have called the one the Male, and the other the Female, the head or spike onely of this is of a pale yellow colour, and in some places on hils, of a more reddish and shining colour, not enclosed in any skinne of leafe, as the other, but standing bare or naked, being also slenderer and longer.

7. *Gramen*

7. *Gramen pratense ſpica multiplici rubra.* Rough ſpiked Graſſe.

This ſpiked Graſſe hath a ſmall roote made of a few fine threds like haires, from whence riſe long and narrow leaves, ribbed all the length of them, and ſo compoſed as is hardly ſeene in any other herbe, for ſome of them are ſo joynted, as if one leafe grew out of another, on the top of the ſtalke ſtandeth a very long head, conſiſting of many more reddiſh ſpikes, ſet together one above another, then in any other Graſſe, and ſomewhat rough in handling.

8. *Gramen ſpicatum foliis Caryophylleis.* Spiked Medow Graſſe with Gilloflower leaves.

The leaves of this Graſſe are ſomewhat hard, thicke, and ſhort, and greener then thoſe of Gilloflowers, or Pinkes, the ſtalkes are halfe a foote high, at the toppes whereof ſtand ſmall ſpikes, ſometimes more and ſometimes fewer, browniſh at the firſt, and afterwards ſomewhat reddiſh, with many yellow threds mixt among them: the rootes runne under the upper cruſt of the ground, foulding one within and over another: there is neither of the greater or leſſer cattle that will willingly feede hereon, as being ſo hard and ſappeleſſe, that it ſeemeth unfit to encreaſe any milke or nouriſhment in them. This cannot be the *Gramen Rabinum* of *Geſner*, as ſome take it to be, although in face it be ſomewhat like it, for the contrary qualities of feeding cattle, ſheweth a repugnancy.

9. *Gramen Caryophylleis foliis ſpica ſquamata.* Gilloflower leafed Graſſe, with a ſcaly ſpike.

This ſmall graſſe hath ſmall long leaves, narrow and bowing: the ſtalkes are ſmall and low, not much above a ſpanne high, bearing at the toppe a ſhort ſcaly head: the rootes are ſmall blackiſh threds.

The Place and Time.

All theſe according to their titles grow in Fields and Paſtures, or neere unto them, and flouriſh at the time when others doe.

The Names.

The firſt is the *Gramen criſtatum Bauhini* of *Lobel*, and by *Bauhinus* himſelfe, *Gramen pratenſe criſtatum, ſive gramen ſpica criſtata brevi*: The ſecond is a variety of the former, mentioned by *Bauhinus* likewiſe: The third is ſet downe, as it groweth with us, and howſoever thought by ſome to agree with the former, yet by comparing them, they are ſoone found to differ as is alſo ſhewed, the fourth is mentioned as a variety of the laſt: the fifth hath his name in his title, to be knowne whoſe it is: The ſixth is called by *Lugdunenſis*, *Gramen Anthoxanthon*: The ſeventh is the *Gramen ſpicatum Dalechampij* by *Lugdunenſis*: The eight is ſo called by *Lobel*, as it is in the title, by *Lugdunenſis Gramen nigrum*, by *Tabermontanus Gramen Caryophylleum*, The laſt is the leaſt, and the laſt remembred by *Thalius* in his *Hercynia ſylva*, of his *gramina Loliacea*.

The Vertues.

Theſe Graſſes, eſpecially the purple ſpiked Medow kinde, is thought to come neere the properties of the other field Graſſes, but becauſe we have no certainty hereof, we leave it and them untill we can learne to what diſeaſes they may be moſt conducible.

CHAP. XIII.

Gramen ſpicatum montanum & nemoroſum. Mountaine and Wood ſpiked Graſſe.

THe other ſorts of ſpiked Graſſes, as I ſaid, were of thoſe that grow on hills, and in Woods, which ſhall be here expreſſed.

1. *Gramen montanum ſpicatum Cluſij. Cluſius* his mountained ſpiked Graſſe.

From a long roote, of a fingers thickneſſe, parted ſometimes into two or three ſtringes with many fibres thereat, and ſomewhat hairy at the toppe, ſhoote forth ſundry heads of leaves each containing five or ſixe ſomewhat long, thicke and halfe hollow like a gutter, very like unto thoſe of the greater Thrift compaſſing one another at the bottome, a little bitter and ſharpe in taſte, from the middle of whom ſpring up ſtiffe ſmooth, bare, and knotleſſe ſtalkes, about a foote high, bearing at the toppes ſundry ſmall flowers ſet ſpike faſhion, and of a greeniſh colour.

2. *Gramen ſpicatum anguſtifolium montanum.* Mountaine ſpiked Graſſe with narrow leaves.

This Graſſe differeth onely from the eight Graſſe deſcribed in the laſt Chapter, in that it hath longer and much narrower leaves, ſlenderer ſtalkes and longer, and in the place of the growing, for it groweth onely upon hils and mountaines, flowring and flouriſhing earlier then moſt of the other, namely in the middle or end of *May*.

3. *Gramen ſylvaticum anguſtifolium ſpica alba.* White ſpiked Wood-graſſe.

The roote hereof is yelloviſh growing aſlope in the ground, with ſmall fibres at it: the leaves which riſe from thence, are many but very ſhort and narrow, ſcarſe foure or five inches long, the ſtalkes oftentimes exceede not the length of the leaves, wherein ſtand ſmall white ſpiked heads, ſcarce an inch long, beſet with ſhort haires.

4. *Gramen Caryophylleum ſpica multiplici*, Double ſpiked graſſe with Gilloflower leaves.

From a roote compoſed of a buſh of many reddiſh hairy fibres ariſe ſundry ſhort narrow leaves, like unto thoſe of Gilloflowers, among which ſpring very many ſlender ſtalkes, naked without joynts or leaves, ſcarſe growing above the leaves, ſuſtaining very ſhort reddiſh ſpikes many ſet together.

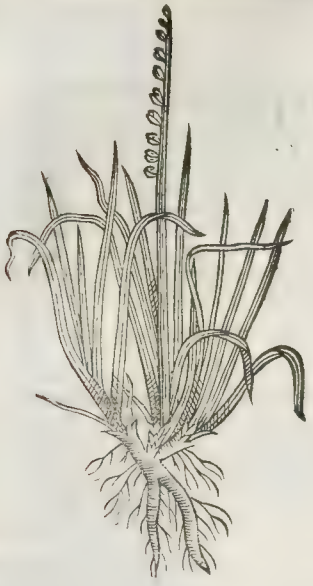
5. *Gramen Caryophylleum ſpica varia.* Variable ſpiked graſſe.

The blacke rootes hereof are ſmall long and threddy, buſhing thicke together, from whence ſpring long and narrow leaves, like thoſe of Gilloflowers among which grow ſundry ſmall naked ſtalkes, bearing a ſlender long ſpiked head, ſometimes ſingle, and ſometimes divided or branched into ſeverall long parts, made of many huskes.

6. *Gramen Caryophylleum Rabinum.* The principall Gilloflower graſſe.

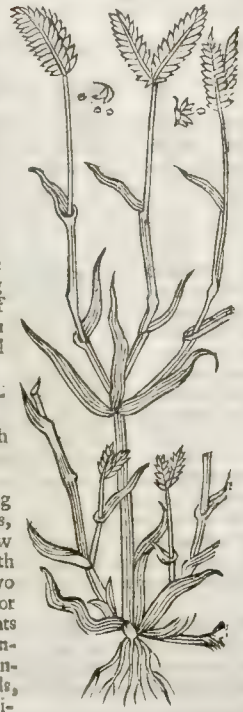
This graſſe hath many thicke firme or fleſhy long and pointed leaves, lying in a round compaſſe, at the head of the roote, like to thoſe of Gilloflowers, not having any nerves or vaines to be ſeene in them: none hath as yet deſcribed the toppe or head, what forme it beareth, but it may be *Bauhinus* hath ſeene it, in that he placeth it with theſe ſorts of ſpiked Graſſes.

1. *Gramen Montanum ſpicatum Cluſij.* *Cluſius* his mountaine ſpiked Graſſe.



4. *Gramen Caryophilleum montanum ſpica varia.* Variable ſpiked Graſſe.

7. *Gramen ſpica gemina Columnæ.* *Columnæ* his double ſpiked Graſſe.



8. *Gramen ſpica nutante longiſſima.* A long ſpiked Graſſe with a bending toppe, or Capons taile Graſſe.

7. *Gramen ſpica gemina Columnæ. Columna* his double ſpiked Graſſe.

From a ſmall whitiſh fibrous roote, riſe up diverſe weake and leaning joynted ſtalkes, with ſmall Graſſe-like leaves thereat, and at the toppes of each, two ſeverall ſpikes, joyned together at the foote of them, dented on the edges with a middle ribbe, betweene the foure angles, and conſiſting of three or foure rowes of leaves, like ſcales, in each whereof is conteined a ſmal browniſh corned head.

8. *Gramen ſpica nutante longiſſima.*

A long ſpiked Graſſe with a bending top, or Capons taile graſſe.

From among many long and narrow graſſie-leaves, which by time & age, grow ſomewhat rounder, ariſeth a ſlender ſtalke, about two foote high, with two or three ſmall leaves at joynts up to the top, where ſtandeth a very long ſpike, bending a little downewards, compoſed of ſmall and hairy tufts, which grow grayiſh being ripe, with ſmall whitiſh ſeede within them, the roote is fibrous and ſtringy.

9. *Gramen*

9. *Gramen spica articulata Virginiana.* A goodly *Virginia* grasse with a joynted spike.

This goodly *Virginia* grasse groweth great, with many faire large and broad Grasselike leaves, very small pointed and somewhat hard in handling, the stalke is somewhat great and tall, bearing a long spike at the toppe, joynted into sundry parts, each of them almost halfe an inch apeece, being almost round, yet a little flat: the roote is bushy and liveth long.

The Place and Time.

These Grasses grow on hils, and in woods, some of them in *Germany*, *Italy* and *Virginia*, and some of them also in our owne land, as time and diligence hath brought them to light, their flourishing being with the rest.

The Names.

The first of these is so called by *Clusius* as it is in the title, who saith he found it or the like, on the Sea coasts of *Flanders*, *Gerard* hath it by the name of *Gramen maritimum alterum*. The second, third, fourth and fifth, are mentioned onely by *Bauhinus*, by the same titles they beare here, saving that whereas he intituleth some of them by the name of *Caryophellatum*, I give it *Caryophylleum*, and as I thinke lesse ambiguous, for *Caryophyllata herba* differeth much from *Caryophyllus*, to the leaves whereof, and not unto *Caryophyllata*, these Grasses have resemblance: The sixth is called by *Gesner in hortis Gramen Alpinum Rabinum, quasi præstantius, & præcipuum*, and by *Lobel Rabinum vel Raviſum*. The seventh is called by *Columna Gramen δυσχόρτοφορες*, and by *Bauhinus*, *Gramen spica gemina*, *Millepedæ similis*. The eighth is the Capons taile grasse of Master *Goodiers* invention: The last came from *Virginia*, and Master *John Tradescant* the younger brought it from thence also, with a number of other seedes and rare plants.

The Vertues.

We have no evidence what properties these Grasses have in Physicke, but are onely left as food for Cattle, but the fifth is extolled by the naturalls of those places where it groweth, to be most singular to cause Cattle to give abundance of milke.

CHAP. XIV.

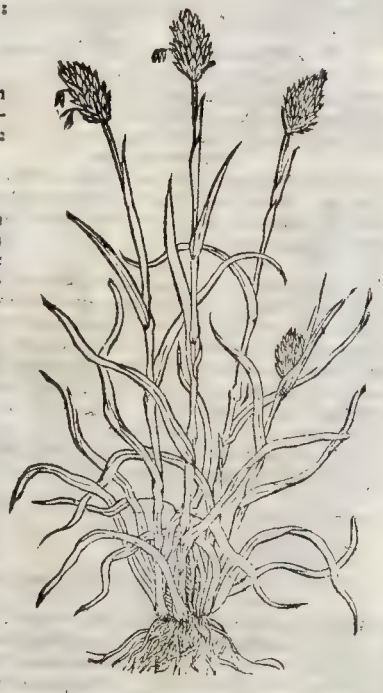
Phalaris. Canary Grasse.

OF this Grasse there are three speciall varieties to be declared in this Chapter, but there are divers other bastard sorts which shall be shewed in the next.

1. *Phalaris vulgaris.* Common Canary grasse.

The common Canary grasse is but an annuall plant, to be new sowne every yeare with us, by them that will see it grow, bearing joynted stalkes halfe a yard high, with grassie leaves on them like Barley, and at the toppe a round chaffie head somewhat pointed above, whose bloomings are yellowish, wherein lye flat round shining seede, bigger then Millet, and lesse then Linseede, of a yellowish colour: and somewhat like to the seed of *Sesamum*: the roote is fibrous, dying every Winter with us.

1. *Phalaris vulgaris.*
Common Canary Grasse.



2. *Phalaris semine nigro.*
Canary grasse with a blackish seede.

This other *Phalaris* differeth not from the former, but in being somewhat lesser both in stalk, leafe, and head, and chiefely in the seede, which is of a pale blackish and shining colour: the roote hereof perisheth like the former.

3. *Phalaris bulbosa semine albo.*
White bulbed Canary grasse.

This Grasse also groweth very like the former, but with smaller, tenderer, and taller joynted stalkes and leaves on them and at the roote more soft and gentle, the spiked heads are smaller and a little longer, and not fully so close growing together, softer also in handling, and bringing smaller, but whiter seede in them then the former: the rootes are many small white bulbes, growing in tufts together with long fibres, descending from them, whereby they are fastened strongly in the ground and dye not every yeare as the others doe, but encrease into great tufts.

The Place and Time.

All these sorts have beene found growing in *Spaine*, and brought us by *Boel*, with some bastard sorts, and many other things: The first hath beene of many yeares knowledge, and brought us from the Canary Ilands with those small sweete singing birds, which wee call Canary Birds, whose foode these seedes are. *Lobel* saith it groweth also in *Provence* of *France*. *Bauhinus* saith that the second came out of *Malta*, where those birdes seede on it. They all are ripe with us in *August*.

The Names.

It is called in Greeke φαλαρὶς, in Latine also *Phalaris*, and so by all Writers, yet *Dalechampius* on *Pliny* taketh it to bee the *Milium alterum* of *Theophrastus*, and is oftentime used in

ſtead of *Alſinum*, being of ſo neere agreement in quality, that there is not a neerer *ſuccedaneum*, and is called in the Canary Illands, *Alpiſti* by the people there, and *Cuneno* in *Malta* as *Lugdunenſis* ſaith, who referreth that name to both the former ſorts, although *Bauhinus* referreth it onely to the ſecond. The laſt is not mentioned by any before.

The Vertues.

Canary ſeede is in ſome places and Iſlands made into bread, but it hath as little nouriſhment therein as Millet, or rather leſſer, and therefore to mend it ſome put to it wheate, that the bread may be the faſter, which elſe would be too brittle and dry. The juyce of the herbe being drunke is very profitably uſed to eaſe the tormenting paines of the Stone, the ſtoppings of vrine, and the diſeaſes of the bladder, and the ſcumme alſo is of the like property as *Galen* ſaith: it is as I ſaid, the neereſt ſubſtitute for Millet in any cataplaſme or fomentation, that is uſed to drye and repreſſe the fluxibility of humours.

CHAP. XV.

Gramen Phalaroides. Baſtard Canary Graſſe.

OF this baſtard kinde we have divers ſorts to offer to your view and conſideration, as they ſhall bee ſeverally deſcribed: ſome of them are moſt like unto the true *Phalaris*, bearing but one ſpike or head on a ſtalke, which ſhall be declared in this Chapter: and there are ſome other kindes that beare many ſmall heads in a tuft, called *Phalaris pratenſis*: and we in Engliſh Quakers, and Quaking-graſſe, which ſhall be ſhewed in the next, becauſe of their differing forme and uſe.

1. *Gramen Phalaroides majus.* The greater baſtard Canary graſſe.

This greater ſort is very like the true *Phalaris*, both in ſtalke leafe and head, but that firſt, this is found growing wilde by the way ſides, in the Medowes of our owne Country: and then the ſtalkes are ſingle, with fewer leaves on them, and laſtly the head or eare is ſmaller, hoary, ſofter, and the roote likewiſe is ſmaller and fibrous periſhing yearely.

Graminis Phalaroides quatuor ſpecies.
The foure ſorts of baſtard Canary Graſſe.

2. *Gramen Phalaroides minus.*
The leſſer Baſtard Canary graſſe.

This is in all things like the former, but that the eare or head is ſmaller and longer, and the leaves doe ſo compaſſe the ſtalke at the bottome, that it ſeemeth to runne through it, as through a truncke.

3. *Gramen Phalaroides ſpica molli Germanicum.*
Baſtard Canary graſſe of *Germany*.

The ſtalke of this is of a cubits height, ſomewhat bigger then the laſt, with a joynt or two thereon, and ſhort leaves at them, compaſſing it at the lower end: the head is ſhorter and ſmaller then the laſt, of a ſhining aſhe colour, and ſoft in handling.

4. *Gramen Phalaroides ſpica hirſutiore.*
More hairy baſtard Canary graſſe.

This is ſomewhat like the laſt, but hath more ſtore of leaves and ſtalkes, riſing from the roote which is living: and the ſpiked head is longer, narrower, and ſet with ſhort haires.

The Place and *Time.*

The firſt as I ſaid, groweth in our fields, as well as in other Countries. The ſecond in *Spaine*. The third in *Germany* about *Vlmes*. And the laſt by the pathes going through many fields in this country, and flouriſh in *July*.

The Names.

Lobel calleth the firſt ſort here, *Gramen Phalaroides ſecundum*, but in *Gerard*, *Gramen Alopecuroides majus*: *Bauhinus* calleth it *Gramen Phalaroides majus ſive Italicum*, the other two are called by *Bauhinus* according to their titles, and ſaith withall, that the learned about *Vlmes* where it is frequent, doe call it *Onocordon*, from the colour of it. The laſt is not mentioned by any before that I know.

The Vertues.

Theſe being very like unto the true *Phalaris*, may come as neere in vertue to the former, as they doe in face but yet wee have no certainty thereof.

CHAP. XVI.

Phalaris pratenſis ſive Gramen tremulum. Quakers, or Maidenhaire graſſe.

BEcauſe, as I ſaid theſe kindes of Graſſes doe differ in their forme from the other, it was fitteſt to ſeparate them, and joyne the moſt likely in a Chapter together.

1. *Phalaris pratenſis major, ſive Gramen tremulum maximum.*
The greateſt Quaking graſſe, or Lovely graſſe.

This greater kinde hath many narrow Graſſelike leaves, both below and upon the joynted ſtalkes, which

which are a foote high and better, on the toppes of the ſtalkes ſtand a number of ſmall flat and long, ſomewhat ſcaly heads, greater then the next, and each of theſe are on a fine hairy footeſtalke and pendulous, which are ſometimes of a whitiſh colour when they are ripe, and ſometimes of a browniſh green colour, being ſhaken with any the leaſt winde that may be.

2. *Gramen tremulum medium.*

Maidenhaire graſſe, or the leſſer quaking graſſe.

This leſſer ſort groweth ſomewhat like the former, with fewer leaves and ſtalkes, and a large panickle or tufted head, of greener, ſhorter, and rounder ſcaly pointed eares, ſtanding on ſmaller or finer footeſtalkes then the former, which are in ſo continuall motion, that the moſt ſteddy hand cannot hold them from ſtirring. Of this kinde *Boel* brought us another out of *Spaine*, ſomewhat greater then it, and of an obſure or ſullen ſooty colour, in nothing elſe differing.

We have alſo two other ſorts hereof, growing in Vpland Corne fieldes, as at *Hatfield, &c.* on the graſſie balkes there, little differing in leaves or ſtalkes from the laſt, the heads onely are a little leſſer, and ſo is the whole panickle alſo, the one whereof is party coloured, of purpliſh and greene: the other of ſtraw colour and white.

3. *Gramen tremulum minus panicula parva.*

Small Quaking graſſe.

The rootes hereof are reddiſh, creeping here and there, from whence riſe two or three ſhort ſtalkes, with few joynts, and ſmooth narrow greene leaves at them, as the many that grow below are, but out of the uppermoſt joynt, and the leafe as it were out of a hoſe, breaketh forth a ſmall long ſingle ſpike of ſmall ſcaly heads of a browniſh colour, with yellowiſh bloomings at their ſeaſon, which is the Spring.

Of this kinde there is another found in *Gaſcoigne*, whoſe panickle is more branched, ſomewhat like the ſecond kind, but ſtanding cloſer together.

4. *Gramen Phalaroides minus ſupinum Danicum Lobelij.*

Low Quakers of *Denmarke*.

This Graſſe groweth low, lying or creeping upon the ground with many ſmall ſhort leaves, and greater ſtalkes then is proportionable for the ſmallneſſe of the plant, not above two or three inches long, having at the toppes of them a ſmall ſlender ſpiked eare, ſeparated into a few ſmall chaffie pointed heads, of a whitiſh colour being ripe, the roote is of a browniſh colour and hairy.

1, 2. *Phalaris pratenſis ſive Gramen tremulum maximum medium & ejus varietates.*
The greateſt Quaking graſſe, or Maidenhaire graſſe with the varieties.

Hiſpanicum alterum acutum. Anglica duo altera.

4. *Alterum.*

3, 5. *Gramen tremulum maximum Hiſpanicum & minus.* The ſmall Quaking graſſe and the greateſt of *Spaine* called Pearle Graſſe.

4 *Gramen Phalaroides Danicum & alterum minimum.*
Low Quakers of *Denmarke* and the other ſmall one.

Minimum. There is another ſmall one with ſmall ſhort leaves and ſtalkes, full of ſmall ſcaly heads, upon very ſhort foote-ſtalkes.

5. *Gramen tremulum maximum album Hiſpanicum.* The greateſt white *Spaniſh* Quakers, or Pearle graſſe.

This greater white *Spaniſh* kinde is a ſmall graſſe, with ſlender ſtalks, and a few ſoft greene leaves on them, at the toppes whereof ſtand the greateſt and flattiſh ſoft ſcaly heades, of any of the other before, and of a ſilver ſhining white colour, very beautifull to behold, each much like unto the head of an hoppe ſtanding on a ſmall thred-like footeſtalke as the others doe, but are almoſt as moving and ſtirring as the other: the roote is ſmall and fibrous periſhing every yeare with us, and ſeldome riſing againe by it owne ſowing, but of the ſowing thereof in the Spring, yet ſowing it ſelfe in *Spaine*, and abiding there all the Winter, in regard they have no frofts.

The Place and *Time.*

All theſe kindes of Graſſes doe grow in the Corne fields, ſome in Ley grounds, and others in dry Medowes, and Paſtures. The firſt and ſecond with the ſeverall ſorts of it in our owne Country as well as in *Spaine*, *Italy*, or elſewhere, thē other ſorts are all of them ſpecified in their titles or deſcriptions where they are naturall. They flouriſh ſome what earlier then divers other Graſſes.

The Names.

The firſt is called by *Lobel Gramen paniculoſum phalaroides*, by *Cluſius Gramen amourettes quaſi amatorium* or *amabile* Lovely graſſe, by *Dodonæus Gramen pratenſe ſextum*, by *Lugdunenſis Gramen filicetum ſive polyanthos ſecundum*, by *Tabermontanus Gramen paniculatum ſativum*, and ſo *Gerard* from him, by *Bauhinus Gramen paniculis elegantiſſimis ſive ἐεάγροστις majus*, and I have called it *Phalaris pratenſis major*, *ſive Gramen tremulum majus*, becauſe it beareth the greateſt number of heads of any the reſt: The ſecond is called *Phalaris pratenſis minor* by *Lobel*, *Amourettes tremblantes* by *Cluſius*, *Ægilops* by *Tragus*, and *Geſner in hortis*, and *Gramen polyanthos* by *Lugdunenſis*: The third is called by *Bauhinus* according to the title, making it the ſame or very neere unto *Thalius* his ſmall ſort of Graſſe, and the other kinde thereof *Gramen tremulum minus panicula magna*, and *Aquitanicum* by *Lobel* in his *Illuſtrations*, that he intended to publiſh: The fourth is called as it is in the title: the laſt is called by *Bauhinus Gramen tremulum maximum*, and queſtioneth if it be not *Phalaris altera* of *Ceſalpinus*, *Cluſius* in his *curæ poſteriores* maketh mention hereof, by the name of *Gramen amourettes majore panicula candicante*, which he ſaith *Boel* ſhewed him as he brought it out of *Spaine*, but he gave it me firſt, by the name of *Gramen elegans lupuli glumis*, and is now adayes among our Gentlewomen much eſteemed, and called Pearle graſſe, the ſorts of the ſecond kinde are by them called Maidenhaire graſſe, or rather Meade haire graſſe: The *Dutch* call them *Leif licke*, and we ordinarily Quakers, or Shakers, or Quaking graſſe, &c.

The Vertues.

The chiefeſt uſe that theſe graſſes are put unto, is for Gentlewomen to weare on their heads or armes, as they would doe any fine flower or pretty toy to behold, as alſo put into wreathes and Garlands, that the Country people make for their ſports and paſtimes, And hath no uſe in Phyſicke for any Medicine that I can heare of.

CHAP. XVII.

Alopecuros. Foxtaile graſſe.

AS I handled the *Phalaris*, ſo will I the *Alopecuros*, that is ſpeake of the *genuine* kind in this Chapter, and joyne unto it ſuch as are likeſt thereunto, and ſpeake of the baſtard kinds in the Chapter following.

1. *Alopecuros genuina.*

The true Foxe-taile graſſe.

The true Foxe-taile graſſe groweth up with two or three ſoft hoary ſtalks about a foote high, with ſmall long and narrow ſoft leaves on them, as hoary as the ſtalks, whereon ſtand ſoft woolly, or hoary heads, ſomewhat long and round, beſet round with ſoft haires, of a pale ſtraw colour, reſembling the taile of a Foxe, whereof it tooke the name: the roote is ſmall, and made of a few fibres which periſheth yearely.

2. *Alopecuros altera Anglica, & Flandrica.*

Another Foxe-taile graſſe like unto the former.

This other Foxe-taile graſſe hath leaves and rootes not much unlike to the former but longer, and the ſtalkes grow higher, the heads alſo are rounder, and ſhorter, and nothing ſo woolly or hoary.

3. *Alopecuros maxima Anglica*

The greateſt Engliſh Foxetaile graſſe.

This greateſt Foxe-taile graſſe groweth to be halfe a yard or two foote high, ſometimes having faire large leaves like unto Wheate but larger, ſet at the joynts, and at the toppes, large great, full ſoft and woolly heads like the former, but much greater and longer, either higher or lower.

The Place and *Time.*

The firſt of theſe is not found naturall in *England*, as the others are, but groweth in diverſe places about *Mompelier* in *France*, we onely have it in our gardens for curioſity.

3, 2, 3. *Alopecuros genuina. Maxima & altera Anglica.* The three ſorts of Foxe-taile Graſſes.

The

The Names.

It is called in Greeke ἀλωπέκουρος, *Alopecuros*, and so in Latine which is *Cauda vulpis*, and so they call it at *Mompelier* as *Lobel* saith; *Plinie* seemeth to call it στεφάνουρος *Stephanuros*, *Lugdunensis* calleth it *gramen tomentosum Alopecuros vera Plinij & Theophrasti*. The second *Lobel* calleth as it is in the title, because he found it in *England* as well as *Flanders*, and is that which *Dodonæus* calleth *Alopecuros*. The last *Lobel* found in the West parts of this Land, betweene *Portsmouth*, and the Isle of *Wight*, and called it *Alopecuros maxima Anglo Britannica*, and hath not beene knowne to any before.

The Vertues.

There is no speciall property found to be in any of these for Medicine, but to be worne onely as a toy, in mens or womens hats.

CHAP. XVIII.

Gramen Alopecurodes. Bastard Foxe-taile grasse.

THere are divers sorts of these wilde or bastard Foxe-taile grasses, some greater, other lesser, all which I meane to comprehend in one Chapter, seeing they are of no great moment, and but to content the curious, yet I must show you the greater first, and the lesser after them.

1. *Gramen Alopecuroides majus.* The greater bastard Foxe-taile grasse.

The greater of these wild Grasses riseth up with a stalke two cubits high, with few leaves long and narrow on them, the spike is somewhat great and long, resembling the former, but not so soft or Woolly. Hereof there is a lesser sort, differing chiefly in the smallnesse, being somewhat smaller but longer. *Minus.*

2. *Gramen Alopecuroides Africum.* Bastard Foxe-taile grasse of *Africa*.

This *African* hath at some part of the stalke small long leaves, set by themselves at the joynts, and at others diverse together, the head or spike is somewhat great and very long, woolly and soft, as the other, the roote is great and long.

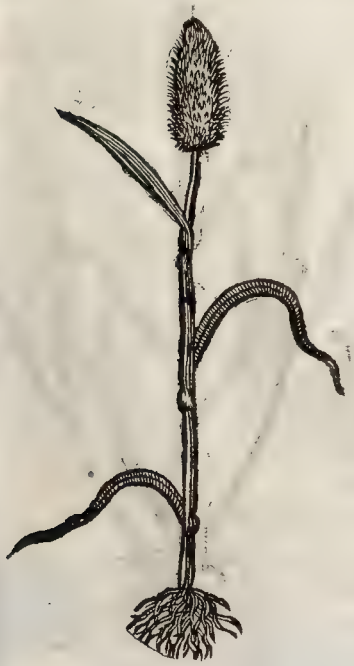
3. *Gramen Alopecuroides cuspidatum maximum Anglicum.* Our bastard Foxe-taile grasse of the greatest size.

This hath many long narrow leaves, rising from a bushy roote, and among them stalkes two cubits high, with few joynts and leaves on them, at the top whereof standeth the longest spiked head of any other, somewhat pointed at the top, and broad at the bottome, set about with white haires on the huskes, which are somewhat like to those of Oates.

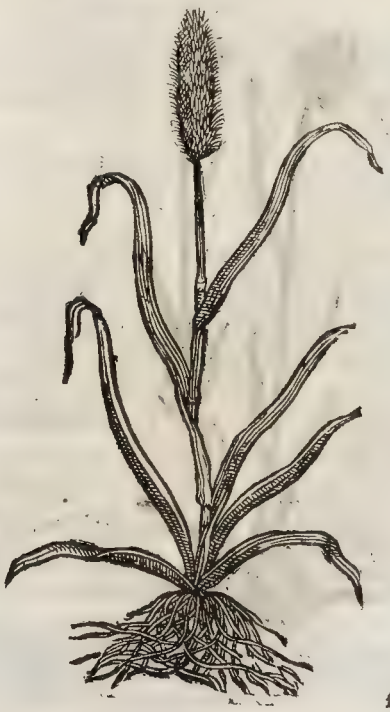
4. *Gramen Alopecuroides cuspidatum majus.* Great spiring bastard Foxe-taile grasse.

This is somewhat like unto the first sort here in this Chapter expressed, but that the spiked head is longer and

1. *Gramen Alopecuroides majus.*
The greater bastard Foxe-taile Grasse.



1. *Gramen Alopecuroides minus.*
The lesser bastard Foxe-taile Grasse.



spiring

2, 3. *Gramen Alopecuroides Africum et cuspidatum maximum Anglicum.* Bastard Foxe-taile Grasse of *Africa*. And Ours of the largest size.

5. *Gramen Alopecuroides alterum radice repente sive Pseudoschænanthum Monspelliensium.* A Bastard Foxe-taile Grasse called *Squinant* at *Monpelier*.

6. *Gramen Alopecuroides spica aspera brevi* Short rough eared bastard Foxetaile Grasse.

7. *Gramen Alopecuroides spica longa maju.* The greater long eared bastard Foxe taile Grasse.

ſpiring upward that is ſmall at the toppe and ſomewhat broad below, with Oaten-like huskes ſet on them, and that the leaves are more, and much ſhorter.

5. *Gramen Alopecuroides alterum radice repente ſive Pſeudoſchænanthum Monſpelienſium.*
A baſtard Foxe-taile graſſe, called baſtard *Sginant* at *Mompelier*.

I doe acknowledge, that this Graſſe might not unfitly have beene placed among the Sea plants and Ruſhes, but in regard the head doth ſo neere reſemble the baſtard Foxe taile-graſſes, let me by your patience inſert it here, whoſe deſcription is thus. It ſomewhat reſembleth the greateſt Engliſh Foxe taile-graſſe, deſcribed in the Chapter before, differing in that this hath thicker, harder, and ſtiffer leaves, like unto Ruſhes, the head or ſpike is long and cloſe, even five or ſixe inches long, of a ſilverlike ſhining colour, but the bloomings are of a pale red, and the huskes redder, which when it hath ſtood long, beginneth to open it ſelfe, and ſheweth ſome downie matter for the winde: the roote creepeth along under ground, ſhooting forth leaves and ſtalkes in divers places.

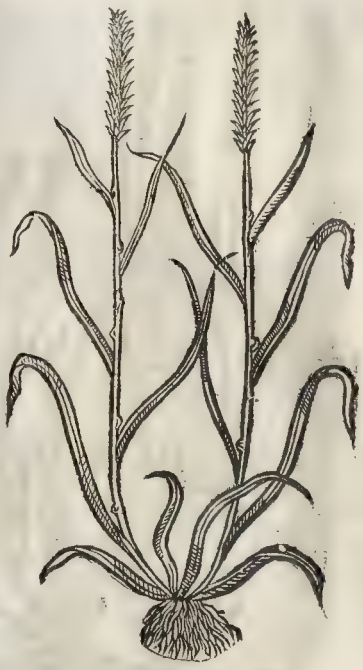
6. *Gramen Alopecuroides ſpica aſpera brevi.*
Short rough eared baſtard Foxetaile-graſſe.

This ſmall rough eared graſſe riſeth up with two or three upright but ſmall ſtalkes with ſomewhat narrow and ſoft leaves on them, at the toppe whereof ſtandeth a thicke and ſhort rough head, about an inch and a halfe long not fully but as it were halfe round, the ſtalke on the backeſide being as it were bare, ſo that it ſeemeth to ſtand but on one ſide: wherein is ſmall white ſeed contained; the roote is ſmall and white periſhing yearely.

7. *Gramen Alopecuroides ſpica longa majus & minus.*
Great and ſmall long eared baſtard Foxetaile-graſſe.

Theſe Graſſes, are one not much unlike another, the one being greater, and the other ſmaller, both in ſtalke and leafe, the ſpiked heads are long and ſlender, and of a whitiſh colour.

8. *Gramen Alopecuroides minus ſpica aſpera longa.*
Small rough long eared baſtard Foxetaile-graſſe.



8. *Gramen Alopecuroides minus ſpica aſpera longa.* Small rough long eared baſtard Foxetaile-graſſe.

This differeth from the laſt in being greener, more ſtored with ſtalkes and leaves, and the ſpiked head more ſlender long, and rougher alſo.

9. *Gramen Alopecuroides minus cuſpidatum.* Small ſharpe pointed baſtard Foxetaile-graſſe.

The ſtalke hereof is about a foote high, ſtored but with few joynts, and ſhort narrow leaves on them, the ſpike or eare is almoſt as big as the laſt but ſharper pointed, and with ſome peeces growing out of the ſides.

10. *Gramen Alopecuroides cuſpidatum minimum.* The leaſt pointed baſtard Foxetaile-graſſe.

This is leſſer then any of them before, in ſtalkes and leaves but longer in both, as the ſpike or eare is alſo being very ſmall and ſlender and pointed at the end.

The Place and *Time*.

All theſe Graſſes except the ſecond and fifth, doe grow in the fieldes and medowes of our land, ſome neere *London*, toward *Hackney*, and others in *Kent*, and keepe the ſame time of flouriſhing with the reſt. The fifth as is ſaid by the Sea ſide of *Narbone*.

The Names.

The firſt ſort of theſe Graſſes, both the greater and the leſſer are expreſſed by *Lobel* and others, under the name of *Alopecuros*, and *Cauda vulpina*: The ſecond *Boel* brought us out of *Barbary*. The third and fouth we have given titles, as well as to it. The fifth is called by *Tabermontanus* and *Gerard*, *Schænanthum adulterinum*, and by *Lobel Iuncus marinus gramineus foliis Schænanthi*, but afterwards altering the title, he ſet it with theſe Graſſes, and called it as it is in the title here: The ſixth is called by *Lugdunenſis*, *Gramen Echinatum Dalechampij*, but *Bauhinus* calleth it *Gramen Alopecuroides ſpica aſpera*. The ſeventh and eighth are called by *Bauhinus*, *Gramen Typhoides*, and are called by others *Gramen Alopecurinum*, as the laſt are alſo.

The Vertues.

I finde nothing remembred by any, whereto any of theſe are profitable.

CHAP. XIX.

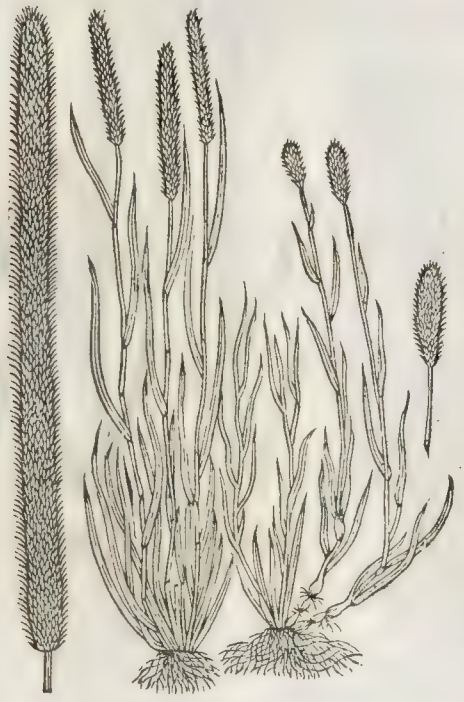
Gramen Typhinum vel Typhoides. Cats taile Graſſe.

ALthough I ſet not *Typha* the Cats taile it ſelfe in this place, being referred to the wet and mooriſh places, where it ſhall be remembred among other of the like nature, yet I will here ſhew you the ſorts of Cats taile Graſſes.

1. *Gramen Typhoides maximum.* The greateſt Cats taile Graſſe.

This greateſt ſort groweth up with faire large leaves like wheate, and ſtalkes two foote high, on which ſtand long round ſpiked heads, foure times bigger then the next, and almoſt of an equall bigneſſe and roundneſſe from the bottome to the toppe. Yet ſometimes it is found with ſtalkes three or foure cubits

1. 4. *Gramen Typhinum max & Danicum minus,*
The greateſt Cats taile graſſe and the Daniſh.



2. *Gramen Typhinum medium ſive vulgatiſſimum.*
The moſt common Cats taile Graſſe.

3. *Gramen Typhinum minus.*
The leſſer Cats taile Graſſe.

bits high, and the ſpike ſomẽwhat ſhorter and ſmaller to the toppe.

2. *Gramen Typhinum medium ſive vulgatiſſimum.*
The moſt common Cats taile Graſſe.

This Graſſe that is moſt common in our more barren grounds, differeth not but in the ſmallneſſe from the former, the ſtalkes not riſing much above a foote high, and the round ſpike two or three inches long: the rootes have ſmall round heades like bulbes, from whence the leaves doe ſpring and encreaſe there.

3. *Gramen Typhinum minus.*
The leſſer Cats taile graſſe.

This differeth not from the laſt, but in having more ſtore of narrower greene leaves and leſſer ſtalkes with ſmaller long ſlender ſpiked heads.

4. *Gramen Typhinum Danicum.*
The Daniſh Cats taile graſſe.

This Daniſh kinde hath leaves and ſtalkes much like thẽ laſt, and differeth in theſe two things onely from it, firſt in having ſhorter ſpiked heads and more rough, and next that at the bottomes of the ſtalkes next above the roote, they have two ſmall knots or bulbes one as it were ſet upon another.

5. *Gramen Typhinum alterum Zelandicum.*
Dutch Cats taile graſſe.

This Graſſe is ſmaller then the laſt, both in leafe and ſtalke, yet but little in the head or ſpike, the chiefeſt difference from it is, that it hath two little bulbes one upon another among the rootes.

6. *Gramen Typhinum Harlemenſe.*
Harlems Cats taile graſſe.

☞ This differeth little from the Daniſh kinde, but in being leſſe both in ſtalke and leafe, and having two ſmall knots above the rootes, but leſſe evident.

The

The Place and Time.

The three first are often found in our owne land, but the three last not knowne as yet, and doe all keepe the same time with others.

The Names.

The first here set downe, is no doubt the same with the first and greatest *Gramen Typhoides* of *Bauhinus*. The second hath heretofore beene called *Gramen Typhinum majus* by divers. The third is likewise called *minus*. The other three have their names in their titles, not being mentioned by any before.

The Vertues.

These are as unprofitable for any Physicall use as the last.

CHAP. XX.

Gramen Cyperoides. Ciperus Grasses.

OF Cyperus Grasses there are a great number, some growing in watery and mooriſh places, either upland or neere the Sea, others in the corners and borders of fieldes or Woods, or the moister places of them, which shall be declared in this Chapter and the other in the next Classis hereafter, and first of that sort that partaketh both with Cyperus and *Typha*, to the one in the leafe, and to the other in the head.

1. *Cyperus Typhinus.* Cats taile *Cyperus* Grasse.

This Cyperus Grasse hath many long narrow three square hard greene leaves rising from a bushye roote, among which rise up stiffe greene stalkes, two foote high and better, with some joynts and leaves at them, and at the toppes two or more slender long rough heades set together one above another, like some of the Cats tailes, and of a darke greene colour tending to purple.

2. *Pseudocyperus gramineus sive Miliaceus.* Tufted bastard Cyperus grasse.

This Grasse hath divers, faire, long, and somewhat broad, and shorter, paler greene leaves then the last, from whence arise three square stalkes like Cyperus, about halfe a yard high, set with leaves from the bottome to the middle of the stalkes, compassing them at the bottome, the toppes being furnished with a larger tufted head, then is equall for the plant, wherein is contained the seede: the roote is blackish and bushie.

3. *Gramen Cyperoides sylvarum tenuius spicatum.* Slender eared Wood Cyperus grasse.

The stalkes of this grasse are three square, a foote high or more, with faire, but hard and rough grassie leaves, foure or five inches long, the spiked heades that grow at the toppes are many, one above another, slender and long, yet some more then others, as some of two inches, others of one inch, or an inch and a halfe of a yellowish greene colour with long yellowish seedes in them, with yellowish great and stringy rootes.

1. *Cyperus Typhinus.*
Cats taile Cyperus Grasse.

2. *Pseudocyperus gramineus sive Miliaceus.*
Tufted bastard Cyperus Grasse.

4. Gramen

4. *Gramen Cyperoides elegans multifera ſpica.*
A fine Cyperus Graſſe with many heads.

This Graſſe hath ſlender triangular ſtalkes about two foote high, the leaves are long and narrow, with a long pointed ſpiked head, made of many ſmall ones, ſo cloſe ſet together that they ſeeme to be but one ſpike or head.

5. *Gramen Cyperoides echinatum montanum.*
Mountaine prickly Cyperus Graſſe.

The ſtalkes hereof are three ſquare, and not much above a ſpanne long, the leaves below, and on them are very long and narrow, the heads are ſhort, with many rough burres on them, ſome ſeparated and ſome cloſe.

6. *Gramen Cyperoides ſparſa paniculâ Altæ Portæ.*
Land Cyperus graſſe with a diſperſed tuft.

The long leaves hereof are of a browne greene colour, and ſomewhat flat betweene a ruſh and a graſſe: the ſtalke alſo is ſomewhat more flat then ſquare, ſometimes but one cubit high, and ſometimes two or three, the toppe whereof is furniſhed with a large round ſpread pannickle made of many parts, and each ſmall prickly head ſtanding on a ſlender footeſtalke, which oftentimes is bent downe with the weight of the heades: the rootes is full of fibres.

7. *Gramen Cyperoides Norwegicum parum lanoſum.*
Cyperus graſſe of *Norwey*, a little woolly.

The ſlender ſtalkes of this graſſe grow about two ſpans high, the bottomes of them being a little woolly, and having at the middle onely a joynt with a leafe, the lower leaves ſet cloſe upon the ground three or foure inches long, ſomewhat like thoſe of the graſſe Crowfoote: the heades of the ſtalkes have ſmall round ſhining eares on them, of a pale browne colour, with a ſmall long leafe under every head.

Anglicanum duplex varietas.

There have beene two ſorts of this kinde of graſſe, found nere unto *High gate*, the one ſmaller then this, but

3,4,5. *Gramen Cyperoides ſylvarum elegans, multifera ſpica & echinatum Montanum.*
Slender eared graſſe, with many heads, and the mountaine Cyperus Graſſe.

6,7. *Gramen Cyperoides ſparſa paniculâ & Norwegicum parum lanoſum*
Cyperus Graſſe with a diſperſed tuft, and of *Norway* a little woolly.

9,10. *Gramen Cyperoides ſpicatum latifolium, & alterum.* Broad leafed Cyperus Graſſe of two ſorts.

with

with more ſtore of burres at the heads of the ſtalkes. The other greater and ſome what higher then that of *Norwey*.

8. *Gramen Cyperoides, Normegicum alterum.* Another *Norway* Cyperus Graſſe.

This other Graſſe groweth in moiſt Woods, as well with us as elſewhere, with a number of long narrow leaves, ſome three or foure inches, others ſixe or ſeven inches long, the ſtalkes are cleare and ſmooth, halfe a yard high, bearing at the toppe many conelike heads, ſet cloſe together.

9. *Gramen Cyperoides ſpicatum latifolium.* Broad leafed Cyperus Graſſe.

This graſſe may be numbred among the other of this kinde, in that it hath long blacke creeping rootes, with many fibres at them, very like unto the ſweete long Cyperus, and hath broad leaves, almoſt a foote long, among which the ſtalkes being a foote high, beare three chaffie ſpiked heades at the toppes, of an inch or an inch and a halfe long, whereof the middlemoſt is longeſt, each of them like unto the ſmall Cats taile graſſe.

10. *Gramen Cyperoides ſpicatum latifolium alterum.* The higher broade leafed Cyperus graſſe.

This alſo is reckoned with the reſt, having as long leaves, but higher ſtalkes by much, bearing at the toppes foure or five ſmall long eares of ſpikes one above another, an inch or two long, with a ſmall leafe at the foote of each of them: the roote is ſomewhat long but ſcaly with many long fibres ſet thereat.

The Place and Time.

The firſt groweth in the lower places of wet fieldes neare the Sea ſhore. The ſecond we have ſometimes found in our ſimpling walkes, betweene *London* and *Kentiſh* Towne, in the bottome of a field, ſome in *Norway*, divers of the others about *High gate*, and in a Wood neere thereunto, and in other places of the Land, and keepe the ſame time with others.

The Names.

The firſt is called by *Tabermontanus, Gramen Typhinum*, and by *Bauhinus Gramen Typhoides ſpica multiplici*, but by *Gerard, Cyperus Typhinus*, and ſo doe I, finding it to participate of both, and is quite left out of the new *Gerard*, as divers others are, for want of the figures: The ſecond is called by *Lobel, Cyperus graminea ſive Miliacea*, by *Lugdunenſis Iuncus latus*, by *Thalius, Pſeudocyperus* πολύκαρπος, and by *Bauhinus Gramen Cyperoides miliaceum*: The reſt are not written of by any before, and therefore their titles are ſufficient to diſtinguiſh them.

The Vertues.

We have nothing to ſet downe of the property of any of theſe graſſes, but are wholly neglected, as unprofitable for any Phyſicall uſe, neither doe they ſerve for fodder, though they may for litter to horſes and cattle.

CHAP. XXI.

Gramen Caninum. Dogs graſſe, or Quich graſſe.

OF the Dogs graſſes there are many ſorts, ſome growing in fields, and other places of the Vpland grounds, others in the fieldes nere the Sea: of the former we will ſpeake here, and of the other in the next Claſſis, among the Sea plants.

1. *Gramen Caninum vulgatius.* Common Quich Graſſe.

2, 3. *Gramen Caninum longius radicatum & latiore panicula minus.* Longer rooted Quich graſſe and with a more ſpread panickle.

1. *Gramen Caninum vulgatius.* Common Quich graſſe.

It is well knowne to all I thinke, that this Graſſe creepeth farre about under ground, with long white joynted rootes and ſmall fibres almoſt at every joynt, very ſweete in taſte (as the reſt of the herbe is) and interlacing one another, from wheece ſhoote forth many faire and long graſſie leaves, ſmall at the ends, and cutting or ſharpe on the edges: the ſtalkes are joynted like corne, with the like leaves on them, and a long ſpiked head, with long huskes on them, and hard rough ſeede in them.

2. *Gramen Caninum longius radicatum, & paniculatum.* Quich graſſe with a more ſpread panickle.

This differeth very little from the former, but in the tuft or panickle, which is more ſpread into branches, with ſhorter and broader huskes, and in the roote which is fuller greater, and farther ſpread.

3. *Gramen Caninum latiore panicula minus.* The leſſer Quich graſſe with a ſparſed tuft.

This ſmall Quich graſſe hath ſlender ſtalkes, about halfe a foote high, with many very narrow leaves both below and on the ſtalkes, the tuft or panickle at the toppe is ſmall according to the plant, and ſpread into ſundry parts or branches: the roote is ſmall and joynted, but creepeth not ſo much, and hath many more fibres among them then the others have, and is a little browner, not ſo white but more ſweete.

4. *Gramen Caninum ſupinum arvenſe.* Low bending Quich graſſe.

This creepeth much under ground, but in a differing manner, the ſtalkes taking roote in divers places, and ſcarſe raiſing themſelves up a foote high, with ſuch like greene leaves as the ordinary, but ſhorter, the ſpiked head is bright and ſparſed, or ſpread abroad, ſomewhat like the Field graſſe.

5. *Gramen Caninum ſupinum Monſpelienſe.* Low bending Quich graſſe of *Mompelier.*

This differeth very little from the laſt in any other part thereof, then in the panickle or ſpiked head, which is longer and not ſpread or branched into parts as it is.

6. *Gramen exile tenuifolium Canarie ſimile ſive gramen dulce,* A ſmall ſweete graſſe, like quich graſſe.

This ſmall graſſe hath divers low creeping branches, and rooting at the joynts as the two laſt, having many ſmall and narrow leaves on them, much leſſe then they, and a ſmall ſparſed panickle, ſomewhat like the red dwarfe graſſe.

4. *Gramen Caninum ſupinum arvenſe.* Low bending Quich Graſſe.

5. *Gramen Caninum ſupinum Monſpelienſe,* Low bending Quich Graſſe of *Mompelier.*

7. *Gramen murorum radice repente.* Wall grasse with a creeping roote.

This Wall grasse from a blackish creeping roote, come forth many smal stalkes a foote high, bending or crooking with a few narrow short leaves on them, at whose toppes stand small white panickles, of an inch and a halfe long, made of many stuell chaffie huskes.

The Place and *Time.*

The first is usuall and common through the Land in divers plowed grounds, which troubleth the husbandmen as much after the ploughing up of some of them, as to pull up the rest by hand after the springing, and being raked together to burne them, as it doth Gardiners where it happeneth, to weed it out from among their trees and herbes: the second and third are nothing so frequent, and are more naturall to sandy and chalkye grounds: the three next are likewise found in fields that have beene ploughed and doe lye fallow, and the last is often found growing on old decayed walles, in divers places: they all keepe the time of Sommer with the rest.

The Names.

This is called in Greeke usually ἄγρωστις, that is simply *Gramen*, as of most use, and in Latine *Gramen Caninum*, by *Lobel Gramen Canarium, medicatum*, from *Pliny* who first called it *Canaria quasi à canibus inventa, qua fastidium deducant, vomitum cum pituita rejicientes hinc Cynogrostis alijs, & a foliorum primo prodeuntium forma quibusdam Deus Canis dicitur.* *Gesner in hortis* calleth it, *Gramen Dioscoridis*, and other Authors call it onely *Gramen*, and *Lugdunensis Gramen vulgare.* The second and third *Lobel* called in his other part to the *Adversaria, Gramen Canarium longius redicatum, majus & minus*, and I thinke is also the *Gramen Caninum vineale* of *Bauhinus.* The fourth *Lobel* calleth *Gramen Caninum supinum*, and added *arvense* afterwards to it: the fifth is so called also by him, because it was sent him from *Mompelier.* The sixth is the *Gramen dulce* of *Lobel.* The last is so called by *Bauhinus* as it is in the title. The *Italians* call it *Gramigna*, as the best of all others, the *French Chiendent*, and *Dent de chien.* And we Quich grasse, or Couch grasse.

The Vertues.

This Quich grasse is the most medecinable grasse of all others, serving to open obstructions of the liver and gall, and the stoppings of the urine, being boyled and drunke, and to ease the griping paines of the belly, and inflammations, and wasteth the excrementitious matter of the stone in the bladder, and the Vlcers thereof also, the rootes being brused and applyed doth consolidate wounds: the seed saith *Dioscorides* doth more powerfully expell urine, and stayeth the belly or laske, and castings or vomittings. *Galen* saith the same thing, and further addeth, that the roote is moderately cold and dry, and hath also a little mordacity in it, and some tenuity of parts, the herbe is cold in the first degree, and moderate in moisture and dryneſse: but the seed is much more cold and drying of some tenuity of parts, and somewhat harsh. *Pliny* confoundeth this and the Parnassus grasse together, applying the same properties to the one, that are attributed to the other: the distilled water, or the decoction alone is often given to children for the wormes: but if some wormeseede be put to it, it is the more effectuall. The first Quich grasse is that which hath beene ever in use in our Land with the Apothecaries for their medicines, as it was also in the hether parts of *France*, but the further parts thereof, and about *Geneva*, they use the knobbed or bulbed kinde, but neither of them was knowne to *Matthiolus*, or the *Germanes*, or *Italians* in his time, as it is evident in that hē hath made no mention of it.

CHAP. XXII.

Gramen Caninum bulbosum & nodosum. Bulbed and knobbed Quich grasse.

VNto this kinde of Dogs grasse, is to be joyned some other grasses, whose rootes are knobbed or bulbed, yet that sort which *Bauhinus* maketh mention of in his *Prodromus*, growing in the water, I will referre to the next Classis, whereunto it is proper.

1. *Gramen Caninum bulbosum nodosum vulgare.* Common bulbed and knobbed Quich grasse.

This kinde of Quich grasse hath for his rootes, three or foure, or more round white knobs or bulbes, one set upon the head of another, with divers fibres underneath them, from the uppermost of whom springeth forth divers long hard grassie leaves, sharpe at the edges, and in the middle of them a joynted stalke, with three or foure such like leaves upon them, at the toppe whereof is a long panickle, spread into many parts like to that of Oates, whereunto some have compared it. *Lobel* exhibiteth another sort hereof differing little in any part, but the rootes which are small and round; and set at distances all along the rootes, and as sweete as the other. *Nodosum.*

2. *Gramen nodosum spica parva.* Knobbed grasse with a small round spike.

This small Grasse hath a small whitish round knob or bulbe for the roote, with small fibres under it, shooting forth from the head thereof another, somewhat like unto a bulbe, but much smaller, and like a slender knob, with a small joynted stalke above it, and a long narrow pointed leafe at each of them being foure or five inches long, and at the toppe one short soft spiked head, somewhat like unto the head of the Cats taile grasse.

3. *Gramen bulbosum geminum.* Double bulbed grasse.

This double bulbed Grasse, hath a greater round sweete bulbed roote below, covered with a reddish skinne, and one like a lesser at the head thereof, the upright stalke is not a foote high, joynted and kneed, like unto a Wheate straw, having foure or five narrow grasse-like leaves on them, and at the head thereof a small long panickle made of diverse huskes, each standing by it selfe, like the huske of an Oate, out of which appeareth small reddish bloomings.

4. *Gramen bulbosum Alepinum.* The bulbed grasse of *Aleppo.*

This *Aleppo* grasse hath a firme white round roote, covered over with a netted outer skinne, and small white fibres underneath, from the midst whereof come forth two or three straked stalkes, above a foote high, and with many grassie leaves set on them, the spike is somewhat like to the Wall Barley, breaking out of a broade leafe whose point riseth above it.

1,2. *Gramen Cammum bulboſum vulgare & alterum nodoſum ſpica parva.* Common knobbed Quich graſſe. And another with a ſmall round ſpike.

1. 3. *Gramen bulboſum geminum, & nodoſum vulgare.* Knotted Quich graſſe, and double bulbed Graſſe.

5. *Gramen bulboſum Meſſanenſe.* The *Sicilian* bulbed Graſſe.

Let me adde this plant here, for I know no fitter place to inſert it, although it be not anſwerable to the reſt, whoſe deſcription is thus. The roote is very ſmall and round ſomewhat like unto a wilde Saffron roote, and of the table of a Cheſnut, having onely two or three long leaves, as ſmall as haires, with ſome ſhorter on the ſtalke on the toppe whereof groweth a ſmall long and round knob or bulbe, of the bigneſſe of an ordinary beane, ſomewhat yellow or browne on the outſide, and having three rough circles about it, equally diſtant one from another, but white within, and of the ſubſtance of a Cheſnut.

The Place and *Time.*

The firſt groweth not ſo common with us as the creeping rooted Graſſe, yet ſufficient plentifull in many plowed fieldes in the Land. The ſecond neere *Baſſill.* The third in *Spaine.* The fourth neere *Aleppo* in *Syria.* The laſt both nere *Verona* and *Italy*, and at *Drepanum*, and *Meſſana* in *Sicilia.*

The Names.

The firſt is called *Gramen nodoſum avenacea pluma* by *Bauhinus*, who alſo doubteth whether it may not be the *Ægilops Plinij*, which hath a kinde of bulbe; others call it *Gramen bulboſum, tuberoſum*, or *nodoſum*: The ſecond is mentioned onely by *Bauhinus* in his *Prodromus* and *Pinax*, by the ſame title it hath. The third is the ſecond *Gramen nodoſum* by *Bauhinus*, and the *Coix Mycon* in *Lugdunenſis*, who tooke it to be the *Coix* of *Theophraſtus, lib.* 8. *c.* 16. *Ceſalpinus* ſaith it is called by the common people in *Italy*, *Perlaro*, and *Oryza ſylveſtris.* The laſt is mentioned by *Iohannes Baptiſti Corteſius* in *Miſcalaneorum medicinalium decade quinta, fol.* 206. where hee ſaith that it is called *Baſyli* by the *Sicilians*, that uſually ſell it in the Markets, and by ſome others there where it groweth, *Caſtancalos*, from the ſweete taſte like Cheſnuts, that both roots and heades have in eating, *Montagnana* alſo, as he there ſaith, mentioneth this roote, and that they of *Verona* call it *Futroſium*, or *Azulinum.*

The Vertues.

The firſt knobbed Quich-graſſe is found by certaine experience not onely with us, but in *Savoy*, *Geneva*, *&c.* where it plentifully groweth, and is uſed to be more effectuall to provoke urine and to breake the ſtone, to caſe thoſe torments of the belly, that come by looſeneſſe, crudities of humours, and obſtructions, and generally is held ſafely to be uſed in any the like cauſes that the other is, and with as good ſucceſſe: The third *Myconus* ſaith hee could underſtand of no phyſicall uſe it was put unto, but that Hares were much delighted to reſt by it, and to digge up and eate the rootes: the laſt is uſed for food, being windy withall, that is not uſed Phyſically.

CHAP.

CHAP. XXIII.

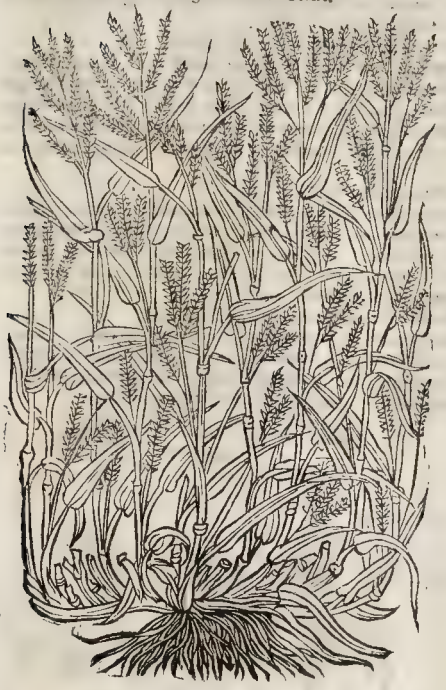
Gramen geniculatum. Kneed Grasse.

OF that kinde of grasse that groweth in the uplands, there is onely a greater and a lesser as shall bee shewed in this Chapter, but there are others growing in the waters, and neare the Sea side, which shall be declared in their proper places.

1. *Gramen geniculatum majus.* The greater Kneed Grasse.

The greater of these grasses hath many long trayling branches upon the ground, with sundry great joynts on them, and shooting out fibres from those joynts that lye next the ground, so that it doth sometimes run twentie foote in length, with one long leafe at each joynt, small at the end but broadest below, from which as

1. *Gramen geniculatum majus,* The greater kneed Grasse.



2. *Gramen geniculatum minus,* The lesser kneed Grasse.

well as at the toppe come forth divers small long spikes of chaffie huskes of an overworne colour, which stalkes and joynts are so full of a most pleasant juice that it feedeth Cattle much more than any other Hay, and therefore those Farmers that have it growing in their grounds, doe keepe the Hay thereof for their chiefe winter provision, and in stead of Provinder; the roote is bushing and fibrous.

2. *Gramen geniculatum minus.* The lesser Kneed Grasse.

This other kneed grasse creepeth not so much on the ground as the former, but spreadeth more upright with his branches, whose joynts are not altogether so great as the other, the stalkes send forth spiked heads at the tops, but somewhat larger then the former, and of a sadder overworne colour: the roote is threddy like the precedent.

The Place and *Time.*

They both grow in most medowes in sundry places of this Land, but have beene especially observed, the greater to grow about *Wilton*, in a great medow lying among the bridges at the townes end, belonging to the Earle of *Pembrooke*, and the other at *Wa. minster*, both of them in *W. Itshire*.

The Names.

Bauhinus as not well knowing these referreth the former sort to the kindes of *Gramen dactylon*, or *Ischæmon*, because of the divers Panicles it beareth together in a tuft, and calleth it *Aquaticum* as *Tabermontanus* and *Gerard* did, but both mistooke it for that other which groweth in waters in our Land as well as others: they have their names from the great joynts or knees on their stalkes.

The Vertues.

We have not knowne these used to any other purpose then is formerly declared.

Chap. XXIV:

Gramen Dactyloides sive Ischæmon. Dew Graſſe, or Cockēs foote Graſſe.

Although formerly there was but one ſort of *Ischæmon* knowne, yet ſince for the likeneſſe of the panicles or tufts thereof, there are divers others referred thereunto as *ſpecies* thereof.

1. *Ischæmon ſylveſtre latiore folio.* Common Cockes foote Graſſe.

The common Cockes foote graſſe hath ſundry cleere reddiſh joynted ſtalks, with faire graſſy leaves on them ſomewhat dented on the edges, broad at the bottome and ſmall to the end, of an harſh or binding taſte, at the toppes of the ſtalkes grow divers long and ſlender rough ſpikes of a browniſh colour when they are ripe: the roote is made of many fibres.

2. *Ischæmon ſylveſtre ſpicis villoſis.* Another Cockes foote graſſe.

This other graſſe hath purpliſh ſtalkes, a cubit high, with fewer and much narrower leaves on them, the ſpiked heads are more in number then the former, and more hairy, having as it were ſhort yellow beards ſet on both ſides of the panicles, wherein lye the ſeede: the roote is buſhie like the other.

3. *Ischæmon ſativum ſive Gramen Mannæ eſculentum.* Dew Graſſe.

The Dew graſſe hath likewiſe faire joynted purpliſh ſtalkes, and larger graſſie or reede like leaves on them, ſomewhat hairy or wolly at the bottome of them, and about the joynts at the toppes of the ſtalkes ſtand larger ſpikes or panicles, and more alſo ſet together, made of many ſmall chaffie huskes, with long white ſeedes in them, ſomewhat greater then Millet, and leſſer then Rice, ſtanding all as it were on the one ſide: the roote is greater and more buſhy, whoſe plante differeth from the former no otherwiſe almoſt then a manured from the wilde plant.

4. *Gramen Scoparium Ischæmi paniculis.* Bruſh Graſſe.

The bruſh graſſe hath a roote conſiſting of many very long hard threds or fibres, a cubit long or more (whereof are made in *France* where it is naturall thoſe bruſhes that wee doe uſually bruſh our heads, &c. withall) the ſtalkes are hard, ſlender and joynted, about a cubit high, with ſmall long leaves on them like unto the ſecond ſort of *Ischæmon* here before ſet forth but ſweeter in taſte, at the toppes of the ſtalkes ſtand five or ſix or more bright long panicles, like unto the Cockes foote but larger, flatter and leſſe dented.

5. *Gramen Canarium Ischæmi paniculis.* Cockes foote like Quich Graſſe.

The Cockes foote like Quich graſſe might as well have beene numbred among the Quich graſſes as among theſe, being as it were indifferent betweene them both; it hath running joynted rootes like the ordinary Quich graſſe, and ſo both ſtalkes and leaves ſomewhat reſemble it, but the head is diſperſed or ſpread into ſuch like ſlender long panicles as the Cockes foote graſſe, the ſmall chaffie huskes whereof conteine rougher ſeede.

1. *Ischæmon ſylveſtre latiore folio.*
Common Cockes foote Graſſe.

3. *Ischæmon ſativum ſive Gramen Mannæ eſculentum:*
Dew Graſſe.

4. *Gramen scoparium Ischæmi paniculis.*
Brush Graſſe.

5. *Gramen Canarium Ischæmi paniculis.*
Cocks foote like Quich graſſe.

6. *Gramen Dactylon repens.*
Creeping Cockes foote Graſſe.

This ſmall graſſe ſendeth forth from a ſparſed threddy roote many long ſlender and weake branches, trayling or creeping upon the ground, and ſhooting forth roots at the joynts, the leaves that grow at the joynts are ſmall and graſſie long and narrow, and at the toppes of the ſtalkes which riſe not much above a ſpanne high, foure or five ſmall ſlender blackiſh ſpikes within the huskes whereof lye the ſeede.

7. *Gramen Dactylon Egyptiacum.*
Egyptian Cockes foote Graſſe.

The roote of this *Egyptian* Graſſe doth ſomewhat creepe under ground like unto Quich graſſe, but much leſſe, the leaves are very ſmall, ſet upon ſmall ſtalkes of an hand breadth long, having foure ſmall long panicles ſet at their tops and no more, oppoſite one to another like a croſſe, with ſmall ſeede in them.

This is *Alpinus* his figure and deſcription, but *Joannes Veſlingius Mindanus* a Chirurgion having lived long in *Egypt*, hath ſet out ſome notes upon *Alpinus* his *Egyptian* plants, and among others giveth us a little differing figure, with the toppe pannicles diſtributed into five or ſix parts reſembling a ſtarre, and therefore calleth it *ſtellatum*, one of the toppes whereof I have thought good to joyne unto the other, that the difference betweene them may be diſcerned.

7. *Gramen Dactylon Egyptiacum.*
Creeping Cockes foote Graſſe.

8. *Gramen Dactylon Africanum.*
Cockes foote Graſſe of *Africa*.

This graſſe of *Africa* is in moſt things like unto the laſt, but growing a little higher, the leaves are as ſmall, and the ſpikes or panicles ſomewhat longer and bigger, more endented or ſet as it were with graines: the root creepeth about as the laſt and abideth extremitie of our winters.

The Place and *Time*.

The two firſt are uſually found naturall in divers places of *Italy*, and *Narbone* in *France*, as alſo in divers places of

of our owne Land, but the third is usually sowen as Corne is in their fields in many places in *Germany*, yet it is sayd to be naturall in *Italy*: the fourth in the Ile which is not farre from *Orleaunce*: the fift is found in *Spaine* and *Narbone* in *France*, and so is the sixt also, and is there the most common: the two last are knowne by their titles; they all keepe the same time that the others doe.

The Names.

It is called in Greeke Τρίχας, and so likewise *Ischemon* in Latin, it is also taken to be *Canaria Plinij* by *Anguilara*, and called *Pes gallinacei Apulei* by him also, and *Gramen Ischamon* by all other Authors, onely *Leonicenus* was deceaved in taking it to be *Coronopus*, because the *Sclavonians* called it *Cornicis pes Bauhinus* and *Tabermontanus* onely make mention of the second: the third is called generally *Gramen Manna*, and some adde *esculentum*, because it is of so much use among the *Germanes*, yet *Thalius* and some others call it *Gramen aculeatum*. *Cordus* upon *Dioscorides* also calleth it *Frumentum Germanicum* Schwaben *Oryzæ species*: the *Italians* call both this and the first *Sanguinaria*, *Sanguinella* and *Capriola*: the fourth *Lobel* calleth *Gramen Scoparium Ischæmi paniculis* as it is in the title: the fift *Lobel* formerly called *Gramen Canarium alterum*, but afterwards *Gramen Canarium Ischæmi paniculis*, *Lugdunensis Gramen vulgare Dalechampij* as *Bauhinus* saith, but I think he is mistaken, for I cannot finde it so, others call it *Gramen* as if it were the first of *Dioscorides*, and so *Clusius* also taketh it to be, calling it *Gramen legitimum*: the sixt is called by *Lugdunensis*, *Gramen vulgare Dalechampij* as *Bauhinus* noteth it truly but not so in the other: the seaventh *Prosper Alpinus* hath made mention of in his booke of *Egyptian* plants, and saith that the *Egyptians* call it *Neiemelmsalb* or *Gramen crucis*: The last is not remembred by any before, and therefore this title is sufficient for it. They may be all called *Gramen Dactylon* or *Dactyloides*, as *Bauhinus* doth from the forme of the pannickles, representing spread fingers, and thereupon might as well bee called in *English* Finger grasse as Cockes foote grasse: the *Germanes* call the third *Himmeldaw quasi cæliros*, and wee in *English* Dew Grasse.

The Vertues.

Cockes foote grasse bruised and layd vpon any place that bleedeth, doth stay the blood presently, whether from the nose or wound, yet if the rough spike be put into the nose and rubbed it will make it bleed: thus the divers manner of using it workes a contrary effect, both to draw blood and to stay it: being boyled with *Axungia*, that is, Hogs Suet and some houshould bread doth quickly heale the biting of a mad dogge: the same also applyed to hard tumors dissolveth them: it is sayd that the juice of branch that beareth onely three spikes together taken in the waine of the Moone, and put into the eyes that runne and water by some distillation of rheume, making them to look red & to be bleare eyed, or else being bound to the necke in the beginning of the sayd disease, doth quickly discusse the humour and heale the eyes. The Dew grasse is sayd to discusse the hardnesse of womens breasts: the seede is good for small birds, and Pidgeons and Hens and for men also, for the *Germanes* and others seeth it like Rice, and so eate it; or put it into the broth of flesh as we doe Oatemeale and divers other wayes, being as familiar and common to them as Oatemeale is to us. The Cocks foote Quich grasse is thought to have all the properties, and effectuall also that eyther of the Quich grasses before spoken of have, and therefore for brevitie I referre you to them. The *Egyptian* Cocks foote as *Alpinus* saith is used by the *Egyptian* women to helpe to breake the stone, eyther in the reines or bladder, but *Velsingius* aforesayd saith he could not learne it to be so effectuall, yet saith that he met with a Religious man comming from mount *Sinai*, that declared that the stone in the uretory vessels, but not in the bladder might bee voyded, by putting up the finger and pressing the bladder, and by putting into the neck of the bladder by the Vrinary passage a Goose quill, and blowing strongly therein, which he himselfe saith knew to be true. They also use the decoction of the rootes and seedes to provoke their courses and to give it to children to expell or drive forth the measels, small pox, faint spots, purples or *petechiæ* in them, as also they use to give it in pestilentiall feavers: the whole herbe, but especially the rootes they hold to be of singular good use to heale both greene wounds and old Vlcers; some of them also use the decoction thereof to procure sweate familiarly.

CHAP. XXV.

Gramen Arundinaceum. Reede grasse.

Of the Reede grasses there are divers sorts, some grow on the land and others in the water, those that grow in the Vp-land grounds, shall be entreated of in this Chapter, and the other hereafter.

1. *Calamogrostis sive Gramen Arundinaceum majus.* The greater Reede grasse.

The greater Reede grasse riseth up with many joynted stalkes and large sharpe cutting leaves on them like to those of the water Reede, but lesser: the toppes of the stalkes are furnished with divers hard long spikes or heades, somewhat like the common Reede, which when they have stood long doe open, and having a flocky substance in them are carryed away with the wind: the root is full of white strings, and some joynted ones, which spread in the ground. There is a lesser sort hereof, whose toppe is not so full of spikes, as having but one or two thereon. *Minus.*

2. *Calamogrostis altera Norwegica.* Reede grasse of *Norway*.

This other Reedegrasse of *Norway* groweth not so great but harder and rougher, both in stalkes and leaves then the former: the spoky tuft at the toppe is larger, more spread into severall pannickles, sharper also and rougher in handling: the rootes hereof likewise consist of many long strings. We have one like hereunto, growing rete *Hackney*, if it be not the same (our milder Country altering the roughnesse) saving that this hath a tuft of hairy threds growing at the head of the roote. *Anglica.*

3. *Calamogrostis nostras sylvæ* S. *Ioannis.* Reede grasse of Saint *Johns* wood.

This Reede grasse is in stalke and leaves somewhat like the next woolly Reede grasse, but the stalkes are joynted in two or three places, two or three cubits high, with narrower leaves sharper and almost two cubits long, and a little striped with al: the toppe pannickles are sometimes a foote or more long, parted into many long spikes, which are soft as silke, and of a shining over-worne murrey colour: the roote is white with thicke strings, which spread in the ground sometimes.

4. *Calamogrostis*

1. *Calamagroſtis ſive Gramen Arundinaceum majus.*
The greater Reede graſſe.

1. *Gramen Arundinaceum minus.*
The leſſer Reede graſſe.

2. *Calamagroſtis altera Norwegica.*
Reede graſſe of *Norway*.

3. *Calamagroſtis ſylvæ Di Joannis.*
Reede graſſe of Saint *Johns* Wood.

4. *Calamogroſtis ſive Gramen tomentoſum.*
The ſofter or woolly headed Reed graſſe.

4. *Calamogroſtis ſive Gramen tormentoſum.*
The ſoft or Woolly Reede graſſe.

This woolly Reede graſſe, is in the roughnes, drynesſe, and forme of the leaves, not much unlike to that ſort of Foxetaile graſſe before ſpoken of in the Chapter of Foxetailes, which they of *Mompelier* called *Pſeudoſchenanthum*, but much greater, and not woolly as ſome related them: the ſtalkes likewiſe being two or three cubits high, and with few joynts are rough, bearing large ſpiked heads, ſet all along a panickle, reddiſh for ſome time, but growing to ripeneſſe of a ſhining ſilver like whiteneſſe, and as ſoft as wooll in handling, from whence it tooke the name, the roote is ſomewhat hard and rough at the toppe, with divers long fibres iſſuing from it. This deſcription is according to the *Dutch* copy, tranſlated by *Lobel* himſelfe.

5. *Calamogroſtis toroſa panicula.*
Round tufted Reede graſſe.

This ſort of Reede graſſe hath narrow long leaves ſomewhat ſofter and gentler in handling then the others before, yet not eaten by any cattle: the tuft or panickle it ſelfe is more round, and thicker, with ſhorter heads, ſet cloſe together like ſmall knots or knobs, but ſomewhat flat on one ſide, the bloomings hereof are of a yellowiſh purple colour, ſome panickles likewiſe are found to be more long and narrow: the rootes are ſmall and ſtringy.

5. *Calamogroſtis toroſa panicula.*
Round tufted Reede graſſe.

6. *Calamogroſtis montana erecta ſive Scirpus Trag.*
The greater Mountaine Reede graſſe.

6. Cala-

6. Calamogroſtis montana enodis ſive Scirpus primus Tragi. The greater Mountaine Reede graſſe.

This greater mountaine Reede graſſe groweth up with ſtrong ſtalkes, as high as a man, without any ioynts on them, or but one at the moſt, having thereat ſoft, and not hard long leaves: at the toppes whereof are many long ſlender chaffie ſpikes, ſet more ſparſedly then the others, each whereof is of a bright reddiſh yellow colour, and ſtanding upright. Another ſort hereof is much lower and ſmaller, the ſpikes being ſmaller and ſhorter, and not ſo upright, of a darke red colour: the roote is ſomewhat hard, but with divers fibres thereat. *Alterum.*

The Place and *Time.*

The firſt ſort, both the greater and the leſſer grow in moiſt Medowes that are ſandy, rather barren then fertile. The ſecond and third are expreſſed in their titles. The fourth in the borders of dry fields, and by the hedge ſides in many Countries of this Kingdome, eſpecially in *Dorſetſhire*. The fifth alſo in the like places. The laſt groweth in the moiſt Woods that are on hills and mountaines: they flouriſh in the Summer time, and their ſtalkes periſh before Winter.

The Names.

The Greekes call it καλαμόγρωστις, *Calamogroſtis* alſo and *Gramen Arundinaceum* in Latine, *Lobel* calleth the firſt *Calamogroſtis forte Babylonicum*, and *Bauhinus Gramen arundinaceum ſpica multiplici*. The ſecond is not remembred by any, before *Lobel* noted it in *Norway*, when he went into thoſe parts with the Lord *Zanche* Ambaſſadour. The third alſo is to be knowne by the title. The fourth is called by *Lobel*, *Gramen tomentoſum Calamogroſtis quorundam, & vulgi Gramen plumoſum*, extant in his *Dutch* Booke, and it may be is that *Gramen arundinaceum plumoſum album*, that *Bauhinus* deſcribeth for the 44. in his *Prodromus*, or very like it. The fifth alſo is not remembred by any Authour before. The ſixth of both ſorts is called by *Tragus*, *Scirpi primum & alterum genus*, and is thought to be the *Iuncus Lychnanthemos* of *Thalius*, and by *Bauhinus*, *Gramen arundinaceum enode montanum.*

The Vertues.

There is none of theſe Graſſes ſerviceable for any Phyſicall uſe that we know, neither doe any Cattle feede thereon, by reaſon of their hard and ſharpe cutting leaves except the ſixt, and that but ſeldome neither: the ſtalkes of ſome of them are platted into mats, for Country women to lay and dry their new preſſed cheeſes on, and for o-the like uſes.

CHAP. XXVI.

Gramen Nemoroſum glabrum. Smooth Wood Graſſe.

HEre are two kindes of Wood graſſes, the one with ſmooth leaves, whoſe ſorts ſhall be entreated of in this Chapter, and the other with rough or hairy leaves, in the Chapter following.

1. *Gramen nemoroſum capillaceum panicula alba.* White tufted Wood graſſe.

This ſmall graſſe groweth thicke and cloſe together in a tuft having a number of greene leaves riſing from the roote, being as ſmall as haires, and of a foote long, the ſtalkes riſe up among them a cu-

2. *Gramen nemoroſum majus ſpica rufeſcente.* The greater browne Wood graſſe.

4. *Gramen nemorum exile durum.* Small hard wood graſſe.

big

bit or more high, ſmooth and bare almoſt without joynt or leafe on them, the toppes whereof end in a ſlender white panickle, not an hand breadth long, compoſed of ſmall huskes ſet with beardes: the roote is ſmall and threddy.

2. *Gramen nemoroſum majus ſpica rufeſcente.* The greater browne Wood graſſe.

The greater Wood graſſe hath a number of narrow graſſie leaves ſpringiug from the roote, among which come forth many ſmooth round ſtalkes, without any joynt or leafe on them, at the toppes whereof ſtand looſe ſmooth browniſh ſpiked heads, ſeperated a little one from another, and as it were a little bearded: the roote is a buſh of many ſmall fibres or ſtringes.

3. *Gramen nemoroſum minus.* The leſſer Wood graſſe.

The leſſer ſort differeth not from the greater, but that it is in all parts leſſer and lower, the ſmall chaffie bearded eares being ſmaller and nothing ſo ſoft, but rather hard and a little more ſparſed.

4. *Gramen nemoroſum exile durum.* Small hard Wood graſſe.

This ſmall graſſe hath divers ſmall hard leaves a ſpan and a halfe long, the ſtalkes are ſlender, with very few joynts and leaves on them, at which joynts, and at the toppes alſo come forth ſmall long chaffie ſpiked heades.

The Place and Time.

Theſe according to their titles doe grow in Woods frequent enough in our owne Land in divers places, *Bauhinus* ſaith the firſt groweth plentifully in an Oaken wood not farre from *Michelfield* in *Swiſerland*, and flowriſh when others doe.

The Names.

Theſe have their names in their titles, being called *Nemoroſum* or *ſylvaticum* by all Authours that have written of them.

The Vertues.

Theſe Graſſes are not uſed in Phyſicke, nor are they any good fodder for cattle, but are utterly neglected both by man and beaſt.

CHAP. XXVII.

Gramen nemorum hirſutum. Hairy Wood Graſſe.

OF this kinde of hairy Wood graſſe, there are ſome more ſorts then of the precedent, as ſhall be preſently ſhewed.

1. *Gramen nemorum hirſutum latifolium majus.* The greater broad leafed hairy Wood graſſe.

This greater Wood graſſe hath divers long and ſomewhat broad leaves turning downewards, riſing from the roote, ſmaller to the end, grayiſh underneath and greene above, ſet about the edges with whitiſh

1. *Gramen nemorum hirſutum majus.* The greater hairy wood graſſe.

2. *Gramen nemorum hirſutum majus alterum præcox tuberoſa radice.* A greater earely hairy wood graſſe with a knobbed roote.

ſmall

3. *Gramen nemorum hirsutum latifolium minus juncea panicula.* The lesser broad leafed hairy Wood grasse with Rush like leaves.

4. *Gramen nemorum hirsutum majus angustifolium.* The greater narrow leafed hairy Wood grasse.

5. *Gramen hirsutum angustifolium majus alterum.* Another sort of narrow leafed hairy grasse.

6. *Gramen nemorum hirsutum minus angustifolium.* The lesser narrow leafed hairy Wood grasse.

ſmall long haires, the ſtalke from among them groweth to be two foote high, with leaves at the joynts, and ſet at the toppe with divers ſmall greeniſh flowers in little huskes which containe ſmall ſeede when it is ripe: the roote is a tuft of many ſmall long threds.

2. *Gramen nemorum hirſutum majus alterum præcor tuberoſa radice.*
A greater early Wood graſſe with a knobbed roote.

This earely Wood graſſe hath larger leaves then the former, of a deeper greene colour and as hairy alſo, on the ſtalkes are leaves at the joyntes, as in the other, and ſuch like heads or knaps of flowers, the roote is thicke, ſomewhat ſhort and browne, almoſt like a Tormentill roote, with a number of ſmall browniſh haires covering it very thicke.

3. *Gramen nemorum hirſutum latifolium minus juncea panicula.*
The leſſer broad leafed hairy Wood graſſe with Ruſh like panickles.

This leſſer Wood graſſe is very like in the growing unto the firſt or broader ſort, but that the leaves hereof are narrower and the panickle or tufted head, at the toppe of the ſmall ſtalke, is ſmaller and ſomewhat reſembling the toppes of Ruſhes.

9. *Gramen hirſutum capitulo globoſo.*
Globe headed hairy Wood graſſe.

4. *Gramen nemorum hirſutum majus anguſtifolium.*
The greater narrow leafed hairy Wood graſſe.

The greater narrow leafed Wood graſſe, is very like in the manner of growing unto the firſt ſort of Wood graſſes, but that the leaves are much narrower, ſhorter, and turning downewards as the firſt, the ſtalke is bare without joynt or leafe, having at the top three ſmall rough and almoſt round ſcaly heads ſet together: the roote is ſmall and long with ſmall fibres ſet thereat.

5. *Gramen hirſutum anguſtifolium majus alterum*
Another ſort of narrow leafed hairy graſſe.

From a ſmall reddiſh fibrous roote riſeth up a ſtalke neere two foote high, and ſmooth, uſually bearing at the toppe a ſoft white panickle, ſomewhat ſpread, and made of ſundry ſmall ſcales as it were, in every one whereof lyeth a ſmall round blackiſh ſeede: the leaves are few a little hairy and ſome of them compaſſing the ſtalke: the whole panickle hath two ſmall leaves ſet at the bottome thereof, the one riſing higher then it, the other lower: this ſaith *Bauhinus*, groweth in the moiſt fieldes of *Michelfield* by *Baſſill*.

6. *Gramen nemorum hirſutum minus anguſtifolium.*
The leſſer narrowleafed hairy Wood graſſe.

This leſſer Wood graſſe is leſſer then the laſt ſort, having many long and narrow leaves growing at the roote, as hairy as any before, the ſtalke hath two or three joynts, and ſhort leaves on them, and at the toppe divers ſmall heads ſtanding upright, each ſtanding on a ſmall hairy footeſtalke; the roote is ſomewhat long, like a *Cyperus* roote with a buſh of ſmall long threds.

7. *Gramen nemorum hirſutum minimum.*
The leaſt hairy Wood graſſe.

The leaſt hairy Wood graſſe hath more ſtore of narrow long hairy leaves then the laſt, but elſe in all things it agreeeth with the ſixt in heads and flowers, but being whiter then the reſt.

8. *Gramen hirſutum ſive exile ferrugineum.* Small hairy browne Wood graſſe.

This Wood graſſe is as ſmall as the laſt, but with leſſer ſtore of leaves, the heads on the ſtalkes that are not above foure or five inches high, are Woolly and not fully round but a little flat and of a yellowiſh browne colour, the roote is ſmall and fibrous.

9. *Gramen hirſutum capitulis globoſis.* Globe headed hairy Wood graſſe.

This Wood graſſe hath long leaves as broad as the third ſort here before, with ſome ſmall ſoft haires about the edges, the ſtalkes are about a foote high, with joynts and leaves on them, the toppes being furniſhed with two or three round ſoft white woolly heads, compoſed of many ſmall ſilver like threds: the roote is ſmall and threddie.

The Place and *Time*.

All theſe grow in Woods, ſome about *High gate*, and other places, and flowriſh in the end of Summer, except the ſecond, which is earlier then any of the reſt by a moneth or two ſometimes.

The Names.

The firſt is called by *Lobel* and others, *Gramen hirſutum nemoroſum*. *Bauhinus* giveth the figure of the third, and of the fifth, but I have thereunto added *alterum* to diſtinguiſh it from the fourth, being of later invention: The ſixt is called *Cyperella Cordi* by *Geſner in hortis*, and *Gramen exile hirſutum Cyperoides* by *Lobel*, *Gramen nemorum Dalechampij* by *Lugdunenſis*, and *Gramen hirſutum capitulis Pſyllij* by *Bauhinus*. The ſeventh is the *Gramen Leucanthemum Dalechampij* by *Lugdunenſis*. The eighth is not mentioned by any before now. The laſt is called *Combretum Plinij* by *Anguilara*, *Gramen Lucidum* by *Tabermontanus*, *Ceſalpinus* ſaith the *Italians* doe uſually call it *Herba Luziola quia noctu lucet*, it ſhineth more by night then by day.

The

The Vertues.

There is nothing of any propertie in them fit for medicine or any other uſe, the Cattle alſo refuſing them by reaſon of their hairineſſe.

CHAP. XXVIII.

Gramen aculeatum & Echinatum. Prickly headed Graſſe.

ALthough ſome of theſe graſſes grow ſometimes in mooriſh grounds yet they are as often found in the moiſt corners and low places of medowes alſo, and therefore may more fitly be inſerted into this Claſſis then the next.

1. *Gramen aculeatum Italicum.*
Matthiolus his prickly headed graſſe.

This ſmall graſſe hath leaves and ſtalkes ſomewhat like the ſmall ordinary graſſes but that at the joynts with the leaves come forth ſmall prickly heads, foulded in huskes, and ending in three points wherein lye ſmall long pointed ſeede.

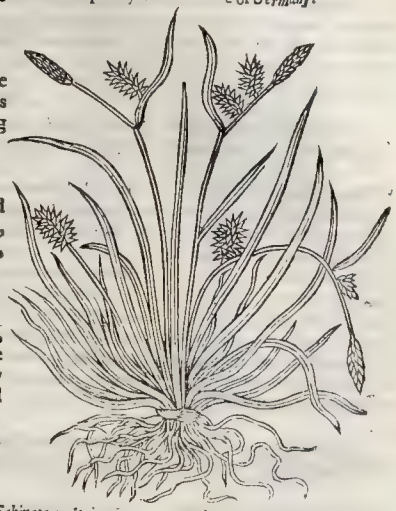
2 *Gramen aculeatum Germanicum.*
The prickly headed Graſſe of *Germany*.

From a white threddy roote riſe up divers graſſie leaves, and among them ſundry ſlender ſtalkes leaning this way and that, whereon are ſet ſhort ſpiked heads very rough and ſharpe, made of many huskes wherein lye white ſeede.

3. *Oxagroſtis pumila Hiſpanica.*
Spaniſh ſharpe pointed Graſſe.

This ſmall *Spaniſh* graſſe groweth not above halfe a foote, and ſometimes but three or foure inches high riſing from the roote, with two or three ſtalkes branching forth into ſundry ſprigs, and ſomewhat long, narrow and ſharpe pointed hard leaves ſet one againſt another, and at the toppes of the ſtalkes ſmall ſpiked heads of halfe an inch or more in length, faſhioned ſomewhat like the heads of *Holoſteum Matthioli*: the roote is white, long, joynted and creeping in the ground.

2. *Gramen aculeatum Germanicum.* The prickly headed Graſſe of *Germany*.



3. *Oxagroſtis pumila Hiſpanica.* *Spaniſh* ſharpe pointed Graſſe.

6. *Gramen Triglochin.* Arrow headed Graſſe.

5. *Echinato capite.* Round prickly headed Graſſe.

1. *Italicum Aculeatum.* *Matthiolus* his prickly headed Graſſe.

4. *Gramen echinatum planum.* Flat prickly headed Graſſe.

This ſmall graſſe riſeth not much higher then a palme or handbreadth, and from a white roote made of many fibres ſendeth forth a few ſmall hairy leaves an inch long, as alſo a ſmall and fine ſtalke, with a flat ſpiked head and moſt ſharpe awnes at the ends of the huskes whereof it conſiſteth.

5. *Gramen echinato capitulo.* Round prickly headed Graſſe.

The roote of this graſſe is compoſed of many white threds, ſending forth ſome few narrow rough leaves two or three inches long, among which riſe up ſlender, ſome higher and others lower ſtalkes, with one or two joynts and leaves at them, each having at the toppe a ſmall round head ſet with very ſharpe prickles, within the huskes whereof lye white cleere ſeede.

6. *Gramen Triglochin Dalechampij.* Arrow headed Graſſe.

Vnto theſe graſſes let me adde this alſo, which although others doe referre to another *genus*, yet I doe to this for the ſharpe heads ſake: it hath ſundry narrow ſlender leaves foure inches long, among which the ſtalke that hath no joynt or leafe thereon groweth a foot high, bearing many ſmall three ſquare heads in a long ſpike one above another, each on a ſeverall ſhort footſtalke, faſhioned ſomewhat like to a broad Arrow head, or the leafe of *Sagittaria*, but that they are ſmall and rounder, biforked below and ſharpe pointed above; the root is a ſmall buſh of many ſmall white fibres.

The Place and *Time.*

The three firſt grow in dry places and old mudde walls, and in the like places doe the other alſo grow and flouriſh at the ſame time with other ſorts of graſſes.

The Names.

The firſt was firſt called by *Matthiolus Gramen aculeatum*, and ſince by others in like manner, *Bauhinus* calleth it *Italicum* as he doth the ſecond *Germanicum*, which *Lobel* called *paluſtre echinatum*, and *Lugdunenſis Gramen aculeatum Dalechampij*: the third is not mentioned by any before now: the fourth is ſet forth by *Bauhinus*, and called *Gramen ſpica plana echinata*: the fift is deſcribed both by *Bauhinus* and *Columna* this calling it *Gramen montanum echinatum tribuloides capitatum*, the other *Gramen ſpica ſubrotunda echinata*, or *Granum echinato capitulato*: the laſt is called by *Lugdunenſis Gramen Triglachin ſive Vermiculatum Dalechampij*, which *Bauhinus* doth diverſly referre, as unto that *Gramen* of *Thalius* that ſome as he ſaith would make a ruſh, but hee would not doe ſo for that the leaves were graſſie, and groweth in wet or mooriſh places, but *Lugdunenſis* ſaith his doth ſpring up in dry grounds; as alſo unto *Gramen ſpicatum marinum alterum* of *Lobel*, whereunto I acknowledge it hath ſome reſemblance, but that the place ſeemeth to contrary it: and that it is alſo the ſecond *Calamograſtis* of *Tragus*, and the fourth *Calamograſtis* of *Lugdunenſis*; ſo that it ſeemeth that for ſome likeneſſe he applyeth the one to the other.

The Vertues.

Matthiolus would transferre the vertues of his *Gramen aculeatum* to thoſe of *Dioſcorides*, but there is much doubt made thereof by the learned, and of the reſt there is nothing can be learned worth the relating.

CHAP. XXIX.

Schænograſtis ſive Gramen Iunceum. Ruſh Graſſes.

THere are divers ſorts of Ruſh Graſſes, ſome that grow in the upland grounds, ſome in the watery and mooriſh plaſhes, and ſome neare the Sea ſhores, of the former onely I meane to entreate in this Chapter, and of the reſt in the next Claſſis among the mooriſh and water plants.

1. *Gramen Iunceum montanum ſubcærulea ſpica Cambro britanicum.*

The gallant mountaine *Welſh* Ruſh Graſſe.

This gallant Ruſh Graſſe hath a great many fine ſlender Ruſh like leaves, little leſſe then a cubit or halfe a yard long, from among whom riſeth up two or three ſlender ſmall ſtalkes, eight or nine inches long and much lower then the leaves, bearing at their toppes out from betweene two leaves which are rather like skins, being broad below and ſmall toward the end yet one alwayes longer then the other, a ſmall ſpiked ſcaly like head, of a fine blewiſh colour.

2. *Gramen Iunceum ſpetioſum minus.* Another gallant ſmall Ruſh Graſſe.

This ſmall Ruſh Graſſe is very like the former, but that it hath much ſmaller ruſh like leaves not paſt three or foure inches long, riſing out of a browne hard huske or hoſe, ſet at the toppe of a ſmall fibrous roote, from among which ſpring up divers joynted ſtalkes with ſuch like leaves on them, and a ſmall head at the toppe like unto the former, but of a browne cleare Cheſnut colour and ſmaller as the whole plant is, having two ſmall leaves thereat as in the former.

3. *Gramen Iunceum Dalechampij. Dalechampius* his Ruſh Graſſe.

Dalechampius his ſmall Ruſh graſſe that groweth in cold and dry places, hath a number of ſmall round ruſh-like greene leaves riſing from a very long white fibrous roote, whence ſpring divers joynted ſtalkes with ſome few leaves on them, and at the toppe a ſpar ſed or open ſpiked head, ſomewhat like unto the *Holoſteum Salamanzuum* of *Cluſius* conſiſting of many purpliſh huskes.

4. *Gramen Iunceum vulgare.* The common Ruſh graſſe.

The leaves of this common Ruſh graſſe are almoſt round, ſeven or eight inches long, among which the ſtalkes that are a ſpan long, beare at their heads ſeverall ſmall panicles ſpike faſhion one above another: the roote is compoſed of browniſh yellow threds.

5. *Gramen Iunceum ſylvarum majus articulato folio.* The greater joynted Wood Ruſh Graſſe.

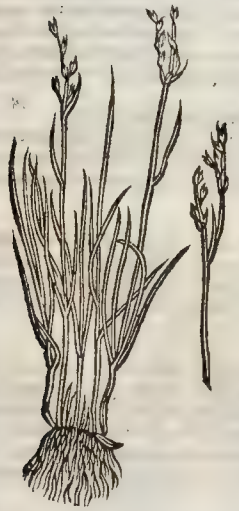
The ſtalkes of this Ruſh graſſe are ſomewhat flat and very greene, the leaves are almoſt round with many ſeverall croſſe joynts on them; the tufted heads at the toppe of the ſtalkes that are neare two cubits high, are much ſpread into many ruſh-like pannickles and ſomewhat flat alſo: the roote creepeth a little ſet with many ſmall fibres.

6. *Gramen*

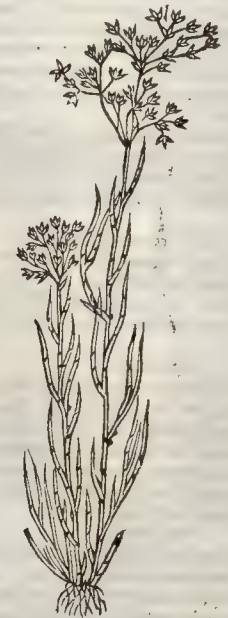
1. *Gramen Iunceum subcæruleo spica Cambro Britanicum,* The gallant *Welsh* Rush Grasse.
2. *Gramen Iunceum speciosum minus.* Another gallant small Rush grasse.

3. *Gramen Iunceum Dalechampij.* *Dalechampius* his Rush Grasse.

4. *Gramen Iunceum vulgare.* Common Rush Grasse.



5. *Gramen Iunceum sylvaticum sparsa panicula.* The greater joynted wood Rush Grasse.



6. *Gramen Iunceum sylvarum minus articulato folio* A lesser joynted wood Rush Grasse.

6. *Gramen Iunceum sylvarum minus articulato folio.* A lesser joynted wood Rush Grasse.

The divers stalkes of this Grasse that rise from the hard spreading roote with many fibres thereat doe take roote againe in the ground and beare such like joynted leaves, and small spread pannickle heads above, very like unto the last but smaller by the halfe in each. And there is a smaller also whose leaves are long and slender, but not joynted, the pannickle whereof is smaller also but sparsed in like manner. *Minus.*

7. *Gramen Iuncoides Iunci sparsa panicula.* Rush Grasse with rush-like sparsed heads.

The stalkes hereof are slender, somewhat flat and almost two foote high, the leaves are smaller then the common sort about two spans long; the toppes likewise are smaller and spread with whitish heads: the roote is yellowish, spreading it selfe with long fibres.

7. *Gramen Iuncoides: Iunci sparsi panicula.* Rush Grasse, with rush-like sparsed leaves.

8. *Gramen Iunceum parvum sive Holoschœnum Matthioli.* Tode Grasse.

9. *Gramen montanum Iunceum capite squamoso.* Mountaine Rush Grasse with scaly heads.

8. *Gramen Iunceum parvum sive Holoschœnum Matthioli & Gramen bufonis Flandrorum.* Tode Grasse.

This small Rush grasse (which the *Flemmings* generally call *Padde grasse*, that is, Tode grasse, and taken to bee the *Holoschœnum* of *Matthiolus* in his last edition) groweth not much above a spanne high, whose leaves are very small, and those on the slender stalkes and branches from the joynts lesser, whereat and likewise at the toppes grow forth small yellowish chaffie heads or huskes, with short awnes as it were at the ends, each upon a short footestalke one above another: the roote is fibrous and reddish. There groweth about *Highgate* and some other wet places one or two other sorts hereof differing from it in smalnesse, and likewise the one smaller then the other, whose heads are thicker or closer set together.

Medium & minus.

9. *Gramen montanum Iunceum capite squamosa.* Mountaine Rush Grasse with scaly heads.

From a small fibrous roote rise up two or three rush-like leaves about halfe a foote long; the stalkes are smooth and without any joynt or leafe thereon rising a foote high, at the toppe whereof from betweene two rough leaves, the one being long the other short shooteth forth a scaly head, small at the toppe somewhat resembling the head of the *Phalaris* Canary Grasse.

The Place and Time.

Some of these grasses grow on hills others in woods or neare them: the first on a high hill in *Wales* called *Berwin* continually covered with clouds and mists, and watered with sundry showers of raine, when at the same time the Sunne will shine faire in the vallies below it: the woods neare *Highgate* and the medowes thereabout doe nourish many of the other varieties: the last was found on mount *Baldus*, and doe all flourish in the Sommer moneths of *Iune* and *Iuly*.

The Names.

By the name σχοῖνος in Greeke, and *Gramen Iunceum* or *Iuncoides* in Latine bee all these plants knowne: The first *Lobel* had entended to call *Nardo Gangiti spuriæ similis capillaris planta*, but I have altered it and referred it rather to these Rush Grasses whereunto it is most like, and so is the second also, being neither of them mentioned by any before: the two sorts of the sixt, the seaventh and the two smaller sorts of the eight are not likewise extant in any other author: the third fourth fift and eight are so entituled by others as they are here set downe, yet *Thalius* calleth the eight *Gramen epigonato caulon*, and *Bauhinus Gramen nemorosum calicul. palcast.* is but I thinke it is seldome in any wood: the last *Bauhinus* so called as it is in the title.

The Vertues.

All these sorts of Grasses have beene so lately found out, that there is no knowne use made of them in Physicke; and for the eight although *Matthiolus* in his last edition gave the figure of it, entituling it *Holoschœnum*, and without any description, and seemed to referre it to that of *Dioscorides*, whose propertie is to binde and consolidate flesh, whereof this is no way guilty, but it is altogether *insipede* like a grasse and without sappe like a rush, and is therefore called *Holoschœnum Matthioli* ever since by all authors, or by these other titiles it beareth, for it is not yet knowne what that true *Holoschœnum* of *Dioscorides* is, not any knowne plant can bee found in all things to equall it fully.

CHAP.

CHAP. XXX.

Juncus. Ruſhes.

THere are diuers ſorts of Ruſhes, ſome great ſome ſmall, ſome ſoft and ſmooth, others hard, ſome barren others bearing ſeede, ſome ſharpe pointed, others not, ſome on the Land, eyther in uplands or neare the Sea, others in the freſh waters, ſome againe ſweet, others not at all: of thoſe I meane to entreate in this Chapter that are not ſweete, for of thoſe kindes, the one called *Schœnanthos* or *Juncus odoratus*, and the other *Juncus anguiloſus* or *Cyperus odoratus*, I have ſpoken in the firſt Claſſis of this worke among the the other ſweete herbes: and firſt of the ſoft or ſmooth ſorts of Ruſhes in this Chapter.

1. *Juncus lævis maximus.* The greateſt Bull Ruſh.

The great Bull Ruſh ſendeth forth ſundry tall, ſoft round ſmooth ſhootes which are the Ruſhes, of a freſh pale greene colour, greater then any of the other ſorts of Ruſhes, having certaine ſheathes like leaves compaſſing them at the bottome, and pointed at the ends but not ſharpe, full of a white pith which are ſerviceable (the outer rinde being pilled away) for lights, being divers of them bound together and dipped in Suet or Tallow: towards the toppes of which on the one ſide breake forth ſundry ſmall browniſh chaffie heads, each upon a ſhort footſtalke, wherein lye three ſquare blackiſh ſeede: the roote is of a blackiſh browne colour, and groweth ſomewhat great and ſlope with divers ſtrings or fibres thereat.

2. *Juncus lævis vulgaris.* The common ſmooth Ruſh.

This Ruſh is in all things like the former but much leſſer and ſhorter having a whitiſh pith within them as the other hath fit for the like uſes, but that the heads are longer and the tuft or pannicle is cloſe and not ſpread open as the next is: the rootes hereof are not great as the other, but are a buſh of ſtrings or threds.

3. *Juncus lævis panicula ſparſa major.* Another ſort of great ſmooth Ruſhes.

This other greater ſort is like the laſt but with fewer ſtore of Ruſhes, of a darkiſh greene colour, and the tuft alſo or browniſh pannicle is more ſpread at large, and each part ſtanding on a pretty long footſtalke, and is broad below and pointed upward: the roote is buſhie like the laſt.

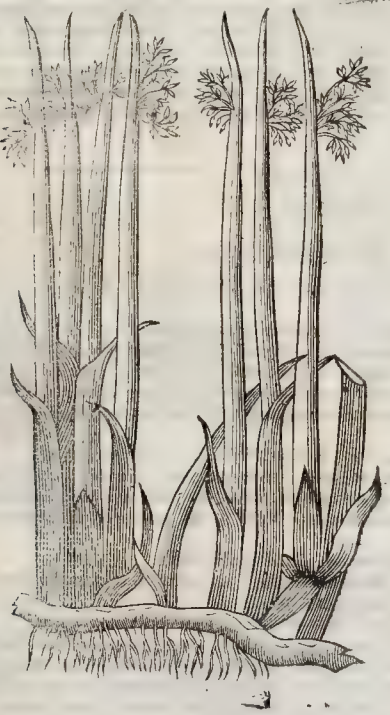
4. *Juncus lævis glomerato flore.* Round headed Ruſhes.

Round headed Ruſhes have divers ſhootes riſing from the roote like unto the ſecond ſort and pitthy within like it, the chiefeſt difference conſiſteth herein that the tufted heads ſtand ſomewhat cloſe together and are round, not pointed at all.

5. *Juncus lævis panicula ſparſa minor.* Small Ruſhes with diſperſed tufts.

This differeth from the greater ſort before deſcribed, onely in the ſmalneſſe of the plant, and growing in dryer grounds, which may peradventure cauſe the ſmalneſſe.

1. *Juncus lævis maximus.*
The great Bull Ruſh.



2. 3. *Juncus lævis panicula ſparſa major & glomerato flore.*
Another ſort of great ſmooth Ruſh and round headed Ruſhes.

6. *Iuncus exiguus montanus mucrone carens.* Small ſmooth pointed Ruſhes.

The roote hereof is ſmall blacke and threddy, ſhooting forth a ſmooth round ſtalke foure or five inches high bearing at the toppe, a browniſh red foure ſquare head, having a ſmall hard long thred above it, it hath alſo three ſmall long leaves at the foote of the ſtalke of an inch long, like unto Ruſhes.

7. *Iuncellus ſive Chameſchænos.* Smell or Dwarfe Ruſhes.

Dwarfe Ruſhes grow not above an inch or two high, although they naturally grow by ponds ſides, having three or foure Ruſhes ſomewhat great and thicke for their proportion riſing from a fibrous roote, this hath not beene obſerved to bring any heads for ſeede, and therefore is called *inutilis*. Like hereunto is that ſmall Ruſh mentioned in the *Adverſaria* by the name of *Iuncellus* but that it groweth ſomewhat higher, and beareth round tufts on the Ruſhes.

Iuncellus Lobel.

The Place and *Time.*

Many of theſe Ruſhes grow in watery plaſhes and grounds, and the firſt uſually in the deeper waters; the three laſt grow in dryer places: and flouriſh chiefly untill the end of *Auguſt* or *September*, yet abide greene all the yeare.

The Names.

Σχοῖνος in Greeke ſo called *a loris & funibus* for ſo in former times it was uſed, is *Iuncus a jungendo* in Latine; from the ſame effect of binding things together: the firſt is taken by *Cordus* and *Bauhinus* to bee the *Mariſcus Plinij*, further hereof by *Gaza* his tranſlation of *Theophraſtus*, ſetting downe *Mariſcus* alwayes for his *Holoſchænos* as being the greateſt, which is as *Pliny* ſaith *ad texandas tegetes aptum*: yet as *Lugdunenſis* ſaith, ſome take the *Iuncus floridus* or *Gladiolus paluſtris* to be it, ſeeing it as well as this is fit to be brought into ſundry workes: *Bauhinus* alſo and others take it to be *Scirpus*: yet it is thought that the ancients tooke them to be different plants. *Terence* in *Andria* bringeth in *Donatus* to ſay *Junci ſpecies eſt ſcirpus lævis et enodis*, and ſuch an one is this Ruſh without any joynt therein, whereupon came the proverbe, *Nodum in ſcirpo quærere*, to ſeeke a knot in a ruſh, ſpoken of ſuch as are ſcrupulous and doubtfull, whereof no ſcruple or doubt neede to bee made: ſome thinke that the text of *Dioſcorides* is corrupt and that in ſtead of Σχοῖνος λεῖα *Iuncus lævis* it ſhould be σχῖνος ἐλαία *Iuncus paluſtris*, and that by comparing *Paulus Ægineta* therewith, who hath ἐλαία and ſo hath *Hermolaus Barbarus* alſo obſerved it. *Geſner* and *Dodonæus* call it *Iuncus grandis Holoſchænos*, and *Lugdunenſis Holoſchænos Theophraſti*, *Tragus* and others *Iuncus paluſtris major*, and *Lobel* and others *Iuncus aquaticus & lævis maximus*: the ſecond *Bauhinus* calleth *Iuncus ſive Scirpus medius*, and ſaith it is the ſame that *Tabermontanus* calleth *Iuncus ſylvaticus*: the third is the *Iuncus vulgaris alter* of *Tragus*, *Iuncus lævis & vulgaris* of *Cordus*, *Dodonæus* and *Lobel*, and *Oxyſchænos* by *Anguillara* and *Lugdunenſis*: the fourth *Lobel* calleth *glomerato flore* and *Iuncus* ſimply by *Matthiolus* and others, and *Iuncus lævis* by *Lugdunenſis*: the fift is *Bauhinus* his title and ſo are the two laſt: the *Arabians* call it *Dis*, the *Italians Giunco*, the *Spaniards Iunco*, the *French Ionc*, the *Germanes Bintzen*, the *Dutch Bieſen*, and we Ruſhes.

The Vertues.

The ſeede of Ruſhes of this ſoft kind eſpecially ſaith *Galen* and *Dioſcorides*, toſted ſaith *Pliny* being drunke in wine and water, doth ſtay the flux of the belly or Laske and womens Courſes, when they come downe two abundantly: it provoketh alſo Vrine; but it cauſeth headach: it provoketh ſleepe likewiſe, but it muſt be given with caution, leaſt it bring a dead ſleepe with it: the bottome or tender leaves or part of the Ruſhes next to the roote being applyed to the bitings of the *Phalangium* or poyſonous Spider healeth them; the roote ſaith *Pliny* boiled in water to the thirds helpeth the cough. *Pliny* maketh mention of an *Oleum Iuncinum* made of *Iuncus* as ſweete as that of Roſes, but ſure it was not made of any of theſe ſorts of Ruſhes but of the *Iuncus odoratus*, ſweete ſmelling Ruſh. *Galen* ſheweth excellently the property of the ſeedes of Ruſhes, that it is compounded of an earthly eſſence ſomewhat cold, and a watery ſomewhat hot: ſo that by drying the lower parts it doth leaſurely ſend up vapours to the head, whereby ſleepe is procured.

CHAP. XXXI.

Iuncus aſper ſive Acutus. Hard or Sharpe Ruſhes.

OF this kinde of Ruſhes there are alſo divers ſorts, ſome great, and ſome ſmall, ſome bearing ſeede others barren or bearing none.

1. *Iuncus acutus vulgaris.* Common hard Ruſhes.

Our common Ruſhes that ſerve to ſtrew the roomes and chambers in houſes, groweth in the ſame manner that the former ſort doth, but that ſometimes the ſtalkes as it were give Ruſhes one from out of another, and not all from the roote ſeperately as others, and are alſo hard and ſharper pointed, with little or no pith within them, the tufts are ſmall, hard, ſpread abroad and ſhort, that breake out towards the toppes as the other ſorts doe.

2. *Oxyſchænos ſive Iuncus acutus Alpinus. Cambro britanicus. Welſh* hard or ſharpe Ruſhes.

The Ruſhes of this ſort are many about halfe a foote long or more, ſomewhat great hard and ſharpe pointed, from among which riſe up naked Ruſhes or ſtalkes halfe a yard high, and from betweene two ſhort leaves breaking forth a ſparſed pannickle, of ſundry ſmall chaffie huskes like unto Reed graſſe, of a browniſh colour: the roote is a buſh of browniſh hard fibres.

3. *Oxyſchænos ſive Iuncus acutus minor.* Small hard Ruſhes.

This ſmall Ruſh groweth very like unto the firſt, but with finer ſmaller, and as hard Ruſhes as the other, the tuft or panickle alſo is very like it, but cloſer and not ſo much ſpread open.

4. *Iuncus maritimus capitulis Sorghi.* Sea hard Ruſhes with blackiſh round heads of ſeede.

This hard Sea Ruſh hath ſundry skinny browne heads, ſet next about the hard long ſloper roote which hath many ſmall fibres under it, out of which riſe thicke round hard, long and very ſharpe pointed Ruſhes, from among which riſe other Ruſhy ſtalkes three cubits high ſometimes, bearing at the toppes from betweene two ſhort leaves a number of blackiſh round heades a little pointed, ſometimes but one and ſometime two or three ſtanding cloſe joyned

1. *Iuncus acutus vulgaris.*
Common hard Rushes.

2. *Iuncus acutus Cambrobritanicus,*
Welsh hard or sharpe Rushes.

3. 7 *Oxyschenos Iuncus seu acutus minor, & Iuncus acutus maritimus Anglicus.* Small hard Rushes and *English* Sea hard Rushes.

4. *Iuncus maritimus capitulis Sorghi.*
Sea hard Rushes with blackish round heads of seede.

5. *Iuncus acutus maritimus alter.*
Sea hard Ruſhes with whitiſh round heads of ſeede.

8. *Iuncus maritimus Narbonenſis.*
The Sea hard Ruſh of *Languedocke.*

joyned togeth̄er, hanging downe from a ſhort footeſtalk̄e, which when they are ripe, open into three parts, ſhewing ſmall and ſomewhat long ſeede within them.

5. *Iuncus acutus maritimus alter.* Sea hard Ruſhes with whitiſh round heads of ſeed̄e.

This other Sea Ruſh groweth after the ſame manner that the laſt doth in all things, as well in height as in thickneſſe or greatneſſe, onely the heads of ſeedes are rounder, and not pointed, and breake out of the Ruſhes, two or three inches under the toppe, or ſharpe pointed ends, about Midſomer each of thoſe round heads will be covered as it were with a white downy or cottony matter, which bindeth and dryeth exceedingly.

6. *Iuncus acutus maritimus caule triangulo.* Sea ſharpe Ruſhes with three ſquare ſtalkes.

The roote hereof is creeping and fibrous, ſending forth a few ſhort leaves, and long three ſquare ſtalkes about a foote in length, very ſharpe pointed at the end, two or three inches under which breake forth ſundry ſcaly and woolly heads of a browniſh colour.

7. *Iuncus acutus maritimus Anglicus.* Engliſh Sea hard Ruſhes.

Our Engliſh Sea Ruſhes differ little in the growing from the other Sea Ruſhes, but that the pannickle is longer and ſlenderer, compoſed of many chaffie huskes.

8. *Iuncus maritimus Narbonenſis.* The Sea hard Ruſhes of *Languedocke.*

This *French* Ruſh hath many ſlender tough and pliant long and ſharpe pointed Ruſhes, of a pale greene colour, from among which riſeth a ſmall ſtalke, little longer then the leaves, bearing at the toppe three leaves, whereof one is exceeding long, and the other are ſhort, in the middle of whom ſtands a large round head compoſed of many long ſharpe huskes ſet in eares, of a pale browniſh colour, wherein lye ſmall ſeede: the roote is browne long ſmall, and creeping, ſet with divers ſhort fibres thereat, ſmelling reaſonably well.

The Place and Time.

The firſt groweth in many low moiſt neglected grounds and fields, where it taketh up much roome and doth little good: The ſecond was found by Doctor *Lobel*, in his life time, upon a high hill in *Wales* called *Bewrin*, in ſundry the wet and mooriſh grounds, in many places thereabouts. The third about *Mompelier* or thereabouts. The fourth and fifth in *Narbone* as *Lobel* ſaith, and betweene Saint *Iohns de luce* and *Bayon*, as we have beene enformed. The ſixth both on the *Venetian* ſhore, and in the way from *Mompelier* to the Sea. The ſeventh groweth on many of our Engliſh coaſts. And the laſt about *Narbone* in *France* alſo. And doe all flowriſh in the end of Summer.

The Names.

The Greekes call it Ὀξυσχοῖνος, *Oxyſchœnos*, and in Latine thereafter, *Iuncus acutus & aſper.* The firſt is called *Iuncus acutus & vulgatior* by *Lobel* and *Dodonæus.* The ſecond hath not beene ſet forth before, and therefore hath the name according to the place of the growing thereof. The third is alſo but now made knowne to all. The fourth and fifth are ſet forth by *Lobel* and *Pena* in their *Adverſaria*, under the title of *Iuncus maritimus duplex.* The former *Bauhinus* calleth *Iuncus acutus, capitulis Sorghi Oxyſchœnos Dioſcoridis.* The later is referred by him unto the *Iuncus Holoſchœnos major* of *Lugdunenſis*, and was brought by *Boel*, from *Bayon*, by the name of *Iuncus Coriandri ſemine rotundo*, and taken to bee the true *Oxyſchœnos* of *Dioſcorides.* The ſixth *Bauhinus* calleth as it is in the

in the title: The ſeventh is peculiar to our Coaſts, and hath the name accordingly. The laſt is the *Iuncus maritimus Narbonenſis* of *Lobel*, whereof I cannot finde that *Bauhinus* hath made any mention.

The Vertues.

The properties of this hard Ruſh, are referred to the former, working the like effects as it is thought, but more weakely.

CHAP. XXXII.

Iuncus acumine reflexo. Hard Ruſhes with bending heads.

THere are yet ſome other kindes of Ruſhes to be handled, which becauſe I would not huddle together, I muſt diſtribute into ſundry Chapters, that ſo every *ſpecies* may be under his owne *genus*, as neere as may be.

1. *Iuncus acumine reflexo major.* The greater bending Ruſh.

The greater of theſe turning Ruſhes, groweth after the manner of the greater ſoft Ruſhes, hath for his rootes ſomewhat round heads, covered with blackiſh browne coates or filmes, and under them, tufts of threds, from which heads riſe ſundry long Ruſhes halfe a yard long or more, breaking a good way under the toppe, which bendeth or turneth downewards, out of a round ſkinny head into many ſkinny round heades, ſtanding on ſhort footeſtalkes, which have as it were five corners, full of cornered ſharpe very ſmall yellowiſh ſeede, of a little harſh taſte.

1.3. *Iuncus acumine reflexo major & trifidus*
The greater bending Ruſh and the triple tufted Ruſh.

2. *Iuncus acumine reflexo alter.*
Another turning or bending Ruſh.

This other hath the Ruſhes more then halfe a yard long, having a blackiſh ſhinig tuft or umbell, breaking forth two or three inches under the turning end, and ſtanding without any footeſtalke, which are compoſed all of threds or thrums and blewiſh at the toppes.

3. *Iuncus acumine reflexo trifidus.*
The triple tufted Ruſh.

The roote hereof is blacke, joynted, and fibrous, the Ruſhes are many, ſlender and foure or five inches long, the ſtalkes are parted at the toppes into three, and ſeldome into fower ſlender long Ruſhes, three or foure inches long a peece, betweene which come forth three ſmall chaffie tufts or panickles.

The Place and *Time.*

They all grow in *France* and *Germany*, and keepe the ſame time that others doe.

The Names.

The firſt is called by *Lugdunenſis Iuncus Melancranis* of *Theophraſtus*, who taketh it alſo to be the *Juncus Oxyſchenos famina* of *Theophraſtus*, *Geſner* and *Tabermontanus* call it *Iuncus laevis*, and may be *Thalius* his *Iuncus Lychnanthemos.* The other two are remembred by *Bauhinus* in his *Pinax* and *Predromus*, but in my opinion the laſt is the ſmall *Iuncus maritimus alter* of *Lobel*, as whoſo will compare them ſhall finde.

The Vertues.

Wee have no other certainty of the Vertues of theſe, but a likelihood to be as effectuall as the laſt kinde of Ruſhes.

CHAP. XXXIII.

Iuncus aquaticus capitulis Equiſeti. Aglet headed Water Ruſhes.

THere are two or three ſorts of this Aglet headed kind of Ruſh, which for the difference ſake from the other kindes of Ruſhes, I thought good to entreate of by themſelves.

1. *Iuncus capitulis Equiſeti.* Aglet headed Ruſhes.

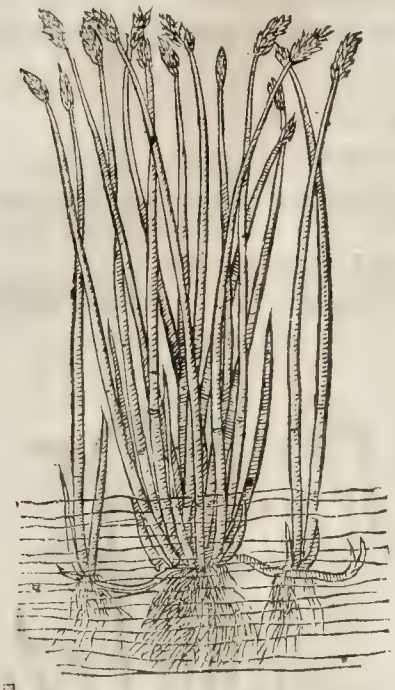
This leſſer ſort bringeth forth from a creeping ſpreading roote, ſtored with many intricate fibres, divers ſlender naked Ruſhes about a cubit long, full of whitiſh pith, and having at the bottomes of them certaine reddiſh skinnes compaſſing them, and bearing each of them at their toppes, a ſmall catkin or Aglet like the firſt head of an *Aſparagus*, blooming with ſmall white threds, like a Plantane head, which fall away quickly.

2. *Iuncus capitulis Equiſeti alter.* Another Aglet headed Ruſh.

This other Ruſh hath ſundry ſhort Ruſhes riſing from the creeping roote, from among which, other ſlender and taller Ruſhes doe ſpring about a foote high, each of them bearing ſuch a like Aglet as the former, but ſomewhat leſſer.

3. *Iuncellus*

1. *Iuncus aquaticus capitulis Equiſeti.* Aglet headed Ruſhes.



2. *Iuncus Equiſeti capitulis alter.* The other Aglet headed Ruſh.

3. *Iuncellus capitulis Equiſeti ſtuitans.* Floting Ruſhes with Aglet toppes.

This ſmall Ruſh hath from a ſmall threddy roote, commeth forth a very ſmall ſlender bowing Ruſh, which divideth it ſelfe into many other ſmall Ruſhes about two or three inches long, floating upon the waters, where it groweth. Whereof ſome grow upright and others doe bow or bend downe againe, each of them bearing a ſmall head like the former, with a ſmall long Ruſh growing by it.

The Place and *Time*,

Theſe all have beene found in our owne land, as well as beyond Sea, the firſt not onely in the ponds and waters of a ſmall village called *Auſtroyel* hard by *Antwerpe*, but in divers places with us alſo, the other in the brookes and ponds, of both *Wales* and *England*, in ſundry places and are to be ſeene in the end of Summer when they flowriſh.

The Names.

The firſt is called by *Lobel Iuncus aquaticus minor capitulis equiſeti*, and by *Lugdunenſis Iuncus clavatus Dalechampij*. The ſecond hath his title ſufficient to expreſſe it, not being deſcribed by any other. The laſt *Bauhinus* ſo calleth as it is in the title, yet calling it *minor*, as he doth the firſt *major*.

The Vertues.

There is no property knowne to what malady any of theſe may be applyed but are held unprofitable as a great many others be.

CHAP. XXXIV.

Iuncus cyperoides floridus. The flowring Cyperus Ruſh.

THere hath formerly beene knowne but one ſort of theſe flowring Ruſhes, but *Bauhinus* hath added another leſſer ſort.

1. *Iuncus floridus major.* The greater flowring Ruſh.

This greater flowring Cyperus Ruſh (as it is differing from all the other ſorts of Ruſhes, ſo it excelleth them all in beauty) hath ſundry heads of leaves like unto thoſe of Cyperus, riſing from a long creeping or ſpreading roote like the Ruſhes, buſhing with many fibres, from whence ſpring round ſmooth Ruſh like ſtalkes two or three cubits high, bearing at the top a large ſpread tuft or umbell of pale bluſh coloured flowers (yet *Tragus* deſcribeth them to be white) with ſome threds tipt with yellow in the middle, which falling away bring in their places ſmall round blackiſh heads, containing ſmall ſeede within them.

2. *Iuncus floridus minor.* The leſſer flowring Ruſh.

The ſmaller Cyperus Ruſh hath a whitiſh joynted roote, a ſmall ſtalke of a hand bredth high, having three long ſharpe pointed Ruſh like leaves, two whereof riſe higher then the ſtalke, and at the toppe five flowers, one flowring

flowring after another, after which come two ſmall round heads ſet together on each footeſtalke, of the bigneſſe of the *Candy* bitter Vetch.

The Place and Time.

The firſt groweth in watery ditches, pooles and plaſhes, in moſt parts of this Kingdome: The other hath beene obſerved in *Switzerland* in ſundry places, and are flowriſhing all the Summer long, ripening the ſeede in the meane time.

The Names.

Although this hath no Greeke name, yet it hath found divers Latine names, being called by *Tragus Calamogroſtis ſecunda*, by *Matthiolus, Lugdunenſes, Camerarius*, and others, *Iuncus floridus*, by *Lobel, Iuncus Cyperoides floridus paladoſus*, by *Cordus, Gladiolus paluſtris*, by *Dodonæus, Gladiolus aquaticus*, who findeth it erronious in them that call it *Iuncus floribus*, but is in as great an error himſelfe to follow *Cordus*, that calleth it *Gladiolus* from the falſe tranſlation of *Gaza*, making *Theophraſtus* his *Cyperus* to be *Gladiolus*, as *Pliny* (it may be) miſled him before, whereunto it hath no correſpondence, ſaving a little in the leaves, hee alſo taketh it to be *Sparganium Dioſcoridis*, wherunto it agreeth as little, ſome alſo call it *Butomos Theophraſti*, and *Lonicerus Carex alterum*. The *Italians* call it *Giunco floride*. The *Dutch Watter Liſel*, and *Gerard* Water Gladioll, following *Cordus*, who confoundeth *Theophraſtus* his *Cyperis*, with *Dioſcoridis* his *Gladiolus*.

The Vertues.

Matthiolus ſaith it is thought to worke the like effects that the other ſorts of Ruſhes doe, but according to *Cordus* his miſtaking it to be *Gladiolus*, he ſaith it is good to helpe the paines of women in their delivery of childing, being boyled in wine and drunke.

1. *Iuncus floridus.* The flowring Ruſh.

CHAP. XXXV.

Spartum herba ſive Iuncus. Matt weed or Mat Ruſhes.

ALthough the *Spartum Pliny* be a kinde of Ruſh, growing rather in dry then moiſt places, yet becauſe the other ſorts of Graſſes that ſerve with us for the ſame purpoſes, to make Mats and other ſuch like workes, doe grow in wet and Mooriſh grounds, neare the Sea ſide, and are called by the ſame name of *Spartum*, I muſt rather then divide it place it with the other.

1. *Spartum Plinij ſive Iuncus Hiſpanicus.* *Spaniſh* Ruſhes.

The *Spaniſh* Ruſh riſeth up with a number of round Ruſhes a cubit long, each whereof is parted a little above the ground, into three or foure more ſlender long, tough and greene Ruſhes, ſomewhat broader at the firſt, being whitiſh in the middle, which ſoone after have both their edges ſo drawne together, that it maketh them ſeeme round, ſo that the partition is hardly diſcerned, and then grow harder, and whitiſh, when they are dry, (as we ſee them in frailes, and in the round mats wherewith the floores of chambers are matted, as they are wrought there and brought over to us) from among which riſe up ſundry ſtalkes, ſomewhat higher then the leaves bearing at the toppe a ſmall long head of many ſharpe pointed huskes, after which come ſmall long ſeede, like unto ſome of the other Graſſes: the rootes ſpread in the ground into many tufts, matting therein that in ſome places they take up two foote ſquare or more.

2. *Spartum Plinij alterum mollius.* The ſofter *Spaniſh* Ruſh.

This other *Spaniſh* Ruſh groweth in the very ſame manner and order, that the former doth, and differeth from it onely in theſe particulars, the Ruſhes are more fine and ſlender, ſofter alſo and bearing a ſhorter tuft at the top, breaking out of a skinny huske or hoſe: the rootes hereof doe mat like the other, and grow in moiſter places.

3. *Spartum marinum noſtras.* Our Matweed or Marram.

This Matweed hath divers long hard, and very ſharpe pointed Ruſhes, piercing their legges that are not booted going among them, the ſtalkes have ſoft ſpiked long heads, like unto the eares of Rye, and blooming like it alſo, the rootes creepe in the ground, and faſten themſelves ſtrongly therein.

4. *Spartum marinum noſtras alterum.* The other of our Sea Matweedes.

This other Matweede is in the growing like the former, but that the ruſhes are broader and ſhorter, and the heads or ſpikes alſo: the rootes likewiſe creepe and are ſtrongly faſtened into the ground.

5. *Spartum parvum Batavicum & Anglicum.* Small Matweede.

The Small Matweed hath ſhorter ſmaller and harder ruſhes, the ſtalkes are a cubit high, having ſmall thin long ſpikes, and harder at the toppes then the former: the rootes likewiſe are long, hard, and ſomewhat tough, fit to be wrought into little baskets or the like.

1. *Spartum Plinij sive Iuncus Hispanicus.*
Spanish Rushes.

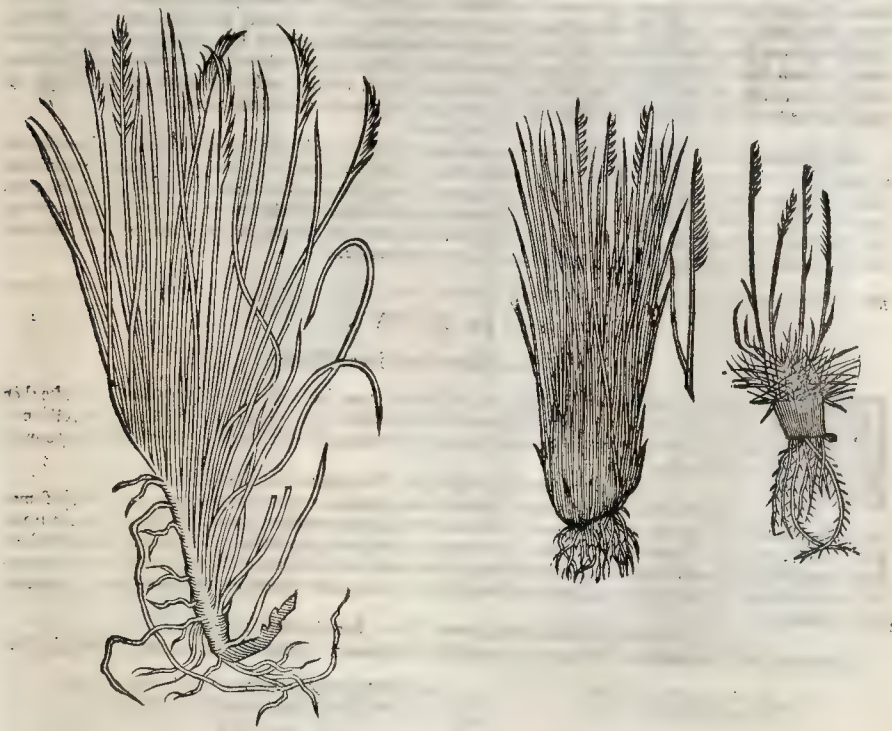
2. *Spartum Plinij alterum molluis.*
The softer *Spanish* Rush.

3. *Spartum marinum nostras.*
Our Matweed or Marram.

4. *Spartum marinum nostras alterum.*
The other of our Sea Matweedes.

5. *Spartum parvum Batavicum & Anglicum.* Small Matweede.

6,7. *Spartum Narbonense & minimum Anglicum.* The ſmall French and Engliſh Matweedes.



6. *Spartum Narbonenſe.* *French* Matweede.

The *French* Matweed hath ſmaller rounder and whiter leaves or ruſhes then the laſt, and cloſer growing togẽther like unto the ſmalleſt and fineſt ſort of ruſhes, and are about a ſpanne long apeece, or ſomewhat more: the ſmall ſlender ſtalkes have ſmall ſingle headed whitiſh ſpikes on them, ſmelling like Moſſe: the rootes are ſmall ſhort threds.

7. *Spartum minimum Anglicum.* The ſmalleſt *Engliſh* Matweed.

The ſmalleſt *Engliſh* Matweed hath many ſmal ſlender round ruſhes like threds, almoſt foure or five inches long, growing thicke together, among which the ſtalkes which are very ſmall, have ſmaller heads and ſingle like the laſt, that is conſiſting but of one or two ſmall rowes: the rootes are long and yellow, like the former ſmal *Engliſh* ſort.

8. *Spartum Baſilienſe capillaceo folio.* The *Germane* Matweed.

The *Germane* Matweed hath ſundry ruſhes riſing from the ſmall threddy roote, which divide themſelves into ſoft very fine Ruſhes, ſometimes but halfe a foote long, and ſometimes a foote, there hath beene no head or ſpike found with it as yet.

9. *Spartum variegatum.* Party coloured Matweede.

The round ruſhes of this Matweed are ſeldome above foure or five riſing from the roote, parted rẽd and greene, but being tranſplanted change their beauty, and come all to be of one colour, this was found on the hills by *Frankenfiſe* in *Germany*. The *Spartum Auſtriacum* of *Cluſius* I have ſet forth in my former Booke, under the title of *Gramen Plumarium.*

The Place and *Time.*

The two former ſorts grow not onely in *Spaine*, but in divers Iſlands belonging thereto, as the *Canaries*, *Madera*, *&c.* The reſt are ſpecified in their titles or diſcriptions, and doe flowriſh in the end of Summer.

The Names.

As wẽ have formerly ſhewed you the *Spartum Græcorum*, which is a ſhrubby kinde of Broome, ſo doe I this here, to be called *Spartum latinorum*; or *herba* to diſtinguiſh it from the other. The firſt is the *Spartum* of *Pliny*, which was in his time as plentifully growing in *Spaine* as now, and therefore the Tract thereof was called *Sparterius campus*, wherein new Carthage, called *Carthagena* now ſtandeth, and therefore all Writers call it *Spartum Plinij* or *herba*, onely *Dalechampius* upon *Pliny* calleth it *Juncus Ibericus ſive Hiſpanicus*, and *Bauhinus*, *Gramen Sparteum primum panicula comoſa.* The ſecond is alſo called *Spartum Plinij*, or *herba alterum*, by all but *Bauhinus*, who calleth it *Sparteum ſecundum panicula brevi folliculo incluſa.* The third is the *Spartum herba tertia maritimum* of *Cluſius*, who calleth it *Spartum noſtras*, meaning his owne Country, but *Gerard* transferreth this title to our owne Land, and ſo doe I, for ſo he and I might very well doe, growing plentifully on the Coaſts of *Norfolke*, and *Suffolke*, and in other places with us alſo. The fourth is the *Spartum herba quartum Batavicum* of *Cluſius*, which

Lobel calleth *Spartum noſtras alterum*, and *Bauhinus*, *Gramen Sparteum ſpicatum latifolium*. The fifth is the *Spartum noſtras parvum* of *Lobel* and I have added *Anglicum* to it in the title, being to be found with us as well as with them, *Bauhinus* calleth it *Gramen Sparteum Iuncifolium*. The ſixth is the *Gramen Sparteum Monſpelienſe* of *Bauhinus*, but it being ſent to Doctor *Lobel* from thence was named as it is in the title, which is not much differing. The ſeventh was found in our owne Land, and for the ſmalneſſe called *minimum*. The two laſt are called by *Bauhinus*, *Gramen Spartum*, with the reſt of their titles as I here ſet them. The *Italians*, and *Spaniards*, call it *Sparto*, and the ſecond ſort *Albardi*. The *Dutch Halm*. And we in *Engliſh*, Helme, and Matweede, but the people all along the Coaſts of *Norfolke* and *Suffolke*, call it Marram, and may be called Sea Ruſhes as well.

The Vertues.

We know of no uſe theſe have in Phyſicke: but are employed wholly by the *Spaniards*, in all the places where it groweth (I meane the Spaniſh kinde) not onely for Mats, ſmall and great, for Chambers, ſraules, and baskets ſowed with the ſame ſtuffe together, or for Bootes, Shooes, Coates, Ropes or Cords, and many other ſuch like uſes: but the ſecond in being ſofter, and not fit for ſuch purpoſes, are uſed to fill ſackes to ſerve them for beds, as we doe with ſtraw to lye upon, our Sea kindes are uſed by diverſe, both with us and in the Low Countries for Mats, Haſſockes, and diverſe other ſuch like meane workes very ſerviceable.

CHAP. XXXVI.

Equiſetum. Horſetaile or rough joynted Ruſhes.

AS a Complement to finiſh this hiſtory of Ruſhes, let me joyne this unto them, for ſo I thinke they may very well be, both for their forme, although differing in roughneſſe, joynts, and poſture of leaves, as place of growing, wherof there are many ſorts, both of the mooriſh and Vpland grounds, as ſhall be ſhewed.

1. *Equiſetum majus paluſtre.* The greater Marſh Horſetaile.

The greater Horſetaile that groweth in wet grounds, at the firſt ſpringing hath heads ſomewhat like to thoſe of Aſparagus, and after grow to be hard rough, hollow ſtalkes, joynted at ſundry places up to the toppe, a foote high, ſo made as if the lower part were put into the upper, whereat grow on each ſide a buſh of ſmall long Ruſh like hard leaves, each part reſembling a Horſetaile, whereof it came to be ſo called, at the topper of the ſtalkes come forth ſmall catkins like unto thoſe of trees: the roote creepeth under ground having joynts at ſundry places.

2. *Equiſetum paluſtre Linariæ ſcopariæ folio.* Broad leafed Horſetaile.

The roote of this Horſetaile creepeth, and is joynted like the former, the ſtalkes likewiſe are a cubit high, hol-

1. *Equiſetum majus paluſtre.*
The greater Marſh Horſetaile.

3.4. *Equiſetum paluſtre minus & alterum brevioribus foliis.*
Small Marſh Horſetaile, and Barren Horſetaile.

low

5. *Equiſetum omnium minus tenuifolium.*
The ſmalleſt and fineſt leafed Horſe taile.

7. 8. *Equiſetum Iunceum ſive nudum & ramoſum.*
Naked and branched Ruſh Horſe taile.

low and joynted in the ſame manner, ſet with leaves after the ſame faſhion but that they are broader then thoſe of Tode Flax, and like almoſt unto thoſe of Broome Tode Flax, greene rough, long, and eaſie to breake, what iule or catkins it beareth hath not beene obſerved.

3. *Equiſetum paluſtre minus.* Small Marſh Horſe taile.

This ſmaller Horſe taile differeth not in the manner of growing from the former, the chiefeſt difference reſteth in that it is ſmaller, and the leaves or briſtles as ſome call them fewer and ſhorter that are ſet at the joynts.

4. *Equiſetum alterum brevioribus foliis.*
Barren Marſh Horſe taile.

This other ſmall Horſe taile differeth litle from the laſt, ſaving that this is often found not to beare any ſeede as the others doe, and yet *Bauhinus* calleth it *Polyſpermon*, as being plentifull in bearing ſeede at the joynts at ſome times and in ſome places.

5. *Equiſetum omnium minus tenuifolium.*
The ſmalleſt and fineſt leafed Horſe taile.

This Horſe taile that for the ſmalneſſe and fineneſſe of the leaves growing in the lower wet grounds in the woods about *Highgate* not farre from *London*, deſerveth alſo to be numbred with the reſt, growing in the ſame manner that the others doe, & differing onely in the forenamed parts. This ſeemeth to differ from that which with *Bauhinus* in his *Prodromus* is the third calling it *Equiſetum paluſtre tenuiſſimis & longiſſimis foliis*, onely in growing higher and the leaves ſomewhat longer.

6. *Equiſetum minus polyſtachion.*
Many headed Horſe taile.

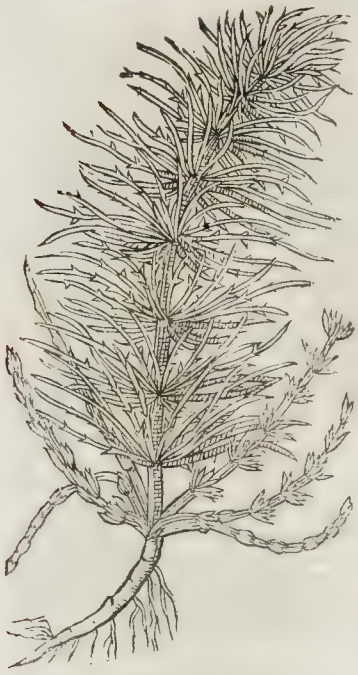
In the joynted and running rootes, in the joynted ſtalkes and in the catkins that it beareth at the toppes, this Horſetaile differeth not from the former ſmall ones: but in this, that at the joynts it beareth three or foure fine ſmall ſtalkes with a ſmall cloſe ſpiked catkin on the toppes of them, and a greater at the head of the maine ſtalkes, more looſely ſet or more opening then the reſt blooming very pale bluſh flowers.

10. *Equiſetum fœtidum ſub aqua repens.*
Stinking Horſetaile.

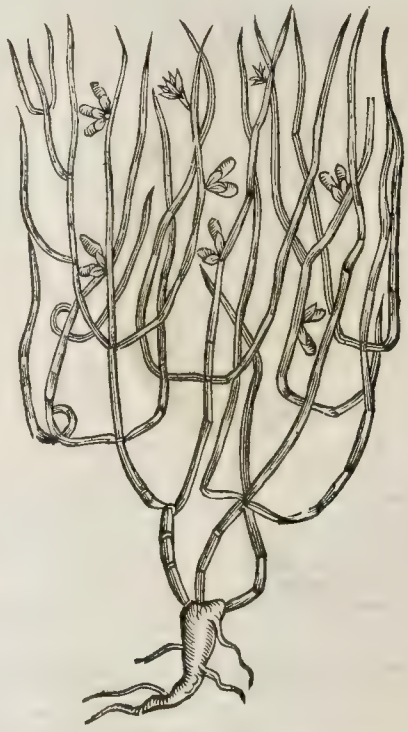
7. *Equiſetum Iunceum ſive nudum*, Ruſh or naked Horſe taile.

The ruſh Horſe taile groweth up with ſundry joynted rough Ruſhes about a foote high or more ſometimes, without any leaves at the joynts, and hereby it is knowne from all the reſt, and is more uſed by ſundry workemen

11. *Equiſetum pratenſe majus.*
The greater medow Horſe taile.



14. *Equiſetum montanum Creticum.*
Mountaine Horſe taile of *Candy*.



to ſmooth and poliſh their workes of wood and bone then any other: the roote is joynted likewiſe and creepeth.

8. *Equiſetum Iunceum ramoſum.* Branched Ruſh Horſe taile.

This differeth onely from the laſt, in growing with many ſtalkes from the toppe of one, that firſt riſeth out of the ground, and that many of thoſe ſtalkes doe branch themſelves forth into others, all of them full of joynts and without leaves.

9. *Equiſetum nudum minus variegatum.* Small party coloured Horſe taile.

From a ſmall blackiſh creeping roote ſpring up ſundry ſmall hollow pale greene ſtalkes of a foote and ſome much leſſe high, full of joynts, the lower joynts whereof are blackiſh and the upper whitiſh without leaves (yet is moſt likely to bee the ſame Mr. *Johnſon* in his *Gerard* ſaith hee found with ſmall leaves, and calleth Horſe taile Coralline, howſoever this may ſometimes ſeeme to differ both from *Geſner* and his) at the toppe whereof ſtandeth a ſmall ſhort head, ſomewhat like a ſmall catkin, the crowne whereof being white hath eight or ten very ſmall ſharpe pointed leaves under it, which being troden on will cracke and make a noyſe.

10. *Equiſetum fetidum ſub aqua repens.* Stinking Horſe taile.

The ſtinking Horſe taile groweth up both in and out of the water, with ſundry branched ſtalkes, but ſtriped athwart, and ſet with ſhort leaves at every joynt, having divers ſmall threds growing at ſpaces on them, greene while it is in the water, but taken forth and dryed it becommeth gray and brittle, eaſie to be rubbed into pouther with ones fingers, and falling alſo into pouther of it ſelfe by lying, and ſmelling ſomewhat like unto Brimſtone: it groweth not onely in the ditches of the bathes of *Aponita* neare *Padon* but in *Luſerne* and *Baſſill* alſo. And theſe be the ſorts of Horſe taile that delight to grow in waters and wet grounds onely, and are not to be found elſewhere. There are ſome other ſorts that are ſometimes found growing although ſeldome as well in the lower wet grounds as in the uplands, which for their double habitations I thought good to ſeperate by themſelves, and ſpeake of them in the laſt place.

11. *Equiſetum pratenſe majus.* The great Medow Horſe taile.

For the forme and manner of growing this differeth not from the former but in growing greater and buſhing with more ſtore, and longer leaves then any at the joynts, each leafe being alſo joyuted with little, ſcarſe diſcernable joynts.

12. *Equiſetum arvenſe longioribus ſetis.* Corne Horſe taile.

This Corne Horſe taile groweth very like the laſt, but greater in bulke although ſomewhat ſhorter in leaves, and not joynted at all that ever I could obſerve, yet I have ſeene it in *Kent* and other places growing in the borders of the Corne fields, and often ploughed up when they fallow their grounds, ſo great, that a ſtalke hath beene like a ſmall buſh.

13. *Equiſetum*

13. *Equisetum sylvaticum minus.* Wood Horsetaile.

This small Wood Horsetaile groweth like the rest, but the joynts are farther seperate in sunder, and the leaves being few are somewhat small and long withall, the rootes are like the rest.

14. *Equisetum montanum Creticum.* Mountaine Horsetaile of *Candy.**

This mountaile horsetaile is somewhat like unto the eight sort here before set downe, having divers Rushie stalkes with leaves on them, branching forth both above and below, at severall places whereof come forth small flowers, and after them small long and round reddish huskes conteining small seede within them: the roote is small and long.

The Place and *Time.*

By the titles or descriptions for the most part may the places of all these be knowne where they grow, and needeth not to be here repeated againe: they doe spring up with their blackish heads in *Aprill*, and their blooming catkins in *July*, seeding for the most part in *August*, and then perish downe to the ground, rising afresh in the Spring.

The Names.

The Greekes call it Ἵππουρις and *Hippuris* in Latine also by divers, and *Equisetum* or *Cauda equina* which is the same with *Hippuris* of the forme of an Horsetaile, and with the stalke of leaves being turned downe doth resemble: by other names it is called as *Equinalis*, and by *Pliny Equisetis*, and of some *Salix Equina*, and *Sanguinalis* from the especiall effect it hath to stanch blood. The first is the *Hippuris major* of *Dodonæus* and others, and *Equisetum majus* by *Lobel* and others, *Anguillara* tooke it to be *Caucon Plinij*, but that I have shewed you before is another plant that is shrubby and liveth: the second *Bauhinus* onely maketh mention of by the same title it beareth: the third is the *Equisetum palustre* of *Lobel* in his *Dutch* booke, the fourth is taken by many to be the *Polygonon fœmina* of *Dioscorides*, and *Pliny* his third *Polygonum* of the many joynts it hath, as *Matthiolus*, *Gesner*, and sundry others, by *Lobel Polygonum fœmina semine vidua*, and by *Cordus Sanguinalis fœmina* and *Limnopence*: the fift is of our owne land not mentioned as I take it by any auther, although as I there say *Bauhinus* his *Equisetum tenuissimis & longissimis foliis* is somewhat like unto it: the sixt, ninth and tenth are all of *Bauhinus* his demonstration as they are entituled, yet *Lugdunensis* mentioneth the tenth by the name of *Equiseti quintum genus minimum*: the seaventh is the first *Hippuris* of *Tragus* and called also by him and *Lugdunensis Equisetum lanceum*, by *Cordus Sanguinalis fœmina similis* and by *Bauhinus Equisetum foliis nudum non ramosum sive lanceum* ἱππουρὶς ἄφυλλος: the eight is the *Equisetum* of *Matthiolus* and *Lugdunensis* called by *Lobel* and *Dodonæus Hippuris minor*, the eleventh is the *Equisetum alterum* of *Matthiolus Lugdunensis* and others, the *Hippuris altera* of *Tragus*, *Hippuris fontalis* of *Lobel* and *Equisetum pratense longissimis setis* by *Bauhinus*: the twelfth is the *Hippuris minor* of *Tragus*, *Polygonum fœmina* of *Fuchsius*, and *Hippuris arvensis major* of *Tabermontanus*: the last is the *Hippuris minor altera* of *Tragus*, and *Equisetum sylvaticum* of *Tabermontanus* and *Bauhinus*. The *Arabians* call it *Then ben alcail Dhemb alchi* and *Dhaneb alcail*, the *Italians coda di cavallo*, the *Spaniards Coda di mula* and *rabo de mula*; the *French Queve de cheval* and *Prelles*, the *Germans Schaffthew*, and *Ross schwantz*. the *Dutch Peert steert*, and wee in *English* generally Horse taile, and of some Shave grasse, and as I sayd in the beginning by resembling a Rush might be called rough joynted Rushes.

The Vertues.

Horse taile the smoother rather then the rough, and the leaved then the bare, is both more used and of better effect in Physicke, and is as *Galen* saith with the bitternesse of a binding qualitie, and dryeth without sharpenesse. It is very powerfull to stanch bleedings whersoever, eyther inward or outward, the juice or decoction thereof being drunke, or the juice, decoction or distilled water applyed outwardly, it stayeth also all sorts of Laskes and Fluxes in man or woman, and the pissing of blood, and healeth also not onely the inward Vlcers and excoriations of the intralls, bladder, &c. but all other sorts of foule moist and running Vlcers, and soone sodereth together the toppes of greene wounds, not suffering them to grow to maturation: it cureth also Ruptures in children quickly, in the elder by time, according to the disposition of the partie, and the continuance: the decoction hereof in wine being drunke is said to provoke urine, to helpe the strangury and the stone, and the distilled water thereof drunke two or three times in a day a small quantitie at a time, as also to ease the paines in the intralls or guts, and to be effectuall against a cough that commeth by the destillation of rheume from the head: the juice or distilled water being warmed, and hot inflammations pustules or red wheales and other such eruptions in the skinne, being bathed therewith doth helpe them, and doth no lesse ease the swellings, heate and inflammations of the fundament and privy parts in man or woman. Countrey huswives doe use any of these rough sorts that are next at hand to scoure both their woodden, peuter and brasse vessels, the young buds are dressed by some like Asparagus, or being boyled, are after bestrewed with flower and fryed to be eaten.

CHAP. XXXII.

Tipha. Cats taile or Reede Mace.

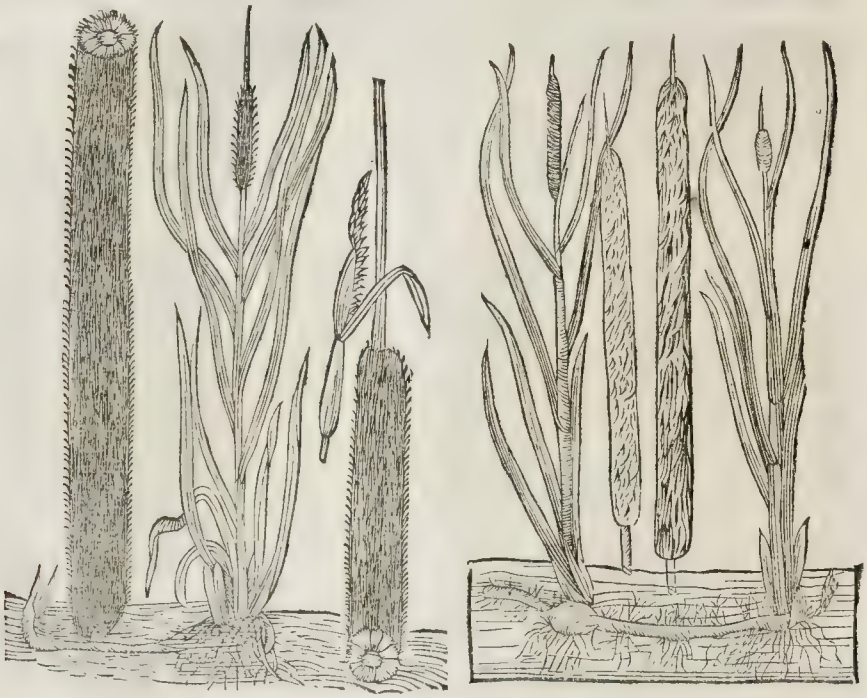
BEeing next to shew you all the sorts of Reedes, I would set this in the first place to be entreated of, as a meane betweene the Rushes and Reedes, before I come to those are properly called Reedes, whereof there are three sorts.

1. *Typha maxima.* The greater Reede Mace.

This great Reede Mace shooteth forth divers very long, soft and narrow leaves, pointed at the ends in a manner three square, because the middle on the backside is great, and sticketh forth, amongst which rise up sundry smooth round and taper-like stalkes, stuffed and not hollow above a mans height, with joynts and leaves on them, from the lower part upwards a good way, but bare and naked thence to the toppe, where they have small long and round heads, shewing forth at the first some yellowish flowers, which being past the torch or spike groweth greater, and consisteth wholly of a flocky substance, of a blackish browne colour on the outside, somewhat solid

1. *Typha maxima.* The greateſt Reede Mace.

2. 3. *Typha minor & minima.* The two leſſer ſorts of Reede Mace.



or weightie, yet is in time blowne away with the winde: the roote is white ſomewhat thicke knobbed and joynted, ſpreading much with many long fibres at it, ſweet in taſte if it be chewed.

2. *Typha minor.* The leſſer Reede Mace.

This differeth in nothing from the former, but in that it attaineth not to that height and greatneſſe that the former doth.

3. *Typha minima.* The leaſt Reede Mace.

The leaſt Reede Mace likewiſe differeth not from the laſt, but in being ſmaller both in leafe and ſtalke, which are more hard or rough, and in the top which in ſome places beareth a ſmaller ſpike above, the lower being greater with a ſmall diſtance betweene them, and a ſmall leafe at the bottome of it.

The Place and *Time.*

They doe all grow either in the middle of watery ditches or ponds, or by the banckes and ſides of them in many places of this kingdome, and flower about Midſommer, the Torch Mace being ripe in *Auguſt.*

The Names.

It is called in Greeke Τύφη and in Latine *Typha a cylindro turbinataque ſpicæ effigie, quaſi typhonis ſeſe gyrantis turbinem, aut gigantis ſtaturam minacem imitatur: aut ut inquit Ruellius, quod ſceptra regum & clavas argenteas vel aureas, quæ ante primos magiſtratus geſtantur, vulgo* a Mace, *dictas perpolitas, caulis lanoſa floccum denſitate, ſummatim faſtigiatus æmuletur*: ſome call it *Ceſtrum morionis* as *Dodonæus* ſaith, and ſome *Typha aquatica* or *paluſtris*, to put a difference betweene it and that kind of *Typha* is put among the Cornes, and therefore called *Typha Cerealis*: *Theophraſtus* maketh mention of them both as it is thought, and *Dioſcorides* but of this one; but *Theophraſtus* ſaith that his *Typha paluſtris* is without leaves, which therefore cannot agree hereunto *Pliny* alſo ſpeaketh hereof, *lib.* 16. *c.* 36. among the ſorts of water Reedes. It hath no other name given it by any author, ſaving that *Anguilara* tooke it to be *Ulna* and *Dodonæus* calleth it *Papyri ſpecies*, and *Lugdunenſis* putteth it by the name of *Iuncus aſper Dodonæi*: *Dodonæus* ſeemeth to take this to be that *Scirpus* that *Ovid* in *ſexto Faſtorum* mentioneth in theſe words, *in plauſtro ſcirpea matta fuit*: but not onely I but divers others more learned doe doubt thereof, as alſo that he referreth it to the *Phleum* of *Theophraſtus* (but not *Phleos*, for that is a thorny plant, as I have here before ſhewed) which he numbereth *inter paluſtria Orchomeny*, and *Ariſtophanes* alſo as I recited him in the Chapter of the ſweete *Cyperus* bringeth in the Frogs rejoycing that they had ſpent the day *inter Cypirum & Phleum*, whoſe flower *Theophraſtus* ſaith is called *Anthela* as *Dodonæus* ſaith, but I rather judge it of the fruit; for *Theophraſtus* mentioneth both *Typha* and *Phleum.* The ſecond is onely remembred by *Cluſius* if it be not the ſame that *Gerard* ſaith he ſaw growing in *Shepey*: the laſt is called *Typha minor* by *Lobel* in his *Adverſaria*, and by *Lugdunenſis*, as alſo *Typhula* and *murina* by *Cluſius* in his *Pannonick* Obſervations. The *Italians* call it *Mazza ſorda*, becauſe that if the duſt of the heads get into the eares of any it will make them deafe: the *Spaniards Bebordo* and *Iunco ama-*

rozdaco:

rocodaco. The *French Maſſe de Iunc.* The *Germanes Narrenk olben.* The *Dutch Liſch doden*, and *Donſen.* And we in *Engliſh* in divers places Cats taile, and Reede Mace by others: but in being betweene a Ruſh and a Reede, it might fitly be called Torch ruſh, or Torch reede: Some alſo call this as well as the next, by the name of Sedge.

The Vertues.

Matthiolus giveth ſuch a property hereunto, that the pouther ſhould helpe children when they are burſten, being mixed with Betony, and the rootes of *Gladioll* and Horſe-tongue, but others doe utterly conteſt againſt it, to be taken inwardly being too dangerous, in that it would rather ſtrangle then helpe them, for it is uſually knowne and mixed as a baite to kill Mice. *Dioſcorides* onely ſaith that the flocky ſubſtance mixed with *Axungia*, is good to heale burnings; it is held by good Authors to be uſed in the place of the true Paper reede, for thoſe uſes it is appointed. It doth moderately clenſe and dry, and being applyed to the bleeding places ſtancheth blood. The leaves hereof are uſually kept to make Mats, and for childrens chaires, and many other the like uſes.

CHAP. XXXVIII.

Sparganium. The Burre Reede.

OF this kinde of Reede I have foure ſorts to ſhew you, two whereof are generally remembred by moſt Writers, a third as the leaſt of them all, is mentioned by *Bauhinus*: but we have a fourth ſort lately brought from *Virginia.*

1. *Sparganium ramoſum.* Branched Burre Reede.

This branched Reede hath larger, broader, and rougher leaves then thoſe of the Reede mace, yet three ſquare as it were like them, and ſharpe, both at the edges and points, among which riſeth a rough round ſtalke two foote high, with the like but leſſer leaves on them, dividing it ſelfe toward the toppe into ſundry branches, bearing on them divers ſmall greene burres, which are not rough at the firſt, but growing ripe are hard and prickly, ſomewhat reſembling the rough burres of *Platanus*, the Plane tree, with a leafe at the joynt, up to the toppe, the roote buſheth into many ſtrings and fibres.

2. *Sparganium non ramoſum.* Vnbranched Burre Reede.

This other burre Reede groweth up in the like manner, with leaves ſomewhat broader then the former, and a ſingle lower ſtalke, not brannhed at all, but bearing the like balles or burres, but ſomewhat ſofter and not ſo prickly with a leafe at every one of them likewiſe: the roote alſo is like the other.

3. *Sparganium minimum.* The leaſt Burre Reede.

This ſmall Burre reede hath a ſtalke about two inches high, riſing from a ſmall roote, compoſed of a few long

1. *Sparganium ramoſum.*
Branched Burre Reede.

1, 2. *Sparganium maſculum ramoſum, & non ramoſum.*
Branched and Vnbranched Burre Reede.

ſtringes

2. *Sparganium non ramosum.*
Vnbranched Burre Reede.

4. *Sparganium majus sive ramosum Virginicum.*
The great branched Burre Reede of *Virginia*.

stringes or fibres, on the toppe whereof standeth a small round head, and another lesse then it thereupon, of the same forme and colour of the former, having foure or five long narrow leaves standing on each side of the staleke, and rising higher then the stalke it selfe.

4. *Sparganium majus sive ramosum Virginianum.* The great branched Burre reede of *Virginia*.

This kinde of Burre reede hath onely two or three very long and somewhat broad, pale greene leaves rising from the roote, and in the midst of them a strong round stalke, without any leaves thereon, but branching forth neare the toppe into many round somewhat prickly Burres, of the bignesse of a Wallnut, without any shew of flowers appearing thereon. The roote is somewhat knobby at the head, with divers strings thereat.

The Place and *Time*.

These Burre Reedes grow in watery ditches, ponds, and rivers usually, or by the sides of them in sundry parts of this Land, except the two last, the one whereof in *Germany*, the other in *Virginia*, brought by Mr. *Tradescant* the younger, they flourish with the Reede mace or thereabouts.

The Names.

It is called in Greeke Σπαργάνιον ἀπὸ τῶν σπαργάνων *quod foliis ejus latis & vitilium modo lentis, pro fascijs nutrices utantur*: in Latine also *Sparganium*, and *Xiphidion* also as *Dioscorides* saith in his time. The first is called *Sparganium* generally by most Authors, yet *Anguilara*, *Ruellius*, and *Dodonæus* take it to be *Butomos Theophrasti*, *Dodonæum* also and *Thalium* call it *Platanaria*, because the burres of it as I said are like those of the Plane trée. *Lonicerus* taketh it to be *Carex*, *Lugdunensis* maketh it to be *Phleos fœmina* of *Theophrastus*. but as I have formerly shewed, there is great difference betweene his *Phleos* and *Phleum*, this last being a moorish plant, and the other a thorny: The second is called *Sparganium alterum* by *Lobel*, *Lugdunensis* and others, and *Platanaria altera* by *Dodonæus*, who findeth fault with that which *Matthiolus* set forth for *Sparganium*, and saith this without branches doth better agree to *Dioscorides* his description, having burres at the toppe of the stalke. The third *Bauhinus* onely maketh mention of, and the last by no other before.

The Vertues.

Galen onely saith that *Sparganium* is of a drying faculty, and *Dioscorides*, that the roote taken in wine is good against the poyson of Serpents.

CHAP.

CHAP. XXXIX.

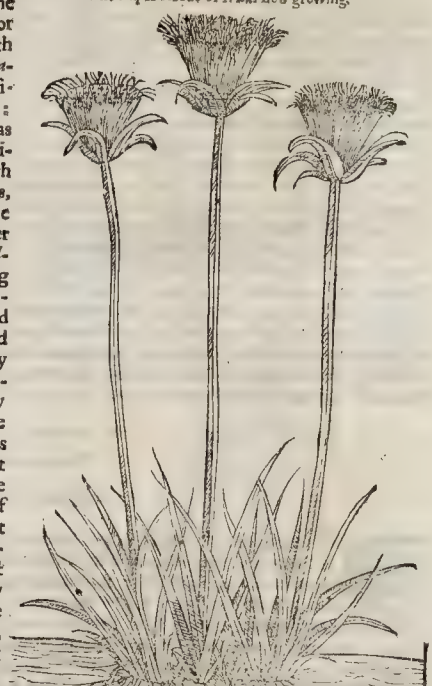
Papyrus. The Paper Reede.

THe ancient Reede called *Papyrus* by *Theophraſtus*, *Dioſcorides*, *Pliny*, and others, whereof the Paper, and bookes were made, that were uſed in their and their former times, we may out of their writings deſcribe unto you, if it be the ſame which *Alpinus* and others ſay, groweth now in *Egypt*, and they call by that name: however we will ſhew you what they ſaid it was, and how it grew, and withall ſhew you how *Alpinus* and others deſcribe it now, and likewiſe ſhew you another ſort thereof, as it is taken.

1. *Papyrus antiquorum Nilotica.* The Paper Reede of the ancients growing in *Nilus*.

This ancient Paper reede (which *Theophraſtus*, & from him *Pliny*, do deſcribe) growing ſay they not in the depth of the River *Nilus*, but in the pooles of *Egipt*, whereinto the River *Nilus* hath broken out, and in the River it ſelfe alſo, yet not in the depth of the ſtreame, but neere the bankes, where the water is oftely about two cubits from the ſhore, or leſſe, whoſe roote is of the thickeneſſe of a great mans wriſt or fiſt, as he can graſpe. (*Pliny* hath an armes thickneſſe) about tenne cubits in length, ſp eading divers of the long but ſmall and thicke rootes, above on the toppe of the mudde and earth wherein it groweth, from whence riſe three ſquare corned ſtalkes, (they are in the Text termed *Papyros*, which I ſo tranſlate, for of leaves they have no mention) of foure cubits bigneſſe almoſt, ſpreading into many parts, and growing ſmaller to the toppe, where it carrieth an unprofitable buſh or tuft, without any fruite or ſeed. This is *Theophraſtus* his relation word for word, as neere as the deſcription could be brought into ſence, which *Pliny* hath altered in ſome things and curtalled in others, ſetting downe *Thyrſus* for *Coma*, they being of different forme, yet *Veſlingius* ſaith the tuft expreſſeth them both, and leaving out *Theophraſtus* his foure cubits greatneſſe, which is ſomewhat difficult well to underſtand and to apply to the purpoſe: therefore will I here give you the deſcription therof, as *Alpinus* firſt, and *Veſlingius* ſince hath amended it. It riſeth up above the water, from a reede like roote, with many fibres therear, with ſundry three ſquare ſtalkes, ſometimes ſeven cubits high or more, with a pith in the middle, with leaves both above and below it, the greater that are at the bottome are large (and three ſquare as *Alpinus* ſaith, but *Veſlingius* ſaith nothing thereof) bending downeward like to the Burre reede or Cyperus, the leſſer are under the tufts at the toppes, which are compoſed of divers long and upright threds, ſet thicke together, and ſmall flowers at the toppes of them, which paſſe away without ſeede, as it is thought, for none hath beene obſerved. This is their exact deſcription of it, ſo that by comparing them both together, we may ſay that the roote is like other Reedes, but much greater, that is as bigge as ones wriſt or arme, yet not of ten cubits long, for that ſize I thinke is more proper to the ſtalke, from the roote to the toppe of the tuft, the ſtalke it ſelfe (cannot be of foure cubits greatneſſe, for that compaſſe exceedeth a great tree but) are about foureteene or fifteene inches compaſſe, which may very well agree to the naturall largeſt breadth of Paper, which was thirteene inches as *Pliny* recordeth it, which was after it was wetted with the water of *Nilus* and ſmoothed out, and thereby enlarged, each fold cloven out from the ſtalke, thoſe inward being leſſer and leſſer. The plant ſay the ancients is ſweete and uſed by the *Egyptians*, before that bread of Corne was knowne unto them for their food, and in their time was chawed and the ſweeteneſſe ſucked forth, the reſt being ſpit out, the roote ſerveth them not onely for fewell to burne, but to make many ſorts of veſſels to uſe, for it yeelded much matter for the purpoſe: *Papyrus ipſe* (ſay they) that is the ſtalke, as I tranſlated it before, is profitable to many uſes, as to make Ships, and of the barke to weave, and make ſailes, mats, carpets, ſome kindes of garments and ropes alſo.

Cyperus Nilotica Alpino.
The Paper Reede of *Nilus* now growing.



2. *Papyrus Siciliana.* The Paper Reede of *Sicily*.

This other Paper Reede (which may be the *Sari* of *Theophraſtus*, mentioned by him next unto the *Papyrus*, *lib. 4. hiſtor. c. 9.* which as he ſaith is very like it but leſſe, being three ſquare alſo) riſeth ſixe or ſeaven cubits above the water, having many three ſquare and ſoft leaves broader and longer then thoſe of *Cyperus* or *Sparganium*: the ſtalkes are many, full of pithy wooll, ſmooth and naked, without any leafe unto the toppe, where it beareth a faire large thicke tuft of cloſe ſet ſlender ſtalkes, with ſmall Moſſie flowers on the heads of them, and a few ſhort leaves under the tufts; which become fruiteleſſe, not bearing any ſeede: the roote is ſomewhat long like a reede, with many fibres thereat.

The

The Place and Time.

The places of both theſe Reedes are expreſſed in their titles, the former properly in *Egipt*, and *Syria*, as *Theophraſtus* ſaith, and in *Euphrates* alſo neere *Babylon* as *Pliny* ſaith. The other groweth in *Sicilia*, and as it is thought in *Italy*, and other places, being in growth much leſſe then the former, and flouriſh in the end of Summer,

The Names.

It is called in Greeke πάπυρος, and in Latine *Papyrus* alſo, the ſtalk was called βίβλος whereof were made βίβλια, which the Latines call *Chartæ* or *libri*, becauſe the tranſlators ſet *liber*, or *cortex* for βίβλος, not knowing otherwiſe the property of the word, but as *Pliny* ſheweth, there was no *Chartæ* leaves of Paper made of the barke, but of the inner foulds, which they divided into thinne flakes, whereinto it naturally parteth, then laying them on a Table, and moiſtening them with the glutinous water of the river, they preſt them, and after dryed them in the Sunne, and according to the largeneſſe thereof was the greater priſe, but becauſe the later times of that old age, grew ſo copious in writing and tranſcribing Bookes, that they could not at any price, get ſufficient for their uſe. *Attalus* as it is thought firſt at *Pergamus*, invented the skinnes of beaſts to be dreſſed and dryed, fit to ſerve that purpoſe, which ever ſince have beene called *Pergamenæ*, ſheetes or Bookes of Parchment, for it is ſaid that *Attalus* furniſhed his Library at *Pergamus* with 200000. volumes, written on this Parchment. This by *Euſtachius & Guillandinus de Papyro* is called *Papyrus Ægyptia ſive Biblus Ægyptia*. The ſecond is called by *Euſtachius*, *Biblus ſecunda*, by *Guilandinus Papyri altera ſpecies, quæ Paperus in Sicilia vocatur*, by *Lobel Papyrus Nilotica*, and by *Bauhinus Papyrus Syriaca*, and *Siciliana*, and is likely to be that *Papyrus* that *Alpinus* ſaith, groweth now in *Egipt*, and called *Berd* or *Bardi* by the *Egiptians*, and as I ſaid before, is moſt likely to be the *Sari* of *Theophraſtus*, which ſome doe thereupon call *Pſeudo papyrus*.

The Vertues.

The rootes of the ancient *Papyrus* was much uſed to be eaten, as is before ſaid, either raw, boyled, or roaſted, by the people of *Egipt* in former times ſucking the juice, and ſpitting out the reſt as *Theophraſtus*, *Dioſcorides*, and *Pliny* doe ſhew, it was uſed as *Dioſcorides* ſaith, to open the cloſed mouthes of Fiſtulaes being put into them, the manner whereof is to take the dryed ſtalkes of Paper, and to lay them in ſoake, which being bound about cloſe with a thred, is to be dryed againe, and then being unbound is to be put into thoſe Vlcers, whoſe mouthes are too ſuddenly cloſed, thereby not eaſily to be cleanſed and healed, which this being put thereinto, by the heate and moiſture of the Vlcer, is cauſed to ſwell to that bigneſſe it had when it was greene, or ſoaked, making a fairer way for the cure, in which manner alſo *Guilandinus in Papyro*, ſaith that the Chirurgions in *Italy* uſed the pith in the ſtalkes of the *Milium Indicum*, Indian Millet. The burnt aſhes thereof were uſed to ſtay running Vlcers, in any place of the body, but eſpecially thoſe in the mouth. But the aſhes of the writing Paper it ſelfe, that was made of the ſtalkes performed it better: but whereas now adayes many by miſtaking the ancient word *Charta*, doe uſe the aſhes of our Paper, which is made of linnen cloutes, for the ſame purpoſes aforeſaid, they erre groſſely, and beſides doe no good at all therewith, but in the ſtead thereof divers learned men doe adviſe to take the dryed ſtalke of *Typha*, to performe the ſame effect. *Theophraſtus* declareth that they formerly uſed to burne the rootes hereof inſtead of fewell, as alſo applyed them to make many ſorts of utenſils, or houſhold veſſels, for they yeelded much wood and very good, for as he ſaith, they made Ships thereof, and of the *Biblos* (which I ſhewed, the Tranſlators not knowing the true meaning of the word, did turne it into *Cortex*, the barcke) the ſtalke they made ſailes, and coverlets, a kinde of garment alſo, mats, and ropes. *Alpinus* ſaith that the *Egiptians* uſe the aſhes of the burnt ſtalkes of this their ſort, in the ſame manner, and to the ſame purpoſes that the formed was uſed to be put unto. And beſides, ſaith that the diſtilled water of the ſtalkes is very profitably uſed to take away the pin and web, and other miſts and darkneſſe happening to the eyes.

CHAP. XL.

Harundo. The Reede.

OF Reedes there are two principall kindes, the one ſweete, called *Calamus aromaticus*, or *odoratus*, whereof I have ſpoken in the end of the firſt Claſſis of this Booke: the other not ſweete, whereof there are many ſorts, *Dioſcorides* numbreth up five, *Naſtos ſive farcta*, *Thely ſive Famina*, *Syringias ſive fiſtularis*, *Donax ſive Cypria*, and *Phragmites ſive Vallatoria*. *Theophraſtus* hath many more, and *Pliny* numbreth up five and twenty: moſt of which being knowne onely to us by the dry Canes, I ſhall give you the figures of ſome here, and ſpeake of thoſe that are proper to theſe neerer climates in this Chapter.

1. *Harundo Vallatoria ſive vulgaris.* Our Common Reede.

Our Common Reede ſhooteth forth with many great round hollow ſtalkes, full of joynts, ſomewhat cloſely ſet one unto another, to a great height in ſome places more then in others, with long and ſomewhat broad hard greene leaves at each of them, ſharpe on both edges and ſomewhat compaſſing the ſtalke, at the bottomes bearing a long and broad ſpread ſoft browniſh pannickle at the toppe, whoſe chaffie or downy ſeede, flyeth away with the winde: the roote is white, hard, round, long, and with divers knobbed joynts therein, running aſlope, but not deepe, and ſhooting up ſtalkes from divers of the joynts: the whole ſtalke dyeth and periſheth every yeare, yet is uſually cut downe before Winter, when as it is growne white to ſerve for many purpoſes.

2. *Harundo Anglica multifida.* Finger Reede.

This rare Reede is like the former, in the manner and greatneſſe of growing, differing onely in the leaves, which are each of them halfe a yard long, and two or three inches broad, with ſundry great ribbes or veines running along them, and parted at the ends into three or foure parts, ſome what like unto the Finger Harts-tongue.

3. *Harundo Donax.* The *Spaniſh* Reede or Cane.

The *Spaniſh* Reede differeth not in the manner of growing from the former, but in the greatneſſe, the canes or ſtalkes being harder, thicker and riſing unto two mens height ſometimes, whoſe joynts are more ſeperate in ſunder, with larger leaves at them, and a larger pannickle at the toppe. Very like here unto are the Reedes that grow

in

in the *Indies*, but by reaſon of the greater heate they grow both taller and greater, ſo that they ſerve in ſtead of timber both to build their houſes and to cover them.

4. *Harundo Indica verſicolor.*
The ſtript or party coloured Reede.

This Reede is in the growing like unto the laſt, growing in its naturall place as great and as high, although it be not ſo with us, the chiefeſt difference herein conſiſteth in the arge long leaves which are parted with white & green like the Ladies Laces or painted graſſe but with larger ſtripes There is another ſort hereof growing in *Bengala* which is ſmaller and more pliable and apt to bend, whereof they make Baskets and many other ſuch pretty things.

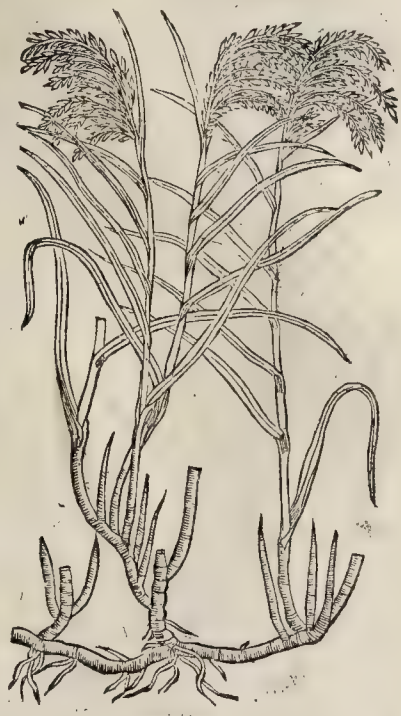
5. *Harundo Saccharifera.* The Sugar Cane or Reede.

The Sugar Cane or Reede groweth (naturally both in the Eaſt and Weſt *Indies* but planted in ſundry warme countries) to bee ſeaven or eight foote high, whoſe Canes are bigger then ones thumbe, full of a ſweete pith, thicke ſet with joynts and very long but narrow leaves at them, with divers great ribbes in them, the tuft or pannickle at the top is like unto the other but ſhorter: the roote is not ſo hard or wooddy but ſpreadeth knobbed joynts and heads at them whereby it may be encreaſed, and is almoſt as ſweete as the Canes; In the naturall places this yeeldeth forth of it ſelfe oftentimes or elſe being cut a certaine white juice or liquor which being dryed and hardned in the Sunne was called by the ancient writers *Sal Indum* and *Saccharum Indum*, which was uſed before Sugar was made out of the Canes by boyling.

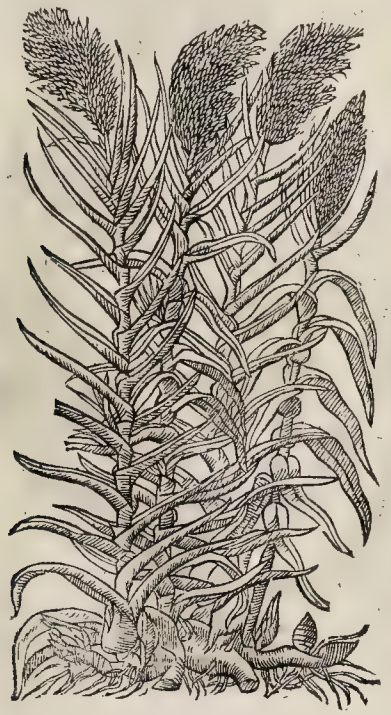
6. *Harundo ramoſa ſive Epigeios Lugdunenſis.*
Low branched Reede.

The branched Reede hath the lower part of the ſtalke with ſhort joynts onely without any branches, covered with a yellowiſh barke, but upwards it ſhooteth forth branches on all ſides, and they againe other leſſer branches up to the toppe almoſt at every joynt, and all of them

1. *Harundo Vallatoria ſive vulgaris.* Our common Reede.



3. *Harundo Donax.* The *Spaniſh* Reede.



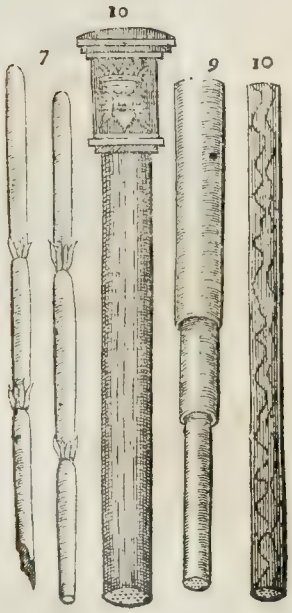
4. *Harundo Indica Laconica verſicolor.* The party coloured Reede.

ſtriped

5. *Harundo Saccharifera.*
The Sugar Cane or Reede.

6. *Harundo ramosa sive Epigeios.*
Low branched Reede.

7. *Harundo Elegia, Sagittalis, & fistula.*
The small writing Reede, the Arrow or Dart Reede, and the greater and lesser solid Reede.



8. *Arundo graminea aculeata.*
The thorny Reede.

striped athwart, with lines and scales thicke set on them without any leaves that were seene on it, being onely found by chance, in a sacke full of *Costus* and Ginger as it was brought from *Arabia*.

7. *Harundo minor sive Elegia.* The small writing Cane.

This small Reede may seeme to be the same with the last recited, and so *Lugdunensis* doth take it, correcting *Plinie* where he mentioneth the Reede *Elegia*, that it groweth not high but spreadeth about the ground like a bush, being pleasant to cattle while it is fresh, saying it should be rather *Epigeios*: but *Bellonius* in his first booke of Observations and 47. Chapter saith, he found this Reede growing in a valley on mount *Athos*, which the Greeke that was with him called *Elegia*, whereof they made writing pens, as also *lib. 2 c. 86.* in the River *Iorden*, knowing it then as seene before, for throughout all *Turkey* they use no pens made of Goose quills as we doe, and those writing pens which we have seene have beene brought us out of *Turkey* doe declare it to bee a small Cane with joynts like unto other Reedes, hollow like a quill, whereas that *Epigeios* of *Theophrastus* and *Lugdunensis* have greater & alkes and thicker joynts, then that thereof can be made any quill or pen to write withall, wee have yet no further knowledge thereof: this onely let me adde hereunto that none may mistake thie for the *Harundo Saguttaria* which is bigger and solid, not hollow.

8. *Arundo graminea aculeata.* The thorny Reede.

This Reede shooteth forth thicke and short rootes with fibres at them, from whence extend on the ground many joynted round Reede-like stalkes about a finger thicknesse, spreading out into branches with small and long leaves set on both sides at distances, whose lower parts being broad compasse the joynts, growing narrow to the end which is very sharpe, hard and thorny; yet it hath neyther flower nor seede that ever could be observed, and is almost without taste or but a little acrimony therein: it groweth in moist grounds and watery places as other Reedes doe.

The Place and *Time.*

All these sorts of Reedes delight to grow in waters or watery overflowne grounds, the severall countries are specified in their titles or descriptions, and are all ripe about the end of *September*.

The Names.

It is called in Greeke κάλαμος and in Latine *Calamus* and *Harundo* or *Arundo* as some writes it, whereof the *mas* according to *Theophrastus* is the *Nastos farcta*, the solid or stuffed Reede, and the *femina* the hollow. The first is *Phragmatis* as *Ruellius* and *Dodonæus* calleth it and *Vallaris* or *Vallatoria*, as *Lobel*, *Dodonæus*, *Lugdunensis* and others doe call it, and *Arundo palustris* as *Matthiolus* and *Tabermontanus* doe, but *Anguilara* calleth it *Canda femina Dioscoridis*, and *Cordus Calamus vulgaris*: the second hath beene onely found with us; the third is called *Arundo domestica* by *Matthiolus* and others, and *Donax sive Cypria* by *Dodonæus*, *Lobel* and others, and *Italica major* by *Camerarius*, for indeede it is one and the same sort whether it grow in *Italy*, *Spaine* or else where, although one country greater and higher then in another, according to the soile and climate: the fourth is probable to me to be the same that *Theophrastus* calleth *Laconica*, although it was entituled *Indica* by them that sent it: the fift is generally called *Arundo Saccharifera* and *Saccharata* by all that have written of it: the sixs is as I sayd the *Arundo Epigeios* of *Theophrastus* by *Lugdunensis*, which *Bauhinus* calleth *Arundo repens*, for what cause I know not, and *Chamecalamus*, and thinketh it to be that which *Gesner* in *hortis* calleth *Arundo humilis*, and *Copia Elegia* as it was termed by them that had it, but surely the *Epigeios* is differing from the true *Elegia* as I have before shewed: the seaventh is called as I sayd before *Arundo Elegia* by the *Græcians* with whom it groweth. The last last is so called by *Alpinus* as it is here. The *Arabians* call it *Casab*, the *Italians Canna*, the *Spaniards Cannas*, the *French Canne* and *Roseau*, the *Germans Korb*, the *Dutch Riet*, and we Reede.

The Vertues.

Galen saith that the rootes have a cleansing quilitie but not sharpe and the leaves also: The fresh leaves bruised, or the rootes applyed to those places that have thornes splinters or the like in the flesh, doe draw them forth in a short space: the same also applyed with vinegar helpeth members out of joynt, and easeth the paines in the loines, the fresh leaves also bruised and applyed unto hot impostumes, inflammations or S. *Anthonies* fire, easeth them: the ashes made of the outer rinde of the stalke mingled with Vinegar helpeth the falling of the haire, the same things doe the other sorts of Reedes as well: the flower or woolly substance if it happen into the eares, it sticketh therein so fast as that by no meanes it will be gotten forth againe, but will procure deafenesse withall: Some have as it is sayd observed, that the Ferne and the Reede are at perpetuall enmitie the one not abiding where the other is, as also the amitie betweene the Asparagus and the Reede to thrive wonderous well being planted among Reedes. They are also put to many very necessary matters both to thatch houses, to serve as walles and defence to gardiners in the cherishing of their plants, to Watermen to trim their Boates, to Weavers to winde their yarne on, and divers others uses. The Sugar that is made of the Sugar Reede, hath obtained now a dayes so continuall and daily use, that it is almost not accounted Physicall, because of the temptateneſse of heate and moisture therein, nourishing much and helping coughes and hoarseneſse of the throate, and is used to be put into cooling as well as heating and warming medecines.

PLANTÆ PALVDOSÆ AQVATICÆ ET MARINÆ MVSCI ET FVNGI.

MARSH, WATER AND SEA-PLANTS, VVITH MOSSES, AND MVSHROMES.

CLASSIS DECIMAQVARTA. *THE FOVRETEENTH TRIBE.*

CHAP. I.

HAving declared all the Grasses of the Vplands, with Rushes and Reeds, in the last foregoing Tribe, I thinke it fittest to joyne those other Herbes & Grasses, that grow either in the Marshes or Waters, or neere the Sea side, before I entreate of the other *Maritime* Plants, & then follow on *ut supra*.

Trifolium Paludosum.
Marsh Trefoile.

The Marsh Trefoile riseth up with a spongious flexible stalke halfe a yard high or more, with sundry smooth, thicke and somewhat broad darke greene leaves set thereon, at farre distances, three alwayes joyned together, and standing on a long footestalke, from the middle of the stalkes up to the toppes, where commeth forth a long bush or spike of fine pale blush flowers, each of them consisting of five round pointed leaves, with a long thicke pointed umbone in the middle, which together with the leaves thereof are covered with a fine hairy downe or frize, which addeth the greater beauty to it, after which are past, come small round heads in their places, containing in them browniſh yellow seede and bitter: the roote is long and white, creeping in the mud all about, and shooting afresh at the joynts.

The Place and Time.

It groweth onely in wet and mooriſh grounds, and will not abide out of it, for the stalke doth quickely grow lancke and withered being broken off from it, it flowreth in *July*, and the seede is ripe in *August*.

The Names.

It is generally called *Trifolium palustre*, or *paludosum*, and is the *Menianthes* of *Theophrastus*, which he saith groweth

Trifolium paludosum. Marsh Trefoile.

in watery plaſhes, whereupon it is called by *Lugdunenſis*, (who giveth two figures being all one,) *Menianthes paluſtre Theophraſti*, which differeth from the *Menianthes* of *Dioſcorides*, being the *Trifolium Aſphaltites* or *bituminoſum*. *Dodonæus* taketh it to be *Iſopyrum* of *Dioſcorides*, by correcting his Text, and yet it will not be, and beſides ſaith, that ſome called it *Trifolium hircinum*, and others *Fibrinum* as *Tabermontanus* alſo doth, who maketh two ſorts thereof, *majus* and *minus*, and both names made from the *Dutch* appellations. The *Germanes* calling it *Biber-klee a Caſtore*. And the Low *Dutch*, *Boex boonen, hoc eſt faſelum hircinum*. We call it in *Engliſh* generally Marſh Treſoile, yet ſome Marſh Claver.

The Vertues.

We know of no property in it to be applyed as a remedy for any diſeaſe, but if you will take it to be *Iſopyrum*, becauſe the ſeede is bitter as *Iſopyrum* is, then *Dioſcorides* ſheweth that the ſeede is good againſt the cough, and other griefes of the breſt or cheſt, for as *Galen* ſaith, it cleanſeth and cutteth tough and groſſe humours, and maketh them the eaſier to be expectorate or ſpit forth; it is alſo good to purge or cleanſe the liver, and helpeth thoſe that ſpit blood.

CHAP. II.

Caltha paluſtris vulgaris ſimplex. Common ſingle Marſh Marigold.

THe ſing'le Marſh Marigold (for I have ſpoken of the double in my former Booke, although I give you the figure of it here againe) hath divers great broad round deepe greene ſhining leaves, a little dented about the edges, every one on a long thicke round fleſhy ſtalke by it ſelfe, among which riſe up fat thicke ſtalkes, a yard high or neere, with ſome leaves thereon, and at the toppes divers faire great gold-yellow flowers, like unto Crowfoote flowers, but much larger and ſhining, the roote is compoſed of many long ſtrings, which grow deepe in the myre.

The Place and *Time.*

It joyeth onely in waters, and watery ditches, and by their banckes ſides, and flowreth ſomewhat earely yet continueth a good while, and is paſt before the end of *Aprill*.

The Names.

It is generally called *Caltha*, and to put a difference betweene it, and the *Calendula* which is alſo called *Caltha* it is called *Caltha paluſtris*. *Tragus* calleth it *Caltha Virgilij*, and *Geſner*, *Caltha paluſtris*, who alſo ſaith it was called of ſome *Ferraria* from the likeneſſe of the leafe unto an Horſe ſhooe, *Cordus* calleth it *Chelidonia paluſtris*, and *Tabermontanus Populago*, for what cauſe I know not, nor yet why two ſorts, whereas they are all one, although

Caltha paluſtris vulgaris ſimplex.
Common ſingle Marſh Marigold.

Caltha flore pleno.
The double Marſh Marigold.

leſſer or greater in one place then another. The *Dutch* call it *Dotter bloemen*, And we Marſh Marigolds, of ſome Goulds, and in ſome Countryes Bootes.

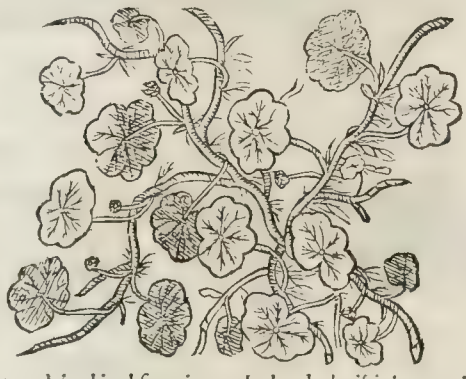
The Vertues.

We have not underſtood that any hath applyed this in Phyſicke for any griefe or diſeaſe.

CHAP. III.

Cotyledon paluſtris. Marſh Penny wort.

Cotyledon paluſtris acris Septentrionalium.



THe Marſh or water Penny wort, as ſome call it, groweth creeping on the ground, with long trayling branches, ſhooting forth fibres at ſundry joynts, and roundiſh deep greene leaves, a little hollow in the middle and unevenly dented about the edges, each ſtanding on a ſmall long footeſtalke, the flowers are very ſmall and white, comming forth under the leaves, the rootes are very ſmall fibres that doe not grow deepe in the ground.

The Place and *Time.*

It groweth alwayes in wet grounds, marſhes or bogges, as on *Hampſteede* heath, and in many other places neere *London*, and flowreth in *July*.

The Names.

It is called by moſt Herbariſtes in theſe daies *Cotyledon paluſtris*, and *aquatica*, *Lobel* calleth it, *Cotyledon aquatica acris Septentrionalium*, and in his obſervations maketh a doubt if it be not thē *Callitriche* of *Pliny*, but is taxed therefore by *Columna*, who calleth it *Ranunculus aquaticus umbilicato folio*, making it a *Ranunculus*, as it is moſt probable, howſoever it be termed *Cotyledon*, from the forme of the leaves. Our Apothecaries as well as they beyond Sea, did uſe this kinde inſtead of the true *Vmbilicus Veneris*, being deceived in that the forme thereof doth ſomewhat reſemble it, but ſure they have amended that error now, in better knowing the true plant. It is called in ſome Countries of this Land the White rot, becauſe if ſheepe feede thereon, it will kill them.

The Vertues.

By reaſon of the ſharpe taſte it cannot but be of an hot quality, ſomewhat like the Crowfeete, and therefore requireth reſpect in the uſe and not a current tradition, we have no certaine property recorded of it.

CHAP. IV.

Ranunculus paluſtris. Marſh Crowfoote.

OF this kinde of Crowfoote there are divers ſorts, which ſhall be declared in this place, being reſerved for it.

1. *Ranunculus paluſtris flammeus major.* The greater or Marſh Spearewort.

This greater Marſh Spearewort hath a long joynted roote, ſtored with many blackiſh fibrēs from whence riſeth up a thicke joynted ſmooth ſtalke two foote high, furniſhed with large and long ſhining, and ſmooth thinner leaves then in the next, ſome being more then halfe a foote long, and two or three inches broad, but ſmaller up to the toppe, where ſtand a few pale yellow Crowfoote like flowers, but larger then in others.

2. *Ranunculus paluſtris flammeus minor ſive anguſtifolius.* The leſſer Spearewort.

The leſſer Spearewort groweth up with more ſtore of ſappy greene ſtalkes, with longer, thicker, and narrower leaves thereon, and more ſtore of pale yellow flowers, like other ſorts of Crowfeete, the ſeede that followeth is like other ſorts of Crowfeete: the roote is nothing but a buſh of threddes or fibres that grow deepe in the mudde.

3. *Ranunculus flammeus ſerratus.* Dented Spearewort.

This other dented Spearewort is altogether like the laſt, or is the very ſame but that this is oftentime found, having the leaves dented about the edges in more plenty then in the other, for both of them is often ſeene, the plaine with ſome dented leaves, and the dented with ſome plaine leaves among them.

4. *Ranunculus flammeus Bayonenſis.* The French Spearewort.

We have had another ſort of Spearewort ſent us from *Bayon*, growing in their Marſhes neere the Sea coaſts, whoſe leaves are long and narrow, ſharpe pointed at the ends, the ſtalke is branched and beareth larger yellow flowers then the laſt, the rootes are like it.

5. *Ranunculus flammeus flore albo minor.* Small white flowred Spearewort.

This little Spearewort hath ſuch like long leaves as the leſſer Spearewort hath, ſtanding upon long footeſtalkes but leſſer and narrower by much: the ſtalke is bare without leaves, ſaving that at the toppe where the flowers breake forth it hath two ſmall long leaves, the flowers are ſmaller then the commen ſmall ſort, but pure white, the ſeede and rootes are alike alſo.

6. *Ranun-*

1,2,3. *Ranunculus flammeus major, minor & fol. serrato.* The greater and lesser Marsh Crowfoote or Spearewort, and with dented leaves.

4,5. *Ranunculus flammeus maritimus Bayonensis & alter flore albo.* The French and small white flowred Spearewort.

6. *Ranunculus palustris Sardonius latis.* Round leafed Marsh Crowfoote.

7. *Ranunculus Sardinius lanuginosus.* The true Sardinian Crowfoote.

8. *Ranunculus aquaticus Hepaticæ facie.*
Water Crowfoote.

9. *Ranunculus Hederaceus aquaticus.*
Water Crowfoote with Ivy leaves.

6. Ranunculus palustris Sardonius lævis.
Round leafed Marsh Crowfoote.

This kinde of Crowfoote shooteth forth a round hollow stalke neere halfe a yard high, branching forth into sundry parts, the lower leaves whereof are more round then those above, and are divided, some into three, which are the first and lowest, others into five divisions, and each of them dented about the edges, somewhat like unto Coriander leaves, of a pale greene colour and smooth, but those up higher on the stalkes and branches are still more and more divided, so that some of the highest have no devision or dent in them, at the toppes stand small yellow (yet *Cordus* saith he hath observed some to beare purplish) flowers, after which commeth a small long round head of many crooked seedes set together, as in other sorts is to be seene, the roots are a bush of small white stringes: the whole plant is as sharpe and virulent as any of the other sorts, here or else where described.

10. *Ranunculus hederulæ folio aquaticus.*
Water Crowfoote with Ale-coast leaves.

7. *Ranunculus palustris Sardonius lanuginosus.* The true Sardinian Crowfoote.

The true Sardinian Crowfoote groweth very like unto the last, but somewhat higher with such like leaves, but more divided and hairy, like a small cotten upon them, in other things there is little or no difference.

8. *Ranunculus aquaticus Hepaticæ facie.* Water Crowfoote.

The Water Crowfoote shooteth forth from a small threddy roote, a long trailing tender stalke with sundry joynts thereat, at every one whereof that are under the water standeth divers fine jagged or featherd leaves, almost like as if they were fibres, but that they are greene, but toward the toppe those that grow above the water, have none of those fine leaves at the joynts, or very few, but onely round leaves upon short footestalkes, cut in a little and dented about the edges, and with them come forth likewise small milke white flowers, of five round leaves apeece, with some yellownesse in the middle, after which come small rough heads like a Crowfoote.

9. *Ranunculus Hederaceus aquaticus.* Water Crowfoote with Ivy leaves.

This small Crowfoote groweth up with divers triangular leaves upon slender trayling stalkes, shooting out fibres at the lower joynts, and with the leaves which are sometimes marked with a blacke spot, come forth small knots of yellow flowers likewise upon short footestalkes.

10. *Ranunculus Hederule folio aquaticus.* Water Crowfoote with Ale-coast leaves.

This Water Crowfoote creepeth likewise, and shooteth fibres at sundry joynts of the stalkes, whereon stand pretty roundish indented leaves, somewhat like unto those of Ale-hoofe, or Ale-coast, having palish flowers, made of five pointed leaves with roundish heads of seed after them.

The Place and *Time.*

All these sorts of Crowfeete grow in Mooriſh and wet grounds, and sometimes at the brinckes of Waters, Ponds, and Ditches. The first is scarce to meete with, but the two next, and the two last are plentifully enough in divers places of the Land, the fourth and fifth came out of France. the sixth and seventh, are found likewise in some places, but not so frequent as the other following. They flower in *May*, and *Iune*, and give their seede soone after.

The Names.

The Greeke name βατράχιον, and the Latine *Ranunculus*, doe most fitly agree to this herbe, in that Frogges have their chiefest residence where these grow. The first is the *Lingua Plinij* of *Lugdunensis*, which *Thalius* saith *Cordus* called *Ranunculus* πλατύφυλλος, & *Ranunculus Lanceolatus major* by *Tabermontanus*. The second is the first *Ranunculus* of *Anguilara*, and the twelfth of *Cordus in Historia*, the *Ranunculus flammeus aquatilis longifolius* of *Lobel*, and *Lugdunensis*, the *Flammula Ranunculus* of *Dodoneus*, the *Ranunculus aquaticus* ἀριοφυλλος, & *major* of *Thalius*, and *Lanceolatus minor* of *Tabermontanus*: some take it to be *Pliny* his *Ægolethron*, *lib.* 21. *c.* 13. and others his *Enneaphyllon*, *lib.* 27. *c.* 9. The third is set forth by *Dodonæus* without any description, and by *Lugdunensis* called *Flammula aquatica*. The fourth and fifth have their names in their titles, sufficient for them. The sixt is the *Strumea & Apiastrum* of *Pliny*, although he confoundeth the *Melissa*, which is also called *Apiastrum*, in that Bees delight to feede thereon, with this, which is in the leafe somewhat like *Apium* (but the next much more) and therefore by some called *Apium risus & Herba Sardoa*, as *Guilandinus* doth, who when he was taken prisoner by Pyrates, and carryed into *Sardinia*, saw this herbe growing plentifully there; it is the *Apium aquaticum* of *Tragus*, and *Apiastrum* of *Cordus* on *Dioscorides*, by *Apuleius* called *Scelerata*, and is the first *Ranunculus* of *Matthiolus*, *Gesner*, and others, the first *Ranunculus palustris* of *Cordus in historia*, of *Lugdunensis*, *Thalius*, and others, and the *Ranunculus palustris apij folio lævis* of *Bauhinus*, but by *Lobel*, *Ranunculus palustris rotundiore folio*. The seventh is as I take it the true *Sardonius* of *Dioscorides*, described by him in the second place, and called by some in his time *Apium sylvestre*, and called also *Ranunculus Sardonius* by *Anguilara*, and is the second *Ranunculus* of *Matthiolus*, and of *Cordus in hist.* *Bauhinus* calleth it *Ranunculus palustris Apij folio lanuginosus*. The eight is called by *Lobel Ranunculus aquaticus hepaticæ facie*, and so it is generally called of all Herbarists with us, by *Dodonæus*, *Ranunculus aquatilis*, by *Lugdunensis Hepatica aquatica*, and by *Thalius*, *Hepatica palustris*, by *Bauhinus Ranunculus aquaticus folio rotundo & capillaceo*, who maketh that other of *Cæsalpinus*, with onely five leaves to be another sort, when as they are both but one, even as that *Trichophyllon* of *Columna* is also. The ninth is called by *Lobel*, and *Gerard Hederula aquatica*, who saith he never saw flowre or seede on it, *Lugdunensis* calleth it *Ranunculus Hederaceus Dalechampij*, and *Bauhinus Lenticula quasi-trifolia*. The last hath not beene mentioned by any before. The *Dutch* call the first sort *Egelacolen*, because if cattle eate thereof it doth enflame and exulcerate their entrals, which disease they call *Egel*, as *Dodonæus* saith, some call it in *English* Banewort, and others Spearewort.

The Vertues.

These Marsh and Water Crowfeete are no lesse sharpe and exulcerating, then any of the other sorts of sharp Crowfeete, and therefore whatsoever hath beene said before of the properties of them, may fitly be applyed to these, for any of the remedies there set downe, and any of these may be used, if the other be wanting, either for Plague sores, rough nailes, warts, ulcers, or any foule markes in the skinne, &c. and for brevity, not willing to repeate the same things, expressed in the Chapter of *Ranunculus* Crowfoote before, I referre you thereunto.

CHAP. V.

Pseudo Asphodelus palustris. Marsh or water Asphodill.

THere are two sorts of this Bastard Asphodill the one greater then the other as shall be shewed in the subsequent discourse, for of the other Asphodills I have shewed you their sorts in my former booke although I shew you here some of their figures.

1. *Pseudo asphodelus major.* The greater bastard Asphodill.

The roote of this greater Bastard Asphodill is long and joynted, with many fibres thereat from whence rise up sundry long and narrow leaves like unto Corne Flag, but not so stiffe or hard, and straked downeright, yet compassing one another as they and the Flowerdeluces doe at the bottome, of a deepe greene colour, among which riseth up a stalke halfe a yard high, with divers short leaves enclosing the stalke as it were with hoses at their bottomes, and at the toppes stand sundry yellow flowers as it were in a spike, each of them made of six leaves a peece, like the other Aspodells with some threds in the middle, after which come somewhat long and square pointed huskes with small blackish seede in them.

2. *Pseudo asphodelus minor folio Indis angustifolia.* The lesser bastard Asphodill.

This lesser Asphodill hath many narrower shorter and fresher smooth greene leaves, somewhat like unto a narrow leafed Flowerdeluce, but neither so hard nor so thicke, the stalke riseth from among them scarse a foote high, having very few small leaves thereon, and paler yellow small flowers at the toppe of it, which turne into small three square reddish huskes, conteining small reddish browne seede within them: the roote consisteth of a few whitish long fibres not spreading farre or much, but increasing into sundry heads.

The Place and *Time.*

Both these sorts have beene found in our owne land as well as beyond Sea in the marrish and wet grounds, the former not onely in *Lancashire* as *Gerard* hath recorded, but in divers other places: and the last likewise by *Egham* not farre from the River side there, and in the West parts of the Land also and in other places, flowring in *Iune* and *July*, and seede a moneth after.

The

1. *Pseudo-asphodelus major sive palustris.*
The greater baſtard Aſphodill.

Pseudo-asphodelus minor folio Iridis.
The leſſer baſtard Aſpodill.

Asphodelus major albus ramosus.
The greater white branched Aſphodill.

Asphodelus luteus minor.
The Kings Speare.

The Names.

They are called both *Aſphodelus luteus paluſtris* as *Dodonæus* doth the firſt, and *Pſeudo aſphodelus* as *Cluſius* doth but calleth the laſt *Aſphodelus pumilio folio Iridis*. And although *Bauhinus* hath three ſorts, making the *Aſphodelus Lancaſtrienſis* which *Lobel* ſaith he had out of *Scotland*, and ſaw it likewiſe in *Norway* to differ from the firſt, yet ſurely he is miſtaken therein for it is all one ſort.

The Vertues.

Wee have not knowne theſe uſed in Phyſicke for any purpoſe, but I have had intelligence from my good friend Doctor *Anthony Salter* of *Exeter*, that he having found it in ſome places neare unto him, could underſtand of the countrey people no other name thereof, or propertie appropriate unto it but knavery, which whether they named it ſo in knavery, or knew any uſe of knavery in it, I neyther can learne nor am much inquiſitive thereafter.

CHAP. VI.

Acorus paluſtris ſive Pſeudoiris & Iris lutea paluſtris. The yellow water Flag.

THe water Flag groweth like the Flowerdeluces, but that it hath much longer and narrower ſadde greene leaves joyned together in that faſhion, the ſtalke likewiſe groweth oftentimes twiſe as high, bearing ſmall yellow flowers, ſhaped ſomewhat like unto the Flowerdeluce, with three falling leaves and other three arched that cover their bottomes, but in ſtead of the three upright leaves as the flowerdeluces have, this hath onely three ſhort peeces ſtanding in their places, after which ſucceede thicke and long three ſquare heads, conteining in each part ſomewhat big and flat ſeede, like unto thoſe of the Flowerdeluces: the roote is longer and ſlenderer then of the Flowerdeluce, of a pale browniſh colour on the outſide, and of an horſe fleſh colour on the innerſide, with many hard fibres thereat, and very harſh in taſte. *Lobel* ſheweth in his *Adverſaria* that there was a great roote brought from *Tholoſe*, which was taken for *Radix China*, but deceaved many in that it was no ſuch thing in effect, for it was in taſte aſtringent, and in the proofe not much differing from the former.

Acorus paluſtris ſeu Pſeudoiris lutea paluſtris.
The yellow water Flagge.

Acorus Aquaticus.

The Place and Time.

It uſually groweth in watery ditches, ponds, lakes, and moores ſides, which are alwayes overflowne with water, as at *Lambeth* in the ditches on the bankes ſide may be yearely ſeene, and in many other places, flowring in *July* and ripening its ſeede in *Auguſt*.

The Names.

This is not *Iris* which was called *Iris id eſt, conſecratrix* as *Gaza* tranſlateth it, but is rather *Pſeudoiris* a baſtard brother of that ſtocke: in the former ages of our fathers it was held by many to bee the true *Acorus* of *Dioſcorides*, ſo ignorantly had the world beene trayned for many yeares, untill ſcruples began to ariſe in mens mindes, not finding the things anſwerable to their deſcriptions in old writers, which cauſed them in theſe later times to be ſomewhat more inquiſite and diligent, to finde out the true and genuine plants, and give them their proper names (and hath it not ſo fallen out in Divinitie thinke you as you ſee it hath done in Philoſophie) for thereupon although *Brunfelſius* call it *Acorus*, yet *Tragus* called it *Adulterinus*, and *Cordus*, *Geſner*, *Matthiolus* and others call it *Acorus falſus*, and *Lobel Acorus paluſtris*, *Fuchſius Turner* and others call it *Gladiolus luteus*, but *Dodonæus Pſeudoiris*, and others *Iris paluſtris lutea* which *Cluſius* in ſpeaking of the true *Acorus* ſaith that the moſt judicious take it to be the *Butomos* of *Theophraſtus*.

The Vertues.

The roote of this water Flagge is very aſtringent cooling and drying, and thereby helpeth all Laskes and Fluxes, whether of blood or humors, as bleedings at mouth, noſe or other parts, blooddy Fluxes and others of that nature, and womens too abounding courſes: the deſtilled water of the whole herbe flowers and rootes is a ſoveraigne good remedy for watering eyes, both to bee dropped into them, and to have clothes or ſpunges wetted therein and applyed to the forehead, it alſo helpeth the ſpots or blemiſhes that happen in or about the eyes, or in any other parts: the ſayd water fomented on ſwellings and hot inflammations of womens ſore breaſts, upon cankers alſo and thoſe ſpreading ulcers called *Noli me tangere* doth much good: the ſame alſo helpeth ſuch foule ulcers as happen in the privy parts of man or woman or elſe where.

CHAP.

Chap. VII.

Tussilago. Coltsfoote or Folefoote.

COltsfoote ſhooteth up a ſlender ſtalke with ſmall yellowiſh flowers ſomewhat earlie, which fall away quickly, and after they are paſt, come up ſomewhat round leaves, yet ſometimes dented a little about the edges, much leſſer, thicker and greener, then thoſe of Butter burre, with a little downe or freeſe, over the greene leafe on the upper ſide, which may be rubbed away, and whitiſh or mealy underneath: the roote is ſmall and white, ſpreading very much in the ground, ſo that where it taketh, it will very hardly be clenſed from it againe, if any little peece be abiding therein, and from thence ſpringing freſh leaves.

The Place and Time.

It groweth in wet grounds uſually, yet as well alſo in the dryer places, and flowreth in the end of *February*, the leaves beginning to appeare in *March*.

The Names.

It is called in Greeke βήχιον, and *Tussilago* in Latine, *a notissima utilitate quam præ ophthalmicis & tussi vexatis*, and in the Apothecaries ſhops *Farfara*, and *Ungula Caballina*, and of ſome *Populago*, from the likeneſſe of the leaves unto the white Popler leaves: many ſuppoſe that this may be *Tiphyum* of *Theophraſtus*, as well as the *Petaſites*, in that both of them bring their flowers before their leaves: *Pliny* calleth it *Farranum*, and *Farrugium*: All Authours call it *Tussilago*, but *Camerarius* maketh three ſorts of *Bechium*, that is this and the *Petaſites*, which he calleth *Tussilago major*, and the third he ſaith is the *Caltha palustris*, which as he thinketh may be uſed inſtead of *Tussilago* which is aſſuredly a great errour, the *Caltha* comming neerer to the nature of *Ranunculus*, then *Tussilago*. The *Italians* call it *Farfara*, and *Farfarella*, and *Vnghia di cavallo*. The *French* Pas de cheval, and Paſd'aſne. The *Germanes Brandat lettich quaſi Vſtulorum lactuca*, and *Roſshub* that is, *Ungula Caballina*. The *Dutch* Hoef bladeren, that is foote leafe. And we in *Engliſh* Folefoote, and Coltsfoote, and Horſe hooſe.

The Vertues.

Coltsfoote while it is frēſh is cooling and drying, but when it is dry the cooling quality which rēmained in the moiſture, being evaporate it is then ſomewhat hot and dry, and is beſt for thoſe that have thinne rheumes and diſtillations upon the Lungs cauſing the cough, thereby to thicken and dry it, as the freſh leaves or juyce, or Syrup made thereof, is fitteſt for an hot drycough, and for wheeſings, and ſhortneſſe of breath: the dryed leaves taken as Tabacco is in the like manner good for the thinne rheumes, diſtillations and coughes, as alſo the roote taken in like ſort as *Dioſcorides* and *Galen* ſay. The diſtilled water hereof ſimply or with elder flowers and Nightſhade is a ſingular remedy againſt all hot Agues, to drinke two ounces at a time, and to have ſome clothes wet therein and applyed to the head and ſtomack, the ſame alſo applyed to any hot ſwellings or any other inflam-

Tussilago Herba ſine flore.
Colts foote without flowers.

Tussilago florens.
Colts foote in flower.

mations

mations doth much good, yea it helpeth that diſeaſe called Saint *Anthonies* fire, and burnings alſo, and is ſingular good to take away wheales and ſmall puſhes that riſe through heate, as alſo againſt the burning heate of the piles or of the privy parts, to apply wet clothes therein to the places. *Matthiolus* ſheweth that in the roote of this Colts foote there groweth a certaine Cotten or white Wooll, which being cleanſed from the rootes and bound up in linnen clothes and boyled in lye for a while, and afterwards ſome ſalt niter added unto it, and dryed up againe in the Sun is the beſt tinder to take fire, being ſtroke from a flint that can be had.

CHAP. VIII.

Cacalia. Great and ſtrange Colts foote.

OF this kinde of Colts foote as I may ſo call it there are two ſorts deſcribed by authors which I meane to ſhew you in this place, and unto them adde another *American* plant which in my opinion commeth neareſt unto the others.

1. *Cacalia incano rotundo folio.* Hoary ſtrange Colts foote.

The hoary ſtrange Colts foote hath a long white roote divided into many heads, with many long ſtrings and fibres thereat, of a clammy taſte like unto gum *Tragacant*, encreaſing thereby much and ſhooting up many hoary reddiſh ſtriped ſtalkes, with large round leaves on them, bigger and thicker then Colts foot, and more woolly alſo on the upper ſide, yet with a greeneneſſe to bee ſeene in them, but very woolly and white underneath, with ſome ribbes and veines in them of a little bitteriſh unpleaſant taſte, from among which riſe up the ſtriped woolly yet reddiſh ſtalkes two or three foote high, having ſundry leſſer leaves on them, and all of them dented about the edges, branching forth at the toppe into ſundry ſmall ſprigges of pale purpliſh flowers made of foure ſmall leaves a peece, with ſome threds in the middle, which after they have beene a while blowne doe paſſe away into downe that is carried away with the winde. *Dalechampius* ſaith that in the middle of the flowers are found hanging downe ſmall white graines like pearles to make it anſweare to *Plinies* deſcription.

2. *Cacalia glabro folio acuminato.* Smooth ſtrange Colts foote.

This other ſort hath as large leaves as the former, but thicker harder greener and ſmoother and not hoary at all but dented or waved on the edges, and pointed alſo with the roundneſſe and not open at the ſtalkes as the other, the ſtalkes are in like manner ſmooth and ſtriped, bearing the like flowers at the toppes but ſomewhat paler; the roote alſo is alike.

1. 2. *Cacalia folio incano rotundo & glabro acuminato.* Hoary and Smooth ſtrange Colts foote.

3. *Cacalia Americana.* Colts foote of *America*.

3. *Cacalia Americana.* Strange Coltsfoote of *America.*

This ſtranger riſeth up with many round ſtalkes about a yard high, and two ſomewhat round but pointed leaves a little dented about the edges, at each joynt of them, the upper leaves being ſmaller, and little or nothing dented, at the toppes of the ſtalkes come forth divers branches with pure white flowers, divers ſmall ones, made of five leaves apeece, riſing out of each huske, which being paſt, there ſucceede ſmall long ſeede, ſticking each to a little downe, which are carryed away together with the winde: The roote conſiſteth of a buſh of blackiſh threds or fibres, which abideth the extremity of the Winter, both ſtalkes and leaves periſhing yearely, but grow browniſh at the end, this hath no ſent that I could perceive, neither in roote, leafe, nor flower, whatſoever *Cornutus* ſaith thereof.

The Place and *Time.*

The two firſt ſorts grow in the vallies of mountaines in ſundry places beyond Sea, and by the Bathes, where they want not moiſture, but not in our owne Land that as yet I can heare of, and flower and ſeede in the Summer time: The laſt in *America*, both *Virginia* and *Canada.*

The Names.

It is generally taken by all our later Writers to be the *Καγκανον ſive Καγκαμον* of *Dioſcorides*, which *Galen* calleth *Cacanum* and not *Cancanum*, as ſome copies have it, for he mentioneth not *Cacalia* as *Dioſcorides* hath it, yet giveth the ſame properties to *Cacanum*, that *Dioſcorides* doth to *Cacalia*, which is not uſuall with him, unleſſe he meane the ſame thing. Theſe plants are called by no other name then *Cacalia* by any Writer but *Lugdunenſis*, who calleth the ſecond *Tuſſilago Alpina ſive montana Dalechampij.* *Bauhinus* would make a third ſort of theſe *European* kinds, but I finde his deſcription ſo anſwerable to the firſt ſort, that I thinke it is the very ſame, and therefore give no further deſcription of it. The laſt *Iacobus Cornutus* calleth *Valeriana Vrticæ folio flore albo*, becauſe he hath another of that ſort with a purple flower, ſaying the roote ſmelleth like *Nardus* or *Valeriana.* But I can find no ſuch thing in it, I have called it great and ſtrange Coltsfoote, and not mountaine Coltsfoote, as ſome have done, becauſe there are other herbs more properly to be called Mountaine Coltsfoote, which grow alwaies on the dryer grounds, as ſhall be ſhewed in due place, and theſe in the moiſter parts of the mountaines; and becauſe the flowers are white and ſtand like a *Valerian*, I have therefore added it to theſe *Cacalia's*, for by that name did Maſter *Tradeſcant* receive it firſt from beyond Sea, of whom I received the plant that groweth with me.

The Vertues.

The roote ſteeped in wine and eaten is good for the cough, and the hoarſeneſſe of the throate, which *Galen* confirmeth ſaying the ſame of his *Cacanum*, that it is without ſharpeneſſe and good for the hoarſeneſſe. *Dioſcorides* addeth that the Pearelike graines which are found in his *Cacalia*, beaten and mixed with a cerote or ointment, doth make the skinne ſmooth, and will ſtay the falling of the haire as *Pliny* ſaith.

CHAP. IX.

Lappa ſive Bardana. The Burre Dockē.

WE have three or fourē ſorts of Burres ſome greater then others, and ſome with more woolly heads, as alſo a ſtrange *American* ſorr.

1. *Bardana major vulgaris.* The common Burre Docke.

The common Burre Docke bringeth forth many large hard greene leaves, ſomewhat like unto the Butter Burre or wild Docke, but more crumpled, and of a darker greene colour on the upper ſide, and and ſomewhat grayiſh underneath, among which riſe up hard and rough greene ſtalkes, two or three foote high with many the like but leſſer leaves on them, and many branches alſo, bearing at their toppes divers rough heads or burres, with crooked pointed prickles, apt to ſticke on any garment or other thing that toucheth it, out of the toppe of each of them come forth many hard purpliſh threds, which are the flowers, which after they are faded and paſt, turne to downe in the heads, and opening themſelves ſhed their grayiſh ſeede, like to the Knapweedes, which together with the winde is often carryed away, and often falleth downe on the ground, the roote groweth great and thicke, blacke on the outſide and whitiſh within, ſweete and pleaſant in taſte at the firſt, but ſomewhat bitter after. We have had from *Virginia*, and thoſe other Northerly parts, another ſort thereof, whoſe leaves are rounder and ſmaller, and the burre ſmaller, harder and with very ſharpe hard crooked points, ſtrongly ſticking to what it toucheth.

Alter Virginiana.

2. *Bardana major roſea.* The Roſe Burre.

This Burre differeth in little or nothing elſe from the former, but in the head, which inſtead of the prickely burres hath many ſmall greene leaves, ſet together like a ſmall Roſe Plantane, and but little prickly at their endes.

3. *Bardana major lanuginoſis capitulis.* The woolly headed Burre.

This alſo differeth little from the firſt but onely that the leaves grow not altogether ſo great, and the heads being ſmaller are woolly all over, and the prickles not ſo ſharpe or ſticking.

4. *Xanthium ſive Lappa minor.* The ſmall Burre.

This ſmall Burre riſeth up with a rough creſted ſtalke, about two foote high, with many blackiſh ſpots upon them, breaking out into ſundry branches, with two much ſmaller and whiter leaves at every joynt, ſtanding upon long footeſtalkes, divided into three parts uſually, ſomewhat like unto a Marſh Mallow leafe, unevenly dented about the edges: at the joynts of the ſtalke and branches with the leaves towards the toppes of them, come forth ſmall flowers, which abide not long, and after them two or three ſmall cloſe burres, a little pointed at the toppe, wherein lye two or three ſmall lancke ſeedes ſomewhat likē unto an Oate which fall not out, nor doe the heades open: the roote is ſmall ſomewhat long and fibrous, periſhing yearely.

The Place and *Time.*

Some of theſe grow not in our Country that I can learne, but neēre *Lipſwicke* in *Germany*, which is the Roſe Burre, the ordinary is plentifull enough with us by ditches and water ſides, and the high wayes likewiſe, every where

1. *Bardana major vulgaris.*
The Common Burre Docke.

4. *Xanthium sive Bardana minor.*
The lesser Burre.

where, but the two last are not so frequent, yet are found in sundry places, and the last in two or three places betweene *Tidenham*, and *Chepstow* in the foote way.

The Names.

It is called in Greeke ἄρκειον *Arcium* (and not *Arctium*, for that is *Arcturum* a plant with leaves like *Blattaria*, whereof I have entreated in the first Classis of this Worke and the 22. Chapter:) in Latine *Personata*, and *Lappa*, by many: it is called *Bardana* in shoppes. The first is called *Personata & Lappa major* by most writers. *Dodonæus* called it *Bardana sive Lappa major*, *Bauhinus Lappa major Arcium Dioscoridis*. *Tragus* putteth it *inter vitia herbarum*, as he and others doe *Lolium* and the like, *inter vitia frugum*, thinking belike that this is a degeneration from other good Herbes, by reason of the burres, as *Cardui* and *Tribuli* be also accounted as they thought, which is an errour intollerable for Christians to averre, who doe or may learne out of a truer Schoole then *Galen*, or the heathens could, that the sinne of man caused God to curse the earth, and to cause it to produce *Carduos* and *Tribulos*, as they are translated, as severall kindes of herbes, even as *Lolium* and the rest are, and each seede bringeth forth its owne kinde, according as God appointed it in the beginning, from the Creation or mans fall at the least. The second is remembered onely by *Bauhinus*, under the title of *Lappa major rosea*. The third is called by *Matthiolus*, *Personata sive Lappa major altera*, and thinketh it to be the *Persolata Plinij*, for he maketh mention both of *Persolata & Personata* in the same Booke and Chapter, and *Lobel* calleth it *Arctium montanum an Persolata Plinij*. *Bauhinus* calleth it *Lappa major montana capitulis tomentosis sive Arctium Dioscoridis*, as *Lobel* doth, whereby it seemeth they confound *Arcium*, and *Arctium* of *Dioscorides* together, which *Dodonæus* before his edition misliked in him or others: for although *Bauhinus* applyeth *Arcium* to the former, and *Arctium* to this later, yet these two being so like one to another, and the description of *Arcium* and *Arctium* in *Dioscorides*, so differing both in leafe, seede and roote, I doe wonder how he can make them to agree. The last is assuredly the *Xanthium* of *Dioscorides*, although *Tragus* was doubtfull so to call it, but rather *Lappa minor*, and is called *Phasganion*, and *Phrasganon* by *Galen*, but *Matthiolus* and all other Authors since, doe call it *Xanthium*, yet some *Strumaria*, and we generally call it *Lappa minor*, and *Bardana minor*. The *Italians* call the greater sort *Lappola maggiore*, and the lesser *minore*. And the *French Gressue Glouteron* or *Gleueron*, and *grande Bardane*, and *petit glouteron*. The *Germanes groß kletten* and *klein kletten*. The *Dutch groote clissen*, and *kleine clissen*. And we in *English* great Burre or Burre Docke, Clote Burre, and Ditch burre: and the lesser, the small Burre or Louse Burre.

The Vertues.

The Burre leaves are cooling, and drying moderately, and discussеth withall as *Galen* saith, whereby it is good to heale old Vlcers and sores: a dramme of the rootes taken with Pine kernels, doth helpe them that spit foule mattery and bloody flegme: The leaves applyed on the places troubled with the shrinking of the sinewes or arteries give much ease: the juyce of the leaves, or the rootes rather themselves, given to drinke with old wine

doth wonderfully helpe the bitings of any ſerpents, as alſo of a mad dogge, and if the roote be beaten with a little ſalt and laid on the place, it will ſuddenly eaſe the patient of the paine: the juyce of the leaves taken with hony provoketh urine, and remedieth the paines of the bladder: the ſeede being drunke with wine, forty dayes together doth wonderfully helpe the Sciatica: the leaves being bruiſed with the white of an egge, and laid on any place burnt with fire, doth take out the fire, giveth ſuddaine eaſe, and healeth it up afterwards. The decoction of them fomented on any fretting ſore or cancker, ſtayeth the torroding quality, which after muſt be annointed with an ointment made with the ſaid liquor *Axungia*, niter and vinegar boiled together. The rootes may be preſerved with Sugar and taken faſting, or at other times for the ſaid purpoſes, and for Conſumptions, as alſo for thoſe that are troubled with the ſtone or laske: the ſeede is much commended to breake the ſtone, and cauſe it to be expelled by Vrine, and is often uſed with other ſeedes and things for that purpoſe: The leſſer burre ſeedes as *Galen* ſaith have a digeſting quality in them, and are hot and dry, and thereby good to aſſwage tumours, the ſeede or the roote bruiſed and often impoſed on kernels or hard knots in the fleſh doth diſſolve them: the decoction alſo of the rootes made with wine, helpeth to conſume the hardneſſe of the ſpleene, being fomented warme on the place: the burres being gathered before they be ripe, bruiſed and laid to ſteepe in warme water or wine, and the haires moiſtened therewith, after they have beene rubbed with a little niter doth make them yellow.

CHAP. X.

Lapathum. The Docke.

THe Docke is of a large extent compriſing within it ſundry ſorts of herbes: ſome whereof are fit to be planted in Gardens, as being rare and worthy plants, and therefore worthy to have ſome care and paines beſtowed on them, which are entreated of in the ſecond Claſſis of this Worke: others belong to the Kitchin Garden, as fit for ſawce and meate, and ſuch are the Sorrels which are called ſowre Dockes, ſpoken of alſo before in the ſixth Claſſis of this Worke. and ſome are found in the fieldes and wet places where they grow, which ſhall be deſcribed in this place. Vnto theſe alſo I might adde all the ſorts of Spinage, if I had not ſet them forth in my former Booke, or were of *Bauhinus* minde, that they belonged to this family.

1. *Lapathum acutum majus.* The Red Docke.

The red Docke from a great and long blackiſh roote on the outſide, and ſomewhat reddiſh and yellowiſh within ſendeth forth many long hard and narrowiſh greene leaves, more pointed at the ends then in other ſorts, among which riſeth up a ſtiffe hard ſtalke, three or foure foote high, ſet with the like leaves, but ſmaller ſtill up to the top,

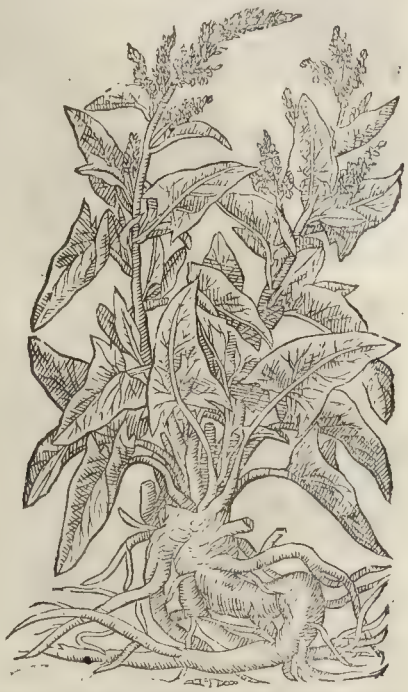
1. *Lapathum acutum majus.* The red Docke.

3. *Lapathum acutum minimum.* The ſmalleſt pointed Docke.

and

4. *Lapatium sylvestre vulgatius.*
The ordinary wilde Docke.

6. *Lapathum acetosum sive Bonus Henricus.*
Eng. Mercury.



7. *Hydrolapathum majus.*
The greater Water Docke.

8. *Hydrolapathum minus.*
The lesser Water Docke.

9. *Lapathum maritimum Fœtidum.*
The ſtrong ſented Sea Docke.

10. *Lapathum ſanguineum.*
Bloodwort.

and brancheth forth into ſundry ſprigges, bearing ſmall rēddiſh flowers, and browne triangular ſeede after them.

2. *Lapathum acutum minus.* The ſmall ſharpe pointed Docke.

The roote of this Docke is long and ſlender, parted diverſly with ſmall fibres thereat, and of a yellow colour on the inſide, the leaves are narrow and long waved in on the edges, as if they were crumpled, the ſtalke and flowers, with ſeede following, is like unto the former, but that they ſtand not on ſuch long ſprigges, but cloſer together, ſome at the joynts, or compaſſing the ſtalkes, and others at the toppes, and of a darker colour.

3. *Lapathum acutum minimum.* The ſmaller pointed Docke.

This ſmall Docke differeth little from the firſt, for forme and manner of growing, but in the greatneſſe, this being much ſmaller and lower, the roote is ſmall and more yellow.

4. *Lapathum ſylveſtre vulgatius.* The Common wild Docke.

The common Docke that groweth every where, differeth little from the Garden Docke or Patience, but that the leaves hereof are ſomewhat broader and rounder at the points, and the rootes more yellow, and of leſſe uſe then it.

5. *Hippolapathum rotundifolium Africum.* The round leafed Docke of *Africa*.

This round Docke is very like in the leaves unto the other round leafed Docke, mentioned in the ſecond Claſſis before, in this worke, but ſomewhat thicker, the ſtalke riſeth higher, the flower is greeniſh, and the roote is ſomewhat round like unto a Turneppe, but yellow both within and without, the whole plant and every part thereof is ſweetiſh without any other manifeſt taſte, and is therefore not cold as the other Dockes are, but hot in the firſt degree.

6. *Lapathum vulluoſum ſive bonus Henricus.* *Engliſh* Mercury.

I muſt needes put this herbe among the Dockes, according as the beſt Herbariſts doe, rather then with the wild *Arraches*, as ſome others have done, and ſhew you that it hath divers broad and long thicke fat darke greene leaves, upon long ſtalkes, pointed at the ends, and double pointed at the bottomes, ſomewhat like unto Sorrell, the ſtalkes are many, two foote high, full of leaves, and at the toppes many ſpikes of greeniſh flowers, and flat ſeedes after them, the roote is thicke great and long, and yellow like a Docke: the whole plant is often overſpread with a mealy duſt, like unto *Arrache*, which hath cauſed divers to referre it to them.

7. *Hydrolapathum majus.* The greater Water Docke.

This great Water Docke, groweth very like the common wilde Docke, but greater and higher, with larger and longer leaves, and not ſo round pointed, the rootes alſo are ſhorter, and fuller of fibres, and of a darke red colour.

8. *Hydrolapathum minus.* The leſſer water Docke.

The leſſer Water Docke hath leſſer leaves, long and narrow, and lower ſtalkes, fuller of branches, with flowers and ſeedes like unto the reſt of the Dockes, and ſo are the rootes likewiſe, but ſmaller and full of long ſtringes and fibres.

9. *Lapathum*

9. *Lapathum maritimum fœtidum.* The ſtrong ſented Sea Docke

Becauſe *Bauhinus* putteth this herbe among the Dockes not knowing belike whercunto elſe to referre it, even ſo muſt I untill I ſee more of it, and ſay with him that the ſtalke is reddiſh, a foote high and bending divers waies: the leaves that ſtand on long footeſtalkes are ſomewhat round, and of a darke red colour, ſometimes waved about the edges, and winged uſually at the bottomes, or with two ſmall peeces like eares: the ſtalke is parted into many branches, with the like but leſſer leaves on them, and a little dented about the edges: at the toppe of the ſtalke ſtandeth a ſpike of flowers, compoſed of foure moſſie leaves a peece, after which follow leafed round heads, containing the ſeede.

10. *Lapathum ſanguineum.* Bloodwort.

This Docke, becauſe it is often uſed as a pot-herbe, is planted in Gardens, yet found wild alſo, having reddiſh long leaves, or greeniſh with red ſtripes, the reſt of the plant comming neereſt unto the red Docke, but ſmaller as the roote is alſo, yet not ſo reddiſh. *Ceſalpinus* mentioneth another ſort hereof, with broader and rounder leaves. *Lapathum rubrum Cretenſe.*

The Place and Time.

All theſe Dockes except the fifth and the ninth, grow in moiſt and wet places on the Land, and thoſe other in the like places neer the Sea, that of *Africa* neere *Sophia*, and the other neere *Mompelier*: And beare ſeede in the end of *Auguſt* at the furtheſt, and ſome earlier.

The Names.

It is called in Greeke λάπαθον ἀπο τῦ λαπάζειν *quod valet exinanire, & pro ventrem levare uſurpatur*, the word λάπαξις is uſed by *Ariſtotle, lib. 2, Phyſic. ζῶον τὸ ἐδώδιμον τὴ λαπάξ & ἐνεργὲ ἰ, id eſt verbi gratia, ambulare, ſi eſt alvi levande gratia. Lapathum* alſo, and *Rumex* in Latine. The firſt is the *Oxylapathum* of *Dioſcorides*, and ſo called by *Fuchſius*, *Matthiolus*, and others, but it is not the *Oxalis*, for *Dioſcorides* doth diſtinguiſh betweene them, the one from the ſower juice, the other from the ſharpe leafe, for ὄξυς is referred both to the taſte and forme. *Cordus* on *Dioſcorides* calleth it *Rumex acutus*, *Tragus*, *Lobel*, and *Dodonæus*, *Lapathum acutum*. The ſecond is called by *Bauhinus*, *Lapathum acutum folio criſpo*, as *Tabermontanus* did, whoſe figure *Gerard* uſed and called it *Hydrolapathum minus*. The third is ſo called by *Lobel*, as it is in the title. The fourth is called *Rumex agreſtis* by *Cordus*, and *Lapathum folio minus acuto*, or *retuſo* by *Lobel*, *Hippolapathum ſylveſtre* by *Tabermontanus*, whoſe figure *Gerard* uſing, entituled it *Hydrolapathum magnum*. The fifth was brought us out of *Africa* by *Boel*, who for the likeneſſe of the leaves, and ſome other reſpects called it as it is in the title, which we have continued, not knowing where elſe to place it, untill we have further knowledge of it, then of the dryed plant which he brought. The ſixt is uſually called *Bonus Henricus* by *Matthiolus*, *Brunfelſius*, *Tragus* and others, *Rumex vnctuoſus* alſo by *Tragus*, and *Rumicis genus* by *Fuchſius*, *Tota bona* by *Dodonæus* and *Lobel*, and *Lapathi ſylveſtris ſecundum genus* by *Dalechampius*, and by *Bauhinus Lapathum vnctuoſum*, by *Geſner Atriplicis ſpecies*, and by *Lonicerus Atriplex Canina ſylveſtris*. The ſeventh *Tragus* calleth *Rumex paluſtris*, *Tabermontanus Lapathum paluſtre*, *Geſner*, *Matthiolus*, and *Dodonæus*, *Hippolapathum ſylveſtre*, *Lobel* and *Lugdunenſis Hydrolapathum magnum aquaticum* or *majus*. The eighth is called *Hydrolapathum minus* by *Lobel* and *Lugdunenſis*, and not *ſativum* as *Bauhinus* ſetteth it downe in his *Pinax*. The ninth is by *Bauhinus* his appellation ſo called as it is in the title. The laſt is called *Lapathum nigrum* by ſome, and *rubrum* or *rubens* by others, *Sanguis draconis herba* by *Geſner in hortis*, and *Lapathum ſanguineum* by *Lobel*. The *Arabians* call the Docke *Humadh*, and *Hamad*. The *Italians Rombice* and *Lapacio*. The *Spaniards Labaſa*, and *Paradella*. The *French Pareille*. The *Germanes Ampffer* for the generall word as *Sawr ampffer* for Sorrell. The *Dutch Patich* and *Peerdick*. And we generally Docke, and then adde the ſeverall denominations as ſower Docke or Sorrell, wilde Docke, Garden Docke, &c. The *Engliſh* Mercury is called by the *Germanes Gooter Henrick* and *Schmerdel*. The *Dutch* Garden *Henrick* and *Lammekens hore*. The *French Herbe de Charpentier*.

The Vertues.

All the ſorts of Dockes have a kind of cooling but not all alike drying quality, for the Sorrels are more cold then any of the reſt, and the Bloodwort more drying, but the ſeedes of moſt of them be drying and binding: ſome of them beſides the Sorrell were uſed to be eaten. *Theophraſtus* therefore put them *inter oleracea*, and for the moſt part the leaves were ſtewed or boyled, and ſo they did the more eaſily paſſe through the belly, without giving either any great or good nouriſhment, ſaving a moiſture to the body. The ſeede of moſt as I ſaid, either of the Garden or the fieldes, doth ſtay laskes and fluxes of all ſorts, and the ſubverſions or loathings of the ſtomacke through choller, and is as helpefull to thoſe that ſpit blood. The rootes likewiſe of the moſt of them except the *Rhaes* or Rubarbes, and the red Dock are drying and binding, conducing to the ſame effects aforeſaid, but all they have an opening quality in them, fit to looſen and make the body ſoluble, and are therfore of greater uſe then all the other parts beſides, opening the obſtructions of the blood, and cooling and cleanſing the blood, and helping thoſe that have the jaundice, and for that purpoſe are our *Engliſh*, and Munkes Rubarbe, the Garden and the wild red Dockes uſed with other things to make diet Ale or Beere: the ſeede being taken in wine helpeth the bitings of the Scorpion ſaith *Dioſcorides* and *Pliny*. The rootes boyled in vinegar, helpeth the itch, ſcabbes and other breakings out in the skinne, if they be bathed therewith, the diſtilled water of the herbe and rootes tendeth to the ſame effect, and beſides cleanſeth the skinne of freckles, morphewes, and all other ſpots and diſcolourings therein. The *Engliſh* Mercury as it is called, or good *Henry* the roote is drying and cleanſing, the herbe is mollifying and looſening, by reaſon of the fatneſſe or moiſt ſlipperineſſe therein taken inwardly, but applyed outwardly to woundes and ſores, it cleanſeth the foulneſſe and healeth and cloſeth them up afterwards wonderfully: The properties of the Rubarbes, and the Sorrels are ſeverally declared before in their proper places.

CHAP.

Chap. XI.

Raphanus paluſtris ſive aquaticus. Water Reddiſh.

THere are two ſorts of herbes entituled Water Reddiſhes, which I muſt therefore here ſet together, and ſhew you which they are.

1. *Rahpanus aquaticus.* Water Reddiſh.

The Water Reddiſh riſeth up in the water with ſlender weake and bending ſtalkes yeelding to and fro, whereon are ſet at every joynt a long and ſomewhat broad leafe, very deepely endented or cut in on the edges, unto the middle rib, at the toppe of the ſtalke commeth forth a ſmall tuft of yellowiſh flowers, made of foure leaves a peece, after which follow ſmall and almoſt round pods with round ſeede in them: the roote runneth in the mudde, ſhooting out fibres in ſundry places. I have thought good to give you both *Bauhinus* his figure hereof, which he ſaith is more exact then that of *Lobels*, and *Lobels* alſo but ſurely *Lobels* life, as both he and I have ſeene ſuch growing, it ſeemeth that *Bauhinus* his figure is of another ſort. being to the

2. *Raphanus aquaticus alter.* Another Water Reddiſh.

This other Water Raddiſh groweth more upright in that it ſeldome groweth in ponds of water, as the other doth, but in or neere watery ditches to be a yard high or better, with ſundry ſtalkes riſing from a long tough white roote, with divers ſtrings and fibres thereat, whereon are ſet many long leaves, much torne or cut in on both edges, at the toppe of the ſtalkes ſtand large tufts of whitiſh or purpliſh flowers, which turne into ſhort pods and ſeede in them, not ſo round as the former.

The Place and *Time.*

The firſt groweth never but in waters or brookes, or where ſtore of water is continually, the other as well in bottomes neere the waters as in ſmall watery ditches ſometimes and flower after Midſommer, the ſeed ripening above a moneth after.

The Names.

The firſt is called *Raphanus aquaticus* by *Tabermontanus* and *Gerard*, and *Bauhinus* addeth *in profundas lacinias diviſus*, (who taketh it may be the *Raphanus* of *Theophaſtus*, that is like to Rocket) and *paluſtris* by *Lugdunenſis*, *Lobel* calleth it *Raphanus ſylveſtris officinarum aquaticus*, and *Dodoneus Radicula ſylveſtris*. *Caſalpinus* called it *Siſymbrium ſylveſtre*. The other is the *Rapiſtrum aquaticum* of *Tabermontanus* and *Gerard*, which *Bauhinus* calleth

1. *Raphanus aquaticus Lobelij.*
Lobels Water Reddiſh.

1. *Raphanus aquaticus Bauhini.*
Water Reddiſh of *Bauhinus*.

Raphanus

Raphanus aquaticus alter, for finding it did better agree with the Reddiſh then with the Charlocke, he altered the title as I here declare it unto you:

The Vertues.

Neither of both theſe are properly uſed in Phyſicke that I know, yet they both taſte ſomewhat hot in the mouth, and the former Water Raddiſh more then the other, and therefore I thinke may be uſed in the ſtead of Horſe Raddiſh, to warme a cold ſtomacke, and to helpe both to provoke urine and to expell winde, for which purpoſe, the ſeede is more effectuall then the herbe, and the roote of more force then the ſeede.

2. *Raphanus paluſtris alter.* Another water Raddiſh.

CHAP. XII.

Vaccinium paluſtre. Marſh Whortes.

MArſh Whorts, hath ſundry ſlender browniſh branches like threds, ſcarſe a foote long, creeping upon the ground, and riſing from a long white roote, that groweth aſlope and not downeright, beſet with many ſmall leaves like thoſe of Time, at certaine diſtances, greene on the upper ſide, and hoary underneath oftentimes, the flowers riſe out from the toppes, ſet upon long threddy footeſtalkes, conſiſting of five reddiſh leaves, with an umbone in the middle, which turne into round reddiſh berries, ſpotted with fine ſmall ſpots and prickes, with ſome lancke ſeedes in them, the berries have a ſowriſh taſte, and the leaves are aſtringent.

The Place and *Time.*

It groweth in Mooriſh places, where it is often covered with moſſe, and flowreth in *July*, the berries being ripe in *Auguſt*.

Vaccinium paluſtre. Marſh Worts.

The Names.

☞ *Dodonæus* and *Lobel*, call this *Vaccinia paluſtria*. *Geſner in hortis*. *Roſa Alpina* calleth it *Acinnaria paluſtris*. *Cordus* in his hiſtory *Fol.* 140. *Oxycoccum*: but *Geſner* doubteth it to be another ſort from this, and *Bauhinus Vitis Idæa paluſtris*, ſaying it is the third *Vitis Idæa* of *Cluſius*, wherein he is much miſtaken, for he doth but onely name it there, and doth not ſay that it is the ſame, as any man that readeth the place may eaſily underſtand.

The Vertues.

Dodonæus ſaith it is good againſt hot agues, and quencheth the thirſt in them, and the heate of choller it ſtayeth vomitings, and reſtoreth a decayed ſtomacke, that hath loſt the appetite by corrupt humours, and doth reſiſt peſtilentiall diſeaſes.

CHAP.

Chap. XIII.

Marrubium aquaticum. Water Horehound.

Vnto the Water Horehounds I muſt adjoyne two or three other plants, neereſt thereunto both in face and place, which I reſerved out from the former Horehounds, to ſet here.

1. *Marrubium aquaticum vulgare.* Our ordinary Water Horehound.

This Water Horehound groweth ſomewhat great and high, with ſtrong ſquare ſtalkes, having two ſomewhat large and long leaves ſet at every joynt, ſomewhat deepely dented about the edges, not hairy or rough at all, but ſmooth and greene: at the joynts with the leaves towards the toppes, ſtand ſmall whitiſh flowers in rough greene huskes compaſſing the ſtalkes about: the ſeede that followeth is blackiſh and round, foure uſually ſet together in the huske: the roote is a tuft of blackiſh ſtrings.

2. *Marrubium aquaticum alterum.* Hairy Marſh Horehound.

This other Water or Marſh Horehound hath ſquare ſtalkes, but hairy and a little hoary and rough, whereon are ſet leaves by couples, as in the former, hairy hard and hoary, much more cut in on the edges, even to the middle ribbe, making them ſeeme like the leaves of the great Mountaine Scabious, the ends being pointed and ſharpe: the flowers are white and ſmall, ſtanding in rough ſharpe pointed huskes compaſſing the ſtalkes at the joynts, as the former doth.

3. *Marrubium nigrum fœtidum Ballote dictum.* Stinking blacke Horehound.

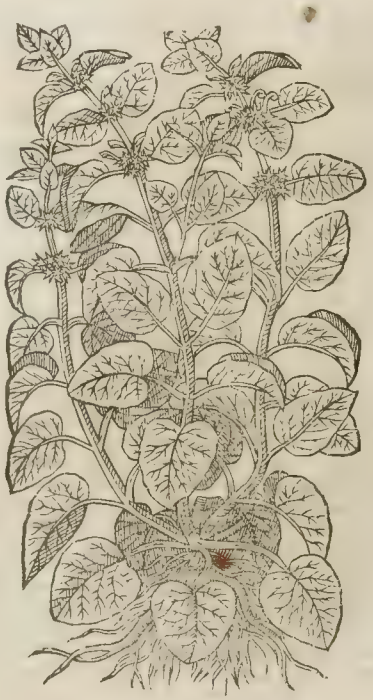
The ſtinking blacke Horehound hath divers ſquare blackiſh hairy greene ſtalkes riſing from the roote, whereon are ſet upon long footeſtalkes round darke greene leaves full of veines, a little hairy, and endented about the edges, ſmelling ſomewhat ſtrongly, two alwaies at a joynt: the flowers are gaping and of a purpliſh colour, ſomewhat like the red dead Nettle, in greeniſh huskes compaſſing the ſtalkes as the others doe, the ſeede likewiſe is blacke and round, and foure ſet together uſually alſo: the roote is blackiſh and threddy. I have found this with white *Flore Albo* flowers, in the way to *Rocheſter*, halfe a mile from *Graveſend*.

4. *Marrubium nigrum Creticum.* *Candy* blacke Horehound.

This blacke Horehound of *Candy*, hath the firſt leaves that riſe from a ſtringy roote, ſomewhat like unto that of a Primroſe, being many larger and longer then thoſe of the white Horehound, dented about the edges and ſharpe pointed, as big as thoſe of Balme, and of ſo blacke a colour as it may ſeeme to be ſo coloured or dyed by art, and ſo are both the ſquare ſtalkes, and the many like leaves but leſſer that grow together, at the ſeverall joynts of them, up to the toppes, where the flowers ſtand compaſſing them, being in forme like unto thoſe of Horehound, but blackiſh alſo, it is wholly without ſent or taſte.

1. *Marrubium aquaticum vulgare.*
Our ordinary Water Horehound.

3. *Marrubium nigrum fœtidum Ballote dictum.*
Stinking Horehound.



The

The Place and *Time.*

These doe all grow in moist and wet grounds: the first and third in our owne Country in sundry places. The second in *Austria*. And the last in *Candy*. They flower in the Sommer moneths, and give their seede soone after.

The Names.

The first is called *Marrubium aquaticum* by *Tragus*, *Dodonæus*, *Lobel*, and *Lugdunensis*, or *Marrubium palustre* by others, *Matthiolus* putteth it for the first *Sideritis* of *Dioscorides*, and so doe *Anguilara*, *Gesner in hortis*, *Lacuna*, *Camerarius*, *Thalius*, and *Lugdunensis*: but *Lonicerus* and *Lobel* put it for his second *Sideritis*, *Gesner* also calleth it *Lancea Christi*, and *Bauhinus Marrubium palustre glabrum*, as he doth the second *palustre hirsutum*. The third is called in Greeke by *Dioscorides* βαλλωτὸς, and μέλαν πεφιον, *Ballote*, and *Marrubium nigrum* in Latine, and so most writers doe call it, yet some call it *Marrubiastrum* or *Marrubium spurium* as *Lobel* doth, and *Bauhinus Marrubium nigrum fœtidum*, and *Ballote*. The last is so called by *Alpinus* as it is in the title, who saith that the seede was sent him from *Candy*, by the name of *Marrubium nigrum*.

The Vertues.

Galen saith that the blacke Horehound, for there is no use of the others in Physicke, that we know it is of a sharpe and cleansing quality, and being applyed with salt, doth heale the bitings of dogges, as *Dioscorides* before him did set it downe. The leaves heated under the ashes untill they grow yellow, and applyed to the hard swellings of the fundament that bleede, being like unto the Hemorrhoides, doe stay the bleeding, and ease the paines, and being used with hony they cleanse foule ulcers.

4. *Marrubium nigrum Creticum. Candy* blacke Horehound.

CHAP. XIV.

Stachys palustris. Marsh base Horehound.

THis hath square round and hairy stalkes, about two foote high, with two somewhat long and narrow darke greene leaves, and gray underneath, pointed at the ends, and dented about the edges, with round dents like Betony, set at every joynt, and somewhat a strong unsavoury sent at the upper joynts, with the leaves come forth sundry pale reddish flowers, set in rankes like unto Betony, the roote is somewhat long and thicke, joynted at severall spaces with fibres at them.

Stachys palustris.
Marsh base Horehound.

The Place and *Time.*

It groweth in the plashy places, of low grounds, in sundry Countries and flowreth in *July*.

The Names.

Camerarius calleth it *Stachys palustris Gesneri*, but *Gesner* himselfe in *Collatione Stirpium*, calleth it *Betonica fœtida*, and questioneth whether it should not be the *Herba Iudaica*: *Lugdunensis* saith it is *Clymenum minus*, *Dalechampij* and *Thalius* calleth it, *Sideritis prima gravis odoris*, *Cæsalpinus Terziola*, because it cureth a tertian ague, *Besler* in the great *hortus Eystetensis*, saith it was called with them *Lysimachia galericulata adulterina*, and *Gerard Marrubium aquaticum acutum*, yet it is not his *Pinax Coloni*, as some would thinke, which is not of so strong a sent as this, neither is the leafe of this so long, nor rootes so *Scrophulous*.

The Vertues.

It is a singular good wound herbe, serving both to heale greene wounds, and foule old Vlcers, the juyce taken in some drinke an houre before the fit of an ague, will lessen and alter the fit, and at two or three times taking, quite rid it away.

CHAP.

CHAP. XV.

Conyza paluſtris major. The greater Marſh or water Fleabane.

THe roote hereof is thicke and diverſly ſpread, ſending forth hollow and creſted ſtalkes three foote high with ſundry joynts and branches, bearing two long leaves at each joynt, which are dented about the edges, greene on the upper ſide, and gray or woolly underneath, at the toppes of the ſtalkes and branches ſtand many ſmall yellow flowers together, like unto thoſe of Ragwort, which when they are ripe the ſeede flyeth away with the winde.

Minor aquatica. There is another ſmaller and lower then this, growing in the like watery places, the leaves will be ſometimes much leſſe dented or jagged on the edges then in others, the flowers likewiſe ſtand not but one on a ſtalke for the moſt part and yellow.

Conyza paluſtris. Marſh Fleabane.

The Place and *Time.*

The place is declared by the titles and deſcription, and their time of flowring and ſeeding, is the end of Sommer.

The Names.

The former is the *Conyza aquatica* of *Geſner in hortis*, *Conyza maxima ſerrati folia* of *Thalius*: *Lingua major Dalechampij* of *Lugdunenſis*, called *Conſolida paluſtris* by *Tabermontanus*, and *Solidago Sarſaenica* by *Gerard*, according to his figure, but not deſcription. The other is called *Conyza aquatica* both by *Thalius* and *Bauhinus*, and that which hath more jagged leaves may be alſo the *Conyza Helenitis foliis laciniatis* of *Lobel.*

The Vertues.

This is as effectuall a wound herbe as any is uſed, and is alſo as availeable to all the purpoſes that the other *Conyza's* are applyed, whereunto I referre you for brevities ſake.

CHAP. XVI.

Oenanthe aquatica. Water Dropwort.

THere are two ſorts of this Water Dropwort, a greater and a leſſer, both which are exhibited by *Lobel* in his *Icones*, under one title as one would thinke, but diſtinguiſhed the one by *Oenanthe aquatica*, which is the leſſer, the other which is the greater, by *Oenanthe quarta Matthioli*, but confounded in his Obſervations, both titles being referred to one, which confuſion I would avoid, and ſhew you them both diſtinctly. The greater hath divers large ſpread leaves next the ground, and lying thereon cut into many diviſions, ſomewhat reſembling Parſley, but much ſmaller, among which riſe creſted thicke hollow ſtalkes, with leaves on them, cut into longer and finer diviſions, bearing white flowers at the toppe, which turne into cloſe umbels of ſmall flat grayiſh ſeede, ſomewhat leſſer then Fennell ſeede, the roote hath ſundry ſmall white knobs growing among the ſtrings.

2. *Oenanthe aquatica minor.* The leſſer Water Dropwort.

The leſſer hath very finely cut ſmall leaves lying on the ground, before the ſtalke beginneth to riſe, which then being carryed up with it ſcarſe ſeeme to be leaves but rather like the ribbes of leaves, of a darke and ſhining greene colour, as the ſtalke is alſo, which reſembleth a Ruſh very nearely, and below the toppe thereof, which is pointed like a Ruſh, (and not at the toppe as the figure expreſſeth it) breaketh forth a ſmall umbell of ſmall whitiſh ſweete flowers, which turne afterward into as ſmall ſeede as Smallage but blacker, the roote hath many ſmall kernels among the fibres, which are as ſmall as haires or finer.

3 *Oenanthe altera minor Africana.* The ſmall Water Dropwort of *Barbary.*

This other leſſer ſort being brought us by *Boel* from *Barbary* doth moſt neerly reſemble the laſt ſmall ſort in the fine

1. *Oenanthe aquatica major.*
The greater Water Dropwort.

2. *Oenanthe aquatica minor.*
The lesser water Dropwort.

fine leaves, but differeth in the toppe, which is at the toppe of the ſtalke, the tuft being larger and the ſeede bigger.

The Place and *Time.*

Both the former grow in wet grounds, neere brookes ſides with us in many places, yet will they both endure in Gardens, but are not there ſo great and large, as in their naturall places: the leſſer flowreth and ſeedeth earlier then the other, uſually the leſſer is paſt before the greater be in flower, which is not untill *Auguſt*. The laſt was gathered about *Sapphi* in *Barbary* by *Boel* aforeſaid.

The Names.

The greater is the *Oenanthe quarta* of *Matthiolus*, exhibited both by him and *Lobel*, ſeparately in the figure, which may bee plainely diſcerned, not to be all one with the other, and as my ſelfe have obſerved them in mine owne Garden, *Bauhinus* who as it ſhould ſeeme knew it not, was deceived by *Lobel* his confounding of the figures and titles. *Lugdunenſis* calleth it *Siſer paluſtre*, and *Tabermontanus* and *Gerard Filipendula aquatica*. The leſſer is referred by *Bauhinus* to both theſe ſorts to *quarta Matthioli*, and to *Oenanthe aquatica*, which is this of *Lobel*, although expreſſed in the figure without any kernells to the rootes, if it doe not repreſent another plant, which both *Dodonæus* and *Lonicerus*, referre to *Sium* or *Laver*, *Dodonæus* calleth it *Iuncus odoratus aquatilis*, I know not by what reaſon, but onely that the ſtalke is in colour and faſhion not much unlike a Ruſh, but nothing elſe is like it.

The Vertues.

They are both of them good to provoke urine when it is ſtopped, and to helpe the Strangury when the vrine paſſeth away by droppes.

3. *Oenanthe altera minor Africana.*
The ſmall water Dropwort of Barbary.

CHAP. XVII.

Limonium. Sea Marſh Bugloſſe.

WE have divers ſorts of this *Limonium* to ſhew you, ſome whereof have beene ſet forth by former Authours, and ſome by none other before now.

1. *Limonium majus vulgatius.* The greater ordinary Sea Marſh Bugloſſe.

This greater *Limonium* hath ſundry faire long thicke or fat greene leaves, riſing from the roote, ſomewhat like unto ſmall Beete leaves, from among which ſpring divers brittle naked ſtalkes, without leaves, neare halfe a yard high, branched at the toppes into ſundry parts, whereon ſtand many ſmall blewiſh purple flowers, all on one ſide for the moſt part, ſomewhat like unto Bugloſſe flowers, but ſmaller, after which come long reddiſh ſeede incloſed in the huskes, that the flowers ſtood in before: the roote is ſomewhat thicke and long like unto a ſmall red Beete roote.

2. *Limonium medium Anglicum.* The *Colcheſter* Marſh Bugloſſe.

This other ſort is like unto the former, but leſſer in leaves, and lower in ſtalkes, being little more then a foote high, the flowers are of the ſame colour with it, and almoſt as great, but the roote being reddiſh is much leſſe.

3. *Limonium Narbonenſe parvum.* The ſmall *French* Marſh Bugloſſe.

This ſmall *French* ſort, hath much ſmaller leaves then the laſt, being little bigger then Mirtle leaves, lying next to the ground, but thoſe on the ſtalkes, which are about a foote high, are very ſmall and fine like unto thoſe of Sampire, the flowers are ſmaller then the other, but elſe like unto them both for forme and colour.

4. *Limonium minus foliis cordatis.* The ſmall Marſh Bugloſſe of *Mompelier*.

This ſmall *Limonium* likewiſe differeth little from the laſt, but in growing lower, not above ſixe inches high at the moſt, having a tuft of ſmall thicke ſmooth, and ſomewhat round leaves next the ground, ſome of them being not pointed at all, and others having a dent at the end, making them ſeeme like the forme of a hart, as it is painted on the cardes, the ſtalkes are ſome higher and lower then others, bare or without leaves unto the toppes, where they ſpread into ſundry ſmall branches, bending a little backwardes, bearing a number of ſmall reddiſh flowers.

5. *Limonium minimum.* The ſmalleſt Sea Marſh Bugloſſe.

This leaſt *Limonium*, is ſcarſe foure inches high, having from a ſmall long reddiſh roote parted at the toppe into ſundry heads, a number of ſmall fat roundiſh leaves thicke ſet together, in forme and manner of a ſmall Houſeleeke, the flowers are few and ſmall that grow on the ſmall ſtalke, of a faint reddiſh blew colour.

6. *Limonium Africum,* Sea marſh Bugloſſe of *Africa*.

Of this ſort there are two or three differences, one low, ſcarſe an handbredth high, whoſe ſtalke is winged, like

1. *Limonium majus vulgatius.*
The greater ordinary Sea Marſh Bugloſſe.

3. *Limonium Narbonenſe parvum.*
The ſmall *French* Marſh Bugloſſe.

unto

6. *Limonium Africanum elatius & humile.*
Sea Marſh Bugloſſe of *Africa* both the higher and lower.

Limonium peregrinum Rauwolfij.
Sea Marſh Bugloſſe of *Syria* or *Spaine*

unto that of *Rauwolfius*, having leaves on one part and bare at another, which leaves are not long, or indented like it, but ſomewhat round and a little waved as it were on the edges. Another ſort groweth halfe a yard high, with the like winged ſtalkes, full of branches which are hard rough and woody, and the like leaves on them, as this other leſſer ſort hath, the flowers of both ſorts are of a pale blew colour like unto that of *Rauwolfius*. Both theſe ſorts we had from *Boel*, as formerly mentioned, taken from the ſight of the dryed herbes: but we received from him at *Leſbbone*, the ſeedes of two other ſorts which were intituled *Lychnitis Conyzæ folio*, and *Limonium Ferulæ folio*, but becauſe neither of them ſprung with us, we can as yet ſay no more of them.

7. *Limonio congener Cluſij.*
The hollow leafed ſtrange plant of *Cluſius*.

This ſtrange plant hath ſuch ſtrange leaves, as the like are ſeldome ſeene in any other that we know growing, for they are nine or ten or more, riſing from the head of a ſmall long roote, each by it ſelfe, being ſmall below, and growing greater upward, with a belly as it were bunching forth, and a bowing backe, hollow at the upper end, with a peece thereon like a flappe, and like unto the flower of *Ariſtolochia*, or Birthwort, and round at the mouth like a halfe circle, full of great darke purpliſh veines on the inſide: the whole leafe is of a thicke ſubſtance almoſt like unto leather; among theſe leaves ſprang a ſtalke but was broken ſhort of, ſo that what flower or ſeed it bore could not be obſerved. This was ſent to *Cluſius* from *Paris*, by one that received it from *Liſbbone* in the ſame manner. But of late Maſter *John Tradeſcant* the younger, found this very plant in *Virginia*, having his toppe thereon, which he brought home, and groweth with him, which I here ſhew you with *Cluſius* his figure: The leaves are longer narrower and not bellying out, and the flower is borne at the top of the roundiſh ſeede veſſell.

7. *Limonio congener Cluſij.*
The hollow leafed ſtrange plant.

Limonium Lychnitis conyzæ folio & Limonium Ferulæ folio.

The Place and Time.

All theſe ſorts grow in the wet fieldes neere the Sea, ſome in our owne land, as the firſt and ſecond, the other three next them in *France* about *Mompelier*, and *Marſelles*, and *Ligorne* alſo, the ſixt *African* kinde, and the other ſorts thereof, were brought us by *Boel* often before remembred, from that part of *Africa* that the *Spaniards* doe

hold about *Sophia*, and those parts, but the other two sorts there mentioned, hee gathered in *Portugall*. The last came assured from the *West* Indies, for so it was signified by him that sent it, but as I have shewed you in *Virginia* also. The rest flower in the end of Summer, and their seede ripeneth not long after.

The Names.

It is taken to be the λειμώνιον ἢ νευροειδὲς of *Dioscorides*, in Greeke so called because it groweth ἐν λειμῶσι, *in pratis riguis vel palustribus*, and *Limonium* also in Latine. The first is most frequent as well beyond Sea, as on our owne coasts, and these rootes being dryed were sold in former times by counterfetters, for *Benrubrum* to the Apothecaries, as *Guilandinus* and *Gesner in hortis* say, *Dodonæus* calleth it *Valerianæ rubræ similis*, all other Authors call it *Limonium*. The second is of our owne Land found out by Doctor *Lobel*, in the fieldes neere the Sea by *Colchester*, and as *Clusius* saith, may be the same he found about *Valentia* in *Spaine*. The third is the *Limonium parvum Narbonense* of *Lobel. Camerarius*, and *Lugdunensis*. The fourth and fifth, are set forth by *Bauhinus* onely in his *Pinax* and *Prodromus*. The sixth of both sorts were never published before by any. The last is as is before said, remembred by *Clusius* in his History of Plants, and I have here amplified it: but it seemeth to mee that *Lobels Thuris Limpidi folium* is this, The *Limonium peregrinum Rauwolfij*, I have shewed you in my former Booke, yet I thinke good to give you the figure thereof here with the rest. *Pliny* referreth the *Limonium* unto the Beetes and calleth it a wilde Beete, but *Galen* saith there is no wild sort of the Beete. *Gerard* called it in *English* Sea Lavender, but without any other good ground, then that the colour of the flowers is somewhat neere those of Lavender. I have therefore as you see altered the title unto a more proper name as I take it, being in forme and colour most like unto Bugloss.

The Vertues.

The seede of *Limonium* as *Dioscorides* and *Galen* say, is astringent, and so is this *Limonium*, and stayeth the fluxe of the belly, and the stomacke, the spitting of blood likewise, and the abundance of womens courses, the leaves are astringent also, and are good for burning by fire: the water wherein the rootes have beene boyled, doth take away the spots in garments, as also in parchment.

CHAP. XVIII.

Anagallis aquatica. Water Pimpernell.

THere are divers sorts of this Water Pimpernell to shew you here, for of the Land sorts I have entreated in the fifth Classis of this Worke.

1. *Anagallis aquatica sive Becabunga.* Brookelime.

Brookelime sendeth forth from a creeping roote that shooteth forth fibres at every joynt, as it run-

1. *Anagallis aquatica vulgaris sive Becabunga.*
Brookelime.

neth

neth divers and ſundry greene ſtalkes, round and ſappy with ſome branches on them, ſomewhat broad, round, deepe greene and thicke leaves ſet by couples thereon, from the boſome whereof ſhoote forth long footeſtalkes with ſundry ſmall blew flowers on them, like in forme unto the land Pimpernels, that conſiſt of five ſmall round pointed leaves a peece.

2. *Anagallis aquatica ſive Becabunga major.* The greater Brookelime.

This differeth in nothing from the former, but in having larger and rounder leaves, and in the flowers which are of a paler blew colour.

3. *Anagallis aquatica folio oblongo crenato.* Great Water Pimpernell.

There is likewiſe little other difference in this ſort from the former, but in the leafe which is longer pointed, and dented about the edges, and in the flowers, which are of a pale whitiſh blew colour. There is one alſo of this *Minor.* ſort leſſer then it, wherein conſiſteth the difference.

4. *Anagallis aquatica foliis pulegij.* Small round leafed Water Pimpernell.

The leaves of this Water Pimpernell are ſmall and round, like almoſt unto Pennyroyall, two alwayes at a joynt, upon the ſtalkes, which are foure ſquare, and beare blew flowers like the land Pimpernell: the white rootes creepe in the ground like the former.

5. *Anagallis aquatica tertia Lobelij folio ſubrotundo non crenato. Lobels* third Water Pimpernell.

The roote of this Water Pimpernell runneth not, but is a ſmall buſh of white fibres, from whence ſpring many ſmooth pale greene leaves, ſmall at the bottomes, and broad and round at the ends, the ſtalke is round, about a foote more or leſſe high, with divers ſmaller leaves thereon, ſet one by one up to the toppe, where breake forth many branched ſpikes of white flowers.

6. *Anagallis aquatica anguſtifolia ſive quarta Lobelij.* Long Chickweed leafed Water Pimpernell.

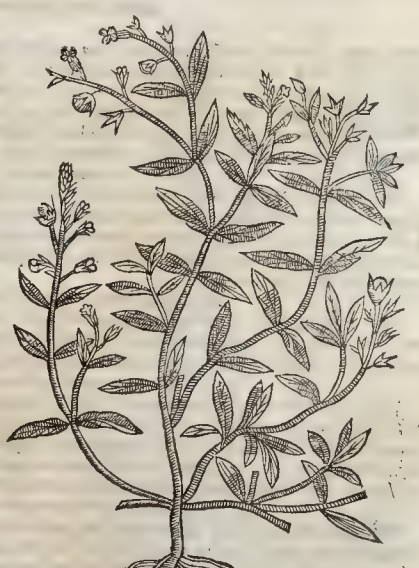
This ſmall Water Pimpernell riſeth not above halfe a foote high, with divers branches ſpreading from the weake ſquare ſtalke, having two ſmall leaves at a joynt ſomewhat like unto the greater Chickweede, but ſomewhat longer: the flowers are white, made of foure leaves a peece, ſtanding on long footeſtalkes like the firſt ſorts, and ſmall ſeede in round heads after them.

7. *Anagallis aquatica anguſtifolia ſcutellata.* Narrow leafed Water Pimpernell.

The roote of this Water Pimpernell is reddiſh, fibrous, and creeping, the ſtalkes are ſmooth ſtraked, joynted, and a cubit high, having two very narrow and long leaves at every joynt, pointed at the ends without any ſtalke unto them: at every joynt almoſt with the leaves come forth ſmall upright branches, winding themſelves one within another, as if they had claſpers, from whence ſpring ſmaller footeſtalkes on both ſides, which ſuſtaine ſmall whitiſh purple flowers like unto Chickeweede, conſiſting of three leaves a peece, after which ſucceede ſmall flat double pods like a ſhield, that is, two ſet together with a thred betweene them, on both ſides whereof lie the ſeede.

5. *Anagallis aquatica tertia Lobelij, folio ſubrotundo non crenato.* *Lobel* his third Water Pimpernell.

6. *Anagallis aquatica anguſtifolia ſive quarta Lobelij.* Long Chickweed leafed Water Pimpernell.



The Place and *Time*.

All these grow in small standing waters, the three first, and the fifth often found in our owne Land, the fourth and the last in *Germany*, The sixth by *Antwerpe*. And flower in *June* and *July* most usually, giving seede the next moneth after.

The Names.

It is called in Greeke ἀναγαλλὶς ὑδρόφυτος, in Latine *Anagallis aquatica*. The first is commonly called *Becabunga*, from the *Germane* word *Bachpunghen*, as is usuall with them to frame Latine words from their owne appellations. *Anguillara*, *Brunfelsius*, *Ericius Cordus*, *Fuchsius*, and others, tooke it to be *Sium* of *Dioscorides*, but very erroniously, and thereupon *Tragus* and *Gesner*, call it *Sium non odoratum*, *Turner*, *Dodonæus*, and *Lugdunensis* take it to be his *Cepæa*, but generally now adaies called *Anagallis aquatica*, and so *Lobel*, *Dodonæus*, and others doe, yet *Tabermontanus* and *Bauhinus* call it *minor*, because he calleth the next *major*, and *Thalius folio maximo*. The third is called *Berula major* by *Tabermontanus*, and by *Bauhinus Anagallis aquatica major folio oblongo*, as he doth the lesser of this kinde *minor*. The fourth is called by *Tragus Sium alterum*, and *Anagallis aquatica*, and by *Bauhinus Anagallis aquatica foliis pulegij*. The fifth and sixth is called ay *Lobel Anagallis tertia & quarta*, *Guilandinus* did diversly thinke of the fifth, taking it one while to be *Alisma* of *Dioscorides*, and another while to be *Cochlearia*, but neither truely. Some also tooke it to be *Samolus* of *Pliny*, *lib.* 25. *c.* 11. and *Bauhinus* calleth it *Anagallis aquatica folio rotundo non crenato*, but some of the others before have rounder leaves. The last is called by him as it is in the title. The *Italians* call it *Gorgestrello*. The *French Birle*, from whence rose *Berula*, yet *Marcellus* saith that *Berula* is the Greekes καρδάμο, Cresses. The *Germanes* as is said *Bachpunghen*, and *Wasserpungen*, or *bungen* as *Tragus* hath it. The *Dutch Water punghen* and *Beekpunghen*. And we in *English* Brookelime usually for the first, and Water Pimpernell for the rest following.

The Vertues.

Tragus saith that Brookelime and Water Pimpernall, are both of a moist faculty, yet others say dry, being no lesse heating then Water Cresses, and are used both in meate and medicine, as Water Cresses are, yet weaker: Brookelime and Water Cresses are generally used together, much in diet Beeres and Ales, with other things serving to purge and cleanse the blood and body from those peccant humours, that would overthrow the health thereof, and the Scurvy also, for which they are very helpefull: they also helpe to breake the stone, and passe it away by urine, which it provoketh also being stopped, it helpeth likewise to procure womens courses, and to expell the dead birth, being fryed with butter and vinegar, and applyed warme, it helpeth all manner of tumours, and swellings and Saint *Anthonyes* fire also, if it be often renewed. Farryers doe much use it about their horses, to take away swellings, to heale the scab, and other the like diseases in them.

CHAP. XIX.

Nasturtium aquaticum. Water Cresses.

I Doe distinguish betweene *Sium* and *Nasturtium aquaticum*, as *Bauhinus* and *Gesner in hortis* doe, holding them to be differing kindes of plants and not *species ejusdem generis*, and therefore entreate of them in severall places, as I also must doe in severall Chapters, and speake of those sorts, that for their likenesse unto *Cardamon*, Cresses may be called κάρδαμον ἐνυδρον, *Cardamon enudron Nasturtium aquaticum*: for of the *Cardamines*, which are Field Cresses, I have entreated in the seventh Classis of this Worke, one of whose figures I give you here to shew their difference.

1. *Nasturtium aquaticum vulgare*. Common Water Cresses.

Our ordinary Water Cresses spreadeth forth with many weake hollow sappy stalkes, shooting out fibres at the joynts and upward long winged leaves, made of sundry broad sappy and almost round leaves, of a browmish greene colour, the flowers are many and white, standing on long footestalkes, after which come small yellow seed contained in small long pods like hornes, the whole plant abideth greene in the Winter, and tasteth somewhat hot and sharpe like Cresses.

2. *Nasturtium aquaticum Italicum*. *Italian* water Cresses.

This differeth little from the former, but in that the stalke is crested, the leaves are cut in a little here and there on the edges, and dented, somewhat resembling Parsley leaves, and in the taste of both herbe and seede, more mild and pleasant, the roote likewise creepeth not as the others.

3. *Nasturtium aquaticum amarum*. Bitter Water Cresses.

This sort groweth greater then the first, with longer and more pointed leaves, when it runneth up to stalke, but the first leaves are very large and round, little differing else from the forme, but is so extreame bitter in taste, that none can away with it to eate it, unlesse it be boyled in water, and shifted againe into other fresh boyling water, to take away the bitternesse, and so some doe eate it: this is often found growing in *Germanie* as *Thalius* saith, with the former, and knowne asunder by the greatnesse.

4. *Nasturtium aquaticum minus*. Sweete smelling Water Cresses.

This small Water Cresse hath a small long white roote, with some fibres thereat, from whence spring sundry winged leaves made of many much smaller then the former, and somewhat long with the smallnesse, smelling reasonable well: the stalkes have divers white flowers upon them like unto the *Cardamine*, but smaller by much: the seedes are like in such slender pods and of the same taste.

The Place and *Time*.

All these grow in the small standing waters for the most part, yet sometimes in small rivulets of running water: they flower and seede in the beginning of Summer.

The Names.

The first is generally taken to be the *Sisymbrium alterum* of *Dioscorides*, which as he saith, some called *Sium*, and others *Cardamine*, being so like in taste thereunto, *Matthiolus*, *Cæsalpinus*, and *Tabermontanus* call it, *Sisymbrium aquaticum*.

1. *Naſturtium aquaticum vulgare.*
Common Water Creſſes.

2. *Naſturtium aquaticum Italicum.*
Italian water Creſſes.

3. *Naſturtium aquaticum amarum.*
Bitter water Creſſes.

cardamine. Ladies Smockes.

aquaticum, Cordus, Gesner and *Thalius Sisymbrium alterum, Fuchsius* and *Lugdunensis Sisymbrium Cardamine: Dodonæus* called it *Sium* and *Laver, Ericius Cordus Cresso Laver odoratum,* and *Lobel Sion Cratevæ Erucæfolium: Anguillara* tooke it to be *Vella Galeni,* and *Tragus, Lonicerus, Dodonæus* and *Bauhinus* call it *Nasturtium aquaticum,* the second *Matthiolus* calleth *Sium vulgare,* which the *Italians* as he saith, call *Crescione. Lobel* and *Lugdunensis* call it *Sium Matthioli & Italorum,* and *Bauhinus Nasturtium aquaticum erectum folio longiore.* The third *Thalius* remembreth in his *Harcynia sylva,* by the name of *Sisymbrij alterius Species secunda,* and *Bauhinus Nasturtium aquaticum majus & amarum.* The last is called by *Camerarius* in his Epitome of *Matthiolus, Sisymbrium aquaticum alterum vel minus,* and by *Lugdunensis Cardamine quarta Dalechampij.* The *Italians* as is beforesaid call it *Crescione,* the *French Cresson deaue,* the *Germanes Brunkressen,* the *Dutch Waterkresse,* and we in *English* Water Cresses.

The Vertues.

The Water Cresses are hotter in taste then Brookelime, and more powerfull against the Scurvy, and to clense the blood and humours, and for all the other uses whereunto Brookelime is before said to be availeable, as to break the stone, to provoke urine and womens courses: the decoction thereof is said to be good to wash foule and filthy Vlcers, thereby to clense them and make them the fitter to heale: The leaves or the juice is good to be applyed to the face or other parts troubled with freckles, pimples, spots or the like at night, and taken away or washed away in the morning, the juice mixed with vinegar, and the forepart of the head bathed therewith is very good for those that are dull and drowsie, or have the Lethargy.

Chap. XX.

Sium sive Pastinaca aquatica. Water Parsnep.

Diuers Writers have made divers sorts of herbes to suite with the *Sium* of *Dioscorides,* some whereof I have shewed you in the Chapter before, the other that are held by the most judicious to be the trueſt and neereſt thereunto shall follow in this.

1. *Sium Dioscoridis sive Pastinaca aquatica major.* The greater Water Parsnep.

This greater sort riseth up with great hollow and cresled stalkes, two or three cubits high, parted into divers branches, whereon stand long wings of leaves made of many long and somewhat broad leaves pointed at the endes and dented about the edges, smooth thicke and sappy, every one whereof is as large as of a Parsnep, the flowers are white and stand in tufts or umbels, after which follow the seede which smelleth well, and is bigger and rounder then Anneseede, the roote is blacke with many fibres at the joints thereof, and of the stalke under the Water neere the ground, the whole herbe is somewhat of a strong sweete sent.

2. *Sium minus sive Pastinaca aquatica minor.* The lesser Water Parsnep.

The lesser sort is very like the former, but lower and lesser, the leaves being long and narrow, and dented also

1. *Sium Dioscoridis sive Pastinaca aquatica major.*
The greater water Parsneppe.

2. *Sium minus sive Pastinaca aquatica minor.*
The lesser water Parsneppe.

about

2. *Sium minus alterum.*
Another ſmall water Parſneppe.

3. *Sium majus alterum anguſtifolium.*
Another water Parſneppe with narrow leaues.

about the edges, the flowers are white and the ſeede ſmall like the former, the roote likewiſe is very fibrous, and both it and the leaues ſmelling ſtrong like *Petroleum*. There is another of this ſort leſſer then it, whoſe white flowers ſtand in rounder tufts then the others.

3. *Sium majus alterum anguſtifolium.*
Another Water Parſnep with narrow leaues.

The ſtalkes of this Water Parſnep are hollow like Hemlocke, a cubit or more high, whereon are ſet ſundry winged leaues like the former, but diuided into ſmaller leaues, and cloſer ſet together, each of them being dented about the edges, the flowers at the toppes of the branches, are of a pale yellowiſh greene colour, which turne into ſmall ſeede like unto Parſley, but taſting like Cummin or Candy Daukeſeede, and the Citron rinde, or rather ſomewhat hotter then they all, the roote conſiſteth of a number of ſlender writhed browne fibres, wrapped among themſelues, and faſtened ſtrongly in the mudde.

4. *Sium minimum Noli me tangere dictum ſiue Impatiens Naſturtij ſylueſtris folio.*
The Quicke or Impatient Creſſe.

This ſmall plant ſpreadeth at the firſt upon the ground many ſmall winged leaues not much above an inch long, which ſo abide from Autumne that it ſpringeth up all the Winter, and in the Spring growing ſomewhat bigger, hath the leaues a little endented about the edges, the end leafe for the moſt part being the biggeſt, and then riſing up with a ſlender ſtalke, hath ſundry branches from the middle thereof to the toppe, at whoſe ends grow many very ſmall white flowers with ſlender long pointed cods after them, and ſmall yellowiſh ſeede within them, when they are ripe, but ſo hard to be gathered, and impatient to bee touched, that the pod breaketh it ſelfe upon the leaſt touch of hand or any thing elſe, and the ſeed flyeth out preſently, it hath little or no taſte of heate in it. Mr. *George Bowles*. A Gentleman of excellent knowledge in Herbariſme, gaue me the ſeedes of another ſort hereof, as he ſaith, which he had from another skillfull Gentleman a friend of his, but becauſe I haue not yet ſeene the face thereof, I can paſſe no further verdict thereon.

4. *Sium minimum Noli me tangere, dictum ſiue, Impatiens Naſturtij ſylueſtris folio.*
The Quicke or Impatient Creſſe.

Alterum minus.

The

The Place and *Time.*

The first as it is thought groweth not with us unlesse the greatnesse make the difference, but in *Germany*. For the second which is very like it groweth in *Kent* in divers pooles, and watery ditches. The third neere *Antwerpe* as *Lobel* saith but hath beene found in our Land also. The last likewise in our owne Land. They all doe flower in the end of Summer, and seede before the end of *August*.

The Names.

It is called *σιον* in Greeke, so called *ἀπο τοῦ σείειν, a concutiendo quia quatitur vacillandoq́, perpetuo succutitur preter labentibus undis atq́, semper alluentibus, unde etiam lavers nomen latinis, nisi quis malit ab vrinis calculisq́, ciendis & excutiendis dictum*: it is also called *Sium* in Latine, and *Lavers* The first is called by *Tabermontanus*, *Gerard*, and *Bauhinus*, *Sium majus* and *Latifolium*: the second is the *Sium verum Dioscoridis* of *Matthiolus Thalius* and *Lugdunensis* and is the same tha Master *Johnson* in his *Gerard* called *Sium majus angustifolium*. It is the *Sium odoratum* of *Thalius*, and *Gesner in hortis: Fuchsius* called it *Sij primum genus quod & Laver*, and setteth the figure of *Apium palustre* (following his country name of *Wasser Eppich*, which is the same) to it, thinking they did agree, but was mistaken. *Anguillara* called it *Silaum Plinij*, *Cordus* and *Dodonæus*, *Sium & Laver*, and so doth *Lobel*, and addeth *Olusatri folio sive aquatica Pastinaca*, The smaller of this sort *Camerarius* calleth *Sium verum* in his Epitome. The third is called by *Lobel Sium alterum Olusatri facie*: but *Lugdunensis* and *Bauhinus*, *Sium erucæ folio*, *Tabermontanus* calleth this *Sium majus angustifolium*, and not the former as Master *Johnson* doth. The last was first remembred by *Prosper Alpinus*, in his Booke *de plantis exoticis*, by the name of *Sium minimum*, but with us as it is in the title. The *Arabians* call it *Rocathalms* and *Inhameh anella*, or *Hamehanella*. The *Italians* as *Cesalpinus* saith, call the *Sium Crescione*, and *Matthiolus* saith, they call it *Sio*, and *Gorgoleßro*. The *Spaniards Rabacas*, as some say, and *Berros* or *Agriris* as others say. *Tragus* saith the *Germanes* call it *Brunen peterlin*, And we as neerer to the likenesse as I thinke, Water Parsneppe.

The Vertues.

Tragus and others, from their Countries erronious appellations of this plant, tooke it to be the *Eliosselinon Dioscoridis*, or *Apium palustre*, and therefore attribute all the properties thereof unto this plant, neither have they or any other of our Moderine Writers left in record, any other particular knowne quality in it, more then *Dioscorides* and *Galen* have left us of it, which say it is of so much more heating faculty, as it is Iweete in taste, it also digesteth and provoketh urine and womens courses, and breaketh and expelleth both the stone in the kidneies, and the dead birth.

CHAP. XXI.

Eruca aquatica. Water Rocket.

Eruca aquatica. Water Rocket.

THis little herbe which is somewhat like the former Impatient Cresse, lyeth or rather creepeth on the ground, with long branches of small winged leaves, somewhat like thereto, but not so much dented on the edges, having but two or three dents for the most part, and yellowish flowers at their toppes, and slender pods following them.

The Place and *Time.*

It groweth oftentimes neere ditches and water courses, and often also further from them.

The Names.

It hath no other name then is in the title, for any thing I know, not finding it mentioned by any other Authour.

The Vertues.

Wee have not heard or found for what griefe this is conducible.

CHAP.

CHAP. XXII.

Mentha aquatica. Water Mintes.

HAving shewed you all the sorts of sweete Mintes, that grow in the dryer or Vpland grounds, there remaine yet two other sorts, that grow in Marshes, and wet places, which shall bee shewed here.

1. *Mentha aquatica rubra.* The Red Water Mint.

This Water Mint riseth up from a creeping roote, running or spreading in the Muddy or watery places, with many browniſh square stalkes, branched almost from every joynt, with a couple of somewhat broad, yet pointed and dented leaves, many times browniſh or reddish, and of a strong sent: the small flowers that are purpliſh, stand at the toppes of the stalkes and branches, in loose round tufts one above another.

1. *Mentha aquatica rubra.* Red Water Mintes.

2. *Mentha aquatica sive palustris minor.* The leſſer Water Mint.

This other Water Mint shooteth forth a square reddish hairy stalke, and sometime a little hoary, about a foote high, whereabouts are set soft hairy round and somewhat long leaves two alwaies at a joynt, dented about the edges, of a darke greene colour on the upperside, and grayish or hoary underneath: from the joynts with the leaves come forth long branched stalkes with purpliſh flowers at the toppes of them, standing in round heads: the whole herbe is of a strong sent.

The Place and *Time.*

They both grow by ditches and water sides, in the plashy grounds, where they joy best, and flower late in the Summer.

The Names.

The Greeke name Σισύμβριον, which *Dioscorides* mentioneth, and many doe call this by, doth more properly belong to the wild Minte *Mentastrum*, then unto this however *Lobel* and others call it *Sisymbria Mentha*, for *Dioscorides* hath but one *Sisymbrium*, that is sweete and like Mintes, and that he saith groweth in waste grounds, the other *Sisymbrium* called *Sinm*, and *Cardamine*, and like *Nasturtium*, as he saith groweth in watery places as I have shewed before, so that as I said his *Sisymbria Mentha*, is no watery or Marsh plant: it hath beene and yet is beyond Sea called by some Apothecaries, *Balsamina*, as *Tragus* saith and by others *Balsamita* as *Besler in horto Eystetensi* saith, Our first sort here set downe, is that which *Lobel* calleth *Aquatica Sisymbria Mentha*, and *Gesner in hortis Sisymbrium agreste aquaticum*, and *Calamentha aquatica*, *Matthiolus* and *Lugdunensis Sisymbrium sylvestre*, and *Sisymbrium* by many others. The other *Bauhinus* onely remembreth by the name of *Mentha rotundifolia palustris minor.*

The Vertues.

There is little set downe concerning these Water Mints, of any other speciall properties, they hold from the other Mints being seldome used, because there are so many of the other sorts of Mints to be had almost at hand every where, yet their strong sweete sents and quicke tastes, doe argue them to be effectuall for many of the purposes whereunto the other Mints doe serve, especially to kill the wormes, to warme and strengthen the stomacke, to expell winde and helpe those that are spleneticke.

CHAP. XXIII.

Dracunculus aquaticus. Water Dragons.

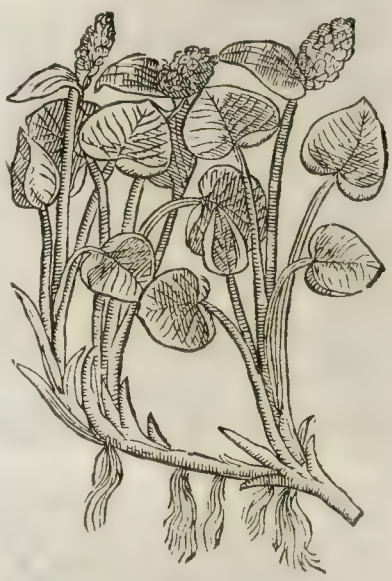
BEsides that Water Dragons that many Authours have written of, *Bauhinus* hath given us the knowledge of another from *Brassil*, which for the likenesse he referreth unto the greater Dragons, but I have thought good to make mention of it in this place.

1. *Dracunculus noster aquaticus.* Our Water Dragons.

This hath a creeping roote full of joynts and fibres at every one shooting forth sundry long sheathes or skins, and with them smooth long hollow stalkes five or sixe inches high, with broad round leaves set on them pointed at the ends, bigger then Ivy leaves by much, and of a shinining greene colour, from among them also rise diverse other smooth hollow stalkes of the same height with the leaves or not much higher, bearing at the toppe of every one, a small long head encompassed with many short white threds, which are as the flowers, and with the head such a like leafe as the rest are, but lesse and white on the inside, enclosing the head before it breake open, which

which when it goweth toward ripeneſſe, becommeth cluſter faſhion like the ſeede head of *Arum* Wake Robin, greene at the firſt and red when it is ripe, containing divers huskes, with ſmall and long browniſh ſeede therein: the taſte of the leaves and ſtalkes, are very ſharpe, hot, and burning the throate: like *Arum* or Wake Robin, but is not ſo felt at the firſt chawing.

1. *Dracunculus noſter aquaticus.* Our Water Dragons.



2. *Dracunculus ſive Serpentaria Braſiliana triphylla:* The three leafed Dragons of *Braſill.*

The ſtalk only of this Dragons with the leafe and flower on it, as *Bauhinus* ſaith was brought unto him, and therefore we can deſcribe unto you no more, then that from a ſtalke that is reddiſh and creſted, riſeth the ſtalke of the leafe which is of an handbredth long, and ſmooth, at the top wherof groweth a thin leafe of a whitiſh green colour, full of veines, and ſomewhat round, divided into three parts, ending in a ſharpe point, the lower parts having each of them an hollowneſſe at the bottome of them, of two inches and a halfe wide apeece, and above foure inches long, the flower that ſtood on a three inch ſtalke was alſo like unto the greater Dragons, being five inches long, and an inch and a halfe broad, of a darke reddiſh colour, and ſtriped with many white veines running through the middle, eſpecially on the outſide, having alſo a blackiſh long peſtle in the middle, and twy forked at the end.

The Place and *Time.*

The firſt groweth in ponds, and lakes of ſtanding waters, but never out of it, and not in any place that I can here of in our Land, flowring in *July*, the berries being ripe in the beginning of *September.*

The Names.

It is called by almoſt all Writers of hērbes, *Dracunculus paluſtris*, or *aquaticus*, yet *Lobel Anguina aquatica*, and *Fuchſius Hydropiperi rubeum*, *Geſner in hortis Aron paluſtre*, and is *Pliny* his third *Dracontium*, with a joynted Reede like roote, having as many leaves growing thereon as it is yeares old, and thereon *Bauhinus* calleth it *Dracunculus paluſtris ſive arundinacea radice.* The other is named of *Bauhinus Serpentaria triphylla Braſiliana* The *Germanes* call it *Waſſer ſchlangenkraut*, and the *Dutch Water ſlangen cruÿt*, and We Water Dragons.

The Vertues.

It is thought to have the ſame property that *Arum* hath, but yēt leſſe effectuall to any purpoſe.

CHAP. XXIV.

1 *Plantago aquatica.* Water Plantaine.

THere are three or foure ſorts of Water Plantaine to be declared, ſome greater and others leſſer.

1. *Plantago aquatica major.* The greater Water Plantaine.

The greater Water Plantaine ſhooteth forth ſundry long thicke greene hollow ſtalkes, with large long greene leaves on them with ſome ſhew of ribbes in them, like unto Plantane, but are much greater, ſtiffer, and longer, and with ſharper ends from among which riſe up divers tall three ſquare ſpongy ſtalkes, parted into divers branches at the toppes, whereon ſtand a number of white flowers, compoſed of three leaves apeece, after which follow three ſquare ſmall greene heads, containing the ſeede: the roote conſiſteth of a great buſh of many long fibres ſet together.

2. *Plantago minor aquatica.* The leſſer Water Plantane.

The leſſer Water Plantane hath ſundry long leaves riſing from the roote, ſixe times ſmaller and narrower then the former, from among which riſe divers bare ſtalkes a foote high, bearing a tuft of many bluſh coloured flowers, made of three leaves a peece like the former, each ſtanding on a long footeſtalke, and all riſing from one head like an umbell, after which follow rough heads like unto thoſe of the Crowfoote: the roote conſiſteth of many ſmall white fibres.

3. *Plantago aquatica minor muricata.* The leſſer ſtarrē Water Plantane.

The ſtarre Water Plantane, hath divers ſmall and long leaves, like thoſe of the Ribbewort Plantane, but much ſmaller, and turning themſelves backewards: the ſlender naked ſtalkes which are halfe a foote high or more, beare at their toppes ſparſed ſmall tufts of white three leafed flowers, and after them prickly heads, ſtanding out with ends like unto a ſtarre, wherein lye the ſeede: the roote is a buſh of long white fibres.

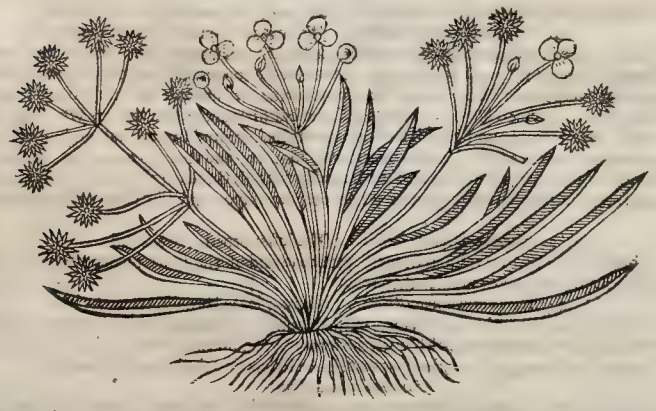
4. *Plantago aquatica minima Cluſij.* The leaſt Water Plantane.

This leaſt Plantane ſpreadeth it ſelfe wholly upon the ground, bringing forth ſundry ſmall long and narrow leaves, ſtanding on very ſlender footeſtalkes, among which come many ſlender ſtalkes lying downe on the ground, being not much above an inch long, and ending in a ſmall head, which ſending forth ſmall fibres comprehendeth and

1. *Plantago aquatica major.*
The greater water Plantane.

3. *Plantago aquatica minor muricata.*
The lesser starre water Plantane.

2. *Plantago aquatica minor.* The lesser water Plantane.



and taketh roote in the ground againe, shooting forth other smaller leaves, among which spring five or sixe small round buttones, (for no flowers were observed) standing on very fine stalkes, opening into two parts, shewing very small seede within them: from among those round buttons grow also other rowes or courses of small heads, bringing forth other smaller leaves and buttons then the former, the rootes are nothing else but very fine threds or fibres.

The Place and *Time.*

These doe all grow in watery ditches, plashes and ponds of water. The first almost every where through the Land. The second also in divers the like places with us, for *Lobel* saith, Doctor *Penny* shewed it unto him. The third I have gathered in the ditches, on the left hand of the Highway from *Hallowey* to *Highgate*. The last hath no certaine place named where it grew.

The Names.

Most of our later Herbarists doe call it *Plantago aquatica*, *Fistula pastoris & Barba Silvana*, although *Tragus* and *Lobel*, and divers others found it little to agree to, or resemble any Plantane, *Cordus* on *Dioscorides* assuredly

meant this by his *Potamogeton*, although *Bauhinus* doubteth whether he meant not *Dioscorides Alismaor Damasonion* which is more likely to be *Helleborine*. *Anguillara* tooke it to be *Limonium*, as *Bauhinus* quoteth it, and Master *Iohnson* in his *Gerard* from him, commenting thereon very seriously both on the foure Greeke names given to *Limonium*, in *Dioscorides* his text, and the severall parts of the description of this Plantane, concludeth this to be his *Limonium* and no other, being so answerable thereto in all parts as he saith: but stay a little, mee thinkes he triumpheth afore the victory, and cannot so cleanely carry away the matter, but that there seemeth some blockes in the way to stumble at: and therefore he must give us leave to scan *Dioscorides* his description thereof, a little more thoroughly: for first hee saith *Limonium* groweth ἐν λειμῶσι *in pratis riguis vel palustribus* (and therefore *Theophrastus lib.7.c.7.* calleth a kinde of *Anemone Leimonia*, which *Gaza* translateth *Fremij genus Limonium dictum*, and by *Clusius* his judgement is the *Anemone sylvestris*, taken from the moist fieldes wherein it groweth) but he doth not say in *aquosis*, where usually this groweth, and I thinke Master *Iohnson* never saw it, but in ponds or ditches of water, which were never dry: then he saith his *Limonium* hath longer and thinner leaves then Beetes, but this Plantaine hath not so, and lastly he saith it beareth red seede, which Master *Iohnson* should have found herein, if it had beene the right *Limonium*, but he wisely concealed it, as making most against his opinion. Many plants may have some resemblance in forme or name, &c. yet faile in some one particular, which quite altereth the whole case, as is shewed in many places of this Worke, and especially in the *Faba Ægyptia Dioscoridis & Theophrasti*, taken to be the *Ægyptian Calcas*, and in *Lobels* opinion of *Tripolium* to be the *Amellus Virgilij*, and so of divers others. And for the other Greeke names, *Neuroidus* is a terme that may be given to any other herbe, whose leaves are full of ribbes or nerves. *Potamogeton & Lonchitis* are severall other herbes, mentioned in *Dioscorides*, and cannot be applyed to this, besides the most judicious Translators and Commentors on *Dioscorides*, have judged that multiplicity of names added to the text, to be none of *Dioscorides* his Worke, but thrust in upon it by some other Authour, who might be as barbarous as the names. I leave the rest to the judicious censure of the expert: *Lobel* also, and *Lugdunensis* from him taketh this Plantane to be *Alisma* of *Dioscorides*, and saith it doth better agree thereto then either *Bifolium* or *Saponaria*, or *Calceolus Mariæ*, or *Bistorte*, or *Limonium*, which Master *Iohnson* thought he had forgotten or *Matthiolus* his *Alisma*. The second is called by *Lobel Plantago aquatica humilis angustifolia*, and *Plantago aquatica minor* by *Cæsalpinus* and *Tabermontanus*. The third is by *Lobel* also called *Plantago aquatica minor altera*, and *Alisma pusillum angustifolium muricatum*, by *Lugdunensis Damasoninm stellatum*, and by *Bauhinus Plantago aquatica stellata*. The last is called by *Clusius Plantago aquatica minima*, and by *Bauhinus Plantaginella palustris*.

The Vertues.

It is found to be cold and dry by the astringent taste it carryeth with it, but yet is not knowne to be used in Physicke to any purpose, either of greater or lesser respect.

Chap. XXV.

Sagitta sive Sagittaria. The Arrow headed watēr plant.

OF this *Sagittaria* there are three sorts observed by most writers as shall be shēwed.

1. *Sagittaria major latifolia.* The greater Arrow headed water plant.

This greater sort sendeth forth sundry thicke square and sappy stalkes from a thicke bushy roote of many strings, with great broad greene leaves on the toppes of them, divided at the bottomes, into two long and pointed parts, so that the whole forme of the leafe resembleth very well the forked head of the broad Arrow as wee call it, which parts stand but little above the waters wherein they grow, be they deeper or shallower: from among which rise up other thicke round spongy stalkes, higher then the leaves bearing divers rowes of flowers at the joynts, one above another, and three in a row for the most part, each whereof is composed of three large white leaves with sundry reddish threds in the middle, after which come in their places round rough burres, that are greene when they are ripe, and like those of *Sparganium*, the Burre reede.

2. *Sagittaria minor latifolia.* The lesser broad arrow head.

This lesser sort hath onely lesser leaves, and flowers, yet broad and of the same forme with thē *precedent*, thē burres and rootes growing as great or greater then they.

3. *Sagittaria minor angustifolia.* Narrow leafed broade arrow head.

This likewise differeth not from the two former, in the manner of growing, but in the narrownesse and length of the leaves which are not of halfe the breadth with the former, yet hold their length, the two lower forked ends being almost as long as the foreright leafe, the flowers also are lesse, as are the burres and rootes.

The Place and *Time.*

All these sorts may be seene sometimes together, in the same ditches and waters where they grow, or else separate in sundry places of this Kingdome, and doe flower about Midsommer, their burres being ripe in the beginning or middle of *August*.

The Names;

It is called in Greeke πτῶα, and as *Pliny* saith, *lib.21.c.17. Magopistana* or *Pistana Magonis*, in Latine *Sagitta*, *Sagittaria*, and *Sagittalis*. *Lobel* hath a *quære* on the first, if it bee not *Stæbe femina*, but called *Phleos mas latifolia* by *Lugdunensis*, as he doth the other *Phleos sive Stæbe Theophrasti angustifolia*: but as I have shewed in sundry places before in this Worke, that *Phleos* and *Phleum* in *Theophrastus* be differing plants, *Phleum* being a watery plant, growing in the Lake *Orchomenus*, and *Phleos* I have set downe in the Chapter of *Poterium*, and proved it I thinke sufficiently to be the *Stæbe* of *Theophrastus* and *Dioscorides*. *Cæsalpinus* calleth the greater sort *Barba sylvana*, and *Dodonæus* saith that some did call it *Lingua serpentis*, and thereupon the *Dutch* called it *Serpents toughen*, and the *Italians Gaetta*. But wee in *English* Water Archer, Arrow head or broad Arrow head as I call it.

The

1. *Sagittaria major latifolia.*
The greater broad Arrow heade

2. *Sagittaria minor latifolia.*
The leſſer broad Arrow head.

The Vertues.

Theſe are held to be of the property of Water Plantane, that is, cold and dry, but *Lugdunenſis* ſaith they are cold and moiſt.

CHAP. XXVI.

Tribulus aquaticus. Water Caltroppe.

THere is a greater and two leſſer ſorts of this Caltroppe to ſhew unto you, which are theſe.

1. *Tribulus aquaticus major.* The greater Water Caltroppe.

This great Water Caltroppe hath ſundry broad, and more then halfe round leaves, in ſome places ſpotted on the under ſide, and dented about the edges, ſet on long footeſtalkes which riſe in the Water from the head of the roote, every one by it ſelfe, being ſmaller at the lower end then they are next the leaves, among which riſe up ſappy round ſtalkes, no higher then the leaves, bearing whitiſh flowers at the toppes, and after them thicke, hard and wooddy, almoſt round heads, with three or foure ſharpe points ſticking out, of the bigneſſe of Haſell nuts in ſome places and blackiſh in others, as bigge as a great Wallnut, having a ſweet white kirnell within it like unto a Cheſnut: the roote groweth ſomewhat long and full of joynts with a tuft of haires or fibres at each of them.

2. *Tribulus aquaticus minor prior.* The former ſmall Water Caltroppe.

The former of the two leſſer ſorts, from a long creeping joynted roote ſending forth tufts of fibres at the joints, as alſo at the lower joynts of the ſtalkes ſhoote forth very long flat ſlender and knotted ſtalkes, two or three cubits long, according to the depth of the water wherein it groweth, (which being dryed are pliant and flexible, fit for many workes) divided towards the toppe, into many branches, carrying ſingle leaves at the lower joynts, on both ſides, being about two inches long and halfe an inch broad, thinne and almoſt tranſparent, ſo waved on the edges, that they ſeeme to be torne, of a reddiſh greene colour for the moſt part: but thoſe on the branches upwards ſtand two alwaies by couples: from the joynts with the leaves come forth ſmall footeſtalkes, bearing at their ends ſmall whitiſh long and thicke flowers, ſet together in manner of a cluſter of Grapes (others have found it with reddiſh flowers) to every of which when they are falne, ſucceede for the moſt part foure ſharpe pointed graines joyned together, containing a ſmall white kernell within them.

3. *Tribulus aquaticus minor alter.* The other ſmall ſort of Water Caltroppe.

There is another ſmall ſort hereof, growing uſually in the ditches of cleere Water, whoſe ſtalkes is not flat but round, bearing leaves at every joynt, ſhorter and more pointed at the ends, and not crumpled or waved at the edges, bearing alſo three or foure ſmall flowers at the ends of long footeſtalkes, ſomewhat like to thoſe of *Meſ-*

1. *Tribulus aquaticus major.*
The greater Water Caltroppe.

2. *Tribulus aquaticus minor prior.*
The former small Water Caltroppe.

chatelli Cordi: the fruite or head that succedeth, groweth to be fixe square: the roote is not much unlike the former.

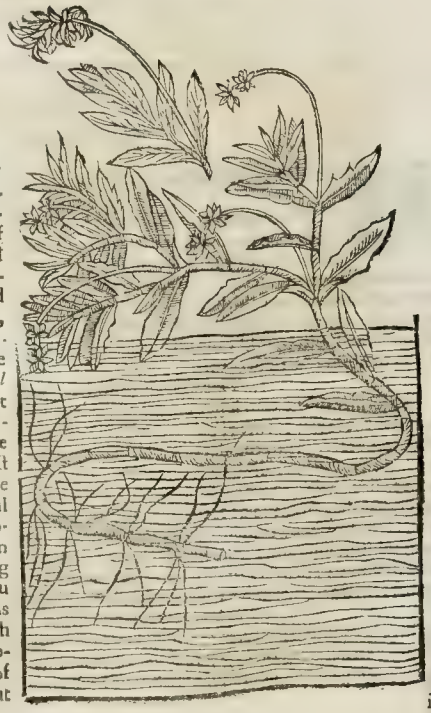
The Place and *Time.*

I cannot heare as yet that the first is found in any country of this Land, as the two others are: but in sundry Lakes in *Germany*, as also in *Brabant*, and in many places in *Italy*, and neere the Sea also, as *Matthiolus* saith, but flower there and give their fruite in Summer.

The Names.

It is called in Greeke τρίβολος ἔνυδρος, and *Tribulus aquaticus* in Latine, *Anguillara* raketh the first to be *Butomos Damocratis*, all other Authours call it *Tribulus aquaticus* or *Lacustris* as *Cordus* doth, and the Apothecaries of *Venice* and other parts beyond Sea *Tribulus marinus*, and the nuts *Castaneæ aquatiles*. The other two sorts are called by *Clusius Tribulus aquaticus minor* and distinguished by him, and by *Bauhinus* referred to the *Potamogeton*, calling them *Potamogeton foliis crispis sive Lactucæ ranarum*, and yet his next sort, is verily the former of these two sorts, as by comparing his words may be seene. *Lobel* calleth it *Fontilapathum pusillum*, and *Tragus* maketh it his second *Alga*. Master *Finch*, a *London* Merchant travelling in the *Mogols* Country, in the East Indies, saw the greater sort growing like a weede, abounding in most tankes or ponds there, whose fruite hee tooke to be the *Hermodactile*, but was much therein deceived: the kernell of the nut as he saith is much eaten by the Natives and others, called *Singara* by them, himselfe finding them very cold in his stomacke, that he alwayes after the eating of them desired some *Aqua vitæ* to warme it againe. You shall find this relation and that of the *Faba Ægyptiaca* (as it is extant before in this worke *folio* 376.) in the fourth Booke of Master *Purchas* his Pilgrims, the fourth Chapter and fifth Section, *folio* 429. The worthy relations of whose travailes there extant doth not onely in this but

3. *Tribulus aquaticus minor alter.*
The other small sort of water Caltrope.



in

in many other excellent matters declare his industry, whereby many have reaped much profit thereby, I would we had many more such worthy Merchants continually. The *Italians* call it *Tribolo acquatico*. The *French Macres* and *Saligot*. The *Germanes Waſſernuſſ*. The *Dutch Water noten* and *Minckyſers*, and we in *Engliſh* Water Caltrops, or Water nuts or *Saligot* after the *French*.

The Vertues.

The leaves are cooling and repreſſe inflammations being made into a pultis and applyed: the juice mixed with hony healeth the Cankers and ſores of the mouth and throate, and the rankeneſſe of the gummes being gargled, *Pliny* ſaith that the *Thracians* that inhabit about the river *Strimon*, do fatten their horſes with the leaves and make bread of the nut kernels to feede themſelves which doth binde the belly.

CHAP. XXVII.

1. *Stratiotes ſive Militaris Aizoides.* Water Souldier.

THe Water Souldier hath divers and ſundry long narrow leaves ſharpe pointed ſet cloſe together ſomewhat like unto the leaves of Aloes for the forme, but much leſſe and ſharpely toothed about the edges like it alſo, from among which riſe up ſhort ſtalkes not much higher then the leaves, and ſometimes lower bearing one greene threeforked head onely at the toppe much like unto a Lobſters claw, which is the huske, out of which commeth a white flower, conſiſting of three leaves with divers yellowiſh hairy threds in the middle: under theſe leaves there is a ſmall ſhort head, broadeſt next unto the leaves and ſmalleſt downewards, from whence doe proceede ſundry long ſtrings, like ſmall wormes (wherewith as *Dodonæus* ſaith, ſome crafty men and women leeches putting them into glaſſes with water to make them ſhew the greater, make others beleeve that they are wormes which came out of their bodies, to whom they have given medicines for that purpoſe) which take roote in the mudde under the Water.

2. *Stratiotes Aquatica vera Dioſcoridis, & Ægyptiaca.*
The true Water Houſeleeke of *Egypt*.

This Water Houſeleeke hath divers large and broad thicke, hard and hairy whitiſh greene leaves lying on the water, in three or foure rowes, round compaſſed together, like unto thoſe of the great tree Houſeleeke, but greater, the outermoſt row of them being broadeſt, and the inner ſmaller and ſmaller, *Alpinus* ſheweth them to be pointed,

1. *Stratiotes ſive Militaris Aizoides.*
The water Souldier.

2. *Stratiotes aquatica vera Dioſcoridis & Ægyptiaca.*
The true water Houſeleeke of *Egypt*.

but *Veslingius* round and plaited, and the ends a little foulded backwards as *Veslingius* hath it, which I give you here together, this hath not beene observed by either of them what stalkes or flowers it beareth, the roote as *Alpinus* saith is a small thin peece of wooll that hangeth downe from under the leaves which lye on the water like Ducks meate, but *Veslingius* saith it hath smal threddy fibres passing downe to the ground, although *Dioscorides* said it had no rootes, the leaves are of a drying stipticke or astringent taste no lesse then *Acacia*.

The Place and *Time*.

The first groweth in *Germany*, and the Low Countries also plentifully, and in *Italy* and other Countries also, the other hath beene observed in *Egypt* by *Alpinus* and *Veslingius*, and no where there but in the watery ditches, neere *Damiata* or *Pelusium*.

The Names.

Dioscorides his Στρατιώτης, whereunto is added ποτάμιος or ἔνυδρος, that it may be knowne from his χερσαῖος, is called by *Matthiolus Stratiotes aquaticus* in Latine, and so also by *Lugdunensis*, and is my second sort, here expresst in my judgement rather then the first because the leaves and the posture also doe more resemble Houseleeke then the former, which is like unto Aloes, although it be called also *Sedum marinum*, and againe, because it hath not beene observed any where but in *Egypt* as I said by *Alpinus* and *Veslingius*, however *Lobel* calleth the former *Stratiotes sive Militaris Aizoides*, and *Dodonæus Stratiotes potamios & Sedum aquatile*. *Bauhinus* placeth the former with the sorts of Aloes, and calleth it *Aloes palustris*, and the other he placeth among the *Lenticulæ*, and calleth it *Lenticula palustris Ægyptiaca sive Stratiotes aquatica folijs Sedo majore latioribus*. *Alpinus* saith that the *Egyptians* call it with them *Hayhalemel maoui*, that is as much to say as *Sedum aquaticum*. It is probable that *Theophrastus* meant this plant, whereunto he giveth no name, speaking thereof in the end of the ninth Chapter of his fourth Booke, growing in ponds like a Lilly with many leaves of a greene colour, &c.

The Vertues.

Each of these are very cooling and drying, and astringent withall, but *Galen* saith it is cold and moist, and as he and *Dioscorides* say stayeth the fluxe of blood that passeth from the kidneys, if it be taken in drinke, *Pliny* addeth thereunto some *Olibanum*, it stayeth likewise the swellings of wounds and causeth that they be not enflamed: it helpeth other inflammations called Saint *Anthonies* fire, and swellings in other parts, it healeth also all wounds and vlcers, and is good for fistulaes or hollow ulcers, *Alpinus* saith that the *Egyptian* women use the juice, decoction or poulther of the herbe, a dramme every morning to stay their courses, or other issues of blood in any other part of the body: as also the Country people use it to heale any wound, in bruising the leaves and laying them thereon, which wonderfully healeth them,

CHAP. XXVIII.

Gladiolus lacustris Clusij sive Leucoium palustre flore subcæruleo Bauhini. Water Gladioll.

THis plant that was sent to *Clusius* from *Groening* by a worthy Apothecary there called *Dortman*, found by him in a great pond or Lake of water where no other herbe did grow, besides in the Country of *Drentia*, neere unto a small village called *Norcke* and *Westervelde*, is set downe by him with this description. The leaves doe seldome exceede the length of nine inches, being thicke and hollow severed with a partition like the cods of Stocke-Gilloflowers, or the like, but greene and sweete in taste, being an acceptable food for the Duckes that dive to the bottome of the water to feede on it, which is diverselles depth under the water: yet the stalke that springeth from among those leaves is seene to rise above the water, furnished with white flowers, larger then those of Stockgilloflowers, the hollow and lowest part, which is next to the stalke, being of a blewish colour, somewhat resembling the forme of a *Gladiolus*, or Corne flagge, but yet not much like it, consisting of five leaves, the two uppermost whereof doe turne backeward to the stalke, the other three which are the larger hang downe: unto these flowers succeede round heads or seede vessels broad below and pointed at the end full of red seede. This was observed in flower in the end of *July*.

Gladiolus Lacustris Clusij sive Leucoium palustre, flore subcæruleo Bauhini. Water Gladioll.

The Place, Time and *Names*:

Are related in the foregoing title and description, as much as can be said of it,

for

for although *Clusius* would not alter the name thereof, whereby it was sent, that others might know with what title it came to him. Yet *Bauhinus* thinking it better to agree in leafe and flower unto the *Leucoium*, rather chose to call it *Leucoium palustre flore subceruleo*, but I dare not herein follow him, for it hath as little correspondence with the Stocke Gilloflower, as with the *Gladiolus* or Corne Flagge, neither leafe nor flower being like a Stocke gilloflower, but in that the leaves are made like the double huske or seede vessell of *Leucoium*, which maketh litte resemblance of a plant, but the flowers doe more answer to the forme of the flower of *Gladiolus*, and therefore I so entitle it. And for the Vertues there is none knowne or made to appeare, that the neighbouring people make any use of it in medicine, or any other wayes more then is before said, for the Duckes to feede on.

CHAP. XXIX.

Nymphæa. The Water Lilly.

THere are divers sorts of Water Lillyes both great and small, both white and yellow, as shal be shewed.

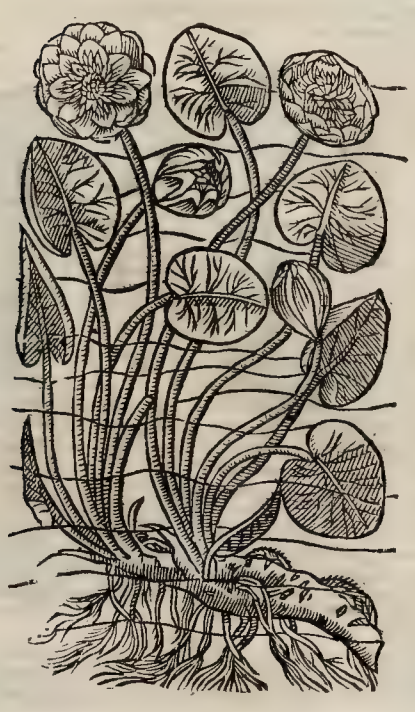
1. *Nymphæa alba major vulgaris.* The great common white Water Lilly.

This Water Lilly hath very large, very round and thicke darke greene leaves lying upon the water (like unto those of *Faba Ægyptia* as *Dioscorides* saith, and that very truely as I have shewed before in the Chapter of *Arum*) sustained by long and thicke footestalkes that rise from a great thicke round and long tuberous blacke roote, spongy or loose and with many knobs thereon like eyes and whitish within, from the midst whereof rise other the like thicke and great stalkes, susteining one large white flower thereon greene on the outside but exceeding white on the inside, as pure snow consisting of divers rowes of long and somewhat thicke and narrow leaves, smaller and thinner, the more inward they be, encompassing a head within, with many yellow threds or thrummes in the middle, where after they are past stand round Poppy like heads full of broad oily and bitter seede.

2. *Nymphæa alba major Ægyptiaca sive Lotus Ægyptia.* The great white Water Lilly of *Egypt*.

This other great white Water Lilly, that is entituled of *Egypt*, sendeth up out of the Water divers faire broad leaves like the former, but somewhat lesser, and more waved about the edges, and with more veines in them lying on the superficies of the water, as they doe upon severall footestalkes also: the flowers also are faire large, and double, that is of many rowes of leaves in the like manner, inclosed in a huske, consisting of foure leaves, greene on the outside, and white within, the middle leaves of the flowers are often upon the first opening somewhat foulded inwards at the ends, but growing elder grow straight forth, all of them being white in the middle part, and yellowish towards the brims of a sweete sent like a Violet, in the midst of whom when they beginne to

1. *Nymphæa alba major vulgaris.*
The greater common white Water Lilly.



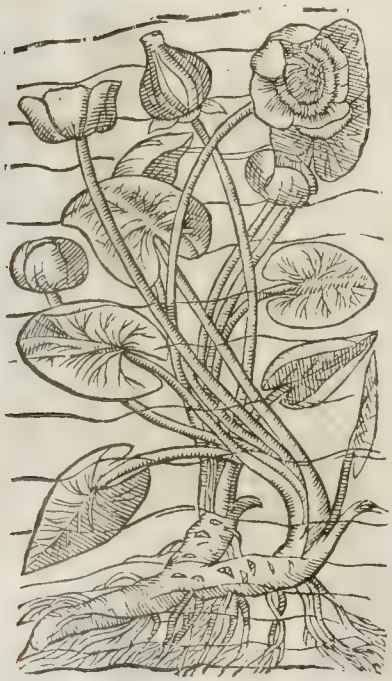
2. *Nymphæa alba major altera sive Lotus Egyptia.*
The great white Water Lilly of *Egypt*.

decay

3. *Nymphæa alba minor.*
The small white Lilly.

4. *Nymphæa alba minima seue Morsus ranæ.*
The small white Water Lilly called Frogge bit.

5. *Nymphæa lutea.*
The great yellow Water Lilly.



6. *Nymphæa lutea minor*
The lesser yellow water Lilly.

decay riseth up a small head, which growing greater becommeth the seede vessell, not much unlike unto the other as bigge as a good Medlar, parted on the inside into cels longwise containing round seede like unto those of Coleworts, the roote is not tuberous as the former, but small round and almost peere fashion, of the bignesse of an hens Egge, blacke on the outside and yellowish within, with many small fibres thereat, the inner substance being fleshy firme and hard, somewhat sweete and binding withall, which when it is boyled, or rosted under Embers, becommeth as yellow as the yolke of an egge, which the *Egyptians* familiarly eate with broth or without, raw also oftentimes, as well as roasted, this loseth both leaves and stalkes after seede time, especially upon the decay of the water wherein it joyed, the roote abiding in the ground, which thereupon was called annuall, but I would rather call it restible.

3. *Nymphæa alba minor.* The lesser white Water Lilly.

This lesser Water Lilly differeth not from the former, but in the smallnesse both of roote and leafe, and in the singlenesse of the flower, which consisteth but of five small and pointed leaves, spread open and laid abroad, with yellow threds in the middle, and small heads with small seede in them.

4. *Nymphæa alba minima quæ & Morsus ranæ vocatur.*
Small white Water Lilly, called by many Frogge bit.

The roote of Frogge bit is long and creeping, set full of joynts, sending downe from thence long fibres, and whereat spring divers small round leaves very like the last small water Lilly, but much smaller, from which rise also other stalkes, bearing on each head one small white flower, made of three small and round pointed leaves with some yellow threds in the middle: the heads and seede are small. This is in all the parts neerer resembling the last white Water Lilly, then any pond weede, whereof some have made it a *species*, and therefore I have placed it with them.

5. *Nymphæa lutea major.* The great yellow Water Lilly.

This greater yellow sort groweth much like the great white, with leaves almost as large as they, but somewhat longer, and standing on cornered stalkes, the flowers also that stand on the toppes of the crested stalkes, are not so thicke of leaves as the white (although *Lugdunensis* doth so describe it, and giveth a figure answerable) in any that ever I saw, but made of five large round shining yellow leaves, with a round greene head in the middle, compassed with yellow threds, which head when it is ripe, containeth within it greater seede then those of the white, and more shining: the roote is great and very like unto the former, yet not blackish, but somewhat whitish on the outside as well as within; each of them being somewhat sweete in taste, and this more loose or spongy then it.

6. *Nymphæa minor lutea.* The smaller yellow Water Lilly.

The leaves hereof are round, but larger then those of the lesser white sort, and so are the flowers larger also, but yellow: the roote hath many strings fastened to a bigge head, and tasteth hotter then the other.

7. *Nymphæa lutea flore minore.* Small yellow Water Lilly with lesser flowers.

There is no other difference betweene this and the last, but in the smallnesse both of leaves and flowers, the roote groweth with long stringes strongly fastened into the mudde,

The Place and *Time.*

All these sorts except the second are found growing with us in sundry places of the Land, some in great pooles and standing waters, and sometimes in slow running Rivers, other in lesser ditches of water, as the Frogge bit, in many ditches about *London*, as well as in the ditches on the Banckes side, in Saint *Georges* fieldes. They flower most commonly before the end of *May*, or soone after, and their seede is ripe in *August*.

The Names.

Νυμφαία in Greeke, and *Nymphæa* in Latine, *quod loca aquosa amet*, be the chiefe appellations of these plants with their severall adjuncts, of *alba* and *lutea*, white and yellow, and called *Nenuphar* in the Apothecaries shops, yet hath it also divers other names by divers Authours: *Apuleus* calling it *Mater Herculana*, *Alga palustris*, *Papaver palustre*. *Clavus Veneris* and *Digitus Veneris*, and *Marcellus* an old Writer, saith it was called *Clava Herculis*, and *Baditin* in *French*, but the *French* at this time call it *Blanc deaue*, and *Lis d'estang*, the *Arabians Nilafar*, and *Ninfar*, the *Italians Ninfea*, the *Spaniards Escudettes del rio* and *Higos del rio*, the *Germanes Seeblumen*, and *Wasser Gilgen*, the *Dutch Plompen*, and we Water Lilly. There hath beene great controversies among the learned Herbarists, whether this *Nymphæa* be not the *Lotus Ægyptia* of *Dioscorides* and *Theophrastus*, because the description of the one so neerely resembleth the other, which made *Clusius* confident, upon *Alpinus* his Allegations, in his Booke *de plantis Ægypti*, to determine them both one, when as there is shewed two maine differences in them, besides that *Dioscorides* describeth them both in two severall Chapters, the one in the roote, that the *Lotus* roote was called *Corsium*, and was round of the bignesse of a Quince, which was used to be eaten, either boiled or rosted under the fire, which the roote of *Nymphæa* faileth in, (this is most probable to bee the *Lotus Ægyptia* of *Dodoneus*:) And then againe in the seede, which as *Dioscorides* sheweth, is flat in the head of the *Nymphæa*, and like *Milium*, that is round in the *Lotus*: but the leaves and flowers in both being so like, the other being hid under the water, caused *Alpinus*, as he saith himselfe to take no further knowledge or marke any difference in them then of a *Nymphæa*, (and I am halfe perswaded the like neglect hath happened to the *Faba Ægyptia*, that it is not yet found in the waters of *Egypt*, because the leaves thereof also are round like the *Lotus* or *Nymphæa*) but now in his Booke of *Exoticke* plants, he changeth his note, and sheweth there that this is the true *Lotus Ægyptia*, and all the parts thereof particularly desciphered. All these sorts of Water Lillyes, are so called by all Writers almost as I doe, and therefore neede no further explanation or amplification. But hereby all men may take a good caveat not to be too forward, either to condemne the Text of the ancients as judging it erronious, or to be too confident of their owne judgement, without well considering all parts: For the like hereunto happened unto the *Faba Ægyptia*, which formerly was confidently supposed to be *Colocassia*, ignorance being the cause of error, which knowledge since by industry hath corrected.

The Vertues.

The leaves and flowers of the water Lillies are cold and moist, but the roote and seede is cold and dry: the leaves doe coole all inflammations, and both outward and inward heates of agues, and so doe the flowers also either by the Syrupe or Conserve, the said Syrupe also helpeth much to procure rest, and to settle the braines of franticke

frantick persons for it wonderfully helpeth the distemperature of the head arising from heate: the seede is sometimes used to stay fluxes of blood or humours, either of wounds or of the belly, yet is as effectuall as the roote, but the roote is of greater use with us, some taking the white roote (which is of the yellow sort) and some the roote of the white Water Lilly, which hath the blacke roote, to be the more effectuall to coole, binde, and restraine all Fluxes or defluxions in man or woman, as also the gonorrhea or running of the reines, and the involuntary passage of sperme in sleepe, and is so powerfull that the frequent use thereof extinguisheth Venerious actions: the roote likewise is very good for those whose urine is hot and sharpe, to be boiled in wine or Water, and the decoction drunke: the blacke roote which beareth the white flowers, is more used with us in these times then the other, because it is more plentifully to be had, then that with yellow flowers: but the white roote of the yellow kinde is lesse pleasant, and more astringent and harsh in taste, and therefore not without just cause doe most preferre it before the other to stay womens courses, and mens spermaticall issues. The distilled water of the flowers is very effectuall for all the diseases aforesaid, both inwardly taken and outwardly applyed: it is much commended also to take away freckles, spots, sunburne, and Morphew, from the skinne, in the face or any other part of the body. The oyle made of the flowers, as oyle of Roses is made is profitably used to coole hot tumours, and the inflammations of ulcers, and wounds, and ease the paines, and helpe to heale the sores. The Frog bit as being a *Species* as I said of the *Nymphæa minor*, and so likewise these lesser sorts, have generally a cooling quality in them, yet in a weaker measure then the greater sorts. But let no man mistake the yellow Marsh Marigold, instead of the yellow Water Lilly, as it is likely, *Serapio lib. simplicium cap.* 144. and some other *Arabian* Authours did, that said there was another kinde of *Nenufar*, which was sharpe and hot, and of subtill parts, and is fit to warme and give heate to cold griefes, for assuredly they meant hereby the *Caliha palustris*, which they mistooke to be a kinde of *Nenufar*, as is evident by this their relation.

CHAP. XXX.

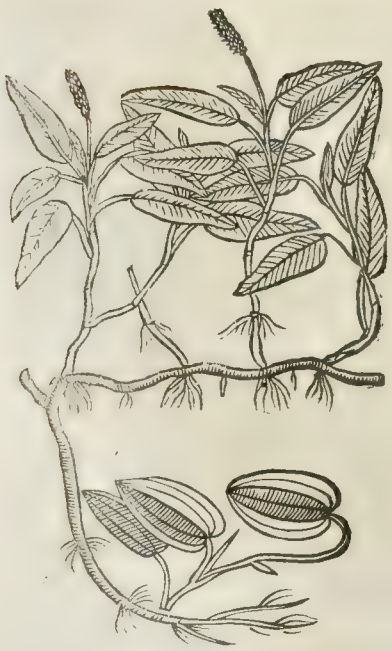
Potamogeton sive Fontalis. Pondweede.

OF the Pondweedes there are divers sorts, more found out and referred to them then was in former times, which are these that follow.

1. *Fontalis major latifolia vulgaris.* The greater ordinary Pondweede.

This greater Pondweede riseth up with sundry slender round stalkes full of joynts and branches, and faire broad round pointed darke greene leaves with long ribs in them like Plantaine, set singly at the joynts and lying flat on the toppe of the water: at the toppes of the stalkes and branches usually, and seldome

Potamogeton sive Fontalis major & minor latifolia vulgaris.
The greater and lesser broad leafed Pondweede.



2. *Fontalis major longifolia.*
The greater long leafed Pondweede.

at the lower joynts come forth long ſpiked heads, of bluſh coloured flowers upon long footeſtalkes like unto thoſe of *Biſtort*, or Arſmart, whereon after they are paſt ſtand chaffie huskes, containing within them blackiſh hard ſeede: the roote creepeth to and fro in the mudde, with divers joynts and tufts of fibres at them, whereby they are faſtened to the ground. There is another of this ſort that is leſſer, not much differing in any thing elſe. *Mixt.*

2. *Fontalis major latifolia.* The greater long leafed Pondweede.

This other greater ſort differeth little from the former, but in the leaves which are longer and narrower, and the ribbes running acroſſe in them, and not at length as the former doth, the ſpiked heads of flowers hereof are in ſome more whitiſh, and in others as faire a bluſh colour as the former, and come as well from the upper joynts as the toppes of the ſtalkes and branches. There is another ſort hereof alſo, with leaves not altogether ſo long or narrow. *Altera.*

3. *Fontalis ſerrato longifolio.* Dented Pondeweede.

The roote of this is joynted and creepeth like the former, bringing very long and narrow leaves at the joynts of the ſtalkes, and dented about the edges without any order on both ſides, and beareth at the toppes ſuch like ſpiked tufts of flowers and ſeede after them as the others doe.

4. *Potamogeton gramineum ramoſum.* Graſſelike Pondweede.

The ſtalke hereof is a foote high or more, being very ſlender round and whitiſh, parted into ſundry branches with many ſmall graſſiy round darke greene leaves not ſet together, but by ſpaces a good way in ſunder, which end in other leaves, that are almoſt as ſmall as haires, yet notwithſtanding from the wing of the firſt leafe, commeth forth a ſtalke with the like leaves at the end, and thereat a ſmall footeſtalke three inches long, ſuſtaining certaine ſmall flowers, diſperſedly ſet in a ſpike and not in a cluſter, and ſmall rough graines ſucceeding them.

5. *Potamogeton minimum capillaceo folio,* Small fine Pondweede.

This fine leafed Pondweede hath a very fine ſlender ſtalke, with ſmall long pale greene and haire-like leaves ſet thereon without order, at the toppe whereof ſpring forth one or two ſmall footeſtalkes, which ſuſtaineth a very ſmall and pointed head, like unto the *precedent*, followed by very ſmall pale coloured flowers, whereof one is laid open, and another is incloſed in a skinny huske, ending in a point.

6. *Potamogeton capillaceum capitulis ad alas trifidis.* Triple headed Pondweede.

This Pondweede hath a ſtalke an handbredth long, no thicker then an haire, yet joynted and branched, and two ſmall long leaves at every joynt which are ſmaller then any haire, and thereat likewiſe ſtand very ſmall pale colored flowers, which growing cloſe, do forme a knot or head, which being ripe appeareth as made of three ſemicircular reddiſh parts ending in a ſharpe point, yet from the boſome of the former leaves, riſeth a ſmall footeſtalk, divided into three or more ſmall leaves, the like knot or head being ſet in the middle, for at the top there is no head at all.

The Place and *Time.*

The two firſt ſorts are to be ſeene in many places of the Land, no Country almoſt being without the one or the other, the third is more rare, and ſeene but in very few places with us, the three laſt are ſtrangers and doe all ſhew their flowers in the end of *Auguſt*, or ſeldome ſooner.

The Names.

It is called in Greeke ποταμογείτων, *quaſi fluminibus vicina*, and σαχίτης, *quaſi ſpicata Fontalis.* The two firſt are generally called by all Writers *Potamogeton*, and by *Lobel Fontalis & ſpicata*, who it is very likely intended this firſt ſort, and not a different kinde from it, although his figure have more pointed leaves, for the veines goe longwiſe, as in the former, which doe not in any other ſort, although it doth expreſſe many ſmall round heads on a long ſtalke, and ſaith the flowers are white, and the ſeede like *Aphaca*, and that his firſt ſort is another *ſpecies* of the *longifolia*, if not the ſame, for we have ſeene ſome variety hereof in the Ponds and Waters of our owne Land. The third is called *Oxylapathum aquaticum* by *Lugdunenſis*, and by *Geſner in hortis*, *Lapathi genus ſylveſtre.* The three laſt are mentioned onely by *Bauhinus*, by the ſame titles they here hold. The *Italians* call it *Potamogeto.* The *French Eſpi d'eau.* The *Germanes Samkgrant.* The *Dutch Founteincruit.* And we in *Engliſh* Pondweed, Water Spike, and of ſome River wort.

The Vertues.

Pondweed is cooling and drying as *Galen* ſaith, like unto Knotgraſſe, but of a thicker eſſence: the decoction of the leaves in wine, ſtayeth the Laske, and griping paines of the belly, and being bathed, is good to helpe itches, old ulcers, and corroding cankers and ſores, the leaves applyed aſſwageth inflammations, and Saint *Anthonies* fire, the freckles and heate in the face: if the leaves be boiled with oyle and vinegar, and applyed to the place pained with the hot Gout, it doth give preſent eaſe: it is profitably alſo applyed with honey and vinegar to helpe thoſe that have foule ſores in their legges, the roote helpeth to diſſolve knots and kernels.

CHAP. XXXI.

Millifolium aquaticum. Water Yarrow.

THere be ſundry ſorts of herbes that for their fine Fennell like leaves, and growing in the waters, ſo neerely reſembling Yarrow or Fennell, are called *Millefolium*, and *Fœniculum aquaticum*, yet differing each from other in ſome notable part, all which I meane to comprehend in one Chapter.

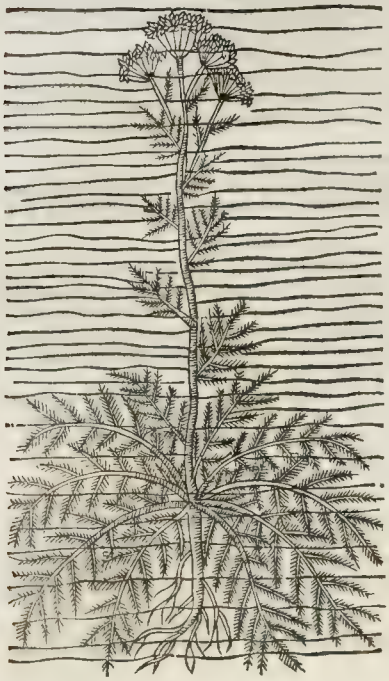
1. *Millefolium aquaticum vulgatius.* Ordinary water Yarrow.

This Water Yarrow which groweth moſt plentifully with us about *London*, riſeth up with a round ſtraight ſtalke, having divers long winged leaves at the bottome of it, cut and divided into many fine ſmall leaves ſet on both ſides of the middle ribbe, like unto the land Yarrow, but much tenderer and with as fine leaves almoſt as Fennell it ſelfe, at the ſtalkes likewiſe grow ſuch fine leaves up to the toppe, where ſtand on branches, large tufts of ſmall white flowers ſet cloſe together, the roote is ſomewhat long white and ſlender with divers fibres at it.

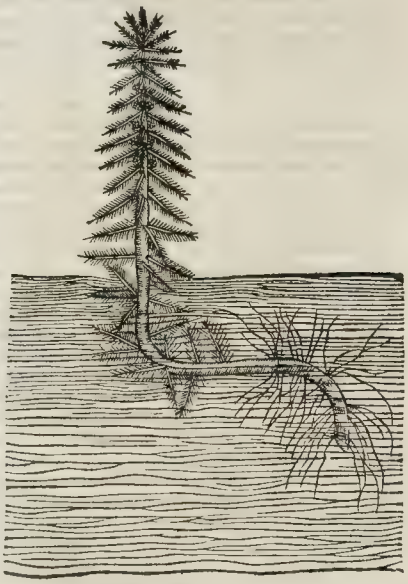
2. *Millefolium Coriandrifolium.* Broad leafed water Yarrow.

The lower leaves of this Yarrow are ſomewhat like in the forme and diviſions of them unto the lower leaves of

1. *Millefolium aquaticum vulgatius.*
Ordinary Water Yarrow.

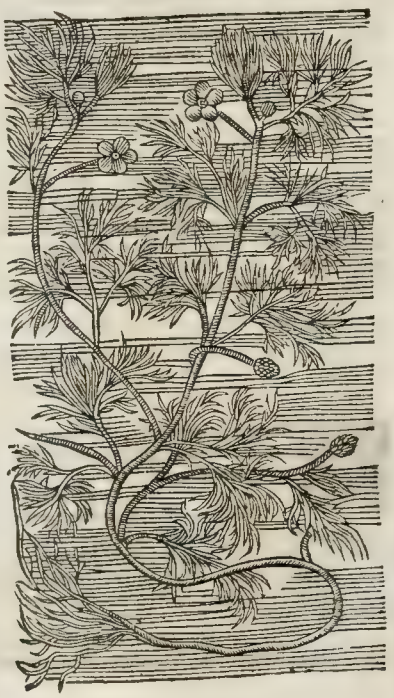


3. *Millefolium aquaticum minus.*
Small water Yarrow.



4. *Millefolium aquaticum floridum sive Viola aquatica.*
Water Gilloflowers.

5. *Millefolium aquaticum Ranunculi flore & capitulo.*
Crowfoote Millfoile.



of Coriánders,but much ſmaller and of a freſh yellowiſh greene colour,but thoſe that grow from thence upwards on the ſtalkes,are ſmaller and more finely cut in like unto Fennell,bearing umbels or tufts of yellowiſh flowers.

3. *Millefolium aquaticum minus.* Small Water Yarrow.

This ſmall Yarrow ſpreadeth many long round greene ſtalkes full of joynts, and thereat ſundry fine ſmall fi res,which take hold of the ground as it creepeth: the upper part of the ſtalke that riſeth above the water,hath five or ſix joynts;and at each of them ſundry fine ſmal green leaves ſcarſe an inch long beingleſſe and leſſe upward, ſo as the toppe of the ſtalke ſeemeth to be ſteeple faſhion,which beare at the toppe ſo many very ſmall flowers, conſiſting of eight ſmall white leaves apeece, joyned together and not opening themſelves, as there are leaves at every joynt,which afterwards paſſe into certaine round heads,which have foure ſpokes or points apeece.

4. *Millefolium aquaticum floridum ſive Viola aquatica.* Water Gillovers.

The roote of this Water Gillover is very ſmall and creeping,ſhooting forth fibres every where,from which riſe up ſundry long winged leaves,conſiſting of many ſmall leaves ſet on each ſide of a middle rib,which are larger and greater then thoſe of the firſt ſort here ſet forth,of a ſad greene colour, the ſtalkes that riſe up among them are bare of leaves, from the bottome to the upper joynts,whereabout ſtand divers ſmall whitiſh and ſweete flowers, ſomewhat like unto Stockegilloflowers,of five leaves a peece, one row above another, with yellowiſh threds in the middle. There is another ſort hereof very like it,but that it hath larger winges and finer jagged leaves. *Alterum.*

5 *Millefolium aquaticum Ranunculi flore & capitulo.* Crowfoote Millfoile.

This is a leſſer herbe then any of them that goe before growing onely in ſhallow waters, where it ſeldome riſeth above an handfull high,with very many and very fine ſhort leaves, as ſmall as Camomill, and of a yellowiſh greene colour,the ſhort ſtalke among them carry ſingle ſmall white flowers,reſembling the water Crowfoote both in the flowers,and in the finer leaves,but hath no broad leaves at the bottome as it hath. and might as well be accounted a Crowfoote,as a Water Millfoile,but that all Authors that write of it doe number it among them, eſpecially becauſe that it beareth a head of ſeede after the flower is paſt, very like unto thoſe of Crowfoote, that is a ſmall bunch of ſeedes ſet cloſe together.

6. *Millefolium maratriphyllon Ranunculi flore.* Fennell leafed Crowfoote Millfoile.

The roore hereof is very long and creeping, the ſtalkes grow much higher then the laſt, the leaves are much longer and greener, very like to thoſe of Fennell,the flowers are white but much larger then the laſt, the head of ſeede being ſomewhat like unto it.

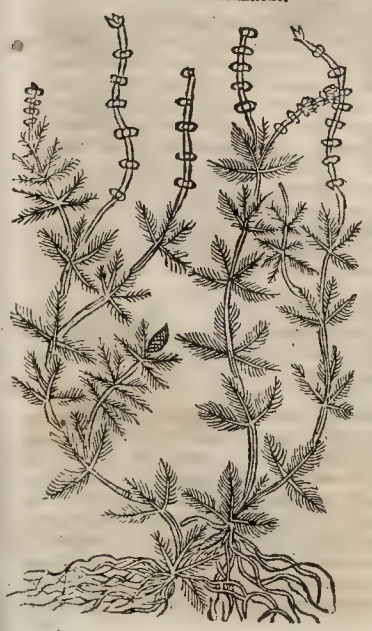
7. *Millefolium aquaticum pennatum ſpicatum.* Feathered Millfoile.

This Millfoile ſendeth forth from a buſhy fibrous roote divers round joynted ſtalkes,hollow,ſtriped and branched at the toppes, ſwimming on the water a cubit high, and at each three or foure leaves ſo finely cut that they ſeeme to be feathers,of a browne greene colour: at the toppes of the ſtalkes come forth long purpliſh ſpikes, as it were containing ſundry knots of ſmall yellowiſh flowers,ſet one above another by ſpaces, after which come ſmall blacke and very hard heads, foure or five together about the joynt, in the hollow part whereof lyeth the ſeede.

8. *Millefolium aquaticum cornutum majus.* The greater horned Millfoile.

This likewiſe hath ſundry ſlender and brittle joynted ſtalkes ſwimming upon the water a cubit high,with many fine thinne and ſmall leaves compaſſing them at the joynts, whereof the lowermoſt are jagged like a Harts horne,but upwards they are finer, from the joynts alſo riſe ſmall ſlender footeſtalkes, three or foure inches long,

7. *Millefolium aquaticum pennatum ſpicatum.*
Feathered Millfoile.



8. *Millefolium aquaticum cornutum majus.*
The greater horned Millfoile.

9. *Millefolium aquaticum flore luteo galericulato.*
Water Millfoile with a yellow hooded flower.

10. *Stellaria aquatica.*
Starre-like Water Fennell.

somewhat like hornes, bearing at the toppe of each a ſmall white flower, made of foure leaves a peece, and after them a ſmall head, with divers ſeedes ſet together like a Crowfoote. *Bauhinus* in his Appendix to his *Pinax*,
M nm. maketh mention of a ſort hereof, much leſſer then the other, with ſmall leaves like haires and ſhort, ſo that the whole wing of leaves ſet together, doth not exceede one leafe of a Lentill.

9. *Millefolium aquaticum flore luteo galericulato.* Water Millfoile with a yellow hooded flower.

This hooded water Millfoile hath divers long leaves iſſuing from the roote lying within the water, made of many parts ſet on each ſide of the middle ribbe, each part conſiſting of many very fine and ſhort greene Fennell-like leaves, ſet as it were in tufts, one againſt another: the ſtalkes riſe up ſomewhat high, and reddiſh, without any leafe on them, but with ſundry pale yellow flowers, ſet in a good diſtance one from another, from the middle almoſt to the toppe, which flowers conſiſt of three leaves, the middlemoſt whereof is as it were hooded, before it be blowne open, but then is the broadeſt, and round at the end with a dent in the middle thereof making it repreſent the forme of an Hart as it is uſually expreſſed on the cardes.

10. *Stellaria aquatica.* Starre-like water Fennell.

Vnto theſe Water Millfoiles is adjoyned by *Lobel* and others this water Fennell, that from a long fibrous roote ſendeth forth ſundry weake ſlender and flexible ſtalkes, bending to and fro in the water, full of joynts, from the bottomes to the toppe, having two ſmall fine leaves like thoſe of Fennell almoſt, ſet at every one of them, and at the toppe of each a ſmall white flower, conſiſting of eight leaves, laid open like a ſtarre from whence roſe the name.

The Place and *Time.*

All theſe grow in the very waters, divers of them being often found in our owne land. The firſt whereof is the moſt frequent and the fourth and fifth next unto it, but the ſecond and third are ſtrangers as the reſt that follow are, and doe all flower for the moſt part, in the middle or in the end of Sommer.

The Names.

Dioſcorides and *Galen* call it in Greeke μυριόφυλλον *Myriophyllum* from the abundance of leaves that it hath, even a million as the word importeth, and *Millefolium* in Latine. Some as *Matthiolus* ſheweth, would referre our *Millefolium* which is a Land herbe unto this *Myriophyllon* of *Dioſcorides*, but he there ſheweth their erreur. The firſt here ſet forth is *Matthiolus* his firſt *Myriophyllum*, and called by *Dodonæus Millefolium aquatile*, by *Lobel Myriophyllum aut Maratriphyllum*, and by *Bauhinus Millefolium aquaticum umbellatum capilleceo brevique folio.* The ſecond is *Matthiolus* his *Millefolium aquaticum*, ſet to the Chapter of *Stratiotes*, in his *Dioſcorides*, which *Lugdunenſis* calleth *Stratiotes millefolium aquaticum*, and *Bauhinus* doubteth that it was a figure made of two herbes and ſent to *Matthiolus*, for *Lobel* in calling it *Millefolium aquaticum alterum Coriandrifolium*, doth rather referre it to the upper fine leaves then the lower of Coriander. The third is called by *Cluſius Myriophyllum aquaticum minus.* The fourth is the *Viola aquatilis* of *Dodonæus*, the *Myriophyllum alterum* of *Matthiolus* and *Lugdunenſis*

and

and the *Myriophyllon equiſetifolium fluviatile* of *Lobel*. The fifth is called by *Lobel Milefolium maratriphyllon flore & ſemine Ranunculi aquatici Hepatice facie*, and by *Cluſius Milefolium aquaticum flore albo*, *Geſnerus in hortis* calleth it *Alga paluſtris ſive flaviotilis*, and is the firſt *Alga* of *Tragus*: The ſixth is the *Myriophyllum maratriphyllum paluſtre alterum* of *Lobel*, & is the *Fœniculus aquaticus Dalechampij* of *Lugdunenſis*, but badly figured, and the *Peucedanum aquaticum* of *Tabermontanus*. The ſeventh and eighth, are onely mentioned by *Bauhinus*. The ninth is called by *Lobel Milefolium aquaticum flore luteo galericulato*, and *Fœniculum aquaticum galericulatum* by *Tabermontanus*. The laſt is the *Stellaria aquatica* of *Lobel*, and the *Fœniculum aquaticum Stellatum* of *Tabermontanus*. The *Italians* call it *Miriofillo*, the *French Groſlees de l'eau*: the *Dutch Water Violieren*, and we in *Engliſh* Water Yarrow, water Millfoile, water Gillovers, and water Fennell.

The Vertues.

The Water Millfoile is of ſuch a binding and aſtringent cold quality as *Galen* ſaith, that it healeth wounds and aſſwageth the heate and inflammations of them, and as ſaith *Dioſcorides*, it freeth wounds from inflammations, being applyed freſh or dryed with Vinegar, it is alſo given with vinegar and ſalt, to them that have had ſhrewd bruſhes or falls from ſome high place: it is likewiſe taken with vinegar to helpe them that cannot make water, and the other griefes in the bladder, caſuall ſighings alſo and the Toothache.

CHAP. XXXII.

Alſine aquatica. Water Chickweede.

THere are divers ſorts of Chickeweedes that grow in or neere the waters, that were reſerved for this place, and there are others that are left for the Sea, to be entreated of there.

1. *Alſine aquatica major.* The greater water Chickweede.

This greater Chickeweede hath a creeping roote, ſhooting out fibres in divers places, from whence ſpring up ſundry upright ſtalkes, joynted from the bottome to the toppe, and two ſomewhat long leaves at every joynt, ſomewhat like thoſe of Pellitory of the Wall, and at the toppe divers white flowers like Chickeweede, having many ſmall and pointed leaves in each flower.

2. *Alſine aquatica media.* The meane Water Chickweede.

The meane Chickweede hath from a fibrous roote ſundry ſtalkes riſing up to a yards height full of branches and ſmall long leaves on them, of a pale greene colour, the flowers are many, ſmall and white, made of five leaves a peece ſtanding at the toppe of every branch.

3. *Alſine aquatica minima* The leaſt water Chickweede.

This leſſer Chickweede hath a number of ſmall tender branched ſtalkes, and ſmall leaves growing on them, thicker ſet then in the former, but lying for the moſt part, on or neere the ground or in the water where it grow-

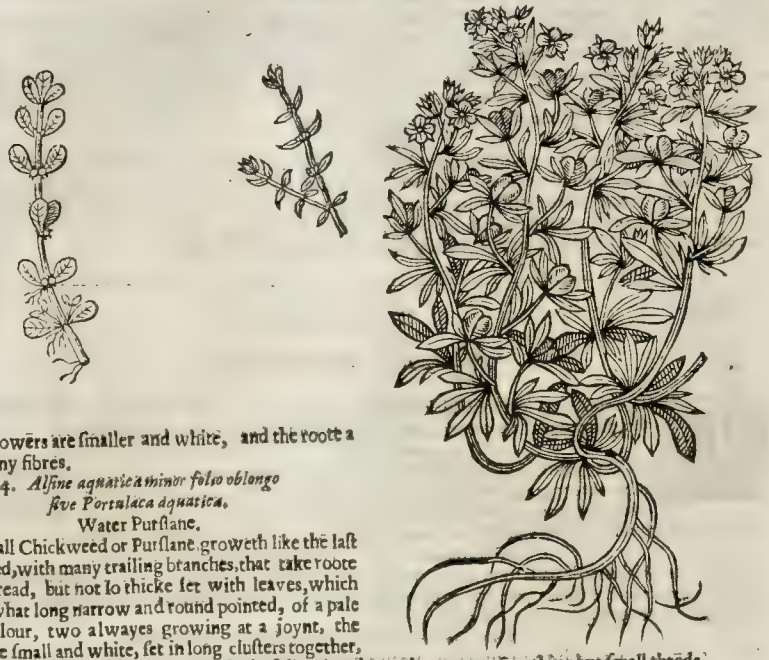
1. *Alſine aquatica ſive paluſtris major,*
The greater water or Marſh Chickeweede.

3. *Alſine aquatica minima.*
The leaſt water Chickeweede.

4. *Alsine aquatica folio oblongo sive Portulaca aquatica.* Water Purslane.

5. *Alsine palustris minor Serpillifolia.* Small Marsh Chickweede.

6. *Alsine recta flore cæruleo.* Vpright blew Chickweede.



eth, the flowers are smaller and white, and the roote a tuft of many fibres.

4. *Alsine aquatica minor folio oblongo sive Portulaca aquatica.* Water Purslane.

This small Chickweed or Purslane groweth like the last Chickweed, with many trailing branches, that take roote as they spread, but not so thicke set with leaves, which are somewhat long narrow and round pointed, of a pale greene colour, two alwayes growing at a joynt, the flowers are small and white, set in long clusters together, on small footestalkes, with very small seede following them, the rootes are nothing but small threds.

5. *Alsine palustris minor Serpillifolia.* Small Marsh Chickweede.

From a small fibrous roote springeth up sundry slender stalkes and branches, rooting againe as they lye, and spreading, with very small leaves thereon by couples, lesser then those, of *Serpillum*, or Mother of Time: after the small white flowers are past, succeede small flat pouches, one on each side of the stalke, with small seede therein.

6. *Alsine recta flore cæruleo.* Vpright blew Chickeweede.

This Chickweede riseth up for the most part with divers upright stalkes, joynted in sundry places, and divers small leaves growing thereon at the severall joynts, somewhat divided like unto the leaves of Rue, or somewhat resembling a Trefoile leafe, at the toppes, as also at the joynts come forth small blew flowers, consisting of foure leaves apeece, after which come small round Chickeweede like heads with seede, the roote is white and long, with some fibres thereat.

The Place and *Time.*

All these sorts grow in or neere Waters, and are found in sundry places of the Land, flowring in the heate of Sommer.

The Names.

Tabermontanus and *Gerard* from him make mention of most of these sorts. The fourth *Bauhinus* saith was sent him by the name of *Portulaca aquatica*, yet calleth it *Alsine palustris minor folio oblongo.* The fifth he also calleth as it is in the title. The last was called by *Tragus Heudlekraut*, not well knowing what title to give it, having the leaves divided somewhat like to ones hand, and that made *Thalius* also to call it *Dactilio botanon cæruleo flore, Lugdunensis* saith that some in those parts called it *Elatine triphyllos. Tabermontanus* called it *Alsine recta*, and so doth *Gerard* also, but *Bauhinus Alsine triphyllos cærulea.*

The Vertues.

The properties of these Chickweedes, are no doubt like unto the other Chickeweedes, their place of growing forme and taste being insipide, watery and cold, declaring the same, and therefore whatsoever may be said of these is to bee found among the other, and therefore to avoid repetitions, I referre you to the rest spoken of before, where you may be abundantly satisfied.

CHAP. XXXIII.

Alga aquatilis & Conferva. Fresh Water Excressences.

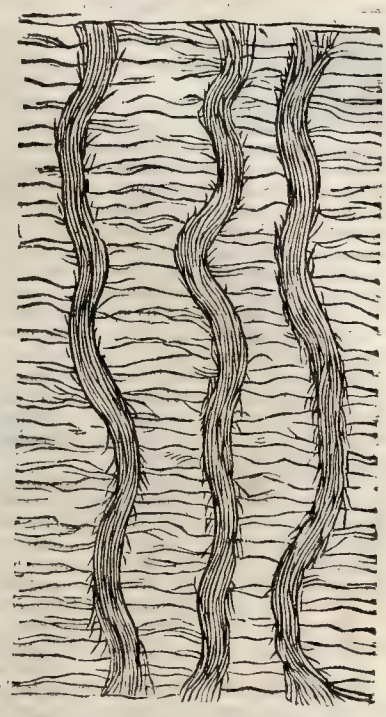
THere are an infinite number as I may so say, of Sea Excressences, called by sundry names as you shall further understand when I come to speake of them, which I would separate from those that grow in the fresh waters, and entreate of these in this Chapter, which although few, have yet severall titles whereby to be called.

1. *Alga sive Conferva fontalis trichodes.* Water Maidenhaire.

The water Maidenhaire groweth upon the stones in the bottome of springs, fastening it selfe thereto, and from thence,

1. *Alga sive Conferva fontalis trichodes,* Water Maidenhaire.

2. *Alga aquatilis Capillacea sive Conferva Plinij alijs Linum aquaticum.* The threddy or hairy water weede.



thence shooteth forth sundry fine greene stalkes with many fine threds on them, of a cubits length sometime, growing smooth out at length, and sometimes foulded one within another, without any other leaves upon them which when they are dry turne to be somewhat browne, and are of little or no taste at all.

2. *Alga aquatilis Capillacea sive Conferva Plinij, alijs Linum aquaticum.*

The threddy or hairy Water weede.

This Water weede groweth from the mudde in the bottome of lakes and other standing waters, and sometimes in slow running Rivers, which is wholly composed of a number of greene browniſh threds or haires joyned together, floting thereon, passing and waving to and fro all the length thereof, as the current of the streame runneth, or the winde driveth them, and are sometimes a yard long or more.

3. *Filum nigrum Scoticum sive Germanicum.* The *Scottish* or *Germane* blacke stringy plant.

This likewise groweth from some small stone in the bottome of the crancke of water neere the Sea shore, to be of two cubits in length, being nothing else then a number of thicke firme smooth, and blackish long strings, folded one among another, and hath neither roote leafe nor flower.

4. *Alga Bombycina.* The Water Cotton plant.

This excrescence is like unto a long and much spread locke of soft Wooll or Cotton, growing close together, spreading somewhat in breadth of a pale greene colour on the upperside, and whitish underneath, and swimmeth on the toppe of the water in pooles, &c.

The Place and *Time.*

The most of these doe grow in rivers and ponds, some not farre of this City, and others in other places, and are to be seene in the Summer time onely floating upon the Waters. *Lugdunensis* saith that the second was found in the greater Lake of *Lombardy*, neere *Millane.*

The Names.

The first is called by *Lugdunensis Conferva trichodes, vel Trichomanes aquatica*, and *Bauhinus Alga fontalis trichoides.* The second is the *Conferva Plinij* by *Lobel, Lugdunensis* and *Anguilara* before them, and as saith *Matthiolus*, called *Lina* by the *Florentines. Imperatus* called this *Linum aquaticum*, as he doth another very like this *Linum maritimum: Bauhinus* calleth it *Alga viridis capillaceo folio.* The third *Bauhinus* calleth *Alga nigra capillaceo folio, & Filum maritimum Germanicum*, saying it was sent him out of *Scotland.* The last he also saith that he had from the *Baltick* Sea, and giveth it the same title that I have prefixed before it. I have also given them their *English* Etymologies, as is fitting unto them as I thinke.

The Vertues.

Pliny hath recorded that he knew one cured incredible quickly, with his *Conferva* of a fall from a tree, while he was lopping it, which fall brake almost all his bones, by having the herbe bound to his whole body when it was fresh, and moistened with the water thereof, as often as it grew dry, and but seldome changed.

CHAP. XXXIIII.

Lens paluſtris, ſive Lenticula aquatica. Water Lentills.

THere are three or foure herbes to be referred to theſe Lentils, which are differing one from another, their place of breeding being their chiefeſt cauſe of affinity.

1. *Lens paluſtris ſive aquatica vulgaris.* Duckes meate.

This ſmall water herbe conſiſteth of nothing but ſmall round greene leaves, lying on the toppe of ſtanding waters, in ponds, pooles, and ditches, without either flower or ſeede that ever could be obſerved, onely from the middle of each leafe on the underſide, there grow certaine ſmall threds finer than haires, which paſſe downe into the water, but are not thought to deſcend to the ground from thence to draw nouriſhment. *Matthiolus* (and from him *Lugdunenſis*) reporteth a ſtrange narration, and I may ſay incredible; That if it ſhould happen (as ſometimes it commeth to paſſe) by inundations, that theſe ſmall Lentils or Duckes meate be carried away into running rivers, as ſoone as they cleave to the ſhore, they are wonderfully encreaſed: for by the roote that will grow from them like threds, they faſten themſelves into the ground, and then growing, becommeth to be plantes like unto *Siſymbrium* water Mintes, or Ladies ſmockes; and that this thing hath beene obſerved by diligent ſearchers of nature, not without much wonder of the matter: *ſtilicet.*

2. *Lens paluſtris ſive aquatica quadrifolia.* Croſſe leafed water Lentils or Duckes meate.

This other *Lens* hath a ſmall long ſlender roote ſhooting forth ſquare ſlender weake and trailing ſtalkes, with ſundry ſmall leaves upon ſeverall long foote ſtalkes, ſtanding together at the joynts diſtinct one from an other, which are parted into foure leaves a peece, and ſometimes it hath beene obſerved with ſix leaves, each end being round and lying in a ſquare forme like a croſſe upon the water: at the joynts likewiſe with the leaves, come forth diverſe ſmall heads of ſeede in cluſters, wherein are incloſed ſmall blackiſh ſeede like unto the fielde Lentils, but not ſo flat, being thicke and hard. *Lugdunenſis* ſetteth forth this kinde of water plant, by the name of *Lemna Theophraſti*, in a much differing manner.

3. *Lens paluſtris latifolia punctata.* Broad leafed ſpotted water Lentils.

This water Lentill hath ſundry round leaves ſet by couples on long ſtalkes, of an excellent greene colour on the upperſide, prickt very full of very fine ſpots, and under them many ſmall Lentill like heads cleaving unto them, ſome having but one, others two three or foure at a place, covered with a rough or rugged thin huske, very full of fine ſmall yellowiſh ſeede: at the bottome of theſe winged ſtalkes of leaves grow the rootes, which are a tuft of long ſtrings and fibers: it is onely of a wateriſh taſte.

4. *Lenticula aquatica bifolia Neapolitana.* Neapolitane water Lentils.

The water Lentils of *Naples*, hath very fine long ſlender ſtalkes, with leaves ſet together by couples, lying along upon the water, having ſeede veſſels growing hard unto them, foure uſually joyned together.

The Place and Time.

The firſt onely of theſe is familiar in our land as I take it: the third *Bauhinus* faith, groweth in the watery ditches at *Padoa*, in the river *Anxeris* by *Piſa*, and in *Sileſia* neere unto *Vratiſlavia*, the reſt are all ſtrangers, and are in their freſheſt beauty in the beginning of the yeare.

1. *Lens paluſtris ſive aquatica vulgaris.* Duckes meate.

2. *Lens paluſtris quadrifolia.*
Croſſe leafed water Lentils, or Duckes meate.

The

The Names.

It is called in Greeke φακὸς ὁ ἐπὶ τῶν τελμάτων, some take it to bee ἴτεον of *Theophraſtus*: in Latine *Lens paluſtris*, and *Lenticula paluſtris & aquatica*, and ſo do all Authors call the firſt ſort: the ſecond is the *Lens paluſtris altera* of *Matthiolus*, and *Lemma Theophraſti* by *Lugdunenſis*; as alſo the *Lenticulæ alterum genus* of *Ceſalpinus*, which *Bauhinus* calleth *Lenticula paluſtris quadrifolia*: the third is called by *Bauhinus* in his *Pinax*, *Lens paluſtris latifolia punctata*, being better expreſt in his *Matthiolus*, then in his *Phytopinax*, and by *Ceſalpinus* taken to bee *Stratiotes aquatica Dioſcoridis*: The laſt is mentioned by *Columna* by the name of *Callitriche* of *Pliny li. 25. c. 11.* mervailing at *Lobel* for ſuppoſing the *Cotylidon aquaticum*, as it is erroniouſly called (being a marſh Crowefoote, as the hot ſharpe taſte thereof doth teſtifie) to be *Callitriche* of *Pliny*; but yet ſaith this of his is not the right, but taketh that *Pliny* meant the *Trichomanes*, by his *Callitriche*, which I thinke cannot hold good, neither the one nor the other, for *Pliny* his words in the place before cited are theſe. *Fit ex Callitriche ſternutamentum, folia ſunt Lenticulæ ſimilia, caulis junci tenuiſſimi, radice minima noſcitur in opacis & humidis guſtatu fervens*; thus much *Pliny*: which it is likely made *Columna* comparing his with this of *Pliny*, both for forme and quality, not to dare to affirme it the ſame, becauſe ſaith *Pliny* it is *guſtu fervens*, which neither his nor *Trichomanes* is. *Bauhinus* calleth it *Lenticula paluſtris bifolia fructu tetragono*. The *Arabians* call it *Tahaleb*, and *Thaleb*, the *Italians*, *Lente de palude*, and *Lenticularia*; the *Spaniards*, *Lentille del lagua*; the *French*, *Lentille d'eau*; the *Germanes*, *Waſſer linſen*; the *Dutch*, *Water linſen*, but more uſually, *Enden grien*, that is Duckes herbe, and ſo we in *Engliſh*, Duckes meate, and of ſome, Water Lentils: the ſecond ſort is called by the *Italians*, with whom it is plentifull, *Lente paluſtre del ſeme*.

3. *Lens paluſtris latifolia punctata & Lenticula aquatica Neapolitana.* Broad leafed ſpotted Water Lentils, and that of Naples.

The Vertues.

It is cold and moiſt as *Galen* ſaith in the ſecond degree, and is effectuall to helpe inflammations, and Saint *Anthonies* fire, as alſo the Goute, either applied by it ſelfe, or elſe in a pultis with barlie meale: it is alſo good for ruptures in young children. Some ſaith *Matthiolus* do highly eſteeme of the deſtilled water of the herbe againſt all inward inflammations and peſtilent feavers, as alſo to helpe the redneſſe of the eyes, the ſwellings of the cods, and of the breſts before they be growen too much, for it doth not weakely repell the humours: the freſh herbe applied to the forehead, eaſeth the paines of the headache comming of heate. Duckes do greedilie devoure it, and ſo will Hens if it be given then mingled with branne.

CHAP. XXXV.

Pſeudocyperi. Baſtard or unſavoury Cyperus.

IN the end of the firſt Claſſis or Tribe of this Worke, I have ſhewed you ſundry ſorts of ſweete ſmelling Cyperus: but there are many other ſorts that ſmell not at all, called either baſtard or unſavoury Cyperus, ſomewhat reſembling the ſweete ſorts, both the round and long rooted Cyperus, and there are Graſſes alſo growing in the mooriſh places like unto them in roote or leafe, and therefore called Cyperus Graſſes. Of the former ſorts called Vnſavoury Cyperus, I meane to entreate in this Chapter, and of the Graſſes in the next following.

1. *Cyperus longus inodorus vulgaris.* Vnſavoury Cyperus with long rootes.

This long rooted Cyperus hath divers long and narrow rough three ſquare leaves riſing from the roote, encloſing or encompaſſing one another at the bottome, from among which riſeth up a three ſquare ſtalke foure or five foote high, with ſome ſuch leaves thereon, but ſmaller to the toppe, at each of whoſe upper joynts breake forth three or foure rough and almoſt round burres upon ſhort footeſtalkes, the roote creepeth under ground ſomewhat like the true ſweete long Cyperus, but blackiſh and with many more fibres thereat, and without any ſent in them.

2. *Cyperus longus inodorus ſylvaticus.* Mountaine or Wood unſavoury Cyperus.

This other long rooted Cyperus hath long joynted reddiſh rootes, and many long and narrow rough greene leaves riſing therefrom, compaſſed in the beginning with a reddiſh skinne: neither ſtalke nor head hath as yet beene obſerved.

3. *Cyperus rotundus littoreus inodorus Anglicus. Engliſh* round rooted unſavoury Sea Cyperus.

Our round rooted Sea Cyperus hath divers round rootes faſtened together by ſtrings, almoſt after the manner of *Filipendula* rootes, ſhooting forth ſundry heads of leaves that are long and narrow, three ſquare and cornered, the

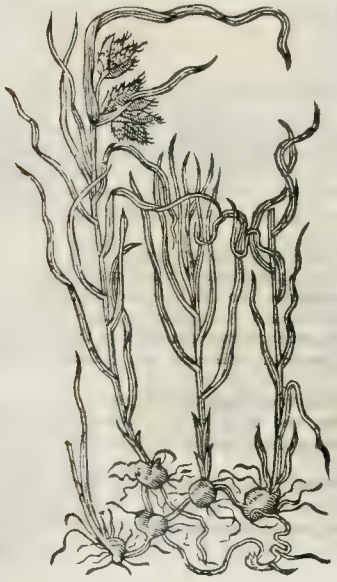
ſtalke

1. *Cyperus longus inodorus.*
Vnsavoury Cyperus with long roetes.

3. *Cyperus rotundus littoreus inodorus Anglicus.*
English unsavoury round rooted Cyperus.

5. *Cyperus rotundus inodorus aquaticus.*
Vnsavoury round rooted water Cyperus.

4. *Cyperus rotundus littoreus inodorus Anglicus alter*
Another round rooted unsavoury Sea Cyperus.



ſtalke alſo is three ſquare, two foote high and more, at each upper joynt whereof with the leaves come forth long cloſe heads, the whole plant is utterly without ſent at all.

4. *Cyperus rotundus littoreus inodorus Anglicus alter.* Another round rooted *Engliſh* Sea Cyperus.

This other *Engliſh* ſort is very like the laſt, both in rootes and leaves, but differeth from it in this, that it hath at the toppes of the ſtalkes three or foure blackiſh ſcaly heads ſet together at ſeverall places with the leaves.

5. *Cyperus rotundus inodorus aquaticus.* Vnſavoury water round rooted Cyperus.

This ſort of Cyperus hath ſundry blackiſh round rootes, ſet with many ſmall fibres as they ſpread in the ground from whence riſe ſuch like cornered leaves and ſtalkes, as in the former, a the toppes whereof with the leaves come forth long pannickles.

6. *Cyperus rotundus inodorus aquaticus alter.* Another Vnſavoury water round rooted Cyperus.

6. *Cyperus rotundus inodorus aquaticus alter,* Another unſavoury water round rooted Cyperus.

This Cyperus is very like the laſt ſort in the rootes, being ſomewhat long and round, like Olives, and many fibres at them, but the leaves are much longer, and the ſtalkes farre higher, the rough heades likewiſe or pannickles are ſhorter and more eminent, with ſome long leaves amongſt them.

The Place and *Time.*

The firſt is often found with us in the borders of fields and in woods; the ſecond in *Germany*, the third and fourth in our Sea coaſts, in divers places both of *Sheppey*, and *Thanet* in *Kent*, and in other places, the fifth on the banckes and in the ditches of the river *Scheld* by *Antwerpe*, and the laſt plentifully in the low marſhes beyond *Ratcliffe*, and are in ſeede in the end of *Auguſt*.

The Names.

The firſt is called by *Lobel Cyperus longus inodorus ſylveſtris*, and by *Bauhinus Cyperus longus inodorus Germanicus*: The ſecond he calleth as it is in the title. The third *Lobel* calleth *Cyperus rotundus inodorus littoreus*. *Cæſalpinus Pſeudocyperus*, ſaying the *Florentines* call it *Noalo*, and *Bauhinus Cyperus rotundus inodorus Anglicus* as I doe, but that I adde *littoreus* thereunto, and terme both it and all the reſt *Cypirus* for the reaſons ſhewed before in the firſt Claſſis. The fourth is a *ſpecies* of the laſt, chiefly differing in the toppe heads, which *Bauhinus* calleth *Cyperus rotundus inodorus Germanicus*, and ſaith that becauſe the figure of *Lobels aquaticus Septentrionalium*, which is my fifth was falſe, he ſet out this as the right, but this differeth both in roote and heads from it, and agreeing better with the former, which is my third for *Lobel* ſaith his *aquaticus Septentrionalium*, hath long pannickles which this hath not. The fifth is termed as I ſaid by *Lobel, Cyperus aquaticus Septentrionalium*, by *Camerarius Cyperus rotundus nigras inodoras radices habens*, being a different ſort alſo from the next, eſpecially in the heads, the laſt hath not beene publiſhed by any before.

The Vertues.

All theſe ſorts of unſavoury Cyperus, doe declare that they are as defective in heate and dryneſſe, as in ſent from the ſweete kindes, and therefore for any thing I can learne are not uſed for any purpoſe in Phyſicke.

CHAP. XXXVI.

Gramina Cyperoidea. Cyperus like Graſſes.

THere are ſo many ſorts of theſe Cyperus like Graſſes that I know not well how to divide them, and therefore muſt ſet them all together in one Chapter, and ſpeake as briefly of them as I can.

1. *Gramen Cyperoides majus latifolium.* The greater ſort of Cyperus Graſſe.

This greater Cyperus Graſſe hath ſundry large and long leaves like unto thoſe of Reedes, (*Lobel* ſaith like unto thoſe of Gilloſlowers) among which riſe up divers three ſquare ſtalkes, bearing three or foure cloſe ſpiked browniſh heads thereon one above another: the roote is browniſh and foulding it ſelfe one within another with many fibres at them. Of this ſort there is another, called by *Bauhinus*, *Gramen Cyperoides latifolium ſpica ſpadicea viridi majus*, whoſe rootes are more buſhy and fibrous, and the ſpiked heads more greene, having a long narrow leafe under the loweſt head. *Alterum.*

2. *Gramen Cyperoides majus anguſtifolium.* A great ſort of Cyperus Graſſe with narow leaves.

This other differeth little from the laſt, but in growing lower, with narrower leaves and ſpiked heads, that are thinner and longer, but of the ſame browniſh greene colour with it.

3. *Gramen Cyperoides minus anguſtifolium.* The leſſer narrow leafed Cyperus graſſe.

This leſſer ſort hath narrower leaves and three ſquare ſtalkes, bearing ſmaller and more ſpiked long heads, at the toppes, three uſually ſet together one a little from the other more ſtiffe alſo and upright, the roote hath long ſtringes and fibres thereat, ſhooting forth like Cyperus.

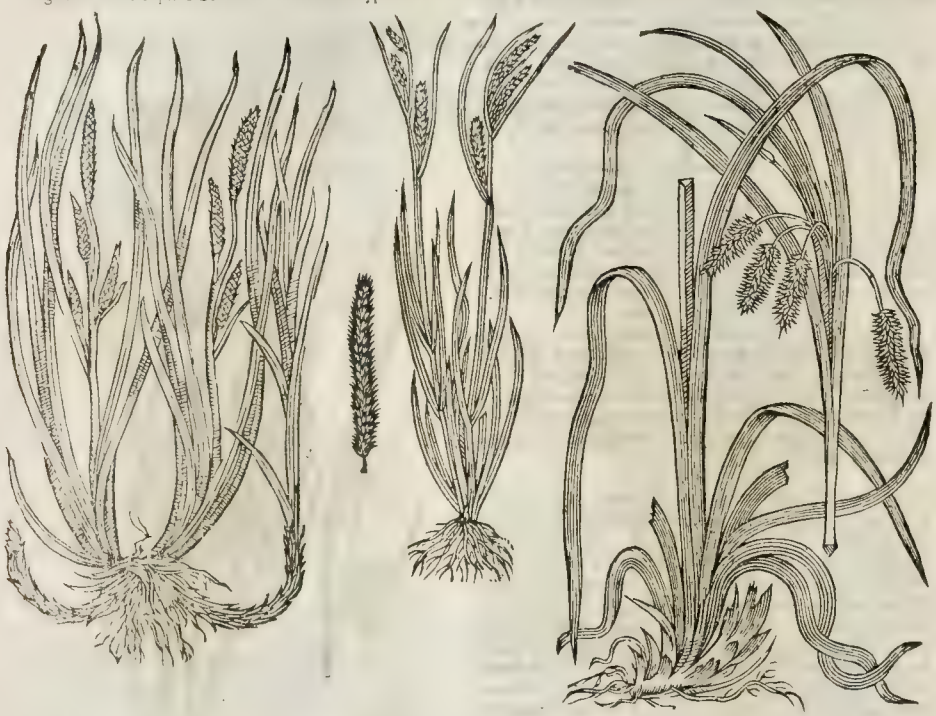
4. *Pſeudocyperus ſpica brevi pendula.* Baſtard Cyperus with ſhort pendulous heads.

This Baſtard Cyperus groweth ſomewhat like unto the true long Cyperus, having large and long graſſie leaves in

1 *Gramen Cyperoides majus latifolium.*
The greater broad leaf Cyperus Grasse.

3 *Gramen Cyperoides minus spicatum angustifolium.*
The lesser Cyperus Grasse with long spiked heads.

4. *Cyperus sive Pseudocyperus spica brevi pendula.*
Bastard Cyperus with short pendulous heades.



6. *Gramen Cyperoides palustre panicula aspersa.*
Marsh Cyperus Grasse with spaised heads.

7. *Gramen Cyperoides palustre majus.*
The greater Marsh Cyperus grasse.

8. *Gramen Cyperoides paluſtre minus.*
The leſſer Marſh Cyperus graſſe.

11. *Gramen Cyperoides Danicum glabrum.*
The Daniſh Cyperus graſſe.

12. *Gramen Cyperoides ſpicata fuſca elegantiſſima paniculâ Baionenſe.* The fine browne ſpiked Cyperus graſſe of Bayon.

in a manner three ſquare, and ſo is the ſtalkē alſo, at the top whereof from among divers leaves come forth great ſpiked thicke and ſhort heads hanging downewards, every one by a ſhort footeſtalke: the rootes likewiſe doe ſomewhat reſemble the true ſweete long Cyperus, but looſer and not ſo firme, fuller alſo of fibres, and not ſmelling ſweet at all.

5. Gramen Cyperoides ſpica pendula longiore.
Another ſort of Baſtard Cyperus graſſe.

This wild Cyperus graſſe hath a cornered ſtriped ſtalke, about two cubits high, bearing long and narrow leaves thereon, which compaſſe the ſtalke at the bottome, with a skinne or hollow ſheath, and hath ſeverall long and narrow pendulous heads at the toppe, five or ſixe inches long a peece with a long leafe under each head.

6. Gramen Cyperoides paluſtre paniculâ ſparſa.
Marſh Cyperus Graſſe with ſparſed heads.

The leaves of this Cyperus Graſſe are long and ſomēwhat narrow, hard and cutting on both edges, the ſtalke is tall without any leaves thereon unto the toppe, where betweene two long leaves and very narrow, ſpread forth divers ſhort footeſtalkes, bearing each foure or five ſmall rough heads: the roote ſpreadeth ſomewhat like the true Cyperus, but harder, fuller of blackiſh fibres and without ſmell.

7. Gramen Cyperoides paluſtre majus.
The greater Marſh Cyperus Graſſe.

This greater Marſh Graſſe hath ſundry long and narrow hard cutting leaves like the laſt. and among them divers tall upright naked ſtalkes, without any leaves on them at all, each of them bearing a long round and ſomēwhat large rough prickly head wherein lye the ſeede, the roote is a buſh of many blackiſh fibres like unto a Graſſe.

8. Gramen Cyperoides paluſtre minus. The leſſer Marſh Cyperus Graſſe.

This leſſer ſort is like unto the greater but ſmaller, the ſtalke bearing ſharpe rough ſpiked heads, foure or five together one above another on both ſides thereof, with a long leafe at the foote of them oftentimes.

9. *Gramen*

13. *Gramen Cyperoides paluſtre Baionenſe.*
Marſh. Cyperus Graſſe of Bayon.

14. *Gramen Cyperoides Bayonenſe Iſchæmi panniculis fuſcis.*
The Cyperus Graſſe of Bayon with browne Cockes foote pannicles.

9. *Gramen Cyperoides ſpicis minùs compactis.* Marſh Cyperus Graſſe with more open heads.

The roote hereof is ſomewhat hard or wooddy and full of fibres bearing many long and narrow leaves like to Graſſe, among which riſeth a rough three ſquare ſtalke bare of leaves for the moſt part unto the toppe, where ſtand ſeverall ſmall rough heades or ſpikes, more looſe or open then the former, having ſharpe pricking ſeede within them.

10. *Gramen Cyperoides panicula ſparſa ſubflaveſcente.* Yellowiſh open headed Cyperus Graſſe.

This yellow headed Graſſe hath ſmaller and ſhorter leaves and naked ſtalkes then any of the former, bearing at the toppes betweene two ſmall long leaves, a head ſevered into many ſmall parts or ſpikes of a yellowiſh colour: the roote is great at the head with divers fibres thereat. Of this ſort there is another differing little from it, but in the colour of the ſmall ſpikes which are blackiſh.

Panicula nigricante.

11. *Gramen Cyperoides Danicum glabrum foliis Caryophylleis.* A Daniſh Cyperus Graſſe.

This Daniſh Cyperus Graſſe hath divers ſtalkes with ſundry narrow ſtiffe and ſmooth leaves, three or foure inches long apeece, ſet together at the middle of them, from among which riſe naked ſhort ſtalkes, bearing at the toppes from betweene uſually two long leaves, diverſe ſmall long ſpiked heads, ſpread like thoſe of Ruſhes, of a browniſh greene colour: the roote is ſlender creeping under ground, ſhooting forth in divers places.

12. *Gramen Cyperoides ſpicata fuſca elegantiſſima panicula Bayonenſe.*
A fine browne ſpiked Cyperus Graſſe of Bayon.

This fine ſpiked Cyperus graſſe hath ſundry long and narrow leaves among which riſe up three ſquare ſtalkes, joynted in divers places and long leaves at them, with whom towards the toppes come forth long buſhing ſpiked heads, ſomewhat hard but not pricking each being two or three inches long of a very fine pale browniſh colour: the rootes are a buſh of many thicke ſtrings.

13. *Gramen Cyperoides paluſtre Baionenſe.* Marſh Cyperus graſſe of Bayon.

This Cyperus graſſe of Bayon, hath divers narrow long leaves, both below and on the ſmall ſtalkes, which are about two foote high, bearing at the toppes ſundry long and ſharpe prickely heads with long leaves at them, the roote is compoſed of ſundry long thicke ſtrings and fibres.

14. *Gramen Cyperoides Bayonenſe Iſchæmi panicuiis fuſcis.*
Cyperus graſſe of Bayon with browne Cockes foote pannickles.

This Graſſe of Bayon hath three ſquare ſtalkes almoſt two foote high, and very long narrow leaves even a foote and a halfe a peece at the bottome of them, and the like alſo at the joynts, with whom towards the toppes come forth very long and ſlender pannickles of a browniſh colour, being three or foure inches long and of the thickneſſe of a Mouſe taile, ſometimes but one at a joynt, but uſually two, and ſometimes three, the rootes are a buſh of many greater ſtrings and fibres at them.

The Place and *Time.*

All theſe ſorts of Graſſes grow in low moiſt and mooriſh grounds many of them as well in our owne land as in others, divers alſo have their ſeverall places expreſſed in their titles, and dee all flowriſh and ſeede in the end of Summer.

The

The Names.

From the likeneſſe as I ſaid unto both Cyperus and Graſſe in leaves or rootes, be all theſe ſorts entituled *Cyperoidea Gramina*. The firſt whereof is the *Gramen Cyperoides* of *Lobel*, *Camerarius* and others, *Bauhinus* taketh it to be the *Graminis quartum genus* of *Tragus*, which *Lugdunenſis* calleth *Carex Tragi*: but in that *Tragus* ſaith, his groweth in dry ſandy grounds and fieldes, and having the ſpiked heads more diſperſed then that of *Lobel*, I preſume they cannot be both one plant. The ſecond is by *Bauhinus* called *Gramen Cyperoides anguſtifolium ſpica ſpadicea viridi minus*, as the other ſort of the firſt he called *Latifolium majus*. The third hath not beene deſcribed by any before. The fourth is the *Pſeudocyperus* of *Lobel*, *Geſner* and *Dodonæus*. The fifth is deſcribed by *Bauhinus* in his *Prodromus* under the twelfth title. The ſixth is the *Gramen Cyperoides aquaticum vulgatius* of *Lobel*. The ſeventh is ſo called by *Lobel* as it is in the title, but *Thalius* calleth it *Gramen Iunceum triquetrum*. The eighth is called by *Lobel Gramen Cyperoides parvum aquaticum*. The ninth is ſo called by *Bauhinus* as it is in the title, and ſo is the tenth alſo, but ſaith it is the *Carex minus* of *Lonicerus*, and the fourth *Calamogroſtis* of *Tragus*, which *Lugdunenſis* putteth in the third place and figure, as alſo his *Iuncus exiguus pratenſis*, and the *Gramen marinum ſpicatum minus* of *Camerarius*. The foure laſt ſorts have not beene ſet forth before now.

The Vertues.

There are none of theſe Graſſes uſed for man or beaſt that I can learne, being moſt of them ſharing or cutting Graſſes, but eſpecially unprofitable for any Phyſicall uſe.

CHAP. XXXVII.

Gramina Iuncea paluſtria, aquatica, &c. Ruſh-like Graſſes of the Marſhes, Waters, &c.

IN the former Claſſis I ſhewed you divers ſorts of Ruſh-like Graſſes, that grew on the upper grounds, in this I meane to exhibite thoſe of the lower, and indifferently diſpoſe them together, whether they be naturall to the Marſhes, or Mooriſh grounds, the waters, or the Sea ſides.

1. *Gramen Iunceum paluſtre racemoſo ſemine.* Marſh Ruſh like graſſe with ſeedes in cluſters.

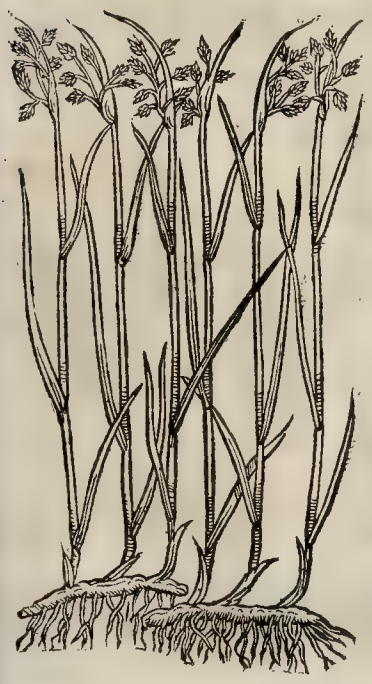
This Ruſh graſſe hath but few ſmall Ruſh like leaves, riſing from the blackiſh threddy roote: from among which commeth up divers ſtalkes a cubit high, bearing at the toppes betweene ſmall long leaves a ſmall head, formed like unto a bunch of grapes, wherein lie the ſeede.

Gramen Iunceum minimum aquaticum capitulo ſquamoſo. A very ſmall water Ruſh like graſſe.

This ſmall water Ruſh graſſe, hath as few, but ſmaller leaves than the former, being about two inches long a peece, the ſtalkes are foure or five inches high, each of them bearing a ſmall ſcaly reddiſh head, with the toppe of the ſtalke appearing above it: this is not that ſort is expreſſed in the former Claſſis among other Ruſh graſſes.

There is another ſomewhat like hereunto, but that the ſtalke appeareth above the head, which is not ſcaly.

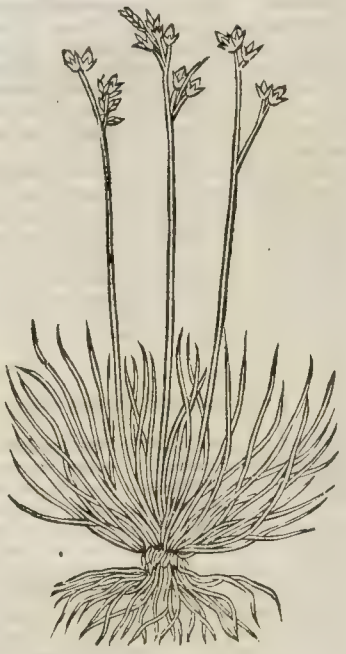
3. *Gramen aquaticum Iunceum vulgare.*
The Common Water Ruſh graſſe.



4. *Gramen Iunceum aquaticum magis ſparſa panicula.*
Another water Ruſh graſſe with joynted leaves.

5. *Gramen Iunceum aquaticum Bauhini folio articulato & cum uiriculis. Bauhinus* his double forme of Water Rush graſſe.

6. *Gramen Iunceum maritimum majus,* The greater Sea Rush-like Graſſe.

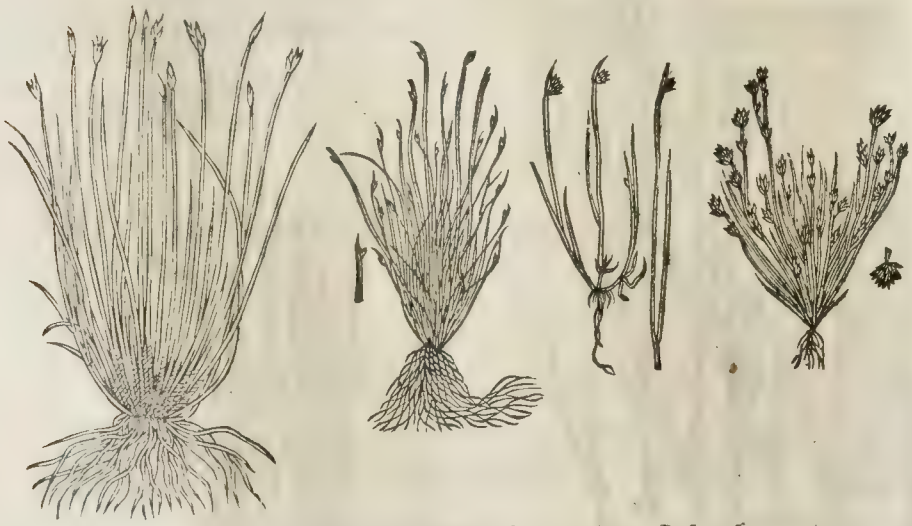


7. *Gramen Iunceum marinum densifolium.* Thicke Sea Rush Graſſe.

9. *Gramen Iunceum exile Plimmoſij.* Small Rush graſſe of Plimmouth,

10 *Gramen Iuncum magis exile pauciſoliu.* The leſſer Rush graſſe with few leaves.

11. *Gramen Iunceum minimum Holoſtio Matthioli congener.* The ſmalleſt Rush Graſſe like the former Toade graſſe.



3. *Gramen Iunceum aquaticum vulgare.* The common water Rush graſſe.

The common water Rush graſſe ſhooteth forth ſundry joynted ſtalkes, from a long thicke ſpreading roote, and at each joynt a narrow Rush like leafe, at the toppes of whom ſtand divers ſmall heades, ſomewhat like unto thoſe of Ruſhes.

4. *Gramen*

4. *Gramen Iunceum aquaticum magis sparsa panicula.* The other water Rush grasse with joynted leaves.

This other water Rush grasse is very like in the growing unto the last, the chiefest differences be in the stalkes, that are greater and rise higher, in the leaves which are joynted like unto the wood Rush grasse, and in the tops which are more spread with small heads.

5. *Gramen Iunceum aquaticum Bauhini. Bauhinus* his double formed water Rush grasse.

I have hereunto added this double formed kinde of Rush grasse of *Bauhinus*, called *aquaticum*, whereby he would correct that *Gramen aquaticum alterum* which *Lobel* and *Tabermontanus* set forth, because the leaves had no joynts in them as he saith the true sort should have, (but is rather another sort as I thinke,) for having given one figure with many small tufts or heades, such as it beareth in the summer time, he sheweth another, that the same plant he saith after hay harvest, shooteth forth another hand-high stalke with certaine chaffie heades, parted into many threds, and seldome beareth then any such like heads as the former on it: not having seene his sort, I can no further judge thereof, but give you my opinion.

6. *Gramen Iunceum maritimum majus,* The greater Sea Rushlike grasse.

This greater Sea Rush grasse hath many hard smooth leaves, like Rushes, rising from the tufted roote, and among them sundry slender naked stalkes about a foote high, with Rush like heades growing at the toppes, but much smaller.

7. *Gramen Iunceum maritimum densè stipatum.* Thicke set Sea Rushlike grasse.

This other Sea grasse hath long hard leaves like Rushes, growing thicke and close together, the stalkes are slender and not much longer than the leaves, every one bearing a small head at the toppe like unto a Rush, whereunto the roote is like also.

8. *Gramen Iunceum maritimum minimum Zelandicum.* The least Sea Rushlike grasse of *Zeland*.

This whole plant scarse exceedeth halfe a cubit in height, but spreadeth like a small tuffocke from each severall roote, whereof riseth a single small stalke, with small hairy like leaves therewith, & a small thicke head at the top.

9. *Gramen Iunceum maritimum exile Plimoutij.* Small Sea Rush grasse of *Plimmouth*.

The leaves of this small Rush grasse are many, growing thicke together, and as fine almost as haires or threds, among which rise up sundry slender unjoynted stalkes, bearing exceeding small sharpe pointed heades thereon, the stalkes appearing above them, and pointed: the rootes are many small long fibers. This was found as well at *Plimmouth* as *Dover* in their wet grounds.

10. *Gramen Iunceum magis exile paucifolium.* A lesser Rush grasse with fewer leaves.

This small grasse hath fewer and shorter stalkes and leaues than the last, more soft also and delicate, whose heads are a little bigger and prickly, and the stalke rising above them as in the other: the roote is small and slender.

11. *Gramen Iunceum minimum Holosto Matthioli congener.* The smallest Rush grasse, like the former Toad grasse.

This little grasse groweth with sundry small thred like leaves, scarse an inch and a halfe long, with smaller on the stalkes, which are about twise their length, at whose toppes stand two or three small heades like to those of Rushes, but with rounder graines or seedes therein, and closer set together; the roote is very small and threddy.

The Place and Time.

All these grasses are sufficiently declared in what manner of places they grow, flourishing in the summer time, as the rest doe.

The Names.

The first, second, fifth, and eight, are of *Bauhinus* mention. The third of *Tabermontanus* and *Lobel*, and so is also the sixt and seventh, the rest have not beene exhibited by any before.

The Vertues.

There can as little be said of these Grasses being hard and sapleſſe, that no cattle will feede thereon as of others the like, nor having in them any medicinable quality for man.

CHAP. XXXVIII.

Gramen Iunceum lanatum sive Bombycinum, vel Iuncus Bombycinus. Cotton Grasses or Rushes.

I Have foure or five sorts of these woolly or Cotton Grasses to shew you in this Chapter, which although they grow not all in wet grounds, yet resembling one another so neerely, I did not thinke it good to separate them, but set them altogether.

1. *Gramen Iuncoides lanatum sive Iuncus Bombycinus vulgaris.* Common feather or Cotton grasse.

The ordinary Cotton Grasse hath a few long slender leaves, almost like Rushes rising from a small tuft of threds thrusting downe somewhat deepe into the moorish ground, wherein it usually groweth, and among them hard slender stalkes, about a foote high, sometimes with a leafe or two thereon, and sometimes without either leafe or joynt, bearing at their toppes a fine soft woolly or rather white silkelike head, finer then the finest white wooll that is, of the bignesse usually of a Wallnut, with the outer huske, which is so eminent in ones eye a farre off, that it giveth much delight and admiration to the beholders, which passeth away into the winde being full ripe, what seede it hath is not observed.

2. *Gramen Iuncoides lanatum alterum Danicum.* The Danish Cotton Grasse.

This Cotton Grasse hath many more and narrower Rush like leaves growing from the roote, then the former, the stalkes are nothing so high as it, and the fine Cottony head is smaller and not so pure white: the rootes are much alike.

3. *Gramen Iunceum lanatum minus.* Small *French* Cotton Grasse.

Although this hath many more Rushy leaves then any of the former, yet doe not the stalkes rise much higher, nor beare they at their toppes so great a tuft or Cottony head, but are small and somewhat long, flying away with the winde being ripe, but leaving a small head like a Crowfoote head of seede behind it: the roote is somewhat blacke, and not much unlike the former.

4. *Gramen tomentosum Alpinum minus.*
Small mountaine Cotton grasse.

From a small unprofitable roote riseth a small stalke halfe a foote high, with two or three leaves thereon, at the toppe whereof standeth a small round head of Cotton.

5. *Iuncus Alpinus Bombycinus.*
Mountaine Cotton Rush.

This also sendeth forth from a Rush like roote, divers Rushes, and among them sundry slender stalkes an handbreadth high, bearing a small white head of wooll or cotton like the rest.

The Place and *Time.*

The first groweth in many places of this Kingdome, and on *Hampestead* heath neere *London*, about a bogge there, the second at *Elsinore*, in great abundance, and in *Germany* also, the third about *Mompelier*, the fourth in some moist places of the *Alpes*, the last in *Moravia*, and flourish chiefly in *July*.

The Names.

The first is diversly called by divers Authours, according as their knowledge and opinion thereof led them, for *Tragus* tooke it to be the *Gnaphalium* of *Dioscorides*, *Anguillara* his *Typha*, *Gesner* and others *Linum pratense* the *Germane* name being *Matten flachs*, *Lobel Iuncus Bombycinus*, *Dodonæus Gramen Eriophorum*, *Thalius Gramen Iunceum lanigerum*, *Tabermontanus*, *Gramen tomentosum & Linagrostis*. The second is the *Iuncus Alpinus capitulis lanuginoso* of *Bauhinus*, although

1, 2. *Gramen Iuncoides lanatum sive Iuncus Bombycinus. vulgaris & alter Danicus.* Common Feather or Cotton grasse, And another of Denmarke.

5. *Iuncus Alpinus bombycinus.* Mountaine Cotton Rush.

3. *Gramen Iunceum lanatum minus.* Small French Cotton grasse.

the figure exhibited was taken after the manner of the Danish growth, the fourth was sent by the title it beareth, The last is entituled as *Bauhinus* giveth it.

The Vertues.

Cordus onely saith of the first, that the decoction thereof in wine, and taken warme, easeth the griping paines in the belly. The woolly heads are gathereth by divers, to serve both to stuffe beds and cushions, and the like, which for the softnesse and goodnesse farre excelleth any Thistle downe.

CHAP. XXXIX.

Gramen Arundinaceum paluſtre. Marſh Reede Graſſe.

I Have ſhewed you in the laſt Claſſis before this, thoſe ſorts of Reede graſſes, that uſually grow on the upper groundes, although ſometimes in the lower alſo. In this I ſhall entreat of ſuch as grow in watery or marſhy places.

1. *Gramen Arundinaceum maximum Bayonenſe,* Great Marſh Reede graſſe of Bayon.

This great Reedegraſſe ſhooteth forth great thicke and very tall ſtalkes, as high as any man, joynted up to the tops, with long & ſomewhat broad hard rough and ſtraked leaves ſet thereon, but leſſe then thoſe below, towards the toppes of the ſtalks, with the leaves come forth many ſparſed tufts of chaffie heads, ſtanding on ſmall long footeſtalkes, the whole pannickle being a foote long and more: the roote creepeth farre about in the watery ditches and places neere *St. Iohn de Luce*, where it groweth.

2. *Gramen Arundinaceum aceroſa gluma noſtras.* Our great Reed graſſe with chaffie heads.

This ſort of Reedegraſſe hath many faire large Reedelike leaves, ſpringing from a joynted reddiſh roote, and are not much unlike to thoſe of Millet graſſe, but harder rougher, and ſtraked all the length of them, having great Reedelike ſtalkes three cubits high, joynted alſo and branched, and towardes the toppes bearing large, and ſomewhat hard pannickles of ſpiked chaffie heads, each of them about a ſpanne long, of a whitiſh colour in ſome places, and reddiſh in others, wherein lye ſmall ſeede.

3. *Gramen Arundinaceum ſericea molliore ſpica.* A leſſer ſoft headed Reede graſſe.

This other Reede graſſe is ſomewhat like the laſt, but leſſer, with narrower and ſhorter leaves, and lower ſtalkes, with but few joynts and leaves on them, the tufted heads that ſtand at the toppes, are ſomewhat like to the Ruſh that is called baſtard *Schœnanthum*, and turne into downe that is carryed away with the winde: the rootes are ſundry long ſtrings, ſet together at a head.

The Place and Time.

The place of the firſt hath beene expreſſed in the deſcription, the two other grow in the low moiſt grounds by *Ratcliffe* neere *London*, and flouriſh in the Summer time.

The Names.

Καλαμάγρωστις in Greeke, and ſo alſo *Calamogroſtis & Gramen Arundinaceum* in Latine, are as fitly applyed to theſe ſorts as the former, all theſe being of later invention, none having publiſhed any of them before.

1. *Gramen Arundinaceum maximum Bayonenſe.*
Great Marſh Reede graſſe of Bayon.

2. *Gramen Arundinaceum aceroſa gluma noſtras.*
Great Reede graſſe with chaffy heads.

The Vertues.

We have not yet heard or learned of any good property they have for medecine.

CHAP. XL.

Gramen aquatica. Water Graſſes.

THere are ſome other ſorts of Graſſes that properly grow in the Waters, and not ſpoken of before, after whom ſhall follow the Sea Graſſes that they may vſher in the reſt of the Sea plants.

1. *Gramen aquaticum majus.* Great water Graſſe.

This great Water Graſſe hath great and tall ſtalkes full of joynts, with large Reede-like leaves at them ſtriped with white and greene, like Ladies faces, but not ſo evidently to be ſeene, up to the toppe almoſt, where ſtandeth a large and long tufted pannickle of many parts and branches, like the common Reede, the rootes runne and ſpread farre, ſhooting up in ſundry places.

2. *Gramen arundinaceum aquaticum.* Great Water Reedegraſſe.

The ſtalkes of this are great and high, having broader and longer leaves then the former, and ſomewhat harder alſo, the joynts alſo be fewer, and the tufted pannickle is more ſpread and ſoft in handling, and of a purpliſh greene colour, whoſe bloomings are white, the rootes creepe not ſo much as the former.

3. *Gramen aquaticum panicula ſpetioſa.* The faire headed water Graſſe.

This Graſſe riſeth to be two cubits high, the leaves are broad and a foote long, but ſlenderly ſet on the ſtalkes, ſomewhat rough on the edges, ſome whereof will be hollow like a trunke that the ſtalke will goe through it halfe way, the toppe pannickle is made of many fine ſoft ſcaly tufts very beautifull.

4. *Gramen aquaticum paniculatum minus.* Small bearded Water Graſſe.

This Graſſe ſendeth forth from a thicke hard white fibrous roote, a round ſtraked ſtalke, about two foote high, compaſſed with ſundry broad rough pale greene leaves, neere a foote long, the toppe pannickle is a ſpanne long, thinnely or ſparſedly placed, made of many whitiſh heads, compaſſed with long awnes or beardes.

5. *Gramen Echinatum aquaticum majus.* The greater prickly headed water Graſſe.

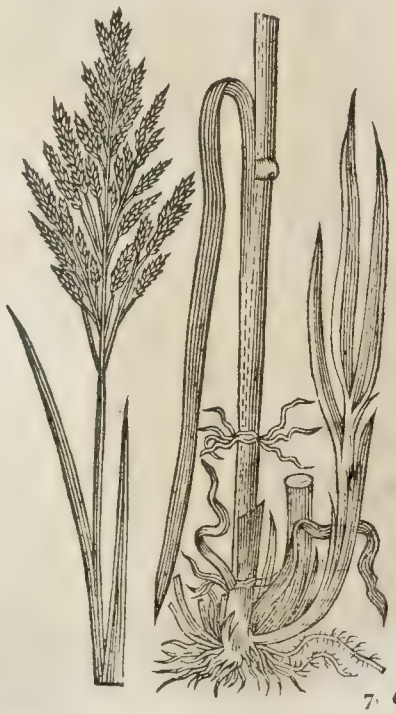
The ſtalke of this Graſſe riſeth up two or three ſpannes above the water, in the ditches where it groweth with divers long and narrow leaves, bearing at the toppes of the ſtalkes, divers ſmall prickely heads with long leaves at them, the rootes thruſt deepe in the mudde.

6 *Gramen echinatum aquaticum minus.* The leſſer prickely headed water Graſſe.

This other Graſſe is like to the laſt both in the leaves and prickely heads but ſmaller, and have no leaves ſtanding with them as the former hath.

1. *Gramen aquaticum majus.*
Great Water Reede.

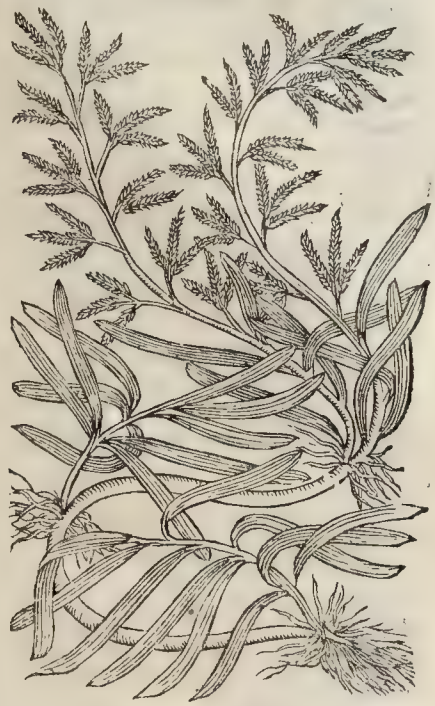
2. *Gramen Arundinaceum aquaticum.*
Great Water Reede graſſe.



7. *Gra-*

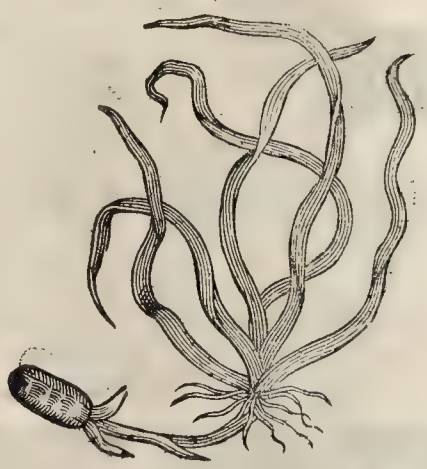
7 *Gramen aquaticum spicatum.*
Spiked Water Graſſe.

8. *Gramen flavitaile.*
Hoare Graſſe.



9 *Gramen aquaticum alterum.*
An other Water Graſſe.

11. *Gramen bulbo'um aquaticum.*
The Water bulbed Graſſe.



7. *Gramen aquaticum ſpicatum.* Spiked Water Graſſe.

The Water ſpiked Graſſe hath ſundry weake ſtalkes, leaning every way, full of joynts which are ſomewhat knobby or round, taking roote againe in divers places, having long and narrow leaves upon them, which lye floting upon and under the Water, that part that groweth up hath ſome leaves likewiſe thereon, and a long ſlender browne ſpiked head at the toppe, the roote buſheth thicke in the mudde with many ſtrings and fibres thereat.

8. *Gramen fluviatile.* Flote Graſſe.

The Flote graſſe groweth in the very like manner to the laſt, with leaning ſtalkes, and rooting at the joynts, but hath more ſtore of leaves on them, the toppes being furniſhed with ſundry ſpiked heads, two or three together at a joynt upwards.

9. *Gramen aquaticum alterum.* Another Water or Burre Graſſe.

The leaves of this Graſſe are long ſmooth and tender, among which riſeth up a ſtalke about halfe a yard high, with a few leaves ſet thereon, and at the toppe a many ſmall rough heads like burres.

10. *Gramen Fluviatile cornutum.* Horned Flote graſſe.

This ſtrange Graſſe hath a very ſlender ſtalke about two foote high, joynted at ſundry places, and two ſmall Ruſhy leaves for the moſt part ſet at each of them, growing ſomewhat broad, and compaſſing it at the bottome with a large skinne, from whence alſo riſe one or two ſtalkes ending in a skinny head, which hath at the end of them three or foure very narrow leaves, turning downewards, and ſeeming like hornes: the roote is ſmall and threddy.

11. *Gramen bulboſum aquaticum.* The Water bulbed Graſſe.

This Graſſe hath an ovall bulbed roote ſpotted with yellow markes, and white within, not having any ſent or taſte, from whence ſpringeth up betweene two eares as it were, a ſmall ſtalke about two inches long, with another longer peece thereon, at the toppe whereof thruſteth forth divers fibres, and from them divers long and broad leaves: but what ſtalke or flower it bore, we are yet to learne, being thus much onely brought and thereby deſcribed.

The Place and *Time.*

The two firſt doe growe in ponds and lakes, in ſundry places, as well of this Land as of others: The third in the watery places about *Padoa* and in *Haſſia* alſo. The fourth in the waters about *Michelfield* by *Baſſill.* The fifth ſixth, ſeventh, eighth and ninth, in watery ditches and ponds in divers parts of the land. The laſt in the Lakes neere *Mompelier*, and doe all flowriſh in the Summer time.

The Names.

The firſt is the *Gramen aquaticum harundinaceum paniculatum* of *Tabermontanus.* The ſecond the *Gramen majus aquaticum* of *Lobel.* The third and fourth are called by *Bauhinus Gramen paluſtre, &c.* but I have ſet them both under the title of *aquaticum.* The fifth and ſixth are not mentioned by any before. The ſeventh is ſo called by *Lobel* as it is in the title. The next hee calleth *Gramen aquis innatans.* The ninth is called by *Lobel Gramen aquaticum alterum.* The laſt is ſo called by *Bauhinus* as it is in the title.

The Vertues.

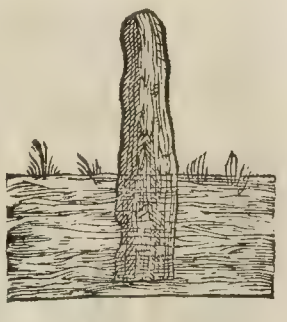
Moſt of theſe Graſſes will Horſes eate of, although we know not any uſe they have for any humane griefe.

CHAP. XLI.

Lythoxylon ſive lignum lapideum. Stone Wood.

Lythoxylon ſive lignum Lapideum.
Stone wood, or Wood made Stone.

LET me yet addethis Wood made Stone, in the end of theſe freſh Water plants, ſeeing diverſe waters in this Kingdome as well as others have that property, that what wood ſoever greater or leſſer, wrought or unwrought, by letting it abide in the water, in the Sommer time or Spring, for ſome time, according as the thickneſſe will give time to penetrate it, the branches of trees and greene herbes, yea leather gloves, and many other have beene metamorphoſed into ſtone, keeping that forme it held before it was put in, by the chilling quality of the water.



CHAP. XLII.

Gramina maritima. Sea Graſſes.

THe Sea Graſſes as I ſaid before, are fitteſt to be joyned next unto the former Water Graſſes, that after theſe I may ſhew you the reſt of the plants that grow in or neere the Sea, or within the aire or breath thereof, which are properly called Maritime plants.

1. *Gramen Caninum geniculatum maritimum ſpicatum.* Sea ſpiked Dogs graſſe or Quich graſſe.

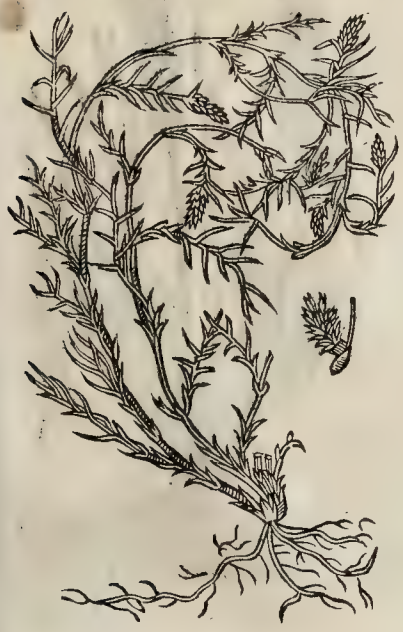
This Sea Graſſe hath divers joynted ſtalkes about a foote high, with hard leaves thereon, a ſpanne long, and like the other quich graſſe, the ſpiked heads are ſhorter by much and harder then the common kinde: the roote is full of joynts and creepeth under ground like it.

2. *Gramen*

1. *Gramen Caninum geniculatum maritimum spicatum.*
Sea spiked Dogs grasse or Quich grasse.

3. *Gramen Caninum maritimum alterum longius radicatum.*
Sea Dogs grasse with longer rootes.

4. *Gramen Caninum maritimum spicatum Monspelicnse.*
Sea spike grasse of *Montpelier.*



5. *Gramen Caninum maritimum asperum.*
Rough Sea Grasse.

2. *Gramen maritimum vulgato Canario ſimile.* Sea Quich graſſe.

This other Sea graſſe is a ſlenderer, harder, and lancker Graſſe then the ordinary quich graſſe, and of a more blewiſh greene colour, and differeth not in any thing elſe. But there are two other differing ſorts hereof obſerved, the one in the rootes, which at the ſeverall joynts as it runneth, doth ſhoote up the like ſtalkes, leaves, and ſpiked tufts, and will be ſometimes twenty foote in length, with a number of thoſe tufts of ſtalkes and leaves at them: the other in the ſpikes, which will have two rowes or orders in them.

3. *Gramen Caninum alterum maritimum longius radicatum.* Sea Dogs graſſe with long rootes.

This long rooted Sea Graſſe differeth little from the former, either in the hard leaves or in the running rootes, but that they ſpread more, and inſtead of ſpiked heads at the toppes of the ſtalkes, this hath chaffie heads among the leaves.

4. *Gramen Caninum maritimum ſpicatum Monſpelienſe.* Sea ſpiked Dogs graſſe of *Mompelier.*

This *French* Sea graſſe hath ſlender wooddy rootes, with but few fibres ſet thereat, from whence riſe divers trailing ſtalkes a foote or more high with ſundry joynts and branches at them, and ſhort narrow reedelike leaves on them, at the toppes whereof grow ſpiked heads of three inches long apeece, of a darkiſh aſh colour.

5. *Gramen Caninum maritimum aſperum.* Rough Sea graſſe.

The roote of this graſſe is a buſh of long white fibres, from whence ſpring many reddiſh round ſmall ſtalkes, which at the firſt leane downewards, about a foote high, compaſſed with hard ſhort and ſharpe pointed leaves, ſtanding as it were in a tuft together, with hard rough dents about the edges: the ſpiked heads are ſomewhat like unto ſmall rough hard burres, breaking out of a skinne wherein they were firſt encloſed.

6. *Gramen exile vicinorum maris aggerum.* A ſmall graſſe of the Sea downes.

This ſmall Sea graſſe ſhooteth forth divers ſhort ſtalkes of two inches long, full of ſmall long leaves like haires, ſet cloſe together, and among them at the toppes ſmall heads, like the catkins of the dwarfe Willow, the roote is ſmall and threddy.

7. *Oxygroſtis maritima Dalechampij.* Sharpe pointed Sea graſſe.

The buſhy ſtalkes hereof are about two foote long, full of joynts, with two long and narrow graſſe like leaves at every one of them, of a darke greene colour, and ſo ſharpe at the points that they are ready to peirce their legges that paſſe by it unawares.

8. *Gramen Iuncoides maritimum.* Sea Ruſh graſſe.

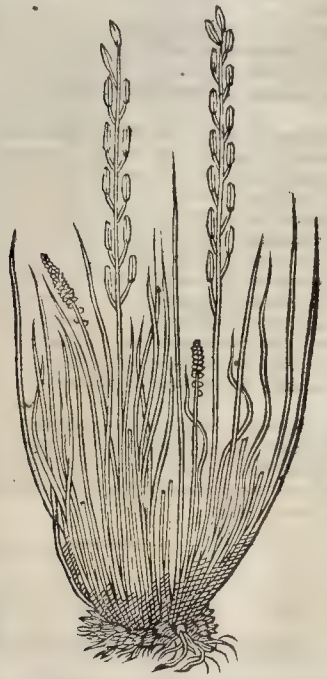
The Sea Ruſh graſſe hath from a blackiſh browne ſingle roote, pleaſant in taſte and full of hairy fibres, ſundry ſhort ſtalkes about a foote long with ſlender limber Ruſh like leaves thereon, twiſe as long as the ſtalkes, and at the toppes three or foure leaves a ſpanne long, encompaſſing a rough head like a Ruſh which is full of chaffie ſeedes.

7. *Oxygroſtis maritima Dalechampij.*
Sharpe pointed Sea graſſe.

9. *Gramen marinum ſpicatum.*
Spiked Sea graſſe.

9. *Gramen*

10. *Gramen marinum ſpicatum alterum.*
Another ſort of ſpiked Sea graſſe.



11. *Gramen marinum mediterraneum majus Statice Plinij quibuſdam.* Great Sea Thrift.

9. *Gramen marinum ſpicatum.* Spiked Sea Graſſe.

The roote of this Graſſe is compoſed of a buſh of many long ſtrings or fibres, from whence riſe many long hollowed or guttery leaves, compaſſing one another at the bottome, among whom ſpring two or three ſtalkes bare of leaves unto the toppes where they beare long ſpiked heads of greeniſh flowers ſet cloſe together.

10. *Gramen marinum ſpicatum alterum.*
Another ſort of ſpiked Sea Graſſe.

The leaves hereof are ſlender long narrow hard and ſharpe pointed growing often on the low places nere the Sea, that ſometimes waſheth over it, which no cattle will eate willingly, it beareth ſundry low ſtalks with ſmall long and round heads thereon.

11. *Gramen marinum mediterraneum majus Statice quibuſdam.* Great Sea Thrift.

Although I have in my former Booke deſcribed and pictured both the ſorts of Thrift, the greater and leſſer, yet becauſe I am to ſhew you another ſort of the greater kinde. I will here againe briefly remember them, and ſhew you that the greater of them groweth with many faire long and ſomewhat broad whitiſh greene leaves, lying cloſe together upon the ground, from whom riſe ſlender ſtalkes, naked unto the toppes, except in one place toward the middle, where it hath two ſmall leaves, turning downewards contrary to almoſt all other herbes and at their tops a tuft of bluſh coloured flowers, opening by degrees.

13 *Gramen marinum minus.*
The ſmall ordinary Thrift or Sea Cuſhion.

12. *Statice Americana.* Great Sea Thrift of *America.*

This other great Sea Thrift of *America*, hath likewiſe many ſuch leaves as the laſt hath, but they are of a ſadder greene colour, and ſomewhat ſhining with two ribbes in each, and blunt at the ends, the ſlender ſtalkes beare alſo ſuch a tuft of flowers, but they are white and breake out of a skinne which falleth downe about the ſtalke, the roote is long and with but few fibres thereat.

13. *Gramen marinum minus.* Small Thrift or Sea Cuſhion.

This other ſmaller ſort is well knowne to have many ſmall hard ſhort greene leaves thicke growing together and

and ſpreading on the ground, the ſtalkes are many of a ſpanne high, without any leaves on them, but at the tops a ſmall round tuft of bluſh coloured flowers.

The Place and Time.

The three firſt ſorts, the ſixt and the laſt, have beene obſerved on our Sea coaſts, eſpecially in *Kent*, the fourth and the eighth, about *Mompelier* and *Narbone*, and the fifth both on the *Venetian*, *Ancomitane* and *French* ſhoares, alſo about *Mompelier*, the eleventh as well on the hils, as neere the Sea, and hath beene often ſent us from *Portugall*, the reſt are found neere the Sea coaſts in many places, and are in flower and ſeede in the end of Summer.

The Names.

The firſt and third ſorts are mentioned by *Lobel*, the ſecond ſixth and eight have not beene remembred by any other Author before, the fourth and fifth are mentioned by *Bauhinus*, by the names of *Gramen Caninum maritimum ſpicatum*, and *Gramen Caninum maritimum aſperum*, the ſeventh is ſo called by *Lugdunenſis* as it is in the title, the ninth and tenth are mentioned by *Lobel*. The eleventh *Cluſius* firſt called *Gramen marinum majus*, and ſo doth *Tabermontanus* alſo, but afterwards in his hiſtory of Plants, he calleth it *Armerius montanus tenuifolius major*. *Lobel Caryophyllus montanus*, *Lugdunenſis* ſaith it is called *Statice* by ſome from the preſent help in ſtanching blood in the body whereſoever, and ſo by *Camerarius* alſo, but differeth from the *Statice* of *Pliny*, and as divers from his *Cantabrica* although *Camerarius* taketh it to be the *Cantabrica* of *Anguillara*, yet ſurely it is called *Statice* by divers now adayes, and as *Lugdunenſis* ſaith, divers herbariſts of *Paris* called it *Catanances alterum genus*, but by many alſo *Caryophyllus montanus alter* or *major*, as *Bauhinus* alſo doth adding therero *flore globoſo*, and others *Gramen marinum majus*, as they doe the laſt *Gramen marinum minus*, and others *Caryophyllus marinus minimus*, but *Cluſius Armerius montanus tenuifolius minor*: *Dodonæus* calleth them both *Gramen palyanthemum majus & minus*, and the leſſer *Pſeudimoly* in his *French* Herball, as *Geſner in hortis* doth alſo, the twelfth is ſtiled *Statice Americana* by *Cornutus*.

The Vertues.

It is generally held that the rootes of the Sea Quich graſſe is as effectuall as the ordinary or common ſort, and therefore for the qualities, I muſt referre you to be enformed there where I ſpeake of it, that ſo I may avoide a double repetition of the ſame things, the reſt are not put to any uſe in Phyſicke that I know. This difference betweene theſe and thoſe of the Land hath beene obſerved that cattle will not feede on the leaves of theſe by reaſon of their hardneſſe, roughneſſe, and ſharpeneſſe, when as they refuſe not the other.

CHAP. XLIII.

Alſine marina. Sea Chickweede.

THere are ſome ſorts of Chickweede that are reſerved out of the family of the former Chickeweedes to be entreated of in this place.

1. *Alſine minima.* Sea Chickweede.

2, 3. *Alſine maritima Neapolitana & Coronopus tenuifolius Neapolitanus marit.* Bluſh Chickweed of Naples, and ſmall Sea Buckes horne of Naples.

1. *Al-*

1. *Alsine marina.* Sea Chickweede.

This Sea Chickweede groweth for the moſt part with the branches lying on the ground, very like unto the middle ſort of Chickweede, but that the ſtalkes are ſhorter and thicker, and cloſer joynted with ſuch like leaves at them, yet thicker and whiter, the flowers are compoſed of many ſmall leaves ſtanding like a ſtarre: the ſeede veſſells that follow, are not long and round like the other, but flat and ſomewhat broad, wherein are contained three or foure greater ſeedes: the roote is threddy. Another like hereunto is that Sea Chickweede that *Cluſius* ſaith he found with thicke leaves, like unto Purſlane, growing on the ſandy hils neere the ſhore in *Holland*, but that the flowers as he ſaith were greeniſh. *Altera.*

2. *Alsine maritima Neapolitana flore rubente.* Bluſh Chickweede of Naples.

The ſtalkes of this Chickweede are exceeding ſmall, lying on the ground, round about the rootes, with as fine and ſmall leaves almoſt thereon, two alwayes or more ſet croſſewiſe at the joyntes, being of a fingers length almoſt: the flowers ſtand at the toppes, as in the former Sea Chickweede, but of a bluſh or pale purple colour, whoſe ſeede is contained in the like long heads as others: the roote is threddy as the reſt. With the figure hereof you have in the ſame table that ſmall Sea Buckes horne of Naples ſet forth by *Columna*, the deſcription whereof you ſhall finde before in *pag* 501. and might very well have beene brought hither, among theſe other Sea plants.

The Place and *Time.*

The titles of theſe declare their places of breeding, and their time is with the others.

The Names.

The firſt is called *Alsine marina* of *Dodonæus* and *Tabermontanus*, but *Lobel* calleth it *Alsine ſive Hippia major*, and *Cæſalpinus Centunculus*, the other kinde whereof *Cluſius* calleth *Alsines genus pelagicum.* The ſecond is called by *Columna*, *Alsine maritima Neapolitana.*

The Vertues.

There is little uſe made of theſe Chickweedes in Phyſicke, and yet their taſte as well as their forme, declare them of the ſame temperature with the other ſorts.

CHAP. XLIV.

Lenticula marina vulgaris. Ordinary Sea Lentils.

Lenticula marina vulgaris, & ſerratis foliis, Ordinary Sea Lentils.

Serratis foliis.

NAturall to the *Tyrrhene* and *Adriaticke* Sea, betweene the *Florentine* and *Venetian* Dominions, there groweth, ſaith *Lobel*, this plant, which hath the long and narrow leaves of *Scoparia* or Broome Flax, very thicke ſet on weak bending ſtalks, halfe a foote long and full of empty round skinny berries, like unto Lentils, from whence it came to be ſo called. There is another ſort hereof called *Lenticula marina ſerratis foliis*, very like it differing onely in that it hath broader and ſhorter leaves, dented about the edges.

The Place, Time, Names and *Vertues.*

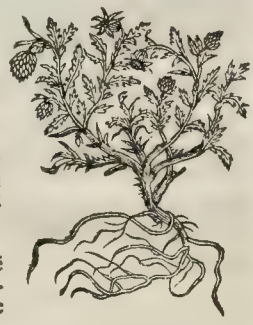
Their Place is declared, and Time to be underſtood the Sommer. *Lobel* calleth it *Lenticula marina Serapionis*, and ſo doe *Tabermontanus* and *Lugdunenſis* after him, who alſo ſaith it is called by ſome *Vva marina*. *Bauhinus* calleth that with plaine leaves *Fucus folliculaceus Linariæ folio*, and ſaith that *Imperatus* called it *Acinariæ marinæ altera ſpecies*, but the other with jagged leaves, he calleth *Fucus foliaceus ſerrato folio*, and of *Imperatus Acinariæ marinæ tertia ſpecies*, but to what uſe it may ſerve in Phyſicke hath not yet beene obſerved. *Cluſius* in his *Scholia* on the laſt Chapter of *Acoſta* his Booke of ſimples putteth it to the queſtion whether that with dented leaves, ſhould not be that herbe that is called *Sarguaſo*, but *Bauhinus* in his *Pinax* ſetteth it downe as if it were certaine. Theſe have been often ſeen covering the Sea, in ſayling to the Eaſt Indies, betweene eighteene and thirty foure degrees of Northerly Latitude, which by hindering the ſhips paſſage, ſome of the Saylers in cleering the ſides of the ſhip, brought it into the ſhip, and while it was freſh did eate thereof both raw and boyled, but grew hard and brittle when it was dry, and was of a cleanſing property for urine, as one of the Saylers troubled with foule humours and the ſtopping of thoſe paſſage, found to his eaſe that did eate thereof. *Acoſta* his deſcription thereof is in this mauner. This plant groweth in a large ſmooth Sea covered therewith, as farre as the eye could diſcerne, whoſe bottome could not be reached unto by our plumme line, yet very likely to riſe from the bottome, as might be diſcerned by the berries wrapped together thereon on the branches, and being pulled up was of an hands length, with leaves halfe an inch long, dented about the edges, and of a reddiſh colour, without taſte but what it had from the Sea water: at every leafe it bore a berry like a Pepper corne, but hollow full of ſalt water, and of a white colour, or mixt of white and red: being freſh and new taken up it is tender, but brittle and hard when it is dryed.

CHAP. XLV.

1. *Parthenium marinum.* Sea May weed or Feather few.

THis ſpreadeth many ſhort branches on the ground about an handbredth long, having divers long and narrow leaves ſet about them. cut in on the ſides like to the greater Daiſy leaves, of a ſtrong or ſtinking ſavour like unto the ordinary Mayweede, and having flowers not much unlike it alſo, the roote is long and ſlender, and ſhooteth forth divers fibres from it.

Parthenium marinum. Sea Mayweed or Feather few.



2. *Chamæmelum maritimum.* Sea Camomill.

The roote hereof is blackiſh ſpreading into many long fibres, ſending forth ſundry weake ſtalkes lying on the ground, ſet on both ſides with larger leaves then are in the ordinary May weede, having a large white flower, and a yellow thrum in the middle.

The Place and *Time.*

The firſt groweth neere the Fiſhers Cottages at the foote of the hill *Ceſtius* in *Narbone* in *France*, the other in the ſandy grounds neere the Sea ſhore, and flower in Summer.

The Names.

Lobel calleth the firſt *Cotula ſive Parthenium marinum minimum, Lugdunenſis Parthenium marinum minimum. Bauhinus Matricaria maritima*, and thinketh that it is the *Chamæmelum maritimum Dalechampij*, ſet downe in the ſecond place and called *Cotula marina* by *Lobel.*

The Vertues.

The firſt hath neither weaker, (ſaith *Lobel*) nor differing properties from thē ordinary Mayweede, which for to avoid a double repetition of one thing, I referre you to the Chapter of Mayweede in the firſt Claſſis of this Worke. Of the other there is no particular property recorded.

CHAP. XLVI.

Conyza marina. Sea Fleabane.

Conyza marina. Sea Fleabane.

THis kind of *Conyza*, that groweth in the fields neere the Sea Coaſts, hath a long dry hard roote, and from thence riſeth a round ſtalke, about a foote high, branched into ſundry parts, ſet with long and narrow leaves ſomewhat like unto the ſmaller Ribbewort Plantane, almoſt without taſte yet a little bitter: the flowers are yellow, ſtanding in a cloſe tuft together, and are blowne away with the wind when the head is ripe.

The Place and *Time.*

The place is declared before, and the Sommer is the time of its flowring.

The Names.

Lugdunenſis calleth it *Conyza marina*, and *Bauhinus* as I ſaid in the ſix and twentieth Chapter of the ſixt Claſſis here before, would referre it to the *Chondrilla altera Dioſcoridis Rauwolfio*, which I there ſaid, I thinke to be erronious for the reaſons there alledged.

The Vertues.

It is thought to have the ſame properties that thē other Fleabanes have.

CHA:

CHAP. XLVII.

Glaux maritima. Sea Milkewort.

OVr moderne Authours have mentioned divers sorts of *Glaux*, whereof that of *Clusius* and another called *Vulgaris*, have beene formerly handled before in this Worke. *Dodonæus*, *Lobel* and others, have exhibited one that I meane to entreate of in this Chapter, which is the lesser, *Cordus* and *Camerarius*, a greater, and *Alpinus* one differing from them both, each supposing theirs to be the neerest unto *Dioscorides* his *Glaux*.

1. *Glaux maritima major.* The greater Sea Milkewort.

The greater of these Milkeworts hath sundry slender weake stalkes spread on the ground, beset with divers Lentill like leaves, yet a little larger, and of a grayish greene colour on the upper side, and more grayish underneath, the flowers are purple set at the joynts with the leaves, after which come small buttons with seede in them, the roote shooteth downeright, but the branches as they spread take roote againe. *Bauhinus* saith there is some variety observed herein: the greater sort having sometimes much larger leaves, and sometimes narrower, the lesser sort having the stalks thicker stored with leaves, especially upwards, the lower being falne away, leaving the stalkes bare, and as if they had great joynts.

2. *Glaux maritima minor.* The lesser Sea Milkewort.

The lesser sort differeth little from the former, in the manner of growing, but in the smallnesse both of stalkes and leaves, and that this is found growing in places neere the Sea or salt Lakes, and the other as well on the hils, &c. as neere the Sea.

3. *Glaux maritima Veneta Alpino.* The *Venetian* Sea Milkewort of *Alpinus*.

This *Venetian* Sea Milkewort riseth up from a slender long wooddy branched roote, with foure or five slender stalkes a cubit or more high, set at equall distances with sundry somewhat long and narrow leaves, greene on the upper side, and hoary white underneath, and at the toppes foure or five flowers standing together, as it were in an umbell for forme and bignesse, being very like unto the bastard Scorpion like podded *Sena* of *Candy*, but of a whitish blush colour, and are succeeded by small short round pods, having small hard round seede within them, tasting a little sweetish.

The Place and *Time*.

The first groweth in many places of *Germany*, and was sent as *Bauhinus* saith, to him from out of *Stotland*, but the lesser is often found, both on the *Kentish* and *Essex* shores, and the last as *Alpinus* saith in the salt marshes neere unto *Clodio*, a City of the *Venetians*, flowring and seeding in the end of Summer.

2. *Glaux exigua maritima.*
Small Sea Milkewort.

3. *Glaux maritima Veneta Alpino.*
The *Venetian* Sea Milkewort of *Alpinus*.

The Names.

The Greeke name γλαυξ is taken from γάλαξ or γλέξ, which is milke, and the Latines follow the Greeke name *Glaux*, and not as some thinke a *glauco colore*, for the Latine derivation cannot suite with the Greeke word. *Pliny* saith it is called also γάλακτιν, because it restoreth the decayed milke in Nourses breasts. *Cordus* on *Dioscorides*, and *Camerarius in horto*, mention the first, which *Bauhinus* calleth *Glaux latiore folio Thuringiaca*. The second, *Dodonæus*, *Lobel*, *Camerarius*, *Tabermontanus* and *Lugdunensis* speake of, and call it *Glaux exigua maritima*. The last is mentioned by *Alpinus* in his Booke of *Exoticke* plants, by the name of *Glaux in maritimis*, but *Bauhinus* would referre it to *Clusius* his *Dorychnio congener*, as if they were both one plant, and of the Family of the Trefoiles, or Lotus, yet surely howsoever they be in some things alike, they are most likely to bee different plants, and therefore I have placed it here, being of *Alpinus* his judgement, that it doth come as neerely if not more, unto *Dioscorides* his *Glaux* then any others.

The Vertues.

It was used to be eaten after it was boiled as a Sallet herbe, with oyle and salt, in generall by all, but in especiall by Nourses that wanted milke in their brests, to helpe to encrease it, for which purpose also it is used now a-dayes.

CHAP. XLVIII.

Kali. Glasse wort.

HAving by I know not what chance left out some sorts of *Kali* from thē other formerly exhibited, let me place them here among the Sea plants, rather then leave them out altogether,

1. *Kali spinosum.* Prickly Glasse wort.

This sort of *Kali* or Glassewort riseth up with one hard stalke, thrēe or foure foote long, somētimes branched from the very bottome, each of them three foote long for the most part, whereon are set narrow leaves, without order, in some places but one at a joynt, at others two or three, standing opposite all along, and others two or three together, some longer then others, the longest being usually about two inches long, at severall joynts with the leaves, both on the stalk & branches come forth certain hard huskes, pointed out into sixe sharpe prickely ends, formed somewhat like a Starre, with a small white flower in the middle, which abideth not long, that middle part afterwards swelling somewhat higher, hath a small pricke thereat, in which head lyeth one seede, almost like a graine of Wheate: the roote is spread into some branches, and perisheth or withereth at the first approach of Winter with us, although it will abide in the forme as it grew a great while after it is withered and dry,

1. *Kali spinosum.* Prickly Glassewort.

2. *Kali floridum repens Neapolitanum Columnæ.* *Columna* his *Neapolitan* Glasse wort.

This small creeping or spreading Glasse wort, shooteth forth sundry weake branches, lying for the most part upon the ground, and raising it selfe up but a little, parted likewise into branches, set confusedly with small, thicke, round leaves, at the toppes of the severall branches whereof, stand many small white flowers clustering together, made of five or sixe small pointed leaves a peece, after whom succeede small heads opening into five parts, each being pointed at the ends, containing within much very small browniſh seede, the roote is composed of many small long strings and fibres at them: the whole plant is very salt, and covered with a rough mealinesse, as many Sea plants are, which although in its naturall place, or in the warmer climates, it wil abide in Gardens, yet will it not doe so in our Country.

3. *Kali longissimis foliis Ægyptiacum.*

The longest leafed *Kali* or Glassewort of *Egypt*.

This *Kali*, that as *Alpinus* saith is more proper to *Egypt* then to any other place, riseth up with a long weake and a little hairy bending stalke branched forth into divers parts, having the lower leaves very long and narrow, a little bowing backewards and hairy with all, those on the stalke and branches, upwards, being like unto the other, but somewhat shorter, and at the toppes foure or five much smaller, and more bowing or bending downewards, from the middle of whom come forth many flowers, like unto Roses saith mine Authour: the whole plant hath a salt and sharpe taste, being smart upon the tongue.

4. *Kali*

2. *Kali floridum repens Neapolitanum.* *Columna* his *Neapolitan* Glasse wort.

3. *Kali longissimis foliis Ægyptium.*
The long leafed *Kali* or Glasse-wort of *Egypt*.

4. *Kali Arabum primum genus Rauwolfio.*
Rauwolfius his first *Arabian Kali*.

4. *Kali Arabum primum genus Rauwolfio.* *Rauwolfius* his first *Arabian Kali*.

It is a small plant (saith he) full of slender branches very orderly set or placed together, sending forth many small knotted joynts dispersedly thereon, and at them sundry small narrow tender and pointed leaves, being of an ash-colour on the upperside and whitish underneath, as the stalkes and whole plant is also.

The Place and *Time*.

The two former sorts grow neere the sea side, the former both in *France* and *Italy*, the other *Columna* first found on the Westerne shore of *Naples*, and flower and seede late in the yeare, the third *Alpinus* saith is most proper to *Egypt*, and the last to *Syria*.

The Names.

The first of these hath beene taken for *Tragum Matthioli*, but his is alwayes found growing lower and smaller, and without leaves, and this never without, whereby it appeareth plainely that they are two severall plants, and so doth *Antonio Donati* of *Venice* account them. *Bauhinus* in making two sorts of *Tragum*, calleth one *Kali*

ſpinoſum cochleatum, but why *cochleatum*, I ſee no cauſe, for it is not *Lobel* his *Kali cochleato ſemine*, for that hee made the firſt of his *Kalies* in the foregoing Paragraph, and I thinke there is no other *Kali cochleato ſemine* beſides, the other he calleth *Kali ſpinoſo affinis*, referring it to the *Tragum* of *Matthiolus*, as all Authours ſince him have called it, and ſaith withall that becauſe *Dioſcorides*, gave no leaves to his *Tragum*, therefore *Matthiolus* and *Tabermontanus*, did expreſſe their *Tragum* without leaves: but *Lobel* ſet leaves, to his *Tragum*, as he himſelfe ſaith he found it on the *Venetians* Iſland called *Lio*: but *Donatus* as I ſaid before, ſaith he found that ſort alſo without leaves in the ſame Iſland. The ſecond *Columna* calleth *Kali floridum repens Aizoides Neapolitanum*, and *Bauhinus Kali Creſſulæ minoris folio*. The third is the third *Kali* of *Alpinus* in his Booke of *Egyptian* plants. The laſt is called by *Rauwolfius Kali Arabum primum genus*, which as he ſaith is called *Uſnen* by the *Arabians*, but by the Natives where it groweth *Schikan*.

The Vertues.

The aſhes of all theſe ſorts, as well as of the former ſorts are both uſed to make Sope and Glaſſe, and to purge the belly alſo, from a dull choller as *Alpinus* ſaith, eſpecially of his ſort, either the juice of the leaves or the pouther of them taken in Wine.

CHAP. XLIX.

Crithmum marinum. Sampire.

IN this Chapter I muſt joyne, for the name and places ſake, three or foure other plants, becauſe I would not make many of them.

1. *Crithmum marinum vulgaris.* Rocke Sampire.

The Rocke Sampire groweth up with a tender greene ſtalke, about halfe a yard or two foote high at the moſt, branching forth almoſt from the very bottome and ſtored with ſundry thicke and almoſt round, ſomewhat long leaves of a deepe greene colour, ſometimes three together, and ſometimes more on a ſtalke, and are ſappy, and of a pleaſant hot or ſpicy taſte: at the toppes of the ſtalke and branches ſtand umbels of white flowers, and after them come large ſeede bigger then Fennel, yet ſomewhat alike: the roote is great, white and long continuing many yeares, and is of a hot ſpicy taſte likewiſe.

2. *Crithmum marinum majus.* The greater Rocke Sampire.

This greater ſort differeth little in forme from the precedent, but in the largeneſſe, and in not being of ſo good a relliſh or ſpicy taſte as it, but ſmelling ſomewhat ſtrongly of Smallage, and taſting more bitter.

3. *Crithmum maritimum ſpinoſum ſive Paſtinaca marina.* Sea Parſneppe.

This Sea Parſneppe is very like the former Sampire, but it groweth greater and higher with ſhorter and nar-

1. *Crithmum marinum vulgatius.* Rocke Sampire.

3. *Crithmum maritimum ſpinoſum ſive Paſtinaca marina.* The Sea Parſneppe.

row

rower leaves, much more divided, and sharpely pricking at the ends, the stalkes are more sappy and of a fresher green colour, breaking into three or foure branches towards the toppes where stand large umbels of white flowers, and afterwards Fennell like seede in prickely huskes: the roote is long and white, somewhat like unto a Parsneppe, but more divided into parts, and is of a good relliſh, somewhat resembling a Parsneppe.

4. *Crithmum Chrysanthemum.*
Golden flowred Sampire.

The Golden Sampire hath sundry hard round stalkes, rising from the roote, thickely stored with very narrow long and somewhat thicke leaves cut in at the endes: at the toppes of the stalkes stand single flowers, like unto *After* or *Chrysanthemum*, wholly yellow, both the border and the thrumme in the middle, wherein lye the seede when they are ripe and are blowne away with the winde: the roote is divided into many strings.

The Place and Time.

All these plants grow in or neere the Sea. The two first on the Rockes that are often moistened at the least, if not overflowne with the Sea water, the other in grounds not farre from the shore: and doe all flower and seede in the end of *July* and *August*.

The Names.

The Greekes κεῖθμον or κείθαμον, or *Galens* κρίθμον, and the Latines *Crithmum*, is generally not onely given to the two first sorts here set forth, but to the two latter sorts also, of which errour *Matthiolus* is the first Authour as I take it, and from him all others have deduced the title; but *Lobel* and *Lugdunensis* first put in the doubt, and expoled another herbe, that did more rightly as he saith, agree to *Dioscorides* his description of *Crithmum* then this, namely the *Portulaca marina*, for as he saith, this hath no resemblance with the *Crithmum* of *Dioscorides*, which he writeth hath whiter and broader leaves then Purslane, and such saith he hath the *Portulaca marina*, but such hath not this *Crithmum*, but very greene, and nothing so large as Purslane, and may more fitly be called, even as the very common sort of people doe *Fœniculum marinum*, Sea Fennell, for so in the umbels and whole face thereof it doth assimilate a Fennell: but if I may be so bold to scanne Doctor *Lobel* his *Crithmum*, I beleeve it will be found as defective in some other part as the former: for although *Portulaca marina* agreeth with *Dioscorides* his *Crithmum* in the leaves, yet it doth not so in the seede, wherein it must also agree if it be the right: but the seed of *Portulaca marina*, is flat like an *Arrach*, and hath not in it a kernell like wheate, as *Dioscorides* description doth enforce it, and therefore we may conclude that neither this nor that doth answer *Dioscorides* his Text in all points: this is therefore more properly to be called *Fœniculum marinum*, untill it can be better determined whereunto it may be appropriate: Some would also make it to be *Empetron Dioscoridis*, but *Matthiolus* hath dissolved those errors, shewing that this Sea Fennell hath no purging quality therein at all, and that it was never seene naturally growing as well on hils, as neere the Sea side. *Cæsalpinus* onely, and *Bauhinus* from him maketh mention of the first *Crithmum* here, calling it *Baticule alterum genus ex Sicilia*, as he doth the second *Baticula quasi parva Batis*, for it is thought to bee that which *Pliny* called *Batis*, as *Gesner in hortis* doth, and *Crithmum marinum* also: It is the first *Crithmum* of *Matthiolus*, whom almost all other Authours doe follow, who also saith the *Italians* his Countrymen called it *herba de San Petro*, and some from thence *Sampetro*, and the *French* thereafter, *San Pierre*, and we from them, being our neerer neighbours, Sampier. *Bauhinus* calleth both these first sorts *Crithmum sive Fœniculum marinum majus & minus*. The third is the second *Crithmum* of *Matthiolus*, called *Crithmum spinosum* by *Dodonæus* and *Tabermontanus* but *Pastinaca marina* by *Lobel*, *Lugdunensis* and others, and as *Bauhinus* thinketh, is the *Tribulus marinus quorundam* of *Dalechampius* also. *Anguillara* tooke it to be *Secacul*, and *Camerarius* calleth it *Cachry marinum*. The last is *Matthiolus* his third sort of *Crithmum* whom *Lugdunensis* and *Camerarius* doe follow, *Dodonæus* calleth it *Crithmum Chrysanthemum* and *Lobel Chrysanthemum littoreum*, *Cæsalpinus Anthyllis prima Dioscoridis*, *Cordus in observat sylva Anthyllis major* and *Bauhinus Crithmum maritimum flore Asteris Attici*, and by some *After Atticus marinus*. The *Italians* besides the former name call it *Finocchio marino*, the *Spaniard Perrexil de la mar & Hinoio marino*, the *French Fenouil marin* and *Bacille* and *Cretemarine*, as the Apothecaries in their shops, beyond Sea *Creta marina*, this from them, or they from it: the *Germanes Meerfenckell*, the *Dutch Zee Uenckell*, and We as I said Sampier and Sea Fennell. *Petrus Gesecntius* calleth it *Crethmum & Rincum marinum*.

4. *Crithmum Chrysanthemum.*
Golden flowred Sampire.

The Vertues.

To shew you the Vertues of *Dioscorides* his *Crithmum*, is but to put you to try whether they answer unto our Sampire: which are these. The rootes and the leaves boyled in wine and drunke helpeth the difficulty in making water, and the yellow jaundice: the same also provoketh womens courses, it is eaten both raw and boyled as other herbes and pickled up to be kept, *Galen* saith it is salt and a little bitter withall, whereby it hath an effectuall, property to dry and to cleanse, but yet each of these properties are weaker in it, then it is in those things that are bitter. Our Sampier is a safe herbe, very pleasant both to the taste and stomacke, not onely by the saltnesse, but by the spicinesse in it likewise in helping digestion, opening in some sort the obstructions of the Liver and Spleene,

provoking

provoking urine and helping thereby to wash away the gravell and stone engendred in the kidneys or bladder:

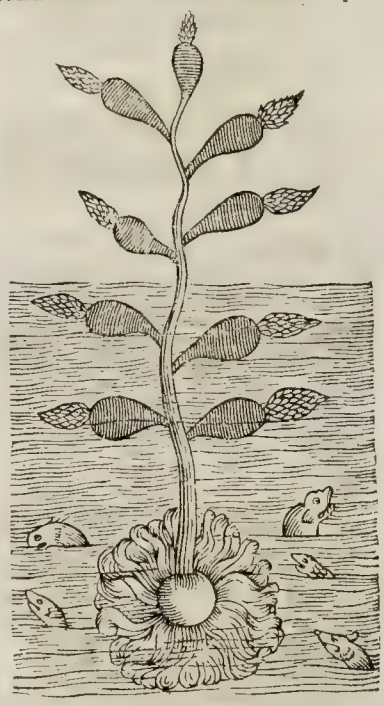
Many other Sea plants might have beene put into this Classis, which I have dispersedly handled and spoken of through this whole worke, because they were so like unto those plants, whereunto I have joyned them, that they could not well be seperated, I thought them therefore fitter to be entreated of there, and reserved onely these few for this place.

Chap. L.

Bulbus Crinitus marinus. The Sea Bulbe with hairy bush toppes.

BEfore I come to the Sea Mosses, let me adde this uncouth, unheard of, and peradventure untrue, or at least uncertaine Sea plant, in that we have not yet read or heard of any found Authour that hath mentioned it, but *Lugdunensis* and he, as he saith out of certaine Navigations in the *Italian* tongue, but neither persons that saw it, nor place of the Sea where it grew but onely among certaine Islands, nor time when it was found, are expressed in the declaration thereof: which maketh it the more suspitious: but as *Lugdunensis* hath set it downe, so I will give it you to cause others to finde out the truth, or folly of the matter. Among certaine Islands doth grow so great abundance of this finely expressed plant, that shippes being forced to passe over it, are often stayed in their course: it groweth in the bottome of the Sea, to the length of foureteene or fifteene fathome (or braces) and rising foute or five above the water, of the colour of yellow waxe, with a reasonable bigge stalke, from whence at certaine spaces are set divers bulbes, sending forth at their ends, certaine bushes or tufts of haires, the roote is bulbous also, but thicker and greater then the others on the stalkes, and bushing out many hairy fibres: Thus much hee. *Bauhinus* saith hee knoweth not what it is, and surely I thinke if there were any such thing, in *rerum natura*, others besides *Lugdunensis* might have the fortune to light upon that unnamed Authour to certifie us of his honesty and knowledge, I can goe no further, not having any further limits alotted me.

Bulbus marinus crinitus. The Sea bulbe with Feather tops.



Chap. LI.

Muscus marinus. Sea Mosse.

OF Mosses I am next to speake, which are of many sorts, some of the Vplands, and others of the Sea, which must be joyned next to those other Sea plants, and those of the Land after them, and because these also are of divers sorts, I thinke fit to distribute them into three rankes. the first to be of those that are of an herby substance, the second of an harder stony, and the last of a spongy matter: the first sort also is to be divided into these plants, that beare fine cut leaves, like Mosse or Fearne, and into those that have broader leaves, of those with fine cut leaves I shall entreate in this Chapter, and of the broader in the next.

1. *Muscus marinus capillaceus Dioscoridis.* The soft Sea Mosse.

This soft Sea Mosse (is not *Corallina*, which is hard and hath a branched stalke, but) is like unto those Mosses that grow upon the ground or trees without any rootes, onely growing upon the rockes, or upon the shels of sundry fishes, being a soft herbe composed wholly of woolly white haires, without any branch or stalke, and is oftner found white then reddish or gray, but is not greene. There is another small sort hereof, found growing on the stones by the Sea side, as also sometimes upon wood, and is likewise sometimes cast up by the Sea on the shore among the *Algæ* of divers sorts, growing somewhat like the former or ground Mosse, but that it is white and tasteth a little saltish and binding.

2. *Muscus marinus Neapolitanus.* Sea Mosse of *Naples*.

This Sea Mosse likewise groweth unto some rocke or stone, rising with a stalke more then foure inches high, with

1. *Muscus marinus capillaceus Dioscoridis & alter parvus Venetus.* The soft Sea Mosse, and another small sort from the Venetian shore.

2. *Muscus marinus Neapolitanus.* Sea Mosse of Naples.

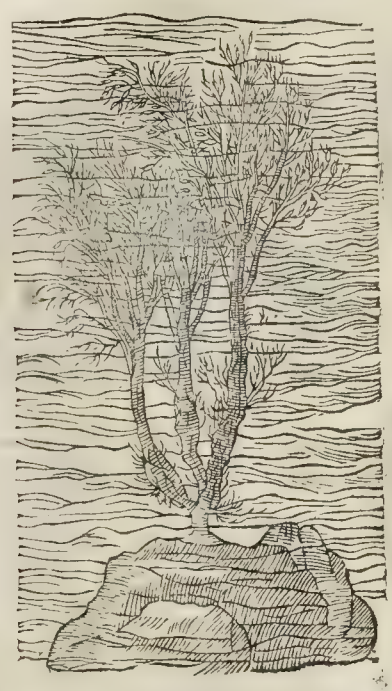
3. *Muscus marinus seu Alga tinctoria.* Dying red Sea Mosse.

4. *Muscus marinus virens Fœniculaceus.* Short Fennell like Sea Mosse.

5. *Muscus marinus Ferulaceus.* Long Fennell like Sea Mosse.

6. *Muſcus marinus Abrotanoides.*
Sea Sothernwood like Sea Moſſe.

7. *Muſcus marinus argenteus plumiformis.*
The ſilver like Sea Feather.



8. *Muſcus marinus [illegible] Coralline effigie.*
The long cloſe Sea Moſſe of Venice.

9. *Penna aurea marina.*
The goulden Sea Feather.

with ſundry branches on both ſides, and they againe divided into leſſer, all of them plentifully ſtored with very fine leaves, as ſmall as Camomill leaves, or finer then they if any other be finer, ſoft in handling at the firſt, eaſie to be bended, and tranſparent if they be interpoſed to the light, greene below at the lower part, and purpliſh above: this is not ſo brittle as Coralline when it is dryed, and groweth more rough by the dryneſſe, although it may well be referred unto ſome kinde thereof, and retaineth a very ſalt taſte with it, but being put into water or a while ſteeped therein, it will grow ſoft againe.

3. *Muſcus maritimus tinctorius ſive Alga tinctoria Lugdunenſis.*
Dying red Sea Moſſe.

This ſmall red Sea Moſſe is ſomewhat like the laſt, but with more ſtore

ſtore of ſoft ſtalkes and fewer branches, and with as fine ſmall leaves on them like unto Fennell of a reddiſh colour, but with ſome whiteneſſe mixed together, this is uſed by divers to ſtrike a deepe crimſon, or reddiſh purple colour, which will laſt long.

4. *Muſcus marinus virens Fœniculaceus.* Short Fennell like Sea Moſſe.

This ſhott Fennell like Moſſe groweth up from blackiſh round and fibrous rootes, with divers fine ſhort leaves like Fennell, of an herby or greene colour, among which an herby ſtalke riſeth alſo with ſuch like leaves on it, and having ſundry ſwolne eminences thereon.

5. *Muſcus marinus Ferulaceus.* Long Fennell like Sea Moſſe.

The leaves hereof are very long and fine like unto the *Ferula*, or Fennell giant, growing from ſtalkes neere a foote long, divided into branches, this ſpringeth from Rockes or the like.

6. *Muſcus marinus Abrotonoides.* The Southernewood like Sea Moſſe.

This alſo riſeth up from the Rockes with thicke ſtalkes and branches, with fine cut leaves on them, ſomewhat like unto Southernewood, but much bigger, and of a browniſh red colour.

7. *Muſcus marinus argenteus plumiformis.* The ſilver like Sea Feather.

This moſt beautifull Moſſe groweth on the Rockes in the Sea, upon the dry ſhels of Fiſhes, and is alſo often found wrapped amongſt the wrake or Sea weede, caſt upon the ſhore, growing up as the figure ſheweth, into many particular parts or branches, made as it were all of haires like other Moſſes, but verily repreſenting ſeverall ſprigs of Feathers, of ſo pure a white ſilverlike colour, that it is to be wondered at, that any Sea Moſſe ſhould become ſo white by nature, or made by Art, the property whereof is to waſte the Spleene applyed with Vinegar, it quickly alſo diſſolveth the ſcrophules or kernels in the throate, or elſewhere: it helpeth the Dropſie in that it doth abundantly provoke urine: it cleanſeth likewiſe the reignes, and gravell or ſtones engendred in the kidneyes, if a dramme of it in pouther be taken in the diſtilled water of *Eryſimum*, Hedge Muſtard or Sea Holly with an equall proportion of the juice of Lemmons.

8. *Muſcus marinus Venetus Coſti Indici rudicis effigie.* The Venetian Coſtus like Moſſe.

This Venetian Moſſe groweth on rockes in the Sea, which by the often agitation of the water, is broken from it, and carryed to the ſhore, not having any roote, but being made as it were of a tuft of ſmall ſtickes ſet together, and being dry reſembleth the roote of *Coſtus Indeus*, but whiter, and being moiſtened againe, openeth it ſelfe into the forme aforeſaid, and as it is expreſſed in the figure, it is very ſalt, and full of it like ſand.

9. *Penna marina aurea.* The goulden Sea Feather.

This Sea plant that for the beauty and excellency thereof, doth worthily deſerve his name, although ſent thus maimed as it were, being but a peece as it is likely, of what it was when it grew, yet ſuch as it is I here offer to your view, being of a moſt ſhining gold colour, both ſtalke and leaves, which very neately reſembleth the *Sparſum Auſtriacum* of *Cluſius*, which we call the Feather graſſe.

The Place and *Time.*

Their places are all declared by their titles to be the ſtones on the ſhore, or Rockes in the Sea, and the ſhells of fiſhes. &c. whereon many of them breede, and but few ſpring out of the ground as the fourth doth, ſome in other Countries, and ſome on our owne coaſts, and periſh not in Winter or Summer.

The Names.

The Greekes call it βρύον θαλάσσιον, and *Muſcus marinus* in Latine, yet ſome promiſcuouſly call theſe *Fucus marinus*, as well as *Muſcus*, but *Dioſcorides* diſtinguiſheth betweene them, entreating of them in two ſundry Chapters, and although *Pliny* be inconſtant herein, making Moſſe ſometimes an herbe, ſometimes a ſhrubbe, and ſometimes confounding both *Muſcus* and *Fucus* together. The firſt of both ſorts is mentioned by *Antonio Donati*, in his herbation of the Ile of *Leo* of the *Venetians*, and is alſo the *Muſcus marinus* of *Dioſcorides*, according to *Conſtantinus*, his more exact conſideration, as *Lugdunenſis* doth relate it, and the *Fucus capillaceo folio* of *Theophraſtus*, as it is thought. The ſecond is *Cluſius* his *Muſcus marinus*, which he received from *Imperatus* of *Naples*, and ſent by the name of *Palmula marina*, but nothing agreeing with that of *Theophraſtus*. The third is the *Fucus ſive Alga tinctoria* of *Lugdunenſis*. The fourth is the *Muſcus marinus virens*, which *Ceſalpinus* calleth *Muſcus marinus herbaceus mollior*. The fifth the *Fucus Ferulaceus* of *Lobel*. The ſixth is his *Fucus marinus foliis Abrotani maris*, whom *Lugdunenſis* followeth, calling it *Muſcus marinus foliis Abrotani*. The ſeventh and the laſt are ſo called by *Donatus* as their titles declare them, and the eighth is mentioned by *Pona* in his *Italian Baldus*. The *Arabians* call the Sea Moſſe *Thahaleb* and *Thaleb*, the *Italians Moſco marino*, the *Spaniards Malhoquiana yerva*, the *French Monſſe de mer*, the *Germanes Meermoſſ*, the *Dutch Zee moſch*.

The Vertues.

Moſt of theſe Sea Moſſes doe binde much, and coole inflammations, and being applyed while they are freſh give much eaſe to thoſe are troubled with the hot Gout, they have an eſpeciall property in drying, thickning, & cooling, what part ſoever ſtandeth in neede of any of theſe qualities: both the ſorts of the firſt, killeth wormes in the body, and the ſecond of them is very effectuall for watering red eyes, if the pouther mixed with ſome Fennell Water be put into them: the ſame pouther taken with Vinegar ſtayeth vomiting, and ſtrengtheneth the ſtomacke, but if the decoction thereof in wine be injected into the bladder by a ſeringe, it cleanſeth the carnoſity in the necke of the bladder and ulcers therein, prooved effectuall to helpe one troubled with that diſeaſe in a ſhort time: the eighth likewiſe is ſaid to helpe to cleanſe foule ulcers of all ſorts, either inward or outward, being made into pouther and given in wine, and cleanſeth the ſtone in the kidneyes: the vertues of the ſeventh are declared in the deſcription.

CHAP. LII.

Fucus marinus ſive Alga marina. Sea wrake or Sea weede.

OF this kinde of broader leafed Sea excreſſences, that are ſoft and herby, ſome more and ſome leſſe, there are many ſorts, as they ſhall be here expreſſed.

1. *Fucus marinus ſive Alga marina graminea.* Wrake or Sea weede, or Graſſe.

The roundiſh rootes hereof are hairy, and blackiſh on the outſide, from whence riſe up ſmall and round

round and long white hairy heads, breaking out at the ſides as it were into branches, on the toppes whereof ſtand three or foure very long and narrow ſoft greene leaves, ſome being an ell or more long, and about an inch broad: this hath neither ſeede nor ſtalke, but lyeth on the ground untill the tide raiſe it on the water, which being broken by the force of the waves, is carryed to the ſhore, where it is kept for many things.

2. *Fucus marinus craſſus latifolius.* Broad and thicke Sea Girdle.

This differeth from the former in that the roote is wholly fibrous, the ſtalke riſing from thence, thicke and round two or three inches high, and the leafe which is ſometimes but one, and ſeldome two, of a very great length, even divers feete or els long, and above foure inches broad, equall from a little above the ſetting on to the end, but ſomewhat waved or crumpled on the edges, being thicke and of a deepe greene colour, ſo ſoft and moiſt while it is freſh, that it is like unto moiſt glue or gelly, and will hardly dry unleſſe it lie long in the Sunne, and will not be fit to be kept without rotting untill after many dayes drying.

3. *Fucus marinus latiſſimo tenuifolio.* Broad and thin Sea girdle.

This is in all things like the laſt, but that the leaves are thinner broader and ſhorter, yet crumpled on the edges, and of a paler greene colour, and is like unto thin parchment.

4. *Fucus alatus ſive phoſganoides.* Winged Sea girdle.

This cleaveth unto ſtones, and ſhels of fiſhes likewiſe both in the deeper and ſhallower places of the Sea, having a round darke reddiſh ſtalke of the bigneſſe of a Gooſe quill, which being growne to the full length is very weake, lying on the ground, unleſſe the water raiſe it, and an ell long: on each ſide whereof groweth a wing, all the whole length of it, like unto a skinne or parchment with veines therein, which being like the feather of an arrow, is ſmall below and broader above equally to the toppe, of two or three inches breadth: the leaves that grow next the ground are many (and ſome are ſet alſo on the ſtalke) of a yellower greeniſh colour, and of an hand breadth, being foure, ſix, or eight inches long, lither or of a skinny ſubſtance like unto the other girdles: the ſtalke doth very well reſemble a two edged ſword: and is uſed to be dreſſed and eaten by the inhabitants of the Sea coaſts where it groweth after it is cleared from the skinny wings, and hath a little ſweete taſte with the ſaltneſſe which maketh it the more acceptable.

5. *Fucus maximus polyſchides.* Great Sea girdle with many Labels.

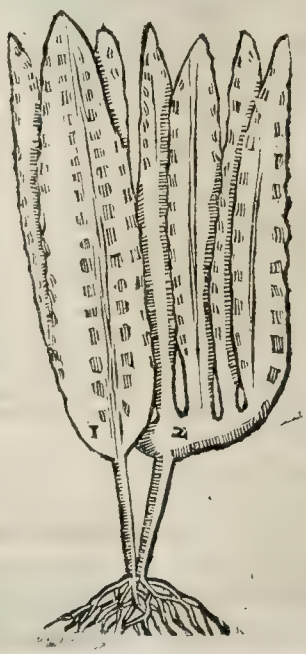
The manner of growing hereof, and the uſe likewiſe is alike with the laſt, but is the greateſt of all theſe ſorts of Sea weedes, having a ſtalke as thicke as that of Angelica, of a browne colour like a Cheſnut on the outſide, and ſo are the round leaves likewiſe, which are three or foure cubits long, being not ſo thicke as ones little finger, and ending in divers broad and ſhort skinny Labels, in like manner as the lower part of the ſwords hangers, which are of a yellowiſh colour. Both theſe laſt ſorts were ſent unto *Bauhinus* from *Aberdein* in *Scotland*, by Doctor *Cargilius*, and as it ſeemeth this and the ſecond are ſomewhat differing from Mr. *Johnſons* figure and deſcription, which containeth both of them in one, yet I have thought good to give you his figure, for want of them ſeverall, although his groweth from a roote, and this from ſhels, &c.

6. *Fucus marinus ſecundus Dodonæi.* Narrow long and thicke Sea girdles.

The roote hereof is round and flat, from whence ſpring two or three narrow thicke leaves, about a foote and a halfe long, divided into ſundry flat thicke thongs like leather, ſome long and ſome ſhorter, and they againe divi-

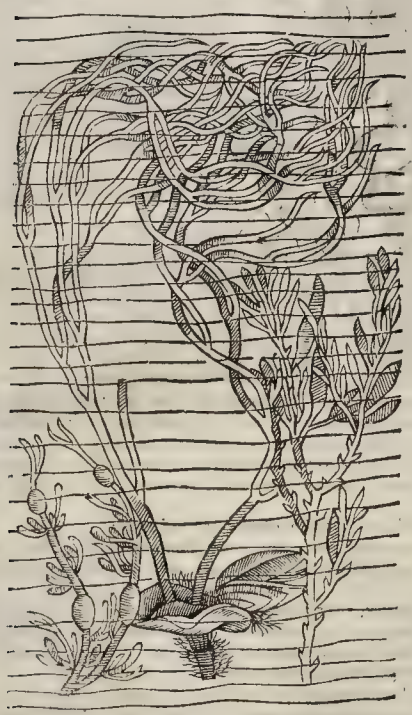
1. *Fucus marinus ſive Alga marina graminea.*
Wrake or Sea weede or Graſſe.

5. *Fucus maximus polyſchides.*
Great Sea girdles with many Labels.

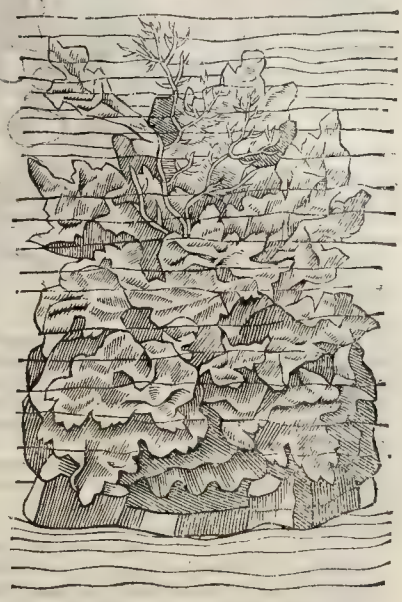


ded

6,7. *Fucus marinus* 2,3, & 4. *Dodonæi.*
Two or three ſorts of Sea thongs or girdles.



9. *Fucus marinus Lactuca marina dictus.*
Oyſter greene.



11. *Quercus marina herbacea & varietas*
Sea Oake or Sea Wrake ſome varieues.

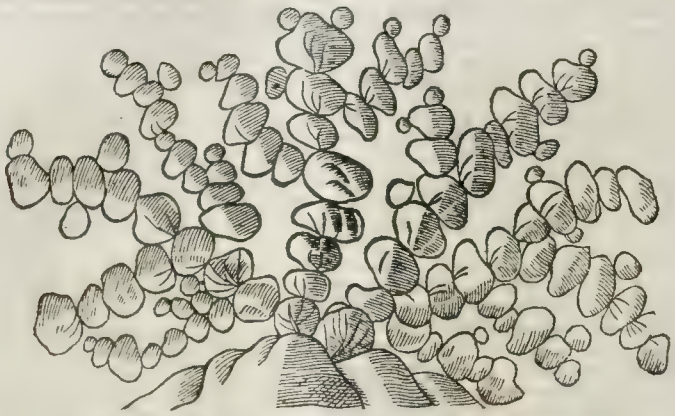
10. *Fucus ſive Alga Intubacea.*
Sea Curld Endive.

ded into ſmaller ones, this hath but few or no ſwolne parts thereon. But there is another of this ſort that hath ſhorter and narrower leaves, the ſtalkes ending all in ſwolne points.

7. *Fucus membranaceus ceranoides.*
Sea weede with skinny hornes.

This hath a ſtalke little above an handbreadth long, an inch and a halfe broad, divided into ſundry branches, ſome broader, and others narrower, varying wonderfully, each whereof endeth in divers ſhort parts, like unto ſmall hornes: hereof are ſeene divers ſorts, differing ſomewhat, though not much one from another, and are uſed to take away the hurtfull longings of women with childe.

12. *Opuntia marina.* The Sea Garland.



8. *Fucus maritimus Gallopavonis pennas referens.* The Peacockes Feather.

This alſo is of a skinny ſubſtance, ſpreading it ſelfe by little and little wide abroad, cut into many jagges, which end in halfe circles, lying ſometimes one upon another, whereon are ſet ſundry ſemicircular ſpots, and ſtroakes of divers colours, and of differing bigneſſe one from another, like as is ſeene in the Peacockes feathers: this groweth to the Rockes in the Sea: ſomewhat like hereunto there is alſo a certaine barke taken from Scallops, that breede on the ſame Rockes.

9. *Fucus marinus Lactuca marina dictus,* Oyſter greene, or Sea Lettice.

The Oyſter greene, as all know is a ſoft tender herbe growing on Rockes, with thinne crumpled, and darke greene leaves, ſomewhat like unto the curld Lettice, and hath neither ſtalke nor roote, but growing as moſt of theſe Sea weedes doe, upon Rockes or ſtones.

10. *Fucus ſive Alga Intubacea.* Sea curled Endive.

The Sea curld Endive, hath divers long and round leaves lying on the ground, and ſhooting forth others on all ſides, as it runneth thereon, ſending out ſmall fibres from the joynts under the leaves, which are dented round at the ſides, making the proportion of a ragged ſtaffe, as it is painted on every leafe.

11. *Quercus marina.* Sea Oake, or Sea Wrake.

This likewiſe in the ſame places, and after the ſame manner groweth on the Rockes, and lyeth thereon flat; when the water is falne therefrom, ſhooting forth many long ſtalkes of leaves, to a great length, cut in and divided ſomewhat like unto Oaken leaves, ſet here and there with bliſters, as it were berries full of winde, and ſome full of water, which being troden on will give a cracke, the whole herbe is of a very greene colour, ſoft and rough, which while it is wet is like wet skinnes, ſome doe call this herbe *Quercus marina baccifera*, by reaſon of the ſmall round knots, which is like hollow berries, and is blacke being dry. Another ſort is called *Glandifera*, becauſe that being ſomewhat like the other, but with ſhorter leaves, and ſome alſo growing from the middle ribbe, it hath no knots or bliſters on the branches, but at the ends thicke ſmall long bunches like ſmall Acornes, and is white when it is dry. And a third ſort called *Quercus marina barbata*, becauſe the ends of the leaves are very finely cut into long hairy threds, repreſenting a beard.

12. *Opuntia marina.* The Sea Garland.

This dainty plant groweth up from ſome Rockes or ſtones, in or neere the Sea, ſpreading ſundry flat, thicke, ſhort and round leaves, one ſet on the toppe of another, and ſome alſo growing from the ſides, forming branches of leaves leaning downewards, each being as it were ſtrung on a thred which yet is ſcarſe to be diſcerned, like as a Country Garland of field and corne flowers, are uſed to be made to decke the Country houſes, and their places of ſport, ſo that the whole plant ſeemeth to be made of nothing but ſtrung leaves, bearing a large yellow flower at the toppe ſaith *Bauhinus*, but I much doubt he taketh that ſuppoſition from the *Ficus Indica Americana*, the lower leaves are ſomewhat browne, the reſt are whitiſh greene, and thoſe that are new ſprung are greene, and all of them ſmooth and ſhining, even kept betweene papers for a long time, and of a ſaltiſh taſte, yet by long time growing rougher and full of wrinckles, but ſtill tough and not brittle like Corall or Coralline, and growing ſoft againe ſteeped in water, yet ſtill very ſalt.

The Place and *Time*.

Divers of theſe are found on our *Engliſh* and *Scottiſh* coaſts, but ſome in the warmer Countries, their cheifeſt time of beauty and uſe, is the end of Summer.

The Names.

It is called in Greeke φύκος θαλάσσιον, and in Latine *Phycos* or *Phucus*, or *Fucus marinus*, *marinus* being added thereunto to diſtinguiſh it from the *Fucus herba*, which is *Anchuſa*, and *Alga marina* alſo, becauſe divers Authours have called divers water herbes by the name of *Alga*, ſome *aquatica*, ſome *paluſtris*, *Pliny* his inconſtancy as I ſhewed in part in the laſt Chapter, appeareth plainely herein, in that in one place, *lib.* 23. *c.* 2. he ſaith that the *Grecians* φύκος, hath not found another name in any nation whereby it may be called, becauſe *Alga* is the name of herbes, and *Phycos* is of a ſhrubbe, and yet in another place *lib.* 32. *c.* 6. he tranſlateth *Theophraſtus* and *Nicander*, φύκος, that ſaith it is the Treakle of the Sea to be *Alga*, and ſay there are many kindes thereof, as they doe of φύκος and thereupon *Gaza* doth alwayes tranſlate *Theophraſtus* his φύκος, to be *Alga*. The firſt of theſe is the *Fucus marinus alter* of *Dodonæus*, the *Fucus ſive Alga marina graminea* of *Lugdunenſis*, called by thoſe of *Mompelier Palea marina*, being uſed by them both for litter for their cattle, and for the beſt ſort of dung for their fieldes, but *Lobel*

Alga

Alga marina, and by *Bauhinus Alga angustifolia vitrariorum*, the broader sort is called by *Imperatus Fucus giganteus*, and *Palmifolium giganteum*. The second, third, fourth, fifth, seventh, and eighth, are set downe by *Bauhinus* in his *Prodromus* by the same names in their titles, or very little differing. The sixth is likewise set downe, in the title, and is likely to be the *Fucus Zoster*, by *Lugdunensis* to whom it doth belong, which *Bauhinus* in his *Prodromus* calleth *Fucus longo angusto & crasso folio*. The ninth is the first sort of *Fucus marinus* by *Dioscorides*, and called *Bryon Lactucæ foliis* by *Pliny* and *Lobel*, by *Matthiolus Muscus marinus alter*, *Dodonæus* calleth it *Fucus marinus prior*, *Lugdunensis Muscus marinus Theophrasti*, and by *Bauhinus Fucus marinus primus Dioscoridis & Theophrasti*. The tenth is called *Fucus sive Alga Intybacea* by *Lugdunensis*. The eleventh with the varieties thereof are mentioned by *Lobel* and *Clusius* calling it *Quercus marina*, by *Dodonæus* and *Bauhinus Fucus maritimus*. The last was first set forth by *Clusius* under the name of *Lichen marinus*, and saith he received it first from *Imperatus* of *Naples*, by the name of *Sertularia*, and after from *Cortusus* by the name of *Opuntia marina*, and *Corallina latifolia*. *Bauhinus* calleth it *Fucus folio rotundo* in his *Prodromus*, but *Fucus maritimus* in his *Matthiolus*.

The Vertues.

All the kindes of Wrake, saith *Dioscorides* and *Galen*, doe coole and dry, and is good to ease the Gout, and inflammations, being used fresh, but *Lacuna* correcteth the cooling word in *Galen*, and saith it doth better agree with Sea plants, to dry rather then to coole, by reason of their saltnesse, which doth binde and constraine, but not coole, *Nicander* in *Theriacis*, commendeth the red sort of *Fucus* to be good against the venome of Serpents, and other venemous creatures. The first sort is much used by the *Venetians* instead of hay or straw, to packe up Glasses to preserve them from breaking, but at *Mompelier* and other places, they use it as litter for their horses, and being made into compost is excellent good manure, to refresh their barren or out eaten grounds: divers of the other sorts are eaten as saller herbes, as the fourth, fifth, and twelfth, the seventh as is said, is good to represse the hurtfull longings of women with childe, and *Clusius* saith that *Cortusus* signified unto him that the commonpeople of *Corsica* did use the last, instead of *Corallina* to kill the wormes in children.

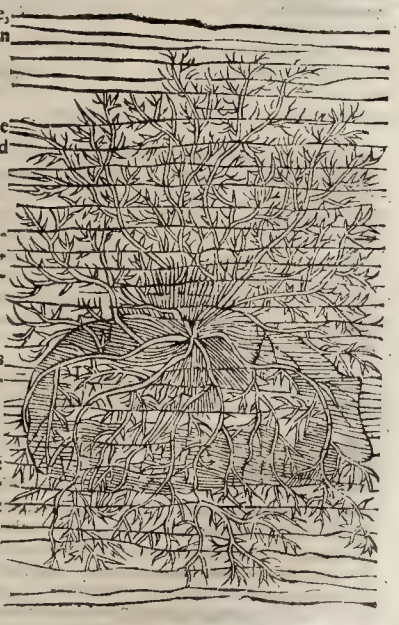
CHAP. LIII.

Muscus marinus Corallina dictus. Hard Sea Mosse or Coralline.

According to the method before prescribed I am in this Chapter to shew you all those sorts of hard Mosses that are either Coralline or come neerest to them.

1. *Muscus marinus sive Corallina alba officinarum.* Common white Coralline.

The ordinary Coralline which is used in the Apothecaries shoppes, is a sort of white, hard or stony Mosse, growing usually on the Rocks in or neere the Sea, rising either from the stones thereof, or from the shels of Scallops, Oysters, or the like, and groweth not above an handfull high, spreading sundry small branches like a greene herbe, with divers small short leaves, like haires thereon, which is soft, under the water, but taken forth groweth as hard almost as a stone. This is our ordinary Coralline, which is gathered in all our Coasts Westwards, and in these Northerne parts of *Europe*, as farre as I can learne, but some have affirmed that it hath beene found somewhat reddish, growing upon the Corall it selfe, which is not found but in the deeper *Mediterranean* Seas, on Rockes under water.



1. *Muscus marinus sive Corallina alba.* Common white Coralline.

2. *Muscus marinus niger Germanicus sive Corallina nigra.* Blacke *Germane* Coralline.

This groweth like unto a Coralline, with branches and fine cut leaves, but blackish of colour, which is a sort seldome heard of before, and creepeth as it groweth.

3. *Muscus marinus sive Corallina rubens.* Reddish Coralline.

This sort of Coralline hath no branched stalkes like the former, nor spreading much, but growing more upright, hath longer leaves thereon then the other, as fine as Fennell, and of a reddish colour.

4. *Muscus marinus latifolius sive Corallina latifolia.* Broad Coralline.

This broad Coralline spreadeth leaves as it were on both sides of a middle stalke, each whereof is broad, and parted into sundry divisions.

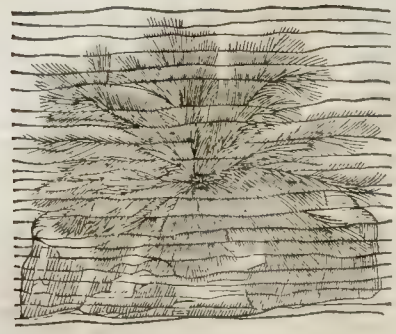
5. *Muscus marinus longifolius sive Corallina longa.* Long Coralline.

This Coralline hath divers upright stalkes set with two, three or foure long leaves by spaces, one above another, in three or foure rowes, each whereof is somewhat flat, and dented or cut in all along the edges.

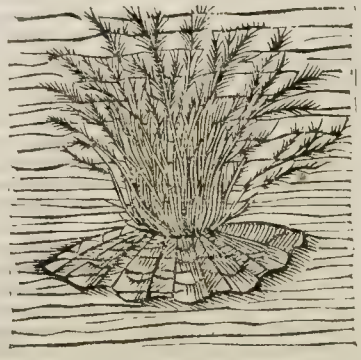
6. *Muscus marinus squammatus sive Corallina squammata.* Scaly Coralline.

This sixt sort of Coralline hath sundry sprigs, with joynts at them, like unto scales, and small haity Mosse like leaves on each side of them, being wholly white.

3. *Muſcus marinus rubens ſive Corallina rubens.* Reddish Coralline.



6. *Muſcus marinus ſquammatus ſive Corallina ſquammata.* Scaly Coralline.



The Place and *Time.*

All theſe Moſſes are expreſſed to grow on the Rockes and ſtones, in and by the Sea, and are to be found growing at all times of the yeare.

The Names.

All theſe ſorts may be referred to the ſelect Synonyme *Muſcus marinus* before ſet forth, both their place of breeding and manner of growing declaring it, and came to be called *Corallina* chiefly from that ſort that grew upon Corall it ſelfe. The firſt is the *Muſcus marinus* of *Matthiolus*, *Dodonæus*, *Lugdunenſis* and others, *Lobel* calleth it *Corallina*, and *Lugdunenſis Fucus capillaceus*. The ſecond *Bauhinus* onely remembreth in his *Pinax*, to have received it from the *Balticke* Sea, calling it *Muſcus capillaceus multifidus niger*. The third is the *Muſcus marinus vulgatiſſimus* of *Lobel*, and the ſecond *Muſcus marinus* of *Dodonæus*, *Tabermontanus* and *Gerard*. The fourth is the *Muſcus Corall. formis* of *Lobel*. The fifth is the *Corallina minima* in the new *Gerard*, whoſe deſcription doth nothing anſwer the figure, for *Gerard's* figure is quite differing from this, yet is anſwerable to his deſcription. The laſt is called by *Lobel Muſcus candidus Coralloides ſquammulis loricatis*, and is the third *Muſcus marinus* of *Dodonæus*, although the new *Gerard* doth entitle another figure by that name, and giveth a deſcription farre differing from his figure.

The Vertues.

Coralline is in a manner wholly ſpent among us to kill the wormes in children, or in elder perſons, and as the matter ſo the manner, not knowne but in theſe latter times to Authours, but by what quality it worketh this effect is not declared by any, for it is altogether inſipide, or without taſte of heate or cold, as Corall it ſelfe is, and if Corall be ſo much commended againſt the ſtone and fluxes, crampes, the falling ſickneſſe, and melancholy, &c. as you ſhall heare in its proper Chapter, doe not thinke but theſe may conduce ſomewhat thereunto alſo.

Chap. LIV.

Frutices Coralloides ſive Corallinæ fruticantes. Shrub Corallines.

VNto the Corallines mentioned in the laſt Chapter, I muſt adjoyne ſundry ſorts of wooddy, gritty, or ſtony ſhrub like Corallines, as I may ſo call them, of ſeverall differing matters and formes, which I would place in a Chapter by themſelves, and neither mingle them with the former Corallines, nor with the next Corals, becauſe different from both.

1. *Corallina fruticans alba.* The white cruſted Shrub Coralline.

This white Shrub Coralline groweth up from the Rocke or ſome ſhell, in forme of a ſmall ſhrub or low tree, to a cubits height, more or leſſe, with a flat ſtemme or trunke below, and ſundry flat branches alſo iſſuing from it on both ſides, and not round like an ordinary ſhrub or tree, which branches are divided into other ſmaller ſprigs above, and thoſe againe into leſſer, it is wholly covered over or cruſted with a white hard cruſt like unto Coralline, or white Corall, but rough or rugged, the middle part or heart being wooddy and bending like the branch of a tree, yet very hard alſo.

2. *Corallina fruticans rubra.* Red cruſted ſhrub Coralline.

This red Coralline is like the former in all things, ſaving that the colour hereof is in ſome wholly of a reddiſh colour, and in others the branches part white, and part purpliſh. And another ſort there is alſo, that is of a whitiſh yellow, ſpotted, which as I take it *Bauhinus* calleth *Corallina pallidè flaveſcentis coloris, & lutea punctata*, for I thinke them both one. *Lutea.*

3. *Corallina lignoſa ruffeſcens Ericæ facie.* Browniſh wooddy Coralline or Sea Heath.

This ſort alſo groweth flat like the former, and from ſome ſtone or Rocke riſeth halfe a yard high or better, with divers ſpread branches, divided againe into other ſmaller ones, ſomewhat like unto Heath, ſpreading almoſt to a yards breadth, all covered with a thinne browniſh barke, and a very hard wooddy ſubſtance under earth, ſet thicke with ſmall knots or bunches, as if they were the buds of flowers, eaſily rubbed to pouther: the whole plant being of a ſaltiſh taſte.

4. *Corallina plumata ſive Myriophyllum Pelagium Cortuſi Cluſio.* The Soleyonian Sea Feather.

This Sea Coralline (for ſo in ſubſtance it is not unlike, and *Cortuſus* found the effects to be alike alſo) groweth not

not as the former, from some stone or shell, but out of the ground in the Sea, from a roote fastened therein, with very hairy fibres, growing up with a slender stalke, (as *Clusius* ghessed by the sight of the figure about a cubits height) which did send forth branches of long leaves, very finely cut into many long parts on both sides and bending the toppe downewards, very like to the branches of the Date tree, or as I may say, unto a Feather, of a pale or whitish colour: the upper leaves are smaller then the lower, else alike, and the toppe of the stalke endeth in a certaine head, composed as it were of many scales wherein is no seede, these scales being as it were young plants, which falling to the bottome of the water, take roote therein, and grow up like the mother plant, this while it groweth in the water, or is fresh new taken forth is tender and pliant to bee bended any way, but when it is dry it is as hard as Coralline or Glasse, and as brittle.

1,2. *Corallina fruticans alba vel rubra.* The white or red crusted shrub Coralline.

5. *Corallina alba nodosa.*

The knotted white Coralline or Barbary Feather.

The stalke hereof is a foote high, white, hard, and woody, covered with a rugged white barke, having sundry straight but weake branches, issuing out on all sides without order, three or foure inches long apeece, and some parted into lesser ones, of not above an inch long, on each stalke there stand divers, even thirty or forty small knots or buttons, for the most part bored through, composed of two halfe circles compassing it round about: this was brought out of Barbary to *Marcelles* and there worne in hats like Feathers.

6. *Corallina rugosa duplex & alia minus rugosa.*

Two sorts of rough Coraline and a smooth,

The one of these is of a hard woody substance, without coare or heart, of a browniish colour, crusted over with a rough knotted or bunched coate or barke, of an ash colour, which is brittle, easie to be rubbed to pouther, from whence spring crooked or bending stalks, and smaller branches from them, all of them crusted and bunched rough, as the stalke and ending in a blunt point, or end. Another is both whiter and smoother, but else not like it in stalkes and branches. There is another also whose crusted coate is pale yellow.

3. *Corallina Ignosa Ericæ facie.* Heath like woodly Coralline.

7. *Corallina reticulata plana purpurascens.*

The red Sea Fanne.

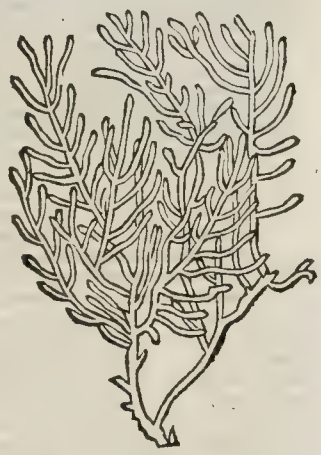
This pleasant and delightfull Sea plant is of divers sises some greater and other lesser, yet all of growing flat like a fanne or large leafe with sundry greater branches spreading on both sides of the maine stemme, and they again into smaller and smaller, ending in very fine and small points, yet all of them joyned close together, so that there is no separation of branches one from another, but yet with sundry small or greater holes, like the mashes of a net, (yet some sorts have beene seene that have had no holes in them, but were whole with some spots on them like unto holes, of a very hard and wooddy matter or substance, easie to be cut with a knife, of a browniish red colour yet tough or hard to breake, although it may bee somewhat bended, and covered in many places, in some more or lesse (but peradventure all over, when it is first taken out of the Sea, or before it be rubbed with handling and carryage,) with a whitish saltnesse. This groweth to the Rockes, which the Seas goe over often times. Captaine *Smith* in his Booke of the plants growing in the *Bermuda* Isles, compareth it to a Vine leafe, as some others that first saw it here did, and called it the Feather. It hath beene brought both from the East and West Indies to us.

8. *Corallina nigra altera duplex.* Two sorts of tall blacke Scrines or Sea Fannes of *Italy*.

For some likenesse unto the last, mentioned pleasant Fanne, I thought good to adjoyne two others, each whereof grow to a mans height from the Rockes in the Sea, and gotten by them that dragge for Coralls: the one of them is branched as it were in one or two places, that is, hath a small fanne issuing out from the maine stemme, and the other hath none, but the stemme thereof is turned or wound round, like as is to be seene in the Vnicornes horne, or

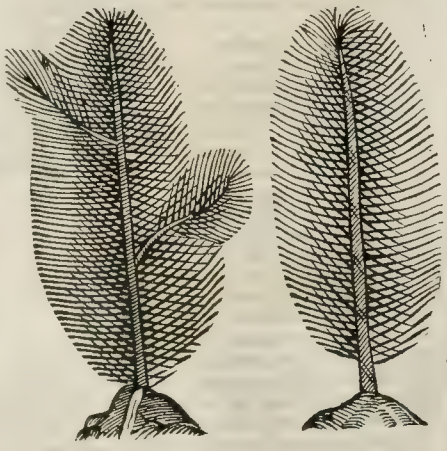
4. *Corallina plumata sive Myriophyllon pelagicum Cortusi Clusio.*
The Sclavonian Sea Feather.

Quercus marina Theophrasti Clusio.
Clusius his Sea Oake of *Theophrastus.*



7. *Corallina reticulata plana purpurascens.*
The red Sea Fanne.

8. *Corallina nigra altera duplex.*
Two sorts of blacke Scrines or Sea Fannes of Italy.



in a ſticke that hath had a With winde, or Hony ſuckle run up upon it, and the other not, both of them conſiſt of a number of ſmall and long leaves, as I may ſo call them, or rather blacke Hogges briſtles, one row or order growing upright from the middle ſtalke, and another from it thwarting them, ſo right all joyning together, in forme of a net, with the holes or ſpaces to be ſeene through them, the ſides being even and the toppe round.

The Place and Time.

The place of the two firſt are *Mompelier*, and ſome places in *Spaine*. The third *Cluſius* ſaith he had from *Norwey*, but not knowne whether growing there or no. The fourth and fifth are expreſſed in their deſcriptions, the ſixt with all the ſorts is not expreſſed: The ſeventh hath beene often brought from ſundry parts of *America*, both of our owne and other Colonies. The eight is not mentioned by *Pona* from what place it was taken. They keepe the ſame time with the reſt.

The Names.

The two firſt are called by *Lobel Corallina alba & rubens Antipathis facie*, and by *Bauhinus Corallina fruticoſa*, who referreth them to *Cluſius* his *Quercus marina Theophraſti*, whoſe figure I here alſo give you for the difference ſake, but *Theophraſtus* his deſcription thereof *lib. 4. c. 7.* can in my opinion no way agree thereunto: for hee there ſaith *Abies marina & Quercus marina* have a thicke long and fleſhy leafe, but this is hard ſtone like, or Corall like on the outſide, and wooddy inward. *Anguillara* calleth it *Juncus petroſus*, and *Geſner Lithophyton marinum*. The third is called by *Cluſius Frutex marinus Ericæ facie*, in his ſixth Booke of Exotickes, and ninth Chapter, ſet downe by *Bauhinus* both among the Corallines by the name of *Corallina ruſſeſcens exaſperata*, and among the *Fuci fruticibus aſſimilati*. by the name of *Ericæ ſimilis maritima*. The fourth is as is ſaid in the title, *Cluſius* his *Myrtophyllum Pelagium Cortuſi*, which *Bauhinus* numbreth among the *Muſci maritimi*, calling it *Muſcus maritimus filicis folio*, but as I there ſay, finding it both in ſubſtance and quality like unto Coralline, I reckon it here among them, and called as *Cluſius* ſaith by the *Italian* Fiſhermen *Pennachie delle Ninfe, & Palma di Nettuno*. The fifth is ſo called by *Bauhinus* as it is in the title, and ſo is the ſixth alſo of both ſorts. The ſeventh is called by *Cluſius Frutex marinus elegantiſſimus*, and *Planta marina retiformis*, for I reckon them both as one, or ſo little differing that they deſerve not to be ſeparated, which he thinketh commeth neere unto the *Palma marina* of *Theophraſtus*, or ſome kinde thereof, but *Theophraſtus* ſaith, his *Palma marina* hath thornes or prickles for the leaves, which may better agree with the eighth, if the colour were red and not blacke. *Bauhinus* calleth them *Corallina cortice reticulato*. The laſt of both ſorts is ſet forth in the *Italian Baldus* of *Pona*, by the name of the third and fourth ſorts of *Antipathes* or blacke Coralline.

The Vertues.

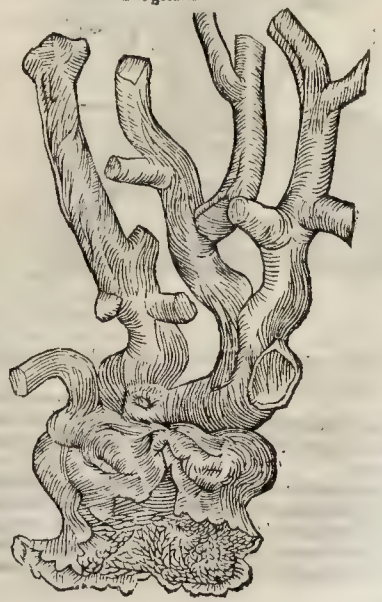
We have little or nothing to deliver unto you of any vertue any of theſe hath beene tryed to have, ſaving that the fourth is ſaid to helpe the bitings of any venemous creature, to heale wounds ſpeedily, and to kill wormes, taken in leſſe quantity then Coralline, but are kept as rarities to declare the wonderfull workes of God, in thoſe Sea plants, which are as much to be admired as any of the Land.

CHAP. LV.

Corallium. Coral.

TO end this relation of the ſtony Sea Moſſes, I muſt alſo ſhew you the Corals (for there are a number of other Sea Excreſſences, which I muſt paſſe over, being of little or no uſe in Phyſicke, and would fill up ſundry ſheetes of Paper) which are, as of ſundry colours, ſo of formes likewiſe.

2. *Corallum rubrum majus.*
The greater red Corall.



Tenuis.

Rubra corde nigro.

1. *Corallium rubrum majus.*
The greater Red Corall.

This greater red Corall groweth on the Rockes in the Sea, like unto a ſmall ſhrub with armes and branches, breaking forth ſome into greater others into ſmaller ſprigs, ſet full of knaggy eminences, of a pale or whitiſh red colour on the outſide for the moſt part, as it is taken forth of the water, but being ſcraped or filed, and poliſhed, becommeth very faire, as it is uſually ſeene, yet ſome will be much more red on the outſide at the firſt taking up, and much redder within of a firmer or hard ſtony ſubſtance, after it is kept a while out of the water, but pliable while it is there. There is ſome other ſorts hereof which grow ſmaller by much, and fuller of branches, and are uſually of a better colour on the outſide. *Ceſalpinus* maketh mention of a kinde of Corall that hath beene found red on the outſide and blacke within.

2. *Corallium album majus & minus.*
The greater and the finer white Corall.

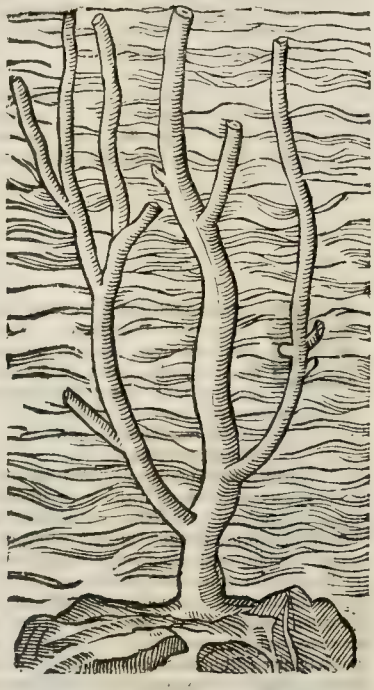
The greater white Corall groweth like the red, but is ſeldome found with ſo ſmall branches, being thicker for the moſt part, and although white within, and not ſo firme, yet ſomewhat darke coloured on the outſide, and as rugged as the red. As there is

of

1. *Corallium album majus & minus.* The greater and the finer white Corall.

3. *Corallium album alterum.*
Loose white Corall.

4. *Corallium nigrum Dioscoridis sive Antipathes.*
Blacke Coral.



of the red, so is there of the white Corall, other sorts of smaller or even as small, and some smaller and finer then the red, some also of a most pure white Corall.

3. *Corallium album alterum.* Loose white Corall.

This white Corall groweth greater and with blacker armes and branches then the last, but is not of so firme a substance being lesse solid and more porous or spungy then it within, and with sundry holes or hollow mansions on the outside.

Album fistulosum. Sundry other sorts of white Corall have beene observed by *Imperatus* of *Naples*, one fistulous or slender like a pipe, with many branches called *Corallium album fistulosum.* Another is bunched out with knots like warts and spotted withall, called *Corallium verrucosum punctatum.* A third hath markes like flames, set on all the branches, and is of two sorts both a greater and a lesser, called *Album stellatum.* A fourth hath certaine divisions therein, as if they were joynts and called *Corallium album articulatum.*

Verrucosum punctatum.

Album stellatum.

4 *Corallium*

4. *Corallium nigrum sive Antipathes.* Blacke Corall.

The blacke Corall groweth great below, where it sticketh to the Rocke, spreading into fewer branches, but as smooth as if they were polished and shining like Jet it selfe. There is said to be one found that is yellow, else like unto the blacke.

5. *Corallium nigrum hirsutum.* Rough bristly blacke Corall.

5. *Corallium nigrum hirsutum.* Rough bristly Blacke Corall.

This sort is often found as tall as any man, and of a large size in the truncke or body, having sundry blacke sprigges like rough bristles, or the aulnes of Corne standing round about it one above another up to the toppe.

The Place and *Time.*

Most of these Corals are found about *Marselles*, and the Ile of *Sardinia*, and other places in the *Mediterranean* Sea, and seldome on this side it, and their time is with the others.

The Names.

Κοραλλιον or in Greeke is likewise *Corallium* in Latine, and so called by all that have written of it, and thereto *rubrum* or *album*, &c. is set for distinction sake, yet the white is not remembred by *Dioscorides*, *Theophrastus*, or *Pliny*, and but onely by our moderne Writers: the blacke sorts are called *Antipathes*, and *Corallium nigrum*. The last is set forth in the *Italian Baldo* of *Pona*, by the name of the second sort of *Antipathes*, or blacke hairy Corall, and is called by the Fishers of *Sardinia Sambeggia*.

The Vertues.

All the sorts of Corall doe coole and binde, yet the white is thought to be of a colder operation then the red and the blacke, to be as effectuall to all purposes as either of the other: but red Corall is of most use, and is commended to be very effectuall for those that spit blood, or that bleede much either at the mouth or nose, or any other flux of blood in man or woman, and being often taken in wine or other drinke doth diminish the speene, it helpeth also the gonorrhea in men, and the whites in women, it likewise helpeth them much that are troubled with the stopping of their water, or hardly make it but by droppes, and also those that have tormenting paines of the stone in the bladder, if the pouther when it is burnt be taken in drinke: the pouther taken in wine, or in water if they have an agne procureth rest as it is said: it is good to be given to those that have the falling sickenesse, or have crampes when it is burned and made into pouther: it dryeth and bindeth more then before it did: it is also much commended against melancholly and sadnesse, and to refresh and comfort the fainting spirits: it stayeth the bleedings of the hemorrhodiall veines, and of wounds, and of the menstrues, causing also an easie delivery of the birth, it also fasteneth loose teeth, helpeth sore gummes and ulcers in the mouth, and healeth up foule hollow ulcers in other parts: the ashes thereof being burned, mixed with other medicines for the eyes, helpeth the watering, heate and redneese in them, by cooling and drying up the moisture in them, although *Galen* hath made no mention of Corall in his bookes of simple medicines, yet he appointeth it as an ingredient into sundry medicines, that are for those that have the phtisicke or cough of the lungs, tending to a consumption, and that spit blood, and that have foule running sores or ulcers, and to cleanse Imposthumes.

CHAP. LVI.

Alia marine plantæ. Other Sea Plants.

HEre yet remaine some other sorts of Sea plants, which are many of them of a stony substance, or crusted over like as if they were so, although while they are in the water, they grow like unto trees of divers shapes and formes, and because there is no use in Physicke knowne of them, nor yet for any other purpose then to behold the variable workes of nature, or rather of the God of nature in the Sea, and to feede the mindes of the curious, I will be breefe in them, and but onely shew you them.

1. *Abies marina.* The Sea Firre.

This as *Clusius* hath set it downe (who found it on the Sea shore of *Flanders*,) groweth upon Oyster or Mussell shels, seldome above an handfull high, very neerely resembling a low or dwarfe Firre tree, with branches set in order, being small and brittle, composed as it were of scales, some being flat and others round compassing the branches all about. *Lobel* referreth it to the Corallines, calling it *Museum Coralloides alter.*

2. *Cupressus marina.* The Sea Cypresse.

This also is so like unto the small Cypresse tree, as nothing can be more, having branches set round but without order, and rising upwards, as the sprigs of the Cypresse doth, and with leaves thereon in the same forme and manner: this having beene long kept in a paper booke, and set in water, will spread it selfe abroad, and shew the forme as it grew.

3. *Myrica & Erica marina.* Sea Tamariske and Sea Heath

Others also he saith he found growing on the like shels, that were likesome unto Tamariske, and some unto Heath, being but of a fingers length, with short branches covered over with a hoary saltnesse of the Sea.

4. *Reseda marina.* Base wilde Rocket of the Sea.

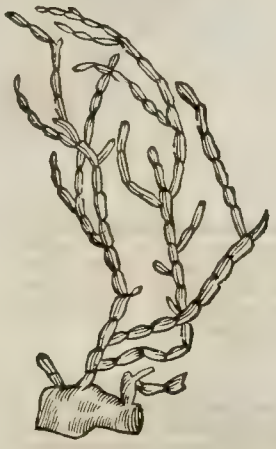
Clusius in his sixt booke of *Exotickes*, and sixt Chapter saith, he had this at *Amsterdam*, and for the rarenesse, there set it forth to be of a hard wooddy substance, crusted over with the white saltnesse of the Sea, being not the whole plant, but much of the lower parts, broken away, yet containing sundry branches, covered upwards with sundry small rough cups or vessels hanging downewards, of a whitish ash colour, not much unlike unto the seede vessels of *Reseda* when they are ripe, but much lesse, and so brittle that they might be rubbed to pouther betweene ones fingers.

5. *Hippuris*

1,2. *Abies & Cupreſſus marina.*
Sea Firre and Cypreſſe.

4. *Reſeda marina.*
Baſe wild Rocket of the Sea.

5. *Hippuris ſaxea.*
Stony Sea Horſetaile.



5. *Hippuris ſaxea.* Stony Sea Horſetaile.

This likewiſe ſeemed to grow to ſome Rocke, a peece thereof remaining to the branch that contained ſundry ſmall ſprigges leaning or bending one way, full of knots and joynts, of a browne ſhining colour, elſe all white cruſted over with a ſtony matter, the middle or inner part being wooddy.

6. *Abrotonoides ſaxea ſive Abrotoni fœminæ ſimilis planta ſaxea.* Stony Lavander Cotton.

This is wholly of a ſtony ſubſtance, riſing up a foote high ſpread into ſundry branches, yet joyning as it were cloſe together at the bottome of them, and they againe ſpread into ſmaller ſprigs, which containe five or ſixe, or more rowes of ſhort hollow leaves like pipes, almoſt like unto the leaves of Lavander Cotton, ſome part of the lower leaves being broken the upper part was whole, being of a purpliſh colour, the reſt white, of a ſtony ſalt ſubſtance, ſhewing the originall to be the Sea.

7. *Salix marina.* The Sea Willow.

This groweth likewiſe upon Oyſter ſhels or the like, riſing up with ſundry ſtalkes, of a grayiſh red colour, and ſet with narrow long leaves like Willow leaves, which lye on the water, ſome being ſmooth, and ſome a little waved or dented about the edges, among which riſe alſo other ſtalkes bearing flowers like thoſe of the Willow, with many points like the ſcales of the catkins, when it is ready to bloome.

8. *Androſace Matthioli ſive Cotyledon marina & Umbilicus marinus.* The Sea Navell.

Leaſt this Sea plant (if you will ſo call it, or what elſe you pleaſe) ſhould be quite left out of this Claſſis, let me thruſt it in, in the end of this Chapter, being a ſea excreſſence, formed like ſmall round ſawſers, hollowiſh in the middle like unto a Navell, and borne up by ſmall ſmooth footeſtalkes about two inches long, every one by it ſelfe, from ſome ſtone, or rocke, or ſhell in the Sea, or ſalt pooles, being of a pale greeniſh aſh colour, while they grow under water, but afterwards grow as white almoſt as Corall, or the like, and of a ſtony ſubſtance. This is generally called *Androſace Matthioli* by divers authours: becauſe he firſt ſet it forth, being ſent him from *Piſa* by *Lucas Ghinus* for the right, and *Lobel* ſeemeth to be of the ſame minde alſo, ſaying he can finde no other herbe that commeth ſo neere thereunto, calling it *Cotyledon foliоſum marinum & Umbilicus marinus Monſpelienſibus*: but *Ceſalpinus* it ſeemeth gave it a truer name, calling it *Fungus marinus minimus*. For it can no way agree in my judgement unto the *Androſace* of *Dioſcorides*, if we will beleeve he knew the thing he wrote of, for he ſaith, it hath no leaſe but a huske with ſeede in it, and doth appropriate whereunto both huske and ſeede is good, but this plant hath never beene obſerved to beare huske or ſeede, for being a ſtony Sea excreſſence, as Corall and many other the like, growing

6. *Abrotonoides saxea sive Abrotoni feminæ similis planta saxea.*
Stony Lavander Cotten.

7. *Salix marina.*
The Sea Willow.

growing upon ſhels ſtonēs,&c. in the Sea how ſhould it be expected to beare any ſeede, yet *Lobel* and others would wreſtle, curtail, and alter *Dioſcorides* text,to make it ſerve their turne,but aſſuredly the true *Androſace*, is not yet found out and made knowne for any thing that I can underſtand,and therefore let *Matthiolus* ſtill have the honour of this Sea plant.

8. *Androſace Matthioli ſive Cotyledon marina & Umbilicus marinus.*
The Sea Navell.

The Vertues.

There is nothing extant of the properties of any of the former recited plants,and but by *Lobel*, none of this who yet would aſſimilate ſome of the properties of *Dioſcorides* his *Androſace* unto this, that is, to provoke urine, and to digeſt the humours gathered to the joynts, procuring paines and aches,gontes,and the like, wee know ſaith *Lobel* that this doth binde the belly,ſo farre of it is from looſening it,as ſome have thought. I have knowne ſome to put this ſtone into the *Vaguentum Citrinum* becauſe it is called *Umbilicus marinus* yet I have ſeene a ſort that is reddiſh.

CHAP. LVII.

Spongiæ & ſpongioſa plantæ. Spunges and Spongious plants.

BEſides the Sponges themſelves,which are of ſundry differing formes and colours, there are alſo many other Sea Excreſſences,(whether I ſhould call them plants or no I know not well)that are of a Spongy ſubſtance, which laſtly I muſt bring to your view.

1. *Spongia marina uſualis.* The ordinary Sponges.

Theſe ordinary Sponges that we have daily uſe of, are ſome bigger others leſſer, ſome round, ſome flat, ſome of a browne yellow colour, others pale yellow or almoſt white, ſome alſo cloſe and hard, others more looſe and open and ſome of a fine thinne ſubſtance,and others of a courſer and thicker, *Banhinus* relateth that ſome ſorts were called *Hircina*, another *Velaris*,another *Ramoſa fiſtuloſa*, with divers other names. I will therefore onely ſhew you that Sponges like other excreſſences are bred in the Sea,growing from ſome ſtone, Rocke, &c. or the ground it ſelfe, and by the Seas operation in ſome places differing from others, brought to the forme as well as colour,

1. *Spongia marina usualis.*
The ordinary Sea Sponges.

2. *Spongia infundibuli forma.*
A Funnell like Spong.

3. *Spongia ramosa Britanica.*
The branched English Sponge.

4 *Spongia ramosa altera Anglica.*
Another branched English Sea Sponge.

colour that it holdeth, beīng as all know of a ſoft ſubſtancē, neither ſtony, woodby, nor herbe like: but rather like a peece of wooll or cloth ſo wrought together by nature, that being full of holes, it is ready to receive and hold much water and by preſſing or wringing ready to yeeld it out againe, but as it encreaſeth in the water, it gathereth into it, or elſe there is driven into the holes thereof divers ſmall gritty ſtones, which are uſually found therein, declaring the breeding thereof, not to be farre from the ground, by the receipt of theſe ſtones. *Ariſtotle* in his fifth booke and 16. Chapter. *de hiſtoria animalium*, ſaith that divers did thinke and ſay in his time that Sponges had ſence in them, for that (as they ſay) they would ſhrinke if any did plucke them, and were hard to be pulled up, and that they doe ſo likewiſe, when the ſurges of the Sea would breake them off from their reſidence, but ſaith *Ariſtotle* in the ſame place, divers did doubt of the trueth of that relation, and thoſe were they that dwelt at *Toronna*. I have beene bold to inſert this proofe of *Ariſtotle* in this place, to refute the opinion of thoſe that hold Sponges, and the like to be *Zoophyta*, ſenſitive creatures, for all though affirmed in *Ariſtotles* time, yet doubted of them alſo: and therefore wee that have beene better taught, and in a Schoole of farre greater knowledge, both of Divine and humane things, may well caſt of ſuch fond conceits.

2. *Spongia infundibuli forma.* Funnell like Sponge.

This Sponge *Cluſius* hath ſet forth to have ſeene cleaving to a very hard blacke ſtone of twelve pound weight, and was broad above and narrow below, where it grew to the ſtone like unto a funell, or to the flower of an herbe yet not of an equall height at the brims, which alſo were ſo turned inwards that they ſeemed to be like leaves foulded inwards. One ſaith *Cluſius*, I remember I ſaw while I lived at *Mompelier*, that did moſt exactly reſemble the forme of a very large hat.

3. *Spongia*

5. *Spongia ramosa fistulosa Veneta.* The Venetian Sea hollow Sponge.

6. *Arbuscula marina spongiosa Coralloides.* A Spongie Corall like tree.

3. *Spongia ramosa Britanica.* The branched *Englisb* Spong.

This saith *Lobel* I found in the Ile of *Portland*, among other Sea excrements, which for substance and colour, you would say was a Sponge, but if you marke the forme of branches in it, you would say it was neere a Coralline, for it was neere a handfull and a halfe high, full of blisters, soft and easie to be bowed any way. Some would take this to be the *Isados Plocamon* of *Pliny*, that was like unto Corall without leaves, growing hard changing the colour to be blacke, and ready to breake if it fall, which is more likely to be the *Antipathes* or blacke Corall of *Dioscorides*.

4. *Spongiosa marina Anglica planta nodosa.* The *English* soft Sea ragged staffe.

This soft Spongie plant hath beene found on our *Kentish* Sea shore, by Master *Johnson* and his Associates, in a simpling voyage to those parts, and is about the thickenesse of ones thumbe, about a foote in length, set with many tuberous, uneven or knagged excrescences on all sides, like unto short branches, being very sappy, and of a soft Spongious substance, and of a browniish yellow colour: it was not observed growing, but broken, and among other such like things cast upon the shore.

5. *Spongia ramosa fistulosa Veneta.* The *Venetian* Sea hollow Sponge.

The *Venetian* kinde groweth on Rockes in the Sea like other excrescences, rising up as it were with stalkes, and breaking out on all sides into sundry short branches, the substance whereof is Spongy, and hollow, as soft at the first, as the crumme of bread, which may then be made into paste, and afterwards being dry, may bee made into pouther.

6. *Arbuscula marina spongiosa Coralloides.* A Spongie Corall like tree.

From the largenesse hereof *Clusius* calleth this a shrubbe or low tree, being three foote high, and seven inches compasse at the bottome, which although it seemed firme and solid, yet was but of a Spongie substance, and white and cutting like unto dry Ginger: both the trunck or body with the many branches thereon, were set full of knobs, the branches themselves ending in greater, which were spongy on the inside, but without any seede in the seeming places, and marked on the outside like staires. The whole plant was covered with a thinne knobby reddish barke (which colour *Clusius* who first set it forth, doubted was not naturall, because he saw others the like which had a white coate) but of so salt a taste, that the salt it selfe did not exceede it. Within a while after (*Clusius* saith) he saw another which was six foote high or more, being wholly flat and halfe a foote broad and two inches thicke, set with branches and knobs in the like manner. *Altera.*

The Place, Time, and Names:

Are sufficiently declared in their descriptions, so that I shall not neede further to insist thereon. The Grecians call it σπόγγος, The Latines *Spongia*, and so doe both the *Italians* and *Spaniards*. The *Arabians Afferagi alhairi* or *alhar*. The *French Esponge*. The *Germanes Baüschwam*.

The Vertues.

Sponges are put to many uſes, buth civill and Phyſicall, as for fomentations or bathings, which moiſtened and applyed containe the warmth of the decoction, much longer and ſtronger then either linnen or woollen cloth: peeces of Sponges very well dryed and put into hollow ulcers, that are ready to cloſe, before they be throughly clenſed and healed, doth open the ſores againe, being to be pulled forth by the thred is faſtened thereto, before it be put in: the aſhes thereof mixed with a little wine or vinegar, is uſed to cleare the eyes when they are bloodſhotten, or watering: the ſtones in the Sponge are uſed by ſome to be given to them that are troubled with the ſtone, to helpe to breake it, and cauſe it to paſſe away with the urine. The *Venetian* Spongie plant is ſaid to clenſe the face, being waſhed with a decoction made thereof in honyed water, and is a remedy for them that have eaten dangerous Muſhromes to be boyled in Vinegar and taken: the pouther thereof taken in wine purgeth like *Cremor Tartari*, and cutteth and thinneth groſſe and viſcous humours.

CHAP. LVIII.

Britanicæ Conchæ Anatiferæ. Barnackles or Brant Geeſe.

TO finiſh this Treatiſe of Sea plants, let me bring this admirable tale of untruth to your conſideration, that whatſoever hath formerly beene related concerning the breeding of theſe Barnackles, to be from ſhels growing on trees, &c. is utterly erronious, their breeding and hatching, being found out by the *Dutch* and others, in their Navigations to the Northward, as that third of the *Dutch* in *Anno* 1536. doth declare.

Britanicæ Conchæ anatiferæ. Barnackles or Brant Geeſe.

CHAP. LIX.

Muſcus terreſtris. Land Moſſe.

HAving ſhewed you the Moſſes and excreſſences of the Sea, let mē exhibite alſo to your knowledge in this place, and not put them to any other, the Moſſes and Muſhromes of the Land: The varieties whereof are many, and therfore to be divided into thoſe that grow on the ground, and to thoſe that grow on trees and other things, of each of theſe in their order.

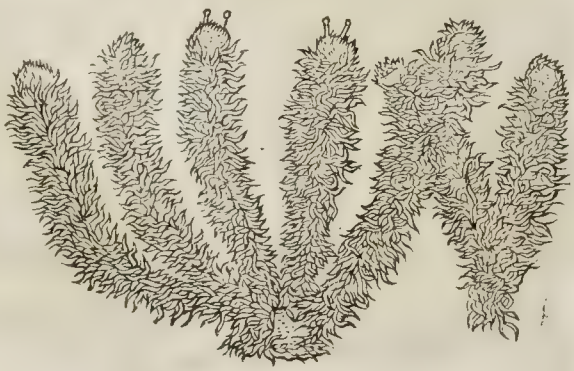
1. *Muſcus terreſtris vulgatiſſimus.* Our common ground Moſſe.

This common Moſſe that uſually groweth in our moiſt woods, and the bottomes of hils in boggy grounds, and ſhadowy ditches and places, groweth very thicke together with many ſmall ſingle ſtalkes about a foote high ſometimes, and often not above halfe the height, with a number of ſoft leaves like haires, growing thicke and cloſe together, the toppe whereof in the hotteſt time of Summer will be ſomewhat round and whitiſh, the whole tuſſocke is often found differing in colour, being either greene or reddiſh, or of a whitiſh yellow. it hath very ſhort rootes faſtened in the earth.

2. *Muſcus terreſtris vulgaris alter.* Another ordinary ground Moſſe.

This other Moſſe that is more common in *Germany*, &c. then wichus, groweth up with many branched ſtalkes of long winged but ſhort greene leaves almoſt like Heath, ſmooth, and ſoft, and not hard like heath, it ſpreadeth on the ground and riſeth not above halfe a foote high.

1. *Muſcus terreſtris vulgatiſſimus.* Our common ground Moſſe.



3. *Muſcus terreſtris ſcoparius.* Beeſome Moſſe.

The Beeſome Moſſe taketh the name from the manner of the growing thereof, which is, from a ſmall head below, ſending up divers ſhining blackiſh purple ſtalks of winged green thredlike leaves about a foote high, which ſpread themſelves out broadeſt in the middle, at the top whereof breaketh forth ſometimes ſmall yellowiſh heads which fall quickely away without any ſeede following them.

3. *Muſcus terreſtris ſcoparius.*
Beeſome Moſſe.

4. *Muſcus clavatus ſive Lycopodium.*
Club Moſſe, or Wolfes claw Moſſe.

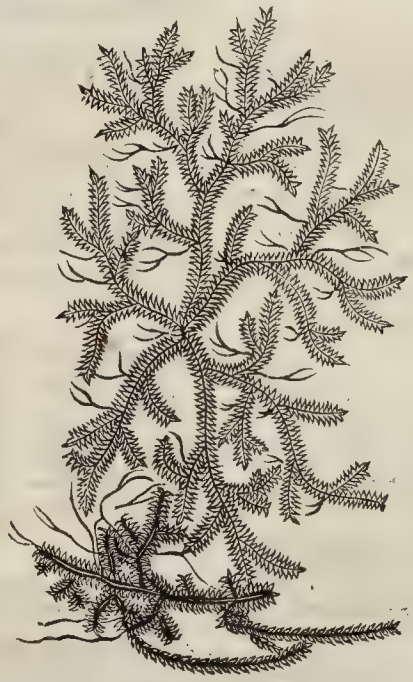
4. *Muſcus clavatus ſive Lycopodium.*
Club Moſſe, or Wolfes claw Moſſe.

The club Moſſe runneth upon the ground to a great length, breaking into other long round branches, ſhooting forth fibres into the ground as it creepeth, being made of many ſhort yellowiſh green hairy leaves: at the joynts of the branches grow in ſeverall places two or three ſmall round and long yellowiſh ſcaly heads, like the catkins or bloomings of the Hazell tree, which as in all the other Moſſes come to nothing.

5. *Muſcus denticulatus major & minor.*
The greater and the leſſer dented Moſſe.

Both theſe ſorts of Moſſes grow one like unto another, but one bigger then another, and each of them ſomewhat like unto the laſt, rooting in divers places, as it runneth on the ground: the ſtalkes are as ſmall as haires almoſt, upon which grow the ſmall leaves thicke ſet together, as if they were ſcales, laide cloſe one unto another, the ends of them ſticking out like teeth, we have not ſeene what flower or ſeede it beareth if it have any.

5. *Muſcus denticulatus major & minor.*
The greater and leſſer dented Moſſe.



6. *Muſcus pennatus major & minor.*
Winged Moſſe ſmall and great.

Both theſe Moſſes alſo neede but one deſcription, not differing but in the largeneſſe, and multitude of branches, one from the other, creeping on the ground and rooting as they runne, whoſe ſtalkes and ſhort branches are thicke ſet with fine yellowiſh greene leaves like wings on both ſides, and thereof tooke the name: theſe grow in woods as alſo upon Rockes and ſtones.

7. *Muſcus ſpicatus repens.*
Creeping Moſſe with ſpiked heads.

This Moſſe groweth hard by, and under trees, creeping farre with thicke, and long branches, which ſend forth

9. *Muſcus parvus ſtellaris.* Heath Moſſe.

11. *Muſcus pyxidatos.* Cup-like Moſſe.

many fine leaves cloſe ſet together in manner of long ſpiked heads, one ſort being greene and another white.

8. *Muſcus erectus ramoſus major.*

The greater branched Moſſe.

The greater branched Moſſe groweth thicke and cloſe together like a turfe or tuſſocke of high graſſe, whoſe ſtalkes are three or foure inches long, ſpreading into branches of two or three inches apeece, and thoſe into others againe, all which are covered with very fine haires like leaves, among which ſhoote forth ſmall naked ſtalkes of an inch long, with ſmall yellow round heads like wheate cornes. There is alſo a leſſer hereof whoſe ſtalkes are ſhorter and leaves ſo ſmall that they are ſcarſe to be diſcerned.

Minor.

9. *Muſcus parvus ſtellaris.* Heath Moſſe.

This ſmall Moſſe riſeth up with divers hard ſtalkes of ſmall ſhort leaves, and at the top a many other ſet thicke and round in a turfe: it groweth much on dry heathy grounds.

10. *Muſcus ſtellatus roſens.* Starre Moſſe.

The ſtalkes of this ſmall Moſſe, riſe ſcarſe above an inch which have many ſmall pale greene ſharpe pointed leaves, ſet at the toppes of their ſmall ſtalkes, in manner of a Roſe, ſpreading forth like a little ſtarre, this groweth upon Rockes and ſtones.

11. *Muſcus pyxidatus.* Cup-like Moſſe.

The leaves of this Moſſe that lye like Liverwort creeping upon the ground, are of a whitiſh yellow colour as the ſmall hollow heaves like cups, that riſe from them are alſo. There is another ſort hereof growing not on the ground as the former, but on rockes and ſtones whoſe cups are ſmaller, more in number and not ſo white.

Alter.

12. *Muſcus corniculatus.* Horned Moſſe.

This horned Moſſe which groweth on thoſe rocky barren hills, and rocky grounds, where almoſt nothing will grow, riſeth out of the ground, with divers ſlender weake and ſomewhat broad ſtalkes three or foure inches high naked and without leaves from the bottome to the toppe, but parted into ſmaller branches, and they againe into leſſer, which are forked at the ends like unto hornes of a duſky white colour.

13. *Muſcus*

13. *Muſcus minimus terreſtris.* The ſmalleſt ground Moſſe.

We have a ſmall kinde of Moſſe (uſually growing with us not onely upon thoſe grounds that are not ſtirred or turned up for two or three yeares together, but in flower pots of earth in Gardens oftentimes, eſpecially ſome that are not ſtirred) which is nothing elſe but a number of greene ſhort haires matting upon the ground, which in the heate of Summer, and ſometimes ſooner will ſend forth ſmall ſhort ſtalks an inch high with ſmall yellowiſh or greeniſh heads on them.

The Place and *Time.*

All theſe are in a manner particularly declared where they are moſt uſually growing and are in their perfection in the Summer time.

The Names.

Moſſe in generall is called in Greeke βρύον and σπλάχνον, and in the *Atticke* tongue *Sphagnum* and *Hypnum*, and *Pliny* thereupon in one place calleth it in Latine *Bryon* and *Sphagnum*, and in another place *Sphagnos ſive Phacos ſive Bryon*, in Latine it is uſually called *Muſcus*, and properly betokeneth any herbe that is compoſed of haires or threds inſtead of leaves. The firſt here ſet forth, is the *Muſcus terreſtris vulgaris* of *Lobel*, and *Dodonæus*, and thought by *Bauhinus* to be the *Muſcus hortenſis* of *Tragus*, but I ſuppoſe rather his is the laſt that I here ſet forth in this Chapter; and none other that I know growing ſo familiar in Gardens: The ſecond is the *Muſcus montanus* of *Tabermontanus*, and *Muſcus terreſtris* of *Gerard*, which *Bauhinus* calleth *Muſcus Denticulato ſimilis*, becauſe it is very like the ſmall *Denticulatus*, but that it rooteth not as it lyeth: The third is the *Muſcus ſcoparius* of *Lobel* and others, and *Selago tertia* of *Thalius*. The fourth is called *Muſcus clavatus* by *Lobel* and *Dodonæus*, who calleth it alſo *Lycopodium*: *Tragus*, *Matthiolus*, and others *Muſcus terreſtris*, and is the *Selaginis ſpecies altera* of *Thalius*, *Geſner in fracti montis deſcriptione* calleth it *Muſcus urſinus*, and ſet it forth for *Chamæpeuce Cordi in hiſtoria*, but *Thalius* ſaith it was impoſed on him by others, for *Cordus* ſent the true *Chamæpeuce* to *Geſner*, a little before his death, *Anguilara* and *Cæſalpinus*, ſay that it was of long time uſed in the ſhops of *Italy*, &c. for true *Spica Celtica*: The fifth of both ſorts is called *Muſcus terreſtris* by ſome, and *denticulatus* by others, and *Luſitanicus* by *Cluſius*. The ſixth of both ſorts is mentioned onely by *Bauhinus* in his *Pinax* and *Prodromus*, and ſo is the ſeventh alſo: The eight is called by *Bauhinus Muſcus ramoſus erectus major & minor*. The ninth is called by *Lobel Muſcus in ericetis provenions*, and by *Bauhinus* as it is in the title, *Muſcus parvus ſtellaris*: The tenth is by *Bauhinus* onely called as it is in the title, *Muſcus ſtellatus roſeus*: The eleventh is the *Muſcus pyxidatus alabaſtriculos imitans* by *Lobel*, the other ſort whereof *Bauhinus* calleth *Muſcus pyxiodes ſaxatilis*, as he did the former of *Lobel*, *pyxiodes terreſtris*: The twelfth is called *Muſcus ceranoides major & minor*, by *Bauhinus*, and no doubt is the *Muſcus corniculatus* of *Tabermontanus* and *Gerard*, however his *Corrigidor* hath put as he ſaith a better in the place, namely the *Filix petræa* of *Tragus*, when as no other Authour doth referre it to any of the Moſſes, but *Bauhinus* who miſtooke his reference herein, for as I ſhewed in the deſcription thereof among the Fearnes, that hath ſpots on the leaves as other Fearnes and Capillare herbes have, which argueth it plainely to be of that family, and no Moſſe, and *Bauhinus* his deſcription of his *Muſcus ceranoides major*, doth plainely agree with this *corniculatus*. The laſt although beſt knowne to many, yet little regarded by moſt, and not mentioned before by any except *Tragus*, if his be it.

The Vertues.

All the Moſſes are ſomewhat cooling and drying, and thereby ſtay fluxes and bleedings, theſe earth or ground Moſſes, eſpecially the firſt and the fourth, are held to be ſingular good to breake the ſtone, and to expell and drive it forth by urine, being boyled in wine and drunke, the herbe bruiſed and boiled in water, and then applyed to any inflammations or paines riſing from a hot cauſe doth allay and eaſe them, and therefore many doe apply it to the hot gout, to eaſe the paines thereof. The cup Moſſe is ſaid to helpe the chincough in children effectually, if they drinke the pouther thereof for certaine daies together. The club Moſſe hung in a veſſell of wine that hath loſt the vigour and vertue, ſo much as is convenient for the bigneſſe of the veſſell, is ſaid in ſhort time to recover it againe, whereupon *Brunfelſius* called it *Wein kraut*, the Wine herbe.

CHAP. LX.

Muſcus herbæ formis & coralliformis. Moſſes that reſemble ſome herbes or Corall.

THere be divers other ſorts of Moſſes that have ſome reſemblance, either to ſome herbes or to Corall, and becauſe I thought it fitteſt to ranke them together, I have as you ſee kept them out of the laſt Chapter, to inſert them here into this.

1. *Muſcus clavatus Cupreſſiformis.* Cypreſſe like Moſſe.

This ſmall Moſſe abideth alwayes greene ſending forth ſundry hard branched ſtalkes, with very ſhort and thicke leaves ſetled upon them, ſomewhat reſembling the branch of a Cypreſſe, being of a darke greene colour, from the top whereof ſometimes come forth ſmall and ſoft ſpiked heads ſtanding on ſmall foote ſtalkes: Another ſomewhat like hereunto is remembred by *Bauhinus*, which he entituleth *Muſcus Cupreſſi formis ramoſus*, to diſtinguiſh it. *Altera.*

2. *Muſcus Abietis facie.* Firre like Moſſe.

The Firre like Moſſe groweth cloſe upon the ground, and creeping thereon with ſundry long branched ſtalkes, with fine ſhort hayrie greene leaves, ſet on both ſides of the middle thereof, reſembling a Firre tree branch, whereof it tooke the name.

3. *Muſcus Filicinus.* Ferne like Moſſe.

There be divers ſorts of this Moſſe, ſome bigger and ſome leſſer than others, all of them riſing up with ſundry ſtalkes ſome blackiſh, ſome reddiſh, and fine leaves on them much like to Ferne leaves, but in ſome more finely jagged or cut into ſeverall parts than in others, on the toppes of the branches of the leſſer ſort hang ſmall round pointed crooked heads.

4. *Muſcus Polytrichoides.* Maiden haire Moſſe.

There are three ſorts of this Moſſe, the one hath many ſhort ſtalkes thicke covered with ſhort, but ſomewhat

1. *Muſcus elevatus Cupreſſiformis.*
Cypreſſe Moſſe.

3. *Muſcus filicinus.*
Fearne-like Moſſe.

8. *Muſcus Corallinus montanus.*
Mountaine Corallina like Moſſe.

9. *Muſcus Coralloides ſaxatilis.*
Rockie Corrall like Moſſe.

Vide duo. hard, rough, haire like leaves, the other is leſſe in each part, and the leaves not rough or hard at all: the third is the leaſt and the leaves ſmootheſt: the firſt groweth in wet wood grounds and the other upon old walls.

5. *Muſcus ſaxatilis Ericoides.* Stone Heath Moſſe.

This ſmall Moſſe hath many ſmall hairelike leaves, next the ground like unto the common ground Moſſe among which riſe rough ſtalkes an hand bredth high, in ſome places bare of leaves, and covered in the reſt, with many ſuch like ſmall leaves, as are growing on the *Erica Coris*, the faire heath low Pine, but without order, on the tops of each whereof ſtandeth a ſmall head.

6. *Muſcus terreſtris coralloides incanus.* Hoary Corall like Moſſe.

This Moſſe is all hoary white about a foote high, whoſe upright branches are thickē, ſolide, and not hollow, divided into many branches, each whereof is like a ſtagges horne, and ſharpē or ſmall at the ends.

7. *Muſcus terreſtris coralloides rufeſcentibus cornibus.* Reddiſh Corall like Moſſe.

Among the ordinary ground Moſſe doth this Moſſe grow, and is a fine ſight to behold the pale greene ordinary Moſſe to grow on the ground, and this Moſſe being all white to grow out from among it parted like Corall into many branches hard or rough in handling, but the ends or tops of them all are of a yellowiſh or reddiſh colour, like ſmall hard or rough hornes.

8. *Muſcus*

8. *Muſcus Corallinus montanus.* Mountaine Coralline like Moſſe.

The Coralline like Moſſe is a ſmall low whitiſh dry herbe, with ſmall hollow ſtalkes, not ſtony nor hard at all, but finely cut and divided into many parts, much reſembling the true Coralline, this is often found upon dry Heath grounds.

9. *Muſcus Coralloides ſaxatilis.* Rockye Corall like Moſſe.

This groweth on the Rockie hills among other Moſſes in *Naples* as *Columna* ſaith, whoſe branches are many and each ending in a twoforked like horne, ſomewhat like the double forked horne of a Stagge, being hollow and greene without, and white within, but of an evill earthy ſent; there is an other ſort of a grayiſh aſh colour and much leſſe than the other, growing in the ſame place with the former. *Alter.*

The Place and *Time.*

The places of moſt of theſe are expreſt in their diſcriptions, and they keepe the Summer time for their flouriſhing.

The Names.

The firſt is called by *Tragus* and *Geſner in hortis Sabina ſylveſtris*, and by *Thalius Selaginis Pliniane prima ſpecies* for *Pliny* in his 25. booke and 11. Chapter hath theſe words, *ſimilis herbe Sabine eſt Celago appellata*, and therefore all doe generally hold this to be his *Selago*, not finding any other herbe ſo neere to reſemble it, although hee call *Sabina* an herbe which is a tree, *Turner* and *Tabermontanus* call it *Chamæcypariſſus*, and ſo doth *Gerard*, but they did not meane Lauender Cotten as *Gerard* doth, but a kinde of Moſſe, which *Turner* fitly Engliſhed Heath Cypreſſe; the ſecond is remembred onely by *Bauhinus*, for that of *Cluſius* is a Sea Plant, as is before ſhewed in his place: the third is ſet downe by *Tabermontanus* and *Gerard*, but the leſſer by *Bauhinus* onely: the fourth, fifth, and ſixth, and ſeventh, are ſpoken of onely by *Bauhinus*, the eighth is called by *Tabermontanus* and *Gerard Muſcus corallinus ſive Corallina montana*, but yet *Gerard* was much miſtaken, to underſtand this of ſtone or Sea Coralline, which is hard like Corall: the laſt is remembred by *Columna* in the ſecond part of his *minus cognitarum ſtirpium*, and calleth it *Lithobryon coralloides.*

The Vertues.

There is nothing recorded in particular of any of theſe ſorts of Moſſes, to be availeable for any griefe or diſeaſe.

CHAP. LXI.

Muſcus arboreus. Tree Moſſes.

THere are other ſorts of Moſſes which grow upon trees, which are next to be ſpoken of.

1. *Muſcus arboreus vulgaris & Quercinus.* Common Moſſe growing on other trees as well as Oakes.

The uſuall Moſſe that generally groweth on all trees, is nothing elſe but a number of haires iſſuing from the bodies and branches of them, in ſome ſhorter in others longer, all for the moſt part hoary or of a grayiſh white colour, which yeeldeth neither roote nor ſtalke neither flower nor fruites ſome onely are found to be reddiſh, and ſometime blackiſh, which is the worſt ſort of all: It groweth upon ſundry trees, upon the great Cedar as *Dioſcorides* ſaith, which is the beſt of all other, and is very ſweete: the next in goodneſſe (ſaith he) is that which groweth on the Poplar tree, eſpecially if it be white and ſweete: that which groweth on the Oake, ſaith he, is the worſt: It is alſo found growing in ſeverall Countries on ſundry other trees, *Matthiolus* commendeth it for the beſt, the whiteſt, and the ſweeteſt, that groweth on the Larch tree: others thinke that to be as good that is found upon the Pine, Pitch, or Firre trees. *Cluſius* ſaith he found a kinde of aſh coloured Moſſe hanging downe from the armes and boughes of the Ilex, or ever greene Oake, in ſome places of *Spaine.*

2. *Muſcus quercinus Fœniculaceus.* Fennell-like Oake Moſſe.

This Moſſe uſually groweth upright on the bodies, and the Elder armes and branches of old Oakes and ſometimes on Beeches alſo, faſtening a ſmall brackiſh roote into their barke, and from thence ſendeth forth ſundry ſlender blackiſh branched ſtalkes about two inches, with a number of moſt fine grayiſh Fennell like leaves which ſmell ſomewhat ſweete, at the toppe whereof ſtand ſmall round hollow veſſels a little rough or hayrie about the brimmes, which quickely fall away without any ſeede following them.

3. *Muſcus quernus fruticoſus capitulis cavis.* Tree Moſſe with hollow heads.

This tree Moſſe hath ſtollow ſtalkes, with broad flat leaves, ſomewhat hayrie on both edges, the heads are hollow, with a blackiſh umbone in the middeſt of them, and ſometimes compaſſed about with a dented verge: this hath ſome ſhort branches ſpread divers wayes, and is wholly of a grayiſh aſh colour.

4. *Muſcus alter quernus latifolius coralloides.* Oake Moſſe with broade horned leaves.

This Oake Moſſe is of a whiter aſh colour, branching it ſelfe into many thicke and broad parts, like unto the hornes of a ſtagge, bearing at the toppes of them certaine ſmall veſſells of the bigneſſe of Cicers or Ciche peaſon at the biggeſt. This doth ſometime grow luxurious ſwelling greater from the bottome to the toppe.

5. *Muſcus arboreus nodoſus ſive geniculatus.* Knobbed or kneed tree Moſſe.

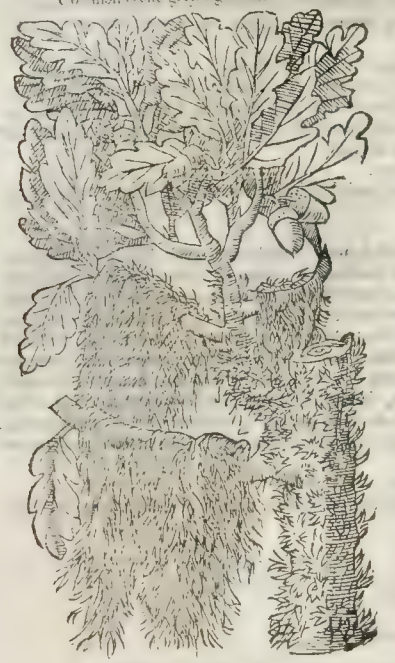
This grayiſh Moſſe is very frequent in *Italy*, hanging from the trees with a large ſpread buſh of haires, a foote and ſometimes halfe a yard long, with divers ſmall knotted joynts like beads, growing upon them towards the lower end, which are hollow and doe ſo grow as if they were ſtrung together, ſome being lower and others ſhorter than the reſt.

6. *Muſcus pulmonarius ſive Cichen arborum.* Tree Lungewort.

This kind of Moſſe that groweth on ſundry ſorts of trees, eſpecially Oakes, and Beeches with broad aſh coloured or grayiſh tough leaves, diverſely foulded, crumpled and gaſhed in on the edges, and ſpotted alſo in ſome places with many ſmall ſpotes on the upper ſide, it never was ſeene to beare any ſtalke or flower at any time.

7. *Muſcus*

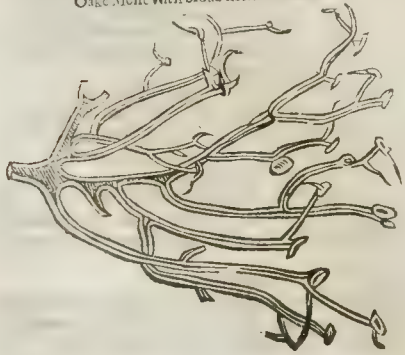
1. *Muscus arboreus vulgaris & quercinus.*
Common brode growing on other trees as well as Oake.



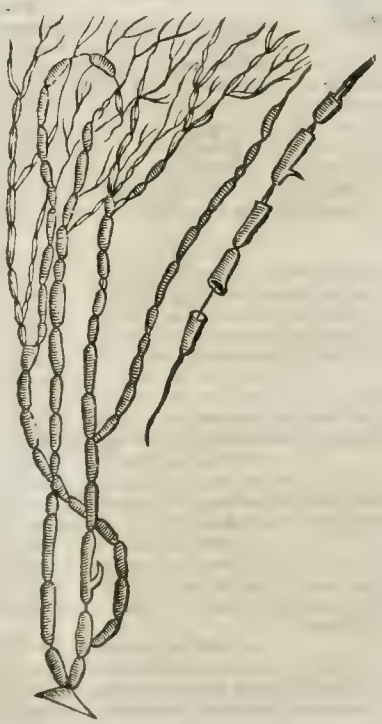
2. *Muscus quercinus feniculaceus.*
Fennell-like Oake Mosse.

3. *Muscus quernus fruticosus capitulis cavis*
Tree Mosse with hollow heads.

4. *Muscus arbor quernus latifolius Coraloides.*
Oake Mosse with broad horned heads.

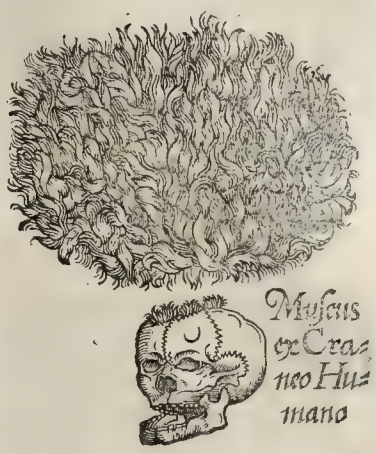


5. *Muscus arboreus nodosus sive geniculatus.*
Knotted or kneed Oake Mosse.



6. *Muscus Pulmonarius sive Lichen arborum.* Tree Lungewort.

8. The Mosse upon dead mens Sculls.



7. *Muscus aridus crustatis.* Crustie dry Mosse or Liverwort.

This kinde also doth not much differ in forme or colour from the former, but in being dryer or more crustie or hard, growing oftentimes as well on trees as one the cleft pales, and shingles of Oaken boards, as also sometimes upon the stones and rockes on the ground, and sometimes also upon the very ordinary Mosse it selfe. as Sir *Matthew Lyster* one of his Majesties Physitians assured me, and sent me some to see which he gathered in *Windsor* Forrest.

8. *Muscus ex cranio humano.* The Mosse upon dead mens Sculles.

Let me here also adjoyne this kinde of Mosse, not having any fitter place to insert it. It is a whitish short kinde of Mosse somewhat like unto the Mosse of trees, and groweth upon the bare scalpes of men and women that have lyen long, and are kept in Charnell houses in divers Countries, which hath not onely beene in former times much accounted of, because it is rare and hardly gotten, but in our times much more set by, to make the *Ungnentum Sympatheticum*, which cureth wounds without locall application of salves, the composition whereof is put as a principall ingredient, but as *Crollius* hath it, it should be taken from the sculls of those that have beene hanged or executed for offences.

The Place and *Time.*

The first is found in many Forrests and Woods in this Land, but the places of the second and third are *Italy*, as the fourth is also, the rest are as usuall to our Land as to others, but the last is often brought out of *Ireland* than found with us, and they are to be gathered in the Summer time.

The Names.

I have shewed you before how the Greekes and Latines called the Mosses, which names indeede doe more properly belong to these trees Mosses, for I cannot finde that any of the ancients made any account of the ground Mosses, or put them to any use, the *Arabians* called it *Axnec* and *Usnec*, and by the Apothecaries *Usnea*, the *Italians Mosco*, the *French Mousse*, the *Germaines Mooss*, and the *Dutch Mosch*. The first here set downe is called *Muscus arboreus* and *Muscus querinus*, by most writers: the second third and fourth are remembred by *Columna*: the fifth is generally called *Pulmonaria* by most writers of this latter age (for it is thought it was not knowne to the elder times) but without distinction almost, whereby many were misled, taking one herbe for another, because there are divers included under that name, and therefore *Lobel* to distinguish it called it *Muscus pulmonarius*, and others *Pulmonaria fungosa*, or *Lichenis genus*, and yet some more properly *Lichen arborum*, the seventh because it is a dryer substance, is so called as it is in the title, and as I take it is *Columna* his *Lichen Dioscoridis* and *Plinii altera*, putting a difference betweene them, this of trees and that on the ground by these titles *Lichen foliosum* being that of the ground, and *Lichen adherens* being this of the trees.

The Vertues.

The Vertues that the ancients attributed unto Mosse, are wholly to be understood concerning these of trees, being cooling and binding, and partake of a digesting and mollifying quality withall, as *Galen* saith, especially that of the great Ceder, for each Mosse doth much partake of the nature of the tree, from whence it is taken, as that of

of the Oake to be more binding than those of the Cedar, Larche, Ivie, Pitche, and Firre, to be more digesting and mollifying, it is of good use and effect to stay fluxes and laskes in man or woman, as also vomittings and bleedings, the powder thereof to be taken in wine: The decoction thereof also in wine is very good for women to be bathed with, or to sit in that are troubled with the aboundance of their courses: the same also drunke doth stay the troubled stomacke, perplexed with casting or the hickocke, and doth also comfort the heart as *Avicen* saith, and as *Serapio* saith procureth deepe sleepe, some have thought it availeable for the Dropsie to take the powder thereof in drinke for some time together: the Oyle of Roses that hath had fresh Messe steeped therein for a time, and after boyled and applyed to the Temples and forehead, doth merveilously ease the head ache that commeth of a hot cause, as also the distillations of hot rheume or humors to the eyes or other parts: the ancients much used it in their oyntments, &c. against lassitude, and to strengthen and comfort the sinewes. The Lungwort is of great good use with many Physitions, to helpe the diseases of the Lungs, and for Coughes, wheesings, and shortnesse of breath, and the sheapheards also to their Cattle doe give it for the same purpose with good successe with a little salt, it is also very profitably put into lotions, that are taken to stay the moyst humors that flow to ulcers, and hinder their healing, as also to wash all other ulcers in the secret parts of man or woman.

Chap. LXII.

Lichen sive Hepatica. Liverwort.

OF the Liverworts also there are diverse sorts, which are also other kindes of Mosses that doe either grow on the ground or on rockes and stones, yet moist withall.

1. *Lichen sive Hepatica vulgaris.* Common ground Liverwort.

The common Liverwort groweth close and spreadeth much upon the ground in moyst and shadowie places, with many sad greene leaves, lying or rather as it were sticking flat one unto another, very unevenly cut in on the edges and crumpled, from among which rise small slender stalkes, an inch or two high at the most, bearing small starre like flowers at the toppes, the rootes are very fine and small whereby it liveth.

2. *Lichen sive Hepatica minor stellaris.* Small ground Liverwort.

This small Liverwort groweth in the like manner as the former, and sendeth forth such like starrie flowers but is smaller for the most part in all places where it grow, for so as it groweth in the shaddow, it will abide in pots as well as on the ground, if the place be not stirred or turned up. There is also another sort that beareth not

Vmbellatus

2. *Lichen sive Hepatica minor umbellatus.*
Small ground Liverwort with round heads.

2. *Lichen sive Hepatica minor stellaris.*
Small ground Liverwort.

4. *Lichen marinus pileatus & calceato folio.*

divided

divided leaves, and the ſmall ſtalkes have round heads not differing in any other thing from the laſt.

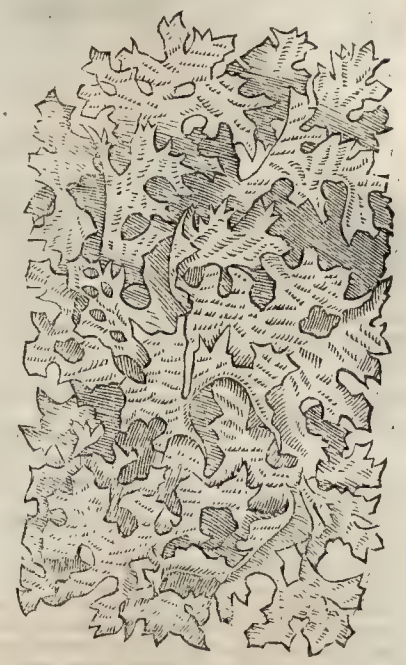
3. *Lichen petræus racemoſus.* Cluſter headed Liverwort.

This Liverwort that groweth upon the ſtones by wells and ſprings, hath much leſſer leaves than the former, but lying flat one upon another in the like manner, and of a paler greene colour and ſomewhat hayrie, from among which riſe ſlender naked ſtalkes, two inches high, bearing at their toppes ſmall heads made like a cluſter of divers graines ſet together of a reddiſh colour.

4. *Lichen petræus pileatus.* Liverwort with a hooded head.

This Liverwort groweth in the like moyſt ſtony places, and hath ſuch like leaves lying one upon another of a yellowiſh greene colour, daſht over with an aſh colour, and ſpotted a little in the middle of them, the ſtalke groweth to be three or foure inches high, being white ſmooth cleare or tranſparent, and of the thickeneſſe of a ruſh, whereon ſtandeth a ſmall head, ſomewhat like unto a hat divided underneath into five parts, of a ſpongie ſubſtance, greene at the firſt, then yellow, and laſtly reddiſh, under which are growing the fruite, which are of a darke purple colour and ſappie while they are freſh, but being dry have a ſmoakie powder within them in ſtead of ſeede: the rootes are ſmall fine and white.

1. *Lichen ſive Hepatica vulgaris.* Common ground Liverwort.



5. *Lichen alter minor folio calceato.* Small Liverwort with skinnie heeles.

This ſmall Liverwort hath ſmooth tranſparent leaves more tender and ſmall than any of the former, growing in time to be of a blackiſh purple colour, and not lying or ſticking one to another, as the other: from the backe whereof groweth forth a skinne or ſheath, ſhaped like a ſhooe, whoſe brimmes are a little crumpled and rayſed higher than the reſt, from whence riſe up foure little darke greene ſhining heads, of the bigneſſe of the ſmalleſt Peaſe, which afterwards open into yellow flowers, with foure leaves a peece, ſtanding on yellowiſh ſtalkes foure inches high, with divers impalpable threads in the middle, the roote hath fibers as ſmall as ſilke.

6. *Lichen petræus minimus acaulis.* The ſmalleſt Liverwort without ſtalkes.

This Liverwort is the ſmalleſt of any, having leaves no bigger than the nayles of ones finger, greene and rough with white ſpots, this hath certaine ſad purpliſh skins ſet on both ſides of the lower part of the leafe, before any flower appeare, but when the leafe groweth greater, it waxeth of a ſad purpliſh colour like the skins and ſwelleth at the end, ſending forth a ſmall fruit, as big as a ſmall Peaſe, being of the ſame colour with the leafe, ſappie or full of whitiſh watry juyce, which afterwards as the fruite groweth ripe, changeth yellow, and being broken hath then a yellow powder, which will colour their fingers that touch it; the leaves cleave very fine ſhort white fibres whereby it liveth.

7. *Lichen petræus purpureus Derbienſis.* Corke or Archill.

There is growing in *Darbiſhire* upon the free ſtones of the Mountaines a kinde of herbe, much reſembling Liverwort, but of a ſad purpliſh colour which the poore people there gather, and grinding it make into a moyſt maſſe, keeping it in barrels, and therewith make a kinde of murrie or purpliſh dye which although it will not hold colour in the cloth long, but will ſtarve and change, yet it ſerveth the poore people for their wearing very well.

The Place and *Time* and *Names.*

There needeth no further declaration of any of theſe Liverworts, then hath beene ſpecified in their deſcriptions, onely let me tell you that the third is taken from *Bauhinus*, as the fourth, fifth, and ſixth from *Columna*, whoſe title to the fifth is *caule calceato*, but his deſcription thereof ſheweth it rather in the leafe then ſtalke, and therefore I have ſo called it. The Greekes call it λειχὴν, and ſo in Latine *Lution* of ſome. *Hepatica* and *Iecoraria*, taken either from the forme of the leaves or from helons, the diſeaſe called Lichen tetters, which deforme the skinne and make it rough, or from helping the diſeaſes of the Liver. The *Arabians* call it *Azez* and *Alſachel*. The *Italians* call it *Fegatella*, the *French Hepatique*, the *Germanes Stein Leber kraut*. The *Dutch Steene lopercruit*.

The Vertues.

Liverwort is a ſingular good herbe for all the diſeaſes of the Liver, both to coole and cleanſe it, and helpeth alſo inflammations in any part, and the yellow jaundiſe likewiſe. Liverwort being bruiſed and boyled in ſmall beere and drunke, cooleth the heate of the liver and kidneyes, and helpeth the gonorrhea in men, and the whites in women. *Galen* inſiſteth on the qualities of cooling, clenſing and drying, but doubteth of the ſtanching of blood, which *Dioſcorides* reporteth of it: it is a ſingular remedy to ſtay the ſpreading of tetters, ringwormes, and other fretting and running ſores and ſcabs, &c. the name it ſelfe importing ſo much.

Having

Having thus passed through the fieldes of grasses, and the rockes and bogges of Mosses, let me last of all runne through the woods and by places of Mushromes, that therewith I may finish this Classis or Tribe: but they are of so great variety that for methods sake, not to huddle them together, and the more orderly proceeding with the them, I must distinguish them into two primary kindes, namely into those that are not dangerous, but edible, and into those that are dangerous and poysonous, unto the former sort belongeth *Agaricke* whereof I have entreated in the second Classis or Tribe of this worke, and Iewes eares which shall be last of all mentioned among the edible ones, although *Clusius* numbreth it with the perilous, and unto the other pertaineth Touchwood, which are wooddy Mushromes, and some other that are of a soft stony substance, which I shall also adjoyne there, being not many of them, that are fit here to be spoken of in this place. And first to speake of those that are not dangerous but edible, that is, may be eaten, and because our Country neither produceth much variety of good or bad, to like or mislike, our Nation also not being so addicted to the use of them, as the *Italians* and other nations are, where they grow more plentifully. I will therefore but runne them over briefly, and not insist so much on them, as in other things of better respect.

Chap. LXIII.

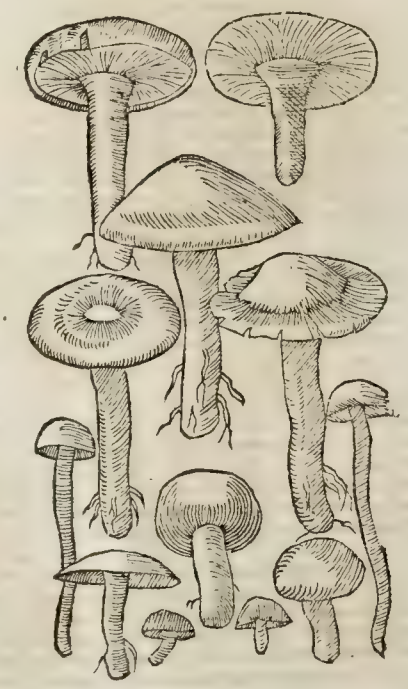
Fungi esculenti. Holsome Mushromes that may be eaten.

IN the handling of these Mushromes I must take a differing course, and manner then I have observed formerly, or shall doe hereafter, for concerning *Place*, *Time*, *Names* and *Vertues*. I will speake of so many of them in their recitals, as shall be sufficient to expresse whatsoever is contingent unto them. The most usuall sorts of Mushromes, have small smooth round heads, standing upon thick short stalks, and are for the most part white, yet in some the upper skinne is brownish or yellow, but generally more yellow after they have stood long and are decaying, most of them are somewhat flat and hollow underneath with many lines running directly from the middle to the edges round about: the substance of them generally, is loose and spongy, easily yeelding to be broken betweene the fingers if they be but pressed a little hard: the taste or relish of them is no doubt according to the soile and place where they grow, for those that grow in the open champion fieldes and medowes, are not onely safer from danger, but of better relish then those of the same kinde that grow in woods and under trees, I speake of them that grow in our owne Land: agreeing with *Horace* in his second booke and fourth Satyre, who saith,

——pr. tensibus optima fungis
Natura est: aliis male creditur.

But I know *Clusius* saith the *Hungarians*, *Germanes*, and others, doe most esteeme of those that grow in the woods, and chiefly of those under the Firre trees, and next unto them, those that grow under Oakes, the ordering and dressing them to be eaten is diversly, as every one pleaseth, some boyle them and draine or presse the water out of them, and then slice them, and put oyle and vinegar to them, and some a little salt, or as others please sugar, and some spice, and so eate them cold: others put butter, sugar and spice, and so eate them hot: or boyle them in milke or creame, or fat broth, others againe slice them and strow fine flower on them, and then fry them with butter, suet, or oyle, and so eate them: *Clusius* saith that they use in *Germany* to hang them in strings, and keepe them dry, others salt them and so keepe them untill winter, (for the best grow up and are gathered in the spring, and not in the Summer or Autumne yet it is observed that they grow most in a rainy season, and often after thunder) and then dresse and eate them. I have beene the longer in the narration hereof, to save the often repetition of one and the same thing in the rest, as also that the difference in others from this may bee the better knowne and discerned.

Fungi esculenti variij.
Divers sorts of edible Mushromes.



Mushromes are called in Greeke μυκήτες, in Latine *Fungus*, by the *Arabians Hater* and *Father*. The *Italians Fonghi*, the *Spaniards Hongos*, *Cogomelos*, and *Cilbergvas*, the *French Champignons*, *Potrions*, and *Mouserons*, the *Germanes* properly *Schwem*, and perticularly *Heyderling*, and the *Dutch Campernoelen Pfifferling*.

1. Some of this kinde grow bigger then others, and some more topped or spiring, and some are parted as it were all over into sundry divisions, making it seeme like unto an hony combe, and therefore are called *Favaginosi*, but are not dangerous as *Gerard* saith, for *Clusius* putteth it as one of his principall or first kindes of edible Mushromes, and saith it seemeth to be that which *Dalechampius* calleth *Spongiosus*, and

the

1. *Fungus ſaruginoſus* 3. *faſtigiatus* 4. *orbicularis.*
Three of the firſt ſorts of edible Muſhromes.

the *Italians ſpongiola*, and the *French Moriües*, becauſe the head doth well reſemble a Mulberry, and *Camerarius* ſaith are called *Morchell* by the *Germanes*, who be much delighted with them.

2. Another kinde is more ſharpe and ſpiring, then in any of the reſt of the edible kindes, and ſmall withall.

3. Another whoſe outſide is of a whitiſh browne colour, is more ſteeple faſhioned and bigger, and is therefore called *pyramidalis*, and are as good as any of the former, being the greateſt of the fourth ſort of *Cluſius* his edible Muſhromes.

4. Another ſort is round, ſomewhat ſoft and whitiſh, having a ſlit on the edges moſt uſually, and are called St. *Georges* Muſhromes, becauſe they grow up chiefly about that time: this is the third kinde of edible Muſhromes with *Cluſius*.

5. Another is cornered either more or leſſe and ſome jagged about the edges, having longer and ſhorter ſtalkes, and ſome of them fuller or lancker then others, which are often found under Elmes, and white Popler trees, and therefore called *Fungus Populneus*: yet *Cæſalpinus* ſaith that at *Turin*, thoſe that grow under the Poplar trees are miſliked, which thing proveth my former aſſertion that the ayre and ſoyle bettereth many of theſe kindes.

6. There is a kinde of Muſhrome called by the Grecians in former times πέξικοῖ and πεζικάι, and by *Pliny Pezicæ* in Latine, which may be called Cup Muſhromes in *Engliſh*. For they doe grow out of the ſolid ground, whereunto they adhere ſo ſtrongly, that hardly without breaking they can be got up, ſticking to the earth by certaine ſmall fibres, that are almoſt inſenſible and ſpeading low upon the ground without any ſtalke, into broad deepe and hollow cuplike peeces, the brims or edges whereof are either plane or crumpled, or cornered and containing many times within the hollowneſſe, three or foure ounces of raine water, eſpecially the greater of them, which by reaſon of the thicke skinny or fleſhy ſubſtance thereof corrupteth not, nor the water therein reſerved for a long time, being white on the outſide and reddiſh within, and are found growing in the fieldes of *Italy* in divers places by the path waies as *Columna* ſaith, and certainely determineth them to be the true *Pezicæ* of the ancients and *Plinie*. Hereof likewiſe he ſaith there is another ſort, which is more crumpled or divided into ſundry folded parts, not elſe differing in ſubſtance, and are thought to be none of the pernitious ſorts, becauſe they are not moiſt or glutinous in handling, and doe not rot but endure a long time, and become wholly dry. *Dodonæus* tooke the Fuſſe bals to be it, but erroniouſly. *Alter.*

7. Another ſort is ſomewhat flat on the head, a little turned in like a Navell, and are of an unequall ſiſe, being browniſh greeniſh or yellowiſh coated, whereof the largeſt is called the Frowes Muſhrome, and the firſt of the thirteenth ſort with *Cluſius*.

8. Another likewiſe not ſo flat throughout, but round in the body, and ſometimes torne on the edges, of a pale browne colour, and ſpotted with white: this is called *tuberoſus fungus*.

9. There is another called by *Cordus Boleti*, and by others *Fungi nemorum*, which is almoſt round and white, ſpotted with yellowiſh browne markes, ſome of them bigger then others, thoſe growing under Beech trees are redder then others, whereof ſome are choiſe in eating them, rather taking the pale then the redder.

10. Another is called *Capreolini*, differing not much from ſome of the laſt, but in being yellower above, and browner underneath, being the twelfth with *Cluſius*.

11. Acother ſort groweth in woods about the beginning of Summer, and for their redneſſe above are called red Muſhromes, although both the ſtalke and the under part be not ſo full of ſtripes.

12. A twelfth ſort *Tragus* calleth *vulgares Amanitæ vel Boleti*, and are called the moſt common alſo by *Lobel* and others.

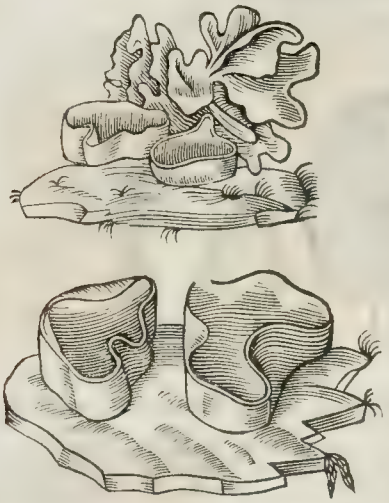
13. Another ſort being round and a little flat above, are all hairy, and of a bluſh colour, and are therefore called *villoſi* or *hirſuti cervini Fungi*; and ſome of them will be blackiſh alſo, ſome alſo will grow two together.

14. Another is leſſe hairy, but otherwiſe much like the laſt, whereof ſome are mixed with white, pale, and browne, and ſome are ſmootty withall, with many blackiſh purple lines underneath, and are called Firre Muſhromes, becauſe they alwaies grow in the Firre tree woods.

15. There is another which is called the Goates hoofe, becauſe it is cut in on the edges into ſuch parts, that it very well reſembleth it, being browne above, and white underneath, and more torne on the edges when it groweth old, then while it is young and new ſprung up.

16. Another ſort hath the ſtalke ſometimes bigger in the lower part, then the upper bole is, and is much diſcoloured with blew, greene, and browne, or in ſome yellowiſh, the upper part of the bole being browne, and without any lines underneath. *Cluſius* thinketh that this ſort commeth neereſt unto the *Amanita* of *Paulus Ægineta*.

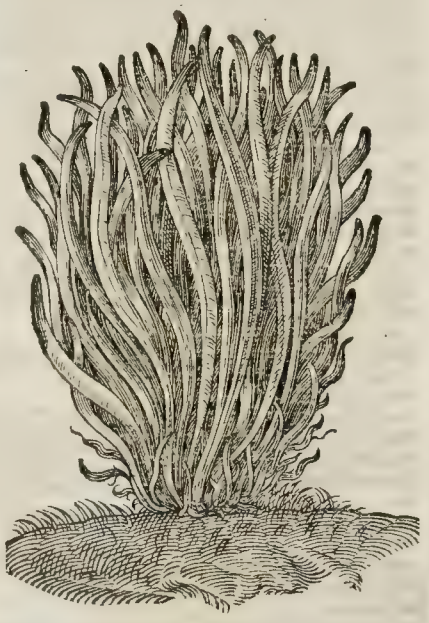
6. *Fungi Pezkæ.*



26. *Fungus ramosus Barba caprina dictus.*
Branched Mushrome called the Goates beard.

22. *Fungus Dipsacoides.*
Teasell Mushrome.

27. *Fungus terrestris Digitatus dictus.*
Finger formed Mushromes.



17. There are two other sorts of so delicate a taste that they are eaten raw, the one is flat at the head, and of a reddish colour, giving a sweete milke when it is broken, and is the sixth sort of *Tragus*, the other is great, white and round, smelling very sweete and called *Richione*, as *Baptista Porta* saith, that is, the King of Mushromes, and for the pleasant taste may be given to the sicke without danger.

18. Then there is one which *Cæsalpinus* calleth *Lingua*, growing on the bodies of Chesnut trees, whose stalke is not so red as of the true *Boletus*, and the head is somewhat red.

19. And then there is the true *Boletus* of the ancients, which is of so delicate a taste, that they that are accustomed to the feeding on Mushromes, desire them more then any, and can never be satisfied with them, which *Claudius Cæsar* found to his cost, being killed with them: they are as white as an egge, and of the same forme when they

30. *Tubera terræ edibilia & Tubera cervina.* Vnderground edible Muſhromes, or Spaniſh Trubbes, and underground Deeres balles or Muſhromes.

they firſt ſpring up, but after two or three dayes the white skinne or coate breaketh above and ſheweth yellow, like the yolke of an egge, which then groweth greater, and into the forme of a Muſhrome (the white skinne falling away by little and little) being rayſed ſomewhat higher in the middle, and of ſo gold a yellow colour, that it ſeemeth deeper coloured then the ſaffron it ſelfe, and leſſe yellow underneath, with as many lines as in other Muſhromes, the ſtalke likewiſe is yellow and an inch thicke, when it groweth old it breaketh into three or foure parts, and looſeth the freſh colour above, becomming more pale, and underneath almoſt white: theſe being preſſed and ſerved as a diſh to the table where *Cluſius* was, ſeemed unto him to be coloured with Saffron.

20. There is ſome that are called *Porcini* or *Suilli*, Swines Muſhromes, which are ſomewhat pointed, and of a ſmokie colour, ſpotted with white ſpots, and underneath with blackiſh lines, the upper part in ſome will be red, but *Cæſalpinus* ſaith that thoſe which were called *ſuilli* or *porcini* with them, were of a browniſh yellow above, and of an aſh colour underneath.

21. Then are there ſuch which thoſe of *Naples* call *Conocielle*, as *Baptiſta Porta* ſaith, and peradventure may be thoſe that *Cæſalpinus* ſaith were called *Scarogia*, growing in medowes, the head being broad, and the ſtalke very long and of divers colours, this with *Cluſius* is his eighteenth.

22. Another ſort is called *Quercinus dipſacoides* by *Columna*. The head hereof is white, and like unto the ordinary ſort for forme, but that the toppe is browne, and groweth to be ſpotted, but the chiefeſt matter of difference is in the ſtalke, which hath about the middle of it, or higher, a certaine hollow diſh, like as the Teaſell ſeemeth to have, being rough and browne, about the brimmes: the lower part of the ſtalke is as it were knobbed, and blackiſh next to the ground, with ſome hairy fibres thereat: it groweth among Oakes, this may be called the Teaſell or Baſon Muſhrome.

23. There is another that groweth on the Larche tree, beſides the *Agaricke*, which is of an huge ſize, containing thirty pound in weight as *Matthiolus* ſaith, and is of a gold yellow colour, ſomewhat torne about the edges, and is moſt pleaſant.

24. Then is there another called *acris* or *piperitis*, and peradventure may be that which *Cordus* on *Dioſcorides* calleth *Piperis ſapore*, being a white Muſhrome, and taſting ſharpe and hot like pepper.

25. There is another ſort which *Cæſalpinus* ſaith the vulgar people called *Prunuli*, being very ſmall of an aſh colour, and very ſweete in ſent.

26. Another is branched and is the nineteenth with *Cluſius*, being in ſome yellow, in others reddiſh, and in others of a pale white, which they call the Goates beard, and adde their colour, the moſt conſpicuous is that which is yellow and ſpotted with white ſpots, *Cluſius* ſaith that theſe are ſome what like thoſe Muſhromes that *Baptiſta Porta* ſaith, were brought from mount *Garganus*, like young Aſparagus buds, and then breaking out into branches.

27. There are two other ſorts called *Digitatus major & minor*, and *Digitelli* by the *Italians* being of a large ſize, and parted as it were into long white fingers, one whereof will ſuffice a man at a meale.

28. Then is there a monſtrous great kinde growing in *Hungary*, being of two foote in breadth, having many large torne leaves like ſcales lying upon it, and faſhioned like an Oaken leafe, ſome of them of a darke red, and ſome of a blackiſh white colour, with many blacke ſpots in the white, the ſtalke is halfe a foote high, and an handbredth and a halfe in thickeneſſe. *Cluſius* thinketh this to be that muſhrome which *Baptiſta Porta* ſaith the *Neapolitanes* call *Gallinacia*, being of ſo large a ſize that it doth weigh foureſcore pound, and that one will ſatisfie a great family. *Bauhinus* referreth it to the *Fungus Leporinus* of *Cluſius*, which is his foureteenth, *Cluſius* ſaith hee hath ſeene in *Hungary* thoſe that have beene ſo great, that one might well ſuffice foure men at a meale

29. There is alſo one that is very ſmall and a little long, formed like unto a tooth, and therefore called *Dentatus*.

30. There is yet another kinde of muſhrome (for ſo it may moſt fitly be termed, and not rootes, as ſome would make them to be) that groweth not out or above the ground, as all the former ſorts doe, but within or under the upper cruſt thereof, called in Greeke either ὕδνον and ὕδνα *ab imbribus*, or διδνα *ab humore*, in Latine *Tuber* and *Tubera* (or *Tubera terræ* to diſtinguiſh it from *Tuber arbor*) in the *Arabian* tongue *Ramech Alchamech*, *Tumer & Kema*, in *Italian Tartuffi* and *Tartufole*, in *Spaniſh Turmas de tierra*, in *French Truffes* and *Truffles*, in the *Germane*

tongue *Hirtæ brunſt*, in *Engliſh* ſome call them *Spaniſh* Fuſſebals, becauſe they are ſomewhat like our Fuſſebals which are not edible, but containe a ſmoaky duſt or pouther in them: but I would rather call them Vnderground Muſhromes, or *Spaniſh* Trubbes to diſtinguiſh them. *Matthiolus* ſaith there are three ſorts of them, (*Pliny* mentioneth two ſorts, one whereof is gritty betweene the teeth, and are ſome bigger then a Quince, and ſome of a pound in weight, and ſaith, that hee knew in his time *Martius Lacinius* a *Prætor* and Iudge at *Carthage* in *Spaine*, that bowed a penny betweene his teeth, that was in that bit of the *Tuber* that he did eate, whereby is manifeſt that the earth did gather it within it of it owne nature, being a thing not to be planted) one whoſe inner pulpe or ſubſtance is white, another more browne, yet the barke or outer rinde of both is blacke and full of rifts or chaps, a third ſort that groweth in the coaſt of *Anania* and *Trent* is leſſe, the barke ſmooth and more browne, and leſſe pleaſant in taſte or inſipide. They grow as I ſaid under the ſuperficies of the earth, yet not cleaving thereto, cauſing it ſometimes to ſwell, and ſometimes to rift and cleave, whereby it is diſcerned where they grow (yet *Pliny* ſaith the contrary, and that they have no ſeede, which will preſently be gaineſaid) being of a blacke or browne colour on the out ſide, and of a ſoft white ſubſtance within, having as *Iohn Baptiſta Porta* ſaith, under the outer skinne, certaine ſmall blacke ſeede, like unto the ſeede of the Cypreſſe tree, whereby it not ouely propagateth it ſelfe, where it is naturall, but as it hath beene often obſerved, there have ſome of them growne where the parings of them have beene caſt. For the qualitie or property of them, they have none evident in them ſaith *Galen*: but *Avicen* ſaith, that they have a more earthy then watery ſubſtance, breeding groſſe and melancholicke humours, more then any other foode, and that they that eate much of them are ſubject to the Appoplexy, and Palſie, and beſides are hard of digeſtion, and trouble the ſtomacke, whether they be roſted under embers or otherwiſe boiled in broth, and eaten with pepper, oyle and vinegar: Vnto *Pamphylus* or *Diphylus*, in *Athenæus*, therefore we muſt not give credit herein, who ſaith that theſe *Tubera's* yeeld a good juice to the body, eaſe the belly by expelling the excrements, and by breeding winde, engender luſt. And againe he ſaith that a certaine herbe groweth above, upon that ground where the *Tubera* breedes, which he calleth ὑδνόφυλλον, but what that herbe is he hath not declared.

Lugdunenſis ſaith that *Myconius* ſent two ſorts of plants out of *Spaine*, which the *Spaniards* in *Caſtile* call *Yerua turmera* (and is the *Ciſtus annuus*, as I ſhewed you before,) that is *Tuberaria*, which peradventure may be it, for they ſuppoſe where they doe grow the *Tubera* doe breede.

31. *Tubera cervina.* The Deares underground balles or Muſhromes are another ſort of theſe *Tuberaes* (whereof *Matthiolus* firſt maketh mention in his third booke of Epiſtles, and the laſt thereof, and after him *Lobel* in his *Dutch* Herball, growing underground, in the woods of *Bohemia*, *&c.* where Deare doe much haunt, eſpecially where they couple as the former do (and thought to grow of their ſperme that falleth on the ground, and is but the opinion of hunters and Country people, whoſe judgement in ſo ſecret a peece of naturall Philoſophy, is not ſo readily to be admitted) which are like them, being alwayes round, but uneven or rugged, whoſe outer skinne is blackiſh, and the inner pulpe or ſubſtance whitiſh: theſe be not eaten in the ſame manner as the former, that is for meate or food, but as a medicament being cut into peeces, and dryed upon ſtrings put through them, to be uſed upon occaſion: while they are freſh they have a ſtrong and evill ſent, which they loſe in the drying, and are uſed either alone one dramme and a halfe in pouther, taken with ſweete wine, or with ſuch other things as provoke venery, as alſo to increaſe milke in Nourſes breaſts, taken in ſome priſane drinke, and a little long pepper added thereto: the ſmoake thereof when it is burned taken underneath, helpeth women troubled with the mother, and openeth the paſſages when they are cloſe: they are thought alſo to expell poyſon, and the venome of creatures, to be taken in pure wine, and alſo applyed outwardly, I much mervaile that *Cluſius* having ſeene and ſet downe ſo many ſorts of Muſhromes, remembred none of theſe, but I preſume that if he had not hope of overground good, he ſought not for underground treaſure.

Vnto theſe Muſhromes may alſo be adjoyned thoſe which are made by art, whereof *Matthiolus* maketh mention, that grow naturally among certaine ſtones in *Naples*, and that the ſtones being digged up and carryed to *Rome*, and other places, where they ſet them in their wine cellars, covering them with a little earth, and ſprinkling a little warme water thereon, would within foure dayes produce Muſhromes fit to be eaten at what time one will. As alſo that Muſhromes may be made to grow at the foote of the white Poplar tree, within foure dayes after warme water wherein ſome leaves have beene diſſolved, ſhall be powred into the roote, which muſt be ſlit, and the ſtocke above ground.

To cauſe that the edible Muſhromes may be leſſe offenſive, in that many doe too greedily deſire them it is held that if they be boyled with wilde peares, they may be eaten without danger, or for want of wilde ones to take a harder or harſher ſort of other peares, the leaves alſo and barke are conducing to that purpoſe, and ſo is raw Garlicke taken with Vinegar.

32. And laſtly there is the Iewes eare, called *Fungus Sambucius*. (which I place among the edible ſorts, and not among the venemous, as *Cluſius* and others doe, becauſe although it be not eaten in the ſubſtance as others are, (and yet *Baptiſta Porta* nameth one *Sambucinus optimus omnium*,) yet the broth is uſed after the boyling, as I ſhall ſhew you by and by) which groweth on the Elder trees that are planted on Cony-boroughes, for their ſhadow and ſhelter, and not ſo frequently on them in other places, being as all know ſoft and limber, while they are freſh, not very thicke but tranſparent, and of a blackiſh colour, of differing formes and ſizes, for ſome will bee twolne or puffed up, in one place more then in another, having ſome reſemblance to a mans eare, ſome thinne on the edge, and thicke in the middle, and ſome two or three growing together, all of them being dryed become of a blackiſh gray colour, and then may be kept a whole yeare or more, ſafe without ſpoyling to be uſed as you neede, for lotions for ſore mouthes and throates, or when they are twolne, to be boyled in milke, or ſteeped in vinegar and ſo gargled, which is the onely uſe they are put unto that I know.

CHA.

CHAP. LXIV.

Fungi pernitiosi. Dangerous Mushromes.

THe other kind of Mushromes as I told you are dangerous, if not poysonous, whereof there are many sorts which *Clusius* hath amply set down in a treatise conterning them, and *Bauhinus* after him hath added more out of other Authours, which because they are too numerous, and to little purpose, either for me to write, or for you to read or know, seeing neither the one halfe of them are found growing with us, nor doe we neede caution to beware of the bad, seeing our Nation is not so enclined to the good, I thinke I may well spare my paines from recounting all the severall varieties that they doe, and onely mention some of the most speciall with the Touchwoods, and some exotickes, and so end this Classis.

1. The first groweth under Plumme trees in the beginning of the yeare of differing formes, and greatnesse, for some grow many together from one roote, as it were, with very little or no stalke at all, yet some are round fashioned, others are cornered, some are larger and smaller then others, all of them being mixt with white, pale yellowish and browne together.

2. Another because it groweth among dung is called *Fimetarius*, and is of a round flatnesse, somewhat thinne white, and covered as it were with meale all over, having browne lines underneath.

3. Another groweth under Hazell nut trees, which are sometimes of a whitish red, and as it were smoaked over, round and somewhat broad.

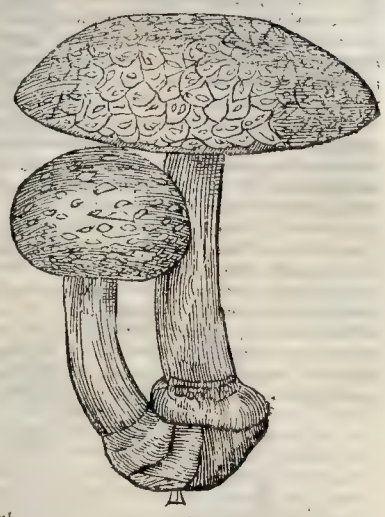
4. Another of a reddish Coralls like colour, full of round yellowish spots above, and pale yellow underneath, full of blackish lines found in *Wales*.

5. Another is called the Toades Mushrome, being of a wan colour, and round like an helmet, or more yellowish but smoaky, or else more flat and reddish with some spots.

6. Another is very small and round not exceeding the naile of ones finger reddish above and very hollow underneath this is called the Goates Mushrome.

7. Another is somewhat like the true *Boletus*, but is

8. *Fungus Muscarius.*
Flye bane Muthrome.



Muscus parvus denticulatus.

Fungi lethales, 9, 10, 19. Deadly Mushromes, the ninth, tenth, and nintereenth of both sorts.

about halfe an inch broad, spiring a little at the toppe, and being of a whitish colour, with a long stalke, of the bigneſse of ones little finger: this is called the foolish or the fooles Mushrome.

8. There are two or three other sorts, that are said to kill as many flies as sit and feede on them, as well when they are dry as fresh, some of them being greater and broader then others, and some much redder, and spotted with white spots all of them doe grow in the woods that have beene feld.

9. In the like woods are found other sorts about *August*, one whose stalke is bigger below then above, and the head or toppe round and pale whitish, but no bigger then the bottome of the stalke.

10. Another sort is much frequent with us, and is of a blackish colour much rent or torne on the edges, and hanging lanke about a small long stalke.

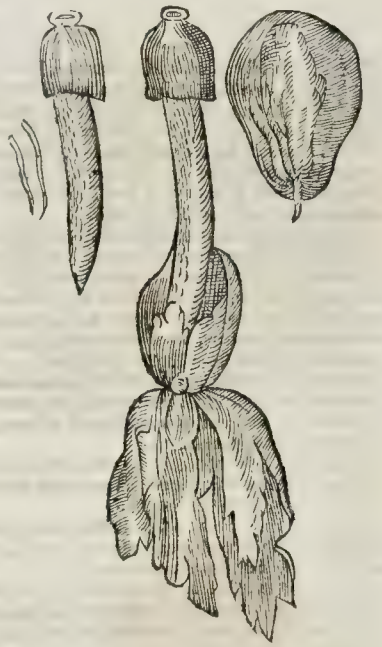
11. There is another kinde which is *Clusius* his nintereenth, and is of divers sorts, which because they are so like unto some of the edible sorts, deceive many that gather them, and are often a speedy death to them that eate them, whereof some are reasonable small, others very large, and most of them of some beautifull aspect, either

whitiſh or reddiſh, or more red and ſmoaked over.

12. Another ſort growing under the Firretrees, that is ſo like unto them that grow there likewiſe and may be eaten, that they know no other difference but that theſe are hairy underneath, for which cauſe they are refuſed.

13. There is a kinde which is called *Phallus Hollandicus* by *Hadrianus Iunius*, and may bee called the *Hollanders* workingtoole, which at the firſt riſing up of it, is ſomewhat round, but the skinne breaking, there riſeth up a ſtalke of the thickeneſſe of ones thumbe, and of a fingers length, ſomewhat like a dogges pricke, having a nut or cappe on the toppe an inch thicke, of a blackiſh greene colour at the firſt, and after blacker, with certaine celles or hollow places in it: the lower part or purſe from whence the ſtalke riſeth, is of an aſhcolour, and ſometimes browniſh, the ſtalke at the firſt is white, but afterwards of divers colours, and ſpotted, this ſort ſtinketh at the beſt, but withering, is turned into a moiſt blackneſſe, colouring the very ground whereon it falleth: Flies are killed that ſit and feede hereon, this is *Cluſius* his deſcription of the fifth ſort, of his three and twentieth kinde, which as hee ſaith doth come neere unto that which *Hadrianus Iunius* reporteth to be much found on the *Hollanders* ſundry Sea ſhores, and although their figures be ſomewhat differing one from another, yet ſurely they both expreſſe but one thing.

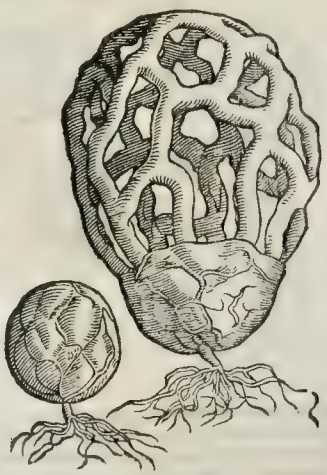
13. *Phallus Hollandicus.*
The *Hollanders* Working toole.



14. On ſome Cherry trees that begin to putrefie, ſometimes groweth a kinde, riſing many together, laid flat one upon another, about an inch or more broad below, and ſpreading to bee three or foure inches above, and about halfe a foote high, being of divers colours at the toppes, the edges being of a deepe red colour, with a mealy white liſt about: the lower part for an inches breadth upwards is pale whitiſh, up higher being yellow and red mixed together, croſſing it athwart, then yellowiſh, and above it red and yellow mixed againe, and then yellow to the very edge, but ſpotted with divers ſmoaky ſpots and pale or yellowiſh underneath. This although it be deadly to men, yet is given cattle with their fodder, dryed and made into pouther ſafely.

14. *Fungus imbricatim diſpoſitus verſicolor.*
The tiled changeable Mushrome.

20. *Fungus Coralloides cavellatus Cluſij ſive Lupi cruſtus efflorescens Columnæ.* A deadly ſtinking Mushrome, though finely branched.



15. Then is there another large round & whitiſh one, as ful of black lines from the center to the circumference above and below but that thoſe above are greater, and not ſtraight as thoſe below and a little waved, the edge alſo being finely dented about.

16. Another

24. *Fungus fruticosus argenteus.*
The branched silver Mushrome.

26. *Fungus durus arborum sive Igniarius.* Touchwood.

27. *Fungus lapideus.*
A stone Mushrome.

32. *Lupi crepitus sive Fungus ovatus.*
Fusse Balls.

16. Another little one hath beene found about *Hackney*, dented in the like manner, about the edges, and of blacke chesnut colour, but not striped above.

17. Some grow on the rotten boordes and timber that lye or are set into the earth, being small and like a greene figge, having small seed within it, which was sent unto *Clusius* to try his skill.

18. And some are round like a Fusse ball, being of a browniſh colour, above and darke red underneath, which when they are broken are of a blewish greene colour.

19. Some others are like brimlesse hats, many growing together and some broade like shields, their brimmes turned up.

20. And there is another which *Columna* calleth *Lupi crepitus*, and with *Clusius Cancellatus*, which hath a small stringie roote, differing from all others, and a round white *Fungus* at the first, which afterwards breaking open, divers reddish branches doe arise out thereof, which doe all joyne together, making round arches of hollow netted barres, or latteſſes as it were, seperated one from the other, this hath a very stinking savour, whereof commeth the name, and is much devoured by flyes that eate it.

21. Those Mushromes likewise that grow upon the stockes or bodies of trees or their armes, or at the rootes of those that are rotting or dead, or upon dry boards are very diverse also, yet are none of them of the hardnesse of touchwood, some whereof are like unto Iewes eares, either whitish or yellowish, crumpled and of a skinnie substance like them.

22. Others grow on Birch trees Willowes Cherry trees, divers growing, one upon another of very variable and delightfull colours, which as *Clusius* saith the Country people use to keepe dry, and although it be deadly to man, yet as they thinke it helpeth their cattle when they are sicke, being broken small and given them with a little salt in their fodder.

23. Some grow like ordinary Mushromes, very many together, on severall stalkes, differing in browneſſe, whiteneſſe, and redneſſe, one from another, either on the dead rotten bodies or on the armes of trees.

24. And some that grow like a shrubbe with many branches, and are of so pure a whiteneſſe that they seeme

as

as if they were made of pure ſilver, if they were ſhining withall, this hath oftentimes no ſtalke, or but of halfe an inch long, and groweth on the rotting bodies of trees, that lye upon the ground.

25. There hath beene another ſort obſerved growing in *Kent*, in ſundry places, as at *Ripton* neere *Aſhford*, on *Bromley* greene alſo, and at a place in *Rumney* Marſh called *Warborne*, the ſtalke whereof is like unto other Muſhromes, but the head is made of ſcales, like unto an Artichocke of a faint yellowiſh colour, and may be called *Fungus Cinaræ forme* Artichoke Muſhromes.

26. The Touchwoods are likewiſe kindes of Muſhromes which grow harder than the others, and are of a dry fungous or ſpungie ſubſtance on the inſide, that may be cut or broken into ſeverall peeces, having a hard or woody cruſt on the outſide, and are of differing formes and colours, ſome being very great, and flat at the head, and ſmaller and rounder underneath, of a browniſh yellow colour, and ſuch be they which *Lobel* compareth to *Agaricke*, and are once or twice boyled in lye, made with wood aſhes, and being afterwards dryed, are kept broken into peeces, ſerving to take fire like lint.

27. And laſtly there are ſome of a ſtony ſubſtance, whereof ſome are of a round forme, very neere unto an ordinary Muſhrome, being of a grayiſh blacke colour, full of white lines and ſtrakes, on the upper ſide, embowing a little from the middle to the edge, and with many lines likewiſe underneath, but not paſſing above halfe way from the edge to the middle.

28. And another greater than it, whoſe diameter is about three inches and a halfe all whitiſh, and full of deepe lines, ſomewhat embowed from the Center to the circumference, where it is finely dented like a ſaw, the under-part is alſo full of rough lines, but ſhallower, browner, and variouſly bending.

29. Another is ſomewhat long with the roundneſſe, and hollow in the middle, the edges being cut in halfe way almoſt, and forming round ends like unto ſome flower, deſcending thence ſmaller unto the ſtalke.

30. Another is like unto *Agaricke* found in hollow places of the hills in *Helvetia* and called by *Geſner Agaricus ſaxatilis vel Fungus petræus*, and by the Country people *Las Luna*, whoſe ſubſtance is white and frothy.

31. Another is halfe a foote long and two inches broad, channelled or guttered, and ſomewhat rough on the upper part, and full of ſtrakes underneath, running two wayes a croſſe the whole, being in forme like unto a neates tongue.

32. The Fuſſe balls or rather Foiſt or Fiſt balls, taken from the *Germaine* word *Fiſt quod crepitum ſignificat*, called in Latine *Fungus ovatus*, or *Orbicularis lupi crepitus*, and *Lucernarum fungi* of ſome (and taken by *Dodonæus* to be the *Pezica Plinii*, as I ſayd before, but *Columna* hath firſt ſet forth the true ſort of it, whereof I gave you the figure before) but without reaſon, the *Lucernarum fungi*, being the ſmall peeces of the Weeke or Cotten, that lyeth in the Oyle in Lampes that ſticking forth, trouble the burning thereof, which aſſuredly *Virgill* meant by thoſe *Putreſcentes fungos* in the Lampes, as his verſes in his firſt of Georgickes doe expreſſe and not theſe Fuſſe balls although *Gerard* would ſo inferre it, becauſe in divers Countries of this Land they uſe to carry fire in them from their houſes, diſtant a good way in ſunder. They are of ſeverall ſizes, ſome of the bigneſſe of a ball or balloone or a childes head more or leſſe, round ſmooth and whitiſh at their firſt riſing, but growing in time to be of a duskie colour, cracking in ſundry places of the outſide, and growing on the ground moſt uſually in the dryer fields, and ſeldome in the moyſter (which while they are young and white, as *Cluſius* ſaith, he and others of his ſchoole fellowes, being children, would in ſport throw one at another) conteining within that outer skinne certaine duſt or powder, which if by the breaking or treading on ſhould flye up into the eyes, would trouble them ſhrewdly, if not goe neere to blind them: yet ſerve to many good uſes, Country Chirurgions uſing often to ſtring up the skinnes of them, to ſerve them to ſtaunch bleeding in wounds or otherwiſe, and the Country people with the powder doe dry up kibed heeles, and the fretting of the skinne in any place of the bodie, as alſo to hold fire as I ſayd before, and with the ſmoake of them being ſet on fire to drive as they call it their ſwarmes of Bees.

Thus have I ſhewed you all the kindes and ſorts of theſe Muſhromes, both wholſome and dangerous, that whoſoever is addicted to the delight of them, may take heede in time upon this admonition, that although many may be found of a pleaſant and delightfull ſhew in our owne Country as well as in others, yet the danger is ſo great yea of the beſt, that many upon ſurfets by over eating of them have dyed remedileſſe, and therefore it is not good to licke your honey from ſuch thornes.

MISCE-

MISCELANEA.
THE VNORDERED TRIBE.
CLASSIS DECIMAQVINTA.
THE FIFTEENTH TRIBE.

CHAP. I.

IN this Tribe as in a gathering Campe I muſt take up all thoſe ſtraglers, that have either loſt their rankes, or were not placed in ſome of the foregoing orders, that ſo I may preſerve them from loſſe, and apply them to ſome convenient ſervice for the worke.

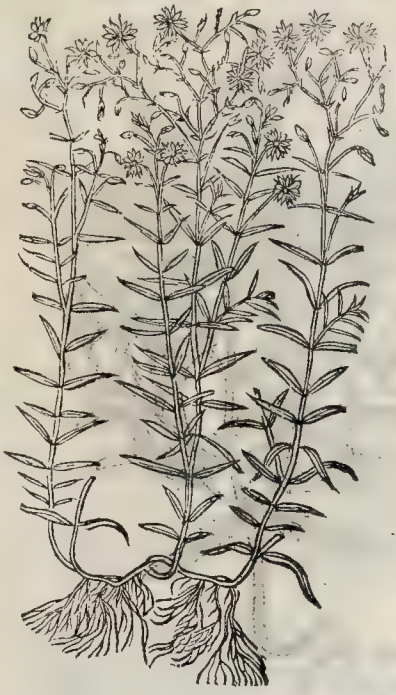
Gramen Leucanthemum. Stichwort.

Although Stichwort is called *Gramen*, yet it much differeth in forme from them, and therefore not fit to have beene there inſerted, whereof there are two principall ſorts, a greater and a leſſer or an earlier, and later, but in each of them there are alſo ſome ſmall diverſities, as ſhall be preſently ſhewed.

1. *Gramen Leucanthemum majus.* The greater Stichwort.

The greater Stichwort hath ſundry round ſlender ſtalkes, riſing from the roote, ſcarſe able to ſuſtaine themſelves, but by the helpe of the hedges or other things that grow neere it, being full of joynts, with two ſmall long hard rough and pointed leaves at each of them, at the toppes whereof ſtand many ſmall flowers, compoſed of white leaves, ſtanding like a ſtarre, with ſome white threads in the middle, the roote runneth or creepeth in the ground all about, with many ſmall fibers thereat. Of this ſort there hath beene ſome varieties obſerved, partly in the ſtalkes and leaves being in ſome higher or greater than others, and in the flowers likewiſe, being larger or leſſer, and in the threds in the middle, ſome being paler or redder than others.

Gramen Leucanthemum.



Varietas.

2. *Gramen Leucanthemum majus.* The leſſer Stichwort.

This leſſer groweth like unto the former, and differeth onely in being leſſer, the leaves ſhorter and the flowers ſmaller, whereof each leafe divided as it were into two, maketh it ſeeme to have

more

more leaves then the former, the ſeede of them both is ſmall and ſomewhat like unto Linſeede contained in round buttons.

This alſo is found to have ſome diverſity both in the ſtalks growing more upright, or elſe lying upon the ground, and alſo in the flowers, ſome having the white threds in the middſt tipt with blacke, that it maketh the whole flower ſeeme to be blacke or elſe with pale yellow.

The Place and Time.

The firſt ſort groweth more uſually under hedges, and upon dry bankes of ditches or the like, and flowreth a moneth earlier then the other, that is in *Aprill*, the other is more common in the fields of Corne, and elſewhere in the more open and champion grounds, and flowreth not untill *May* or *Iune*.

The Names.

Tragus calleth it *Euſraſia gramen*, and *Lonicerus Euſraſia major*. *Camerarius Gramen floridum*. *Matthiolus Gramen alterum*. *Fuchſius*, *Dodonæus* and others, *Gramen Leucanthemum*. *Dodonæus* and *Lobel* call it *Holoſtium Ruellij*, who took it to be the *Holoſtium* of *Dioſcorides*, *Dodonæus* alſo referreth it to the *Crateogonon* of *Dioſcorides*, which he ſaith was alſo called *Melampyrum*. *Bauhinus* calleth them both *Caryophyllus arvenſis, glaber flore majore & minori*, but why he ſhould referre them to the *Caryophylli* I ſee little reaſon, I would thinke they ſhould better agree with the Chickweedes. The *Germanes* call them *Augen troſtgraſſ*, and the *Dutch Ooghen trooſt gras*, and we in *Engliſh* Stichwort.

The Vertues.

It is much commended by ſome to cleere the eyes of dimneſſe, or filmes that beginne to grow over the ſight, to drop ſome of the juice into them. It is no leſſe accounted of to helpe ſtitches in the ſides, to drinke the pouther thereof with white wine. Other properties this is ſaid to hold; but they are onely taken from *Dioſcorides* his *Holoſteum*, which whether this be it, is much doubted, and therefore, the properties, whereof one is that *Dioſcorides* ſaith it is ſharpe, is not found in this herbe.

CHAP. II.

Melampyrum & Crateogonon. Blacke Wheate, and Cow Wheate.

THeſe two names although they ſeeme to be different, yet are the plants referred unto them, not ſo much differing one from another, but that I may joyne them both in one Chapter, their varieties to be explained are as followeth.

1. *Crateogonum vulgare.* The common Cow wheate.

This that is moſt frequent in our Land, hath an hairy ſquare ſtalke, branched almoſt from the bot-

1. *Crateogonum vulgare.*
The common Cow Wheate.

2. *Crateogonum flore varia,*
Another party coloured Cow Wheate.

tome,

tome, halfe a yard high or more very weake and ſlender, and ſuſtained by the buſhes among which it groweth, having two long and narrow leaves ſet at each joynt, broadeſt next to the ſtalke, and pointed at the end, ſomewhat rough alſo on the underſide, if it be drawne downewards: the toppes of the ſtalkes and branches, are ſet with tufts of leaves and flowers together, which being growne are ſeparated, two flowers onely ſtanding at a joynt with the like leaves ſet with them, but ſhorter and ſmaller, the flowers are long round and hollow, gaping open at the end, and ſtanding looking all one way, of a pale yellow colour, and white together, but grow yellower in time, yet in ſome of a blewiſh or purpliſh colour, either deeper or paler, each ſtanding in a ſmall greene huske, wherein afterwards grow round cups or veſſels, containing browniſh ſeede, not much unlike to wheate: the roote is compoſed of ſmall threds. I give you here the figure of another ſort of this Cow Wheate, which I found among Doctor *Lobels* papers, without deſcription, and therefore can frame none thereto.

2. *Crateogonum flore vario.*

Another party coloured Cow Wheate.

This other groweth like the former, but the ſtalk is more reddiſh, and ſo are the leaves alſo, and more finely dented upwards, where the ſpikes or tufts of flowers are of a reddiſh or bluſh colour, before they ſpreade open, and then ſhew the flowers to be yellow, about the mouth or gaping place, and the reſt purpliſh red.

3. *Crateogonum incognitum.*

4. *Melampyrum.* Blacke Wheate.

Incogn. ſum

5. *Melampyrum perpuſillum luteum.* Small blacke Wheate.

3. *Crateogonon luteum anguſtifolium.*

Yellow narrow leafed Cow Wheate.

This differeth little from the former, but that the ſtalkes being red, the leaves are long and narrow, like unto *Linaria* or Tode-flaxe, without any cut or dent at the edges, the flowers are long gaping and hollow, of a pale yellow colour, ſtanding in a long ſpike and looking forward.

4. *Melampyrum.*

Blacke Wheate.

This in the forme being ſo like the reſt, ſheweth that it is of the ſame family, for but that it groweth greater in the Corne fields, where it moſt delighteth, and the leaves be ſhort and nar-

row,

row, ſet on the ſtalkes and branches which are many, and having other ſmaller leaves comming forth at the joynts likewiſe, the ſpiked head of flowers opening not ſo much, but abiding cloſer, in ſome wholly reddiſh, both above and below, and white in the middle, in others reddiſh below, and yellower above, or mixed with white yellow, and greene amongſt, you may ſay it is the ſame, with theſe onely differences.

5. *Melampyrum perpuſillum luteum.* Small blacke Wheate.

This ſmall plant growing among the corne, in the fieldes of *Provence* in *France*, riſeth not above two inches high, with ſlender ſmall narrow leaves, deepely cut in on the ſides, like unto Harts horne, the heads being cloſe, and the flowers yellow, ſomewhat reſembling the forme of *Alopecuros*, the Foxetaile.

6. *Melampyrum lanuginoſum.* Woolly blacke Wheate.

This woolly Wheate hath a ſquare hoary or woolly ſtalke a foote long, branching forth from the roote with two long and narrow woolly leaves ſet at every joynt, finely dented on the edges, much like unto thoſe of the dented *Caſſidony*, on the toppes of the ſtalkes and branches are ſet long ſpiked heads, ſoft and woolly, with long flowers breaking out of them like the others, but ſpreading a little broader.

The Place and Time.

The firſt as I ſaid groweth among buſhes and brakes and the like, upon barren heathes, as at *Hampſteede*, neere *London*, and many other places of this Land, but I have not head that any of the reſt have beene found with us, but in *Auſtria* and *Germany*, the fifth in *France*, and the laſt in *Spaine*, and doe flower moſt of the Summer, the ſeede ripening ſoone after.

The Names.

Κεγχρόμυρον, *Crateogonum* is remembred by *Dioſcorides*, *id enim τὸν μύρον κεγχρῖν dicitur, hoc eſt, ſemen robore acuere, & quaſi viribus imbuere*, but *Melampyrum* is not, ſaving that he ſaith *Crateogonum*, hath the like leaves to *Melampyrum* and that *Myagrum* was called alſo *Melampyrum*, but *Theophraſtus* in his eighth Booke and fifth Chapter, mentioneth *Melampyrum* to grow among corne, and which in compariſon of *Lolium* Darnell, that troubleth the braine, he calleth *res innocens*, a harmeleſſe thing. *Galen* hath it *primo alimentorum ultimo*, to grow from degenerated Wheate, and ſome thinke that the *Stelophuros* of *Pliny lib. 21. c. 17.* is it, and as ſome thinke it is his *Alopecuros* alſo, but rightly in neither, as it is likely, *Bauhinus* alſo thinketh it may be *Aera* of *Theophraſtus*, which is generally taken to be *Lolium*, but it cannot be his *Aera*, becauſe he nameth them both in one Chapter, and compareth them together: Moſt men now adayes call it *Triticum vaccinum* or *bovinum*. *Bauhinus* maketh all theſe to be *Melampyra*, not allowing any one diſtinctly to be called *Crateogonum*, but as others doe ſo call them, *Cluſius* in following an ancient error among the *Germanes*, whereas *Tragus* firſt as it is likely remembreth it, calleth them *Parietaria ſylveſtris*, which he ſaith himſelfe he knoweth no reaſon or cauſe why it ſhould be ſo called The firſt here is the *Parietaria ſylveſtris ſecunda* of *Cluſius*, called *Crateogonum* by *Lobel* and others, *Lugdunenſis* hath it both by the name of *Satureia lutea Dalechampy* in one place, and by *Hyſſopus nemorenſis lutea* in another. *Tabermontanus* calleth it *Milium ſylvaticum*, and *Thalius* and *Bauhinus Melampyrum*. The ſecond is *Cluſius* his third *Parietaria ſylveſtris*, and called *Triticum vaccinum* by *Tragus*, *Dodonæus* and *Lugdunenſis*, and *Melampyrum* by *Camerarius* and others. The third is the laſt *Melampyrum* of *Thalius* as it is likely, and the *anguſtifolium*, or *luteum Linarie folio* of *Bauhinus*, The fourth is the *Melampyrum* of *Lobel*, and the firſt *Parietaria ſylveſtris* of *Cluſius*. The fifth is called ſo by *Lobel* as it is in the title. And the laſt is called *Parietaria montana Betica* by *Cluſius* in his *Curæ poſteriores*, which *Bauhinus* calleth *Melampyrum lanuginoſum Baticum*. The *French* call them *Ble de vache*, and *ble de beuf*, the *Germanes Kuweiſſen*, and *brawn ffeiſch blumen*, the *Dutch Peerts bloomen*, and wee in *Engliſh* Cow wheate, and *Melampyrum*, Blacke wheate genetally, ſome authours, account them degenerations of wheate and Rye, others take them to be the faults of the Corne when as they are with them as well as with us, no other then weedes, as Cockle, Blew bottles, and Cornroſe, which come where they are ſowne, as well out of the Corne as in it.

The Vertues.

The Cow Wheates generally in all the places where they grow among Corne, if they be not weeded out, but ſuffered untill the Corne is gathered, doe make the bread blacker then that which hath it not as *Tragus* ſaith, and cauſeth the like diſſignes in the head and eyes that Darnell doth, as *Lobel* ſaith, yet he ſaith the ſeede is a great incendiary to Venery, as *Dioſcorides* and *Pliny* ſpeaketh of it before. *Galen* ſaith that the ſeede of *Crateogonum* is ſharpe in taſte, and is uſed as Millet is.

CHAP. III.

Eufragia. Eyebright.

ALthough formerly there hath beene but one ſort of Eyebright knowne, yet theſe later times have found out divers herbes that for their likeneſſe thereunto they have entituled by the ſame name with their diverſities as ſhall be ſhewed together.

1. *Eufragia vulgaris.* Common Eyebright.

The common Eyebright is a ſmall low herbe, riſing up uſually but with one blackiſh greene ſtalke, a ſpanne high, or not much more, ſpread from the bottome into ſundry branches, whereon are ſet ſmall and almoſt round yet pointed darke greene leaves, finely ſnipped about the edges, two alwayes ſet together and very thicke: at the joynts with the leaves from the middle upwards, come forth ſmall white flowers ſtriped with purple, and yellow ſpots and ſtripes, after which follow ſmall round heads with very ſmall ſeede therein, the roote is long ſmall and threddy at the end, this is found on ſome hills, to vary in the colour of the flower to be more whitiſh, yellow, or more purple.

2. *Eufragia minima.* Small Eyebright.

This ſmall Eyebright groweth not much above two inches high, having narrower and ſmaller leaves thereon then the former, in all other things not differing from the former.

3. *Eufragia pratenſis rubra major.* Great red Wooddy Eyebright.

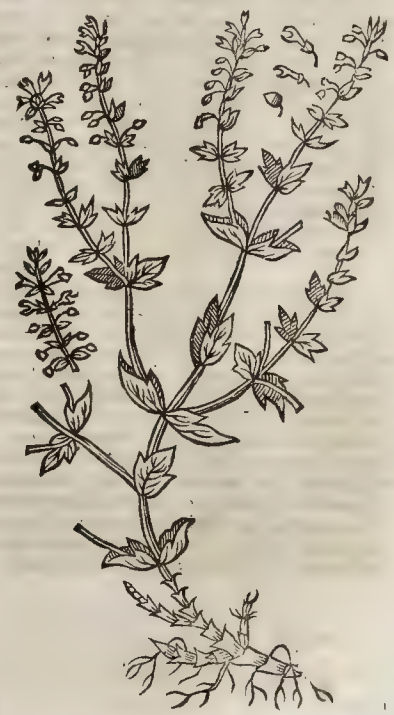
This wooddy wilde kinde riſeth up with one wooddy ſquare browniſh ſtalke divided into ſundry branches, a little

1. *Eufragia vulgaris.*
Common Eyebright.

3. *Eufragia pratenſis rubra major.*
Great red woody Eyebright.

5,6. *Eufragia purpurea latifolia: & pratenſis major lutea.*
The greater purple broad leafed, and yellow Eyebright.

7. *Eufragia lutea radice ſquamata Bauhini, ſive Anonyma radice Dentariæ Columnæ.* The leſſer yellow Eyebright.



little above the ground, that it seemeth a pretty bush, about halfe a yard or two foote high, set with somewhat long and narrow leaves, pointed at the ends, and somewhat endented about the edges, two alwayes set together at a joynt one against another, which will in the heate of Summer turne somewhat reddish: the flowers are gaping and hooded, of colour purplish red, the roote is made of divers hard wooddy strings.

4. *Eufragia pratensis minor purpurea.* Small red wooddy Eyebright.

This smaller red Eyebright hath one square reddish hairy stalke, an handfull high, sometimes without branches and usually but with two seldome more branches, compassed with a few thicke, hairy, almost round leaves, two together and deepely cut into parts, the lower leaves which are the lesse but into three parts, the upper into five or sixe: the flowers breake forth, sometimes from betweene the leaves and the stalkes, and sometimes they stand in tufts at the toppes, two standing together hooded and purplish, comming out of long greene huskes, sometimes the flowers have beene observed to be white, but very seldome: after which come long and cornered white seede in the said huskes, the roote is small wooddy and blacke.

5. *Eufragia purpurea latifolia.* Broad leafed purple Eyebright.

This is somewhat like the last, but that it hath broader leaves, and the flowers are set by spaces up to the tops, of a finer purplish colour, in other things not much unlike the last.

6. *Eufragia pratensis major lutea.* Great yellow Eyebright.

This great yellow Eyebright hath a square hard reddish stalke neere two foote high, set with fewer joynts, and longer narrower thicke leaves at them by couples, and but smally dented about the edges: at the joynts on both sides come forth branches, and at the toppes of them such like hooded flowers, standing thicke or close, two together, bending downewards and looking all one way, of a gallant gold yellow colour, and standing in long greene huskes having in them white seede like the former: the roote is slender and wooddy, the whole plant is bitter and harsh on the tongue and astringent.

7. *Eufragia lutea minor radice squammata.* The lesser yellow Eyebright.

This lesser sort hath a smooth hollow stalke a foote high or lesse, set with branches and leaves by couples on them, which are like unto the *Germander*, or Ivy leafed Chickeweede but longer pointed, the flowers are yellow, but like unto those of the common Eyebright, the seede is small blacke and round, and pointed at the ends, standing two together on a small footestalke: the roote is white and round like a bulbe, composed of foure thicke coates or scales lying close together, the whole plant is without taste, and somewhat resembleth Fumiterry, but *Columna* saith that the rootes are like the *Dentaria major* of *Matthiolus*, as the figure expresseth it.

The Place and Time.

The first and third are onely frequent in our Land, the former in many Meddowes and grassie places throughout our Country, and the other in many places of *Kent*, in the barren fields and waste grounds, both about *Gravesend*, and the tracts thereabouts, and in many other places, the rest some in *Italy*, and at *Naples*, or in *Spaine* and *Austria*, they all for the most part flower not untill the end of Summer, the seede ripening within a while after.

The Names.

It is called *Eufragia* and *Eufrasia*, and by some onely thought to be anciently called εὐφροσύνη, (yet is *Euphrosyne* not knowne, nor described by any of the former Greeke or Latine writers,) for it is of later invention, and for the effects called *Ophthalmica* and *Ocularia*. The first is generally called *Eufresia* and *Eufragia*, or *Euphragia* by all Writers. The second is called by *Columna Eufragia linifolia*, although the leaves bee farre lesse then those of Line or Flax: the third is the *Eufragia altera* of *Dodonæus*, *Lobel*, and others, the *Sideritis pratensis rubra* of *Lugdunensis*, the *Odontites* of *Tabermontanus*, the *Ericoides rubrum* of *Thalius*, and the *Crataogonon Euphrosyne* of *Gerard*, who would needes make it a kinde of *Crataogonon*, against the saying of *Dodonæus*, from whom he hath the most that he hath, saying it cannot agree with *Crataogonon*, by the defect in many parts, and yet his Corrector doth so let it passe. The fourth *Bauhinus* called in his *Phytopinax*, *Brunella Italica*, but in his *Pinax Euphrasia pratensis Italica latifolia*, and in his *Prodromus Eufrasia purpurea minor*, and is the third *Eufrasia non scripta* of *Columna*. The fifth is the *Eufragia major sylvestris purpurea latifolia* of *Columna*. The sixth is the *Sideritis pratensis lutea* of *Lugdunensis*, *Ericoides luteum* of *Thalius*, *Odontites flore luteo* of *Tabermontanus*, and the *Eufragia sylvestris major lutea angustifolia* of *Columna*. The last *Columna* calleth *Anonyma radice Dentariæ*, and *Bauhinus Euphrasia lutea Alsinefolio radice squammata*. The *Italians* and *Spaniards* call it *Eufrasia*, the *French Enfrase*, the *Germanes Augencrost*, the *Dutch Ooghentroost*, and we Eyebright.

The Vertues.

The bitter taste that is herein sheweth it to be hot and dry, and is especially used for all the diseases of the eyes, that cause dimnesse of the sight, for either the greene herbe or the dry, the juice or the distilled water is very effectuall for the said purpose, to be taken either inwardly in wine or in broth, or to be dropped into the eyes, and used for divers dayes together: Some also make a conserve of the flower to the same effect. Any of these wayes used, it helpeth also a weake braine or memory, and restoreth them being decayed in a short time. *Arnoldus de Villa nova*, in his booke of wines, much commendeth the Wine made of Eyebright, put into it when it is new made, and before it worke (which because we cannot make in our land, I could wish that the Eyebright might be tunned up with our strong Beere in the same manner, which no doubt would worke the like effects, their Wine and our Beere having a like working, as we use with Wormewood, Scurvigrasse and the like) to helpe the dimnesse of the sight, and saith that the use thereof restored old mens sight, to read small Letters without spectacles, that could hardly read great ones with their spectacles before: as also did restore their sight that were blinde for a long time before. If this drinke be not to be made or had, the pouther of the dryed herbe either mixed with Sugar, a few Maces and Fennell seede, and drunke or eaten in broth, or the said pouthers made into an Electuary with Sugar, doth either way tend to the same effect.

CHA.

CHAP. IV.

Speculum Veneris sive Viola pentagona. The Corne Violet.

WE have in our Corne fieldes in this Land, two sorts of Corne Violets a greater and a lesse which shall be shewed to you in this Chapter.

1. *Speculum Veneris majus.* The greater Corne Violet.

The greater of these Violets hath sundry slender weake trayling stalkes, lying on the ground, and rising from the roote, divided and subdivided from every joynt into branches so plentifully, that one plant growing in a good Garden ground, will be hardly covered with a pecke measure, thicke set without order, with small and somewhat long leaves, slightly dented or rather waved on the edges, at every leafe from the middle upward, commeth forth a flower, of the bignesse of a two pence, so (that five hundred flowers almost, will be seene open at once, a goodly spectacle) set in a fine pointed greene huske, of a faire purplish blew colour, made of one whole leafe, plaited into five round pointed ends, white at the bottome, with a white pointell in the middle, closing up every night, and opening in the day onely, the seed is yellow, and contained in small long heads, the roote is small threddy, and annuall.

2. *Speculum Veneris minus.* The lesser Corne Violet.

The lesser sort groweth more upright like unto the little Centory, with stiffer and fewer branches, more harsh or rough also in handling, the leaves are like unto the former but somewhat lesse, at each joynt almost come forth two or three flowers, standing at the ends of long cods like unto *Lysimachia siliquosa*, of the same fashion and colour as the former, but so small as the eye of a little bird, never rising above the huske it standeth in, and not but in the heate of the day to be seene, which then onely layeth it selfe open, the seede is small and yellow as the former, the roote is small and annuall also.

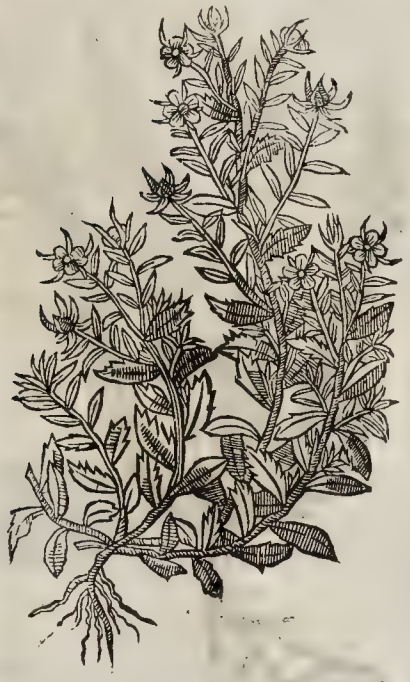
The Place and Time.

The first groweth in the Corne fields, betweene *Greenehithe* and *Dartford* in *Kent*, as also in the Corne fields about *Liley*, a towne in the uttermost part of *Hartfordshire*, towards *Bedford*, the other about *Hatfield*, and in sundry other places in this land, being more frequent by much, and flower from Midsommer untill the end of *August* almost, the seede ripening in the meane time.

The Names.

We have not understood as yet by any that the lesser sort hath beene observed by any Authour beyond sea but onely the former, which is called *Onobrychis* and *Campanula arvensis* by *Dodonæus* and *Lugdunensis*, and *Onobrychis altera Belgarum* by *Lobel*, *Viola anonymos inodora* by *Gesner*, and *Viola arvensis*, and *Viola Pantagonia* by *Tabermontanus*, but *Speculum Veneris* by *Gerard*, from the *Dutches Vrowen spiegel*, which is *Venus* looking Glasse in *English*.

1. *Speculum Veneris majus.*
The greater Corne Violet.



2. *Speculum Veneris minus.*
The lesser Corne Violet.

but because it usually groweth in Corne fields, and that some have called it a Violet, I have thought it fittest to terme it a Corne Violet, which if any list to alter they may at their pleasure.

The Vertues.

We have not understood that any hath made triall what vertues it is endued withall, and therefore I can say no more thereof.

CHAP. V.

Polygala. Milkewort.

OF this Milkewort besides that there is a greater and a lesser kinde, and each of much variety in the colour of the flowers, there are some other plants somewhat resembling them, which must be entreated of together.

1. *Polygala major.* The greater Milkewort.

This greater kinde shooteth from the roote five or sixe hard, slender, and flexible stalkes, a foote high or more, thicke set with somewhat long and narrow leaves like those of Diers weede: the flowers grow at the toppes in a long spike thicke together, somewhat like to those of Fumiterry, but larger and of a fine delayed reddish purple colour and shining withall, after which follow flat pouches, with two seedes in them usually, which are long blackish and hairy: the roote is hard and wooddy, with divers fibres thereat, and abideth long. This hath beene found to vary, the colour of the flower, especially in shadowy and moist places, to be either blew or white, or mixed as the smaller kinde is.

Varietas.

2. *Polygala minor.* The lesser Milkewort.

The lesser kinde groweth in all things like the former, but with lower and slenderer stalkes, yet somewhat hard or wooddy, not so many rising from a roote and with fewer and smaller leaves on them: the flowers also are alike but smaller and vary as much or rather more in their colour, some being of a blewish purple, others purple and white, some all white, other reddish or of a wan colour, or overworne red, &c. There is also another sort hereof whose lower leaves that spread on the ground are many, and rounder then in any of the former, but those that grow on the stalkes are long like the rest, the flowers whereof are onely blew, without mixture or variation.

Alia species.

3. *Polygala Monspeliaca.* Milkewort of *Mompelier.*

This *French* Milkewort hath upright stalkes a foote high, many rising from a small long white roote, with sundry longer and narrower leaves on them set without order: the flowers grow one above another, in longer spikes then in the other smaller, and not fully like the other, but of a reddish colour, the seede that followeth is small contained in long cornered huskes.

1. *Polygala major.*
The greater Milkewort.

2. *Polygala minor.*
The lesser Milkewort.

4. *Poly-*

4. *Polygala repens.* Creeping Milkewort.

This ſmall Milkewort hath a number of ſtalkes, full of branches lying and ſpreading on the ground, not above a ſpan long, ſet thicke by couples with very ſmall leaves like *Herniaria* Rupture wort: the flowers are of a whitiſh colour, ſtanding among the leaves at the toppes in wharles compaſſing the ſtalkes one above another.

4 *Polygala repens.* Creeping Milkewort.

5. *Polygala affinis.* Baſtard Milkewort.

This ſmall plant ſpreadeth many weake ſlender round ſtalkes upon the ground a ſpanne long or more, ſet with ſundry ſmall leaves without order, in faſhion ſomewhat like unto Mirtle leaves, but not ſo much pointed, the flowers are very beautifull, ſtanding in a ſmall ſpike one above another, with leaves amongſt them, conſiſting of ſixe leaves of a fine bright ſhining purple colour, the ſeede is ſmall, contained in ſmall huskes: the roote is made of ſmall long and white fibres.

The Place and Time.

The firſt kinde groweth not in our Country that I can heare of, but in *Auſtria*, *Germany*, and the parts thereabouts, found out by *Cluſius*. The ſecond is frequent with us, as well in barren and untilled places, heathes and the like, as in fertile and paſture grounds, yet there it will be more freſh and large. The third about *Mompelier*, and ſo doth the fourth and laſt, and in other places in *France* not farre of. They all flower in the beginning or middle of May, and continue flowring a moneth, and perfect their ſeede preſently after.

The Names.

The name *Polygala* or *Polygalon* as *Tragus* doth call it, is impoſed on theſe plants, upon ſuppoſall that they are the *Polygala* of *Dioſcorides*, but they doe but reſemble it, and are not the ſame, and therefore *Lobel* calleth it *Polygala recentiorum*, as not judging it to be right, which *Geſner* alſo before him perceived by the bitter taſte it hath, and therefore called it *Amarella*, yet according to the *Germane* vulgar name, he called it alſo *Crucis flos*. *Dodonæus*, *Cluſius*, *Lobel*, and ſundry others following the currant knowne name, call it *Polygala*, as not knowing a fitter to call it by, yet *Anguilara* ſeemeth to call it *Theſion*, and *Dodonæus Flos Amber valis*. *Cluſius* calleth the firſt *Polygala vulgaris major*, and the ſecond *minor*, although it be ſet amiſſe, *major* for *minor*. The third *Bauhinus* referreth to the *Onobrychis tertia purpurea* of *Lugdunenſis*, and calleth it himſelfe *Polygala acutioribus foliis Monſpeliaca*. The fourth is generally called *Polygala repens* by *Lobel*, and all others that have written of it: The laſt is the *Chamæmyrſine quorundam* of *Lugdunenſis*, which *Bauhinus* calleth *Polygalæ affinis* as I doe. *Bauhinus* numbreth up among theſe *Polygala's*, one with a yellow flower, which he referreth to a plant that *Anguilara* found, and was like unto a Lentill, but had thicker and fuller leaves, a yellow flower and ſeede in cods, which I have referred rather to the *Scorpioides leguminoſa*, as I have there ſhewed. The *Italians* call it *Poligala*, the *French L'herbe ancroiz*, the *Germanes Creutz blumlin*, and *Ramſel*, the *Dutch Cruys bloomen*, and we in *Engliſh* Gang-flower, Croſſe-flower, or Milkewort.

The Vertues.

Geſner as I ſhewed you before, by reaſon of the bitterneſſe of this herbe, having called it *Amarella*, ſaith that he found it to purge choller, having made the tryall of it on himſelfe, by ſteeping a handfull thereof all night in wine, and drinking it in the morning, and therefore is not likely to encreaſe milke in womens breſts, neither bitter nor purging thing working any ſuch effect that we have known, and therefore cannot be the *Polygala* of *Dioſcorides*, which worketh not that effect: other certainty hereof we have not yet learned, and therefore we forbeare to ſet downe gheſſes or falſities.

CHAP. VI.

Antirrhinum ſylveſtre medium. The greater wild Snapdragon.

THE wilde Snapdragon is of two ſorts, one greater then another, the greater whereof riſeth up uſually but with one ſtalke, branching forth on all ſides into ſome other, whereon are ſet long and ſomewhat narrow thicke darke greene leaves, by couples: at the toppes of the ſtalkes and branches ſtand in ſeverall places reddiſh purple gaping flowers, in ſhape like thoſe of the garden or manured kinde, but farre leſſe and without any white colour therein, after which come ſuch like heads, like calves ſnoutes, as in the other, but not halfe ſo bigge, wherein is contained very ſmall blackiſh browne ſeede: the roote is ſmall and periſhing, every yeare regaining it ſelfe from the ſhed ſeede. We have had another of this ſort brought us out of *Spaine* by *Boel*, often remembred before, whoſe flower was much more beautifull, being of a bright crimſon colour, the mouth or chappes being of a yellowiſh white, much like ſome of the garden kindes, but more lively for colour. As alſo another with milke white flowers, which ſpreadeth abroad a little more then the former. The leſſer ſort groweth lower by the one halfe, yet buſhing thicker with branches, having long narrow leaves not halfe ſo great, and the flowers very ſmall alſo and whitiſh, the ſeede is ſmall

Alterum. Beticum rubrum.

Alterum flore albo. Minimum.

1. *Antirrhinum sylvestre medium.*
The greater wild Snapdragon.

Antirrhinum sylvestre minimum.
The least Snapdragon.

Saxatile Bauhini

small and blacker then the former, and the roote perisheth alike and is so also raised againe, *Bauhinus* hath another of this sort with red flowers, whose leaves he saith are like *Serpillum*, Mother of Time.

The Place and *Time*.

These grow wilde in *Spaine*, *Italy*, *France*, and other places, but we have them onely in Gardens, where they that once sow them, shall lightly have them continually, if they will suffer them to shed their seede being ripe, and are in flower from *July* unto the end of *August*.

The Names.

They are called *Antirrhinum sylvestre*, and *arvense majus*, and *medium & minus*, or *minimum* by all our moderne Writers, yet some call them *Orontium* or *Auruntium*, and *Os leonis*: *Honorius Bellus* in his second Epistle to *Clusius*, calleth it *Phyteuma*, and saith that in *Candy* the people call it χασκουσα.

The Vertues.

There is as little use of these wilde kindes in Physicke, as of the garden kindes in our dayes, although *Matthiolus* saith that the leaves, flowers, and seede are good for the rising of the mother, to be mixed with Rose water and honey, and that the herbe doth cause the Scorpion presently to lose the force of his poyson, as soone as he seeth it, and that the herbe applyed to the forehead taketh away the pin and webin the eyes.

CHAP. VII.

Linum sativum & sylvestre. Manured and wilde Flaxe.

HAving divers sorts of wilde Flaxe to shew you in this Chapter, I thought it fit to prevene them with the manured kinde, and rather speake thereof together, then distinctly in a Chapter by it selfe.

1. *Linum sativum*. Manured Flaxe.

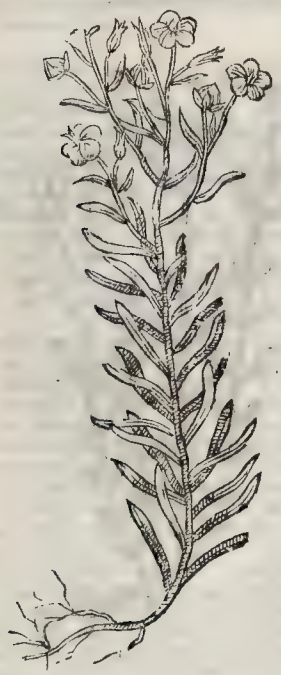
The manured Flaxe hath a slender round pliant stalke three foote high, beset with narrow long and soft leaves without order, branched at the toppe into three or foure small branches, each of them bearing two or three faire blew flowers, made of five round pointed leaves apeece, with some threds in the middle, after which come round buttons pointed above, wherein is contained flat shining smooth browne seede: the roote is small and threddy, perishing every yeare.

2. *Linum sylvestre vulgatius*. The more common wilde Flaxe.

This wild Flaxe groweth like the former, but hath greater and higher stalkes, more branched at the toppes, and more store of blew flowers on them, the seede also is like the former, but the seede vessels will hold the seede therein, and not breake open with the heate of the Sunne, when it is ripe, as the manured kinde will doe, which must be presently gathered and kept.

3. *Linum*

1. *Linum sativum sive vulgare.*
Manured Flaxe.



3. *Linum sylvestre latifolium cæruleum.*
Broad leafed blew wilde Flaxe.

3. *Linum sylvestre latifolium cæruleum.*
Broad leafed blew wilde Flaxe.

This wilde Flaxe riseth up sometimes but with one ſtalke, and often with more, a foote or ſometimes more high, which are ſtiffe, thicke, and hairy, ſet with greater and broader hairy leaves, then in any of the other ſorts, the ſtalkes branch forth towards the toppes, bearing ſmaller leaves then thoſe below, and larger flowers, even as great as Mallowes, of a deeper or paler blew colour, the heads containing the ſeede are ſet in the greene huskes, that held the flowers, which open being ripe, ſhewing a blacke flat ſhining ſeede like the reſt, the roote is great and liveth after ſeede time, ſhooting new ſtalkes with woolly leaves on them, and ſo abide all the Winter: this groweth in *Hungary* and *Auſtria*.

Of this ſort there was obſerved by *Cluſius* in *Spaine*, one with large broad woolly leaves like it, but the flowers were white with purple veines in the leaves.

4. *Linum ſylveſtre latifolium luteum.*
Broad leafed yellow flowred Flaxe.

The divers ſtalkes of this Flaxe are round browne, and ſtiffe, with large leaves on them, and not hairy but hard: the flowers are many that ſtand at the toppes of the ſtalkes, and large, of a faire ſhining yellow colour, with ſome threds in the middle, the ſeede veſſels are flatter, and the ſeede blacker then the other, and not ſhining like them: the roote is thicke and crooked, with fibres the reat and periſheth not but abideth many yeares.

Bauhinus maketh mention of one with broad leaves, whoſe ſtalke is glutinous or clammy, and the flower of a red colour which grew on the hills by *Bononia*, and about *Ingolſtad* in *Germany*.

5. *Linum ſylveſtre anguſtifolium cæruleo vel albo flore magno.* Narrow leafed wilde Flaxe, with either white or blew flowers.

This Flaxe hath ſundry ſtalkes, of a foote high, and ma-

Album luteum.

Flore rubro.

ny

7. *Linum ſylveſtre anguſtifolium luteum.* Narrow leafed wilde Flaxe with yellow flowers.

10. *Chamælinum Cluſij flore albo ſive Linum ſylveſtre Catharticum.* Dwarfe wilde Flaxe with white flowers, or Mill mountaine.

ny narrow long leaves on them, the flowers are very large, and are either of a pale blew, tending to an aſh colour, or elſe white, each leafe having a purple line running through the middle, in the reſt there is little difference from the former wilde ſorts, the roote abiding.

6. *Linum ſylveſtre anguſtifolium flore minore.* Narrow leafed wilde Flaxe with ſmall flowers.

The ſtalkes hereof are many round and ſtiffe, a foote long, having many narrow ſhort leaves thereon, of a blewiſh greene colour: the flowers are blew and no bigger then thoſe of the manured Flaxe, the heads, ſeede, and rootes are like the reſt.

7. *Linum ſylveſtre anguſtifolium luteum.* Narrow leafed wilde Flaxe with yellow flowers.

This yellow wilde Flaxe hath ſundry ſtalkes halfe a yard high, with few leaves ſet on them like unto the manured Flaxe, the flowers are ſmaller then it, but of colour yellow.

8. *Linum fruticoſum ſemper virens.* Everliving wilde Flaxe.

This Flaxe hath divers wooddy ſtalkes of a foote high, with a number of leaves thereon, ſomewhat ſhort and narrow, of a whitiſh greene colour, and abiding in the Winter on the ſtalkes, not falling of as the reſt doe, the flowers are wholly white, and a little larger then the laſt, ſtanding at the toppes of the ſtalkes like others.

9. *Linum arboreum Creticum luteum.* The yellow ſhrubbe Flaxe of *Candy*.

This groweth like a ſmall ſhrub, covered with a blackiſh barke, with long leaves, thicke ſet on the branches, ſomewhat like unto thoſe of Flaxe but larger, comming neereſt unto large Myrtle leaves, the flowers are yellow and very bitter in taſte: the ſeede veſſels are as bigge as Ciche peaſe, containing foure ſeedes within them very like unto Flaxe ſeede.

10. *Chamælinum Cluſij flore albo, ſive Linum ſylveſtre Catharticum.*
Dwarfe wilde Flaxe with white flowers, or Mill mountaine.

This Dwarfe Flaxe hath many ſlender ſtalkes, of about a ſpanne and a halfe long, with divers ſmall long leaves ſet by couples on them, and white flowers at the toppes of the branches, leſſer then thoſe of the manured, with yellow threds in the middle, the ſeede is ſmall that followeth in the ſmall round heads: the roote is ſmall alſo and threddy.

Flor. luteo *Lobel* ſetteth forth another ſmall one, not riſing above foure or five inches high, with ſmall leaves and yellow flowers.

11. *Chamælinum ſtellatum.* Dwarfe wilde Flaxe with ſtarre like flowers.

This whole plant is ſcarſe three inches high, having but one or two very ſmall ſtalkes at the moſt, and as ſmall leaves ending in a very ſharpe point, the flowers are few and ſmall, made of five narrow pale greene leaves, pointed at the ends, and ſtanding forth in that manner that every flower reſembleth a ſtarre, with a round umbone in the middle.

The

The Place and Time.

Some of these as is before said, grow in *Spaine*, some in *France* or *Germany*, and some in our owne Land also: they all are in flower for the most part from Midsommer untill *August*, and some abide longer, the seede ripening in the meane time.

The Names.

Linum in Latine, and Λινον in Greeke, signifieth as well the herbe as it groweth, as the same prepared to be spun, and when it is made into cloath also. The first is called by all Authours *Linum sativum*, and the second *Linum sylvestre* by *Tragus*, who saith it is sowne in the fields of *Germany* in sundry places, because it yeeldeth more store of Flaxe, and yet is found naturally growing among Oates. The third is *Clusius* his first *Linum sylvestre latifolium*. The fourth is the third *Linum sylvestre* of *Clusius*. The fifth is *Clusius* his second *Linum angustifolium* which *Lobel* and others call *Linum sylvestre floribus albis*. The sixth is *Clusius* his *angustifolium primum*, which *Lobel* and others call *tenuifolium*. The seventh is the *Linum sylvestre* of *Matthiolus*, *Dodonæus*, *Camerarius* and others, the *Linum marinum luteum* of *Lobel*, and may be the first *Linum fruticosum subflavum* of *Bauhinus in Prodromo*, and the *Linum luteum sylvestre latifolium* of *Columna*, for they differ little. The eighth is the *Linum sylvestre fruticosum* of *Clusius*. The ninth is the *Linum arborcum* of *Alpinus* in his booke *de plantis Exoticis*. The tenth is the *Chamælinum* of *Clusius*, which is called Mill mountaine in many parts of this Land, by the Country people where it groweth. The last is called *Linum minimum stellatum* by *Bauhinus*, who saith it is also called by some *Passerina minor saxatilis*. The *Arabians* call it *Bazari-chichen* or *Bezerchetan*, which is the seede thereof onely, the *Italians Lino*, the *French Lin*, the *Germans Flachs*, the *Dutch Vlas*, and we Flaxe, and Line.

The Vertues.

There is neither leafe, flower, nor roote of Flaxe used in any medicine with us, that I know, neyther greene nor dryed, neither the juice, distilled water, or any other composition made thereof, but onely the seede, and that more in outward then inward Physicke in these dayes, although in former times as *Galen* sheweth, that some used the seede parched for their food, taken with honey, and some used to put it into their bread, but saith he *primo alimentorum*, it troubleth the stomacke, hardly digesteth, and giveth little nourishment to the body: but concerning the mooving of the belly downewards, saith he, I will neither praise nor dispraise it, yet it hath a small property to provoke urine, which it doth best being parched, thus saith *Galen* of the manured kinde, but the wilde kindes that are more bitter have another property: The seede of Line made into pouther, mixed with honey and some pepper into an electuary, and thereof the quantity of a Nutmeg taken every day, doth helpe the cough as some say, the seede also boyled in water, and some honey put unto it and drunke, is said also to ease the paines of the body, as the collicke, and stitches, and all inflammations; if it be outwardly used also, with Fenugrecke and Linseed, and some Mallows, a pultis being made therof is of good use to mollify and discusse any tumour or hardnes in any part of the body, or of the mother by sitting in the warme decoction of the seede, or to receive the hot fumes through a seate for the purpose: being taken with Raisins saith *Pliny*, it helpeth the obstructions of the Liver: the seede mixed with niter or salt, and figge tree ashes, easeth the paines and hardnesse of the muscles, sinewes and arteries, and used with figges, it ripeneth and digesteth, mixed with the wild Cowcumber roote, it draweth forth splinters, thornes, nailes or any other thing sticking in the flesh, and broken bones also: the decoction thereof made in wine and applyed to any fretting or running sore, stayeth it from spreading further: used with as much Cresses, it taketh away the ruggednesse of the nailes, and with Myrrhe, and Rossin, it helpeth ruptures, and the swellings of the cods: used with *Oliboanum* and water, or Myrrhe and wine, it helpeth watering eyes, and mixed up with hony or suet, or waxe and applyed, it helpeth the hard kernels and swellings under the eares or throate, it taketh away also the spots and blemishes of the skin, Sunburning and other discolourings. The oyle of Linseede (besides that it is of much use for Painters to fasten their colours, either on cloth, wood, stone, iron, or glasse, and to burne in lamps abiding longer then the Oyle of Olives, although it giveth much more smoake and soote) is of exceeding good use, to mollifie the hardnes and shrinking of the sinewes, helpeth the hemorrhoides or piles, the rifts and chaps of the fundament, and the hardnesse and paines thereof, and of the mother; being beaten with Red-rose water it is good against burnings. The wilde Flaxe is of the like use in most things, and the more effectuall, by reason of the bitternesse in many others: the decoction thereof with the flowers doth resolve tumours, and lenifie inflammations, the arteries also when they grow hard and stiffe, and the swellings and sores in the groine: of Mill mountaine some triall hath beene made among our people, to move the body to the stoole.

CHAP. VIII.

Caryophylli sylvestres minores. Small wilde Pinkes.

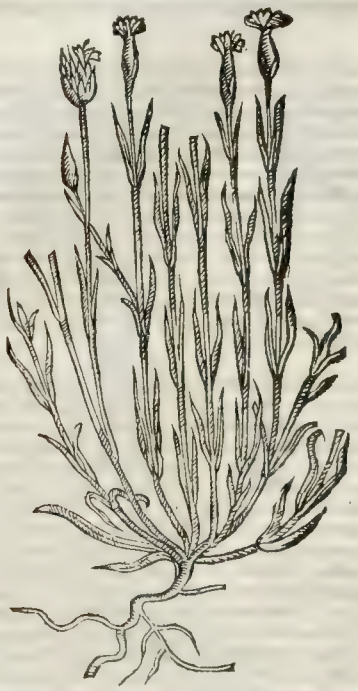
HAving shewed you so many Gilloflowers, Pinckes, sweete *Williams* and *Johns*, of beauty in my former Booke, let me also here shew the rest of that family, which are not of that respect, and doe rather delight in their owne naturall, then in any other forraine habitation, and they are of three sorts, growing either in the fields, on the mountaines, or among the rockes and stones: of these severally in their order.

Caryophylli arvenses. *Primus Ordo.* **The first Rancke of wilde Pinckes of the Fields.**

1. *Caryophyllus prolifer.* Childing Pinckes.

This wilde Pincke is but annuall, that is perishing after seede time, having a few pale greene grassie short blunt leaves lying on the ground for the first yeare, and are the next yeare carryed up with the stalkes, divided into some branches, and set by couples at the joynts, having a short thicke grayish greene huske at the toppes, out of which start out by degrees one after another; seven or eight small faint red flowers, smaller then the smallest Garden Pincke by much, which scarse shew themselves above the brimme of the huske: more flowers then one as I said, appeare not at a time out of the huske, or very seldome two, whereby they are long in flowring, in the outer huske

1. *Caryophyllus prolifer.*
Childing Pinckes.



3. *Caryophyllus arvensis glaber minimus.*
The ſmalleſt white wilde French Pincke.

4. *Caryophyllus cæruleus Monſpelienſis.*
The blew Pincke of *Monſpelier.*

6. *Caryophyllus arvensis umbellatus.*
Wilde Pinckes in tufts.

huske is found after they have done flowring, ſo many ſeverall ſmall long huskes as there did flowers ſhew forth, each containing within them ſmal blackiſh ſeed, the roote is ſmall white and hard, periſhing every yeare, and raiſing it ſelfe by its owne ſowing, or elſe muſt be ſowne in the Spring.

Alter unico flore. Of this ſort there is one that hath but one flower riſing out of the huske, and of a paler reddiſh colour then the former.

2 *Caryophyllus pratenſis noſter major.*
Our greater wild field Pincke.

Wee have in many places of our Land growing wild a ſmall kinde of Pincke, as I may ſo call it, and eſpecially by *Deptford* and *Rederiffe*, which ſpreadeth much oftentimes, and rooting by the branches as it

groweth

groweth with ſmall ſhort greene leaves next the ground, and by couples on the ſtalkes, with ſmall reddiſh Pincke-like flowers on the toppes. Of this ſort alſo there is a leſſer, growing among the thicke graſſe in our medowes about *London*, namely towards *Totnam Court*, whoſe roote is ſo ſmall and threddy, that it will not abide tranſplanting, having very ſlender ſtalkes, and ſmaller, ſhorter, and greener leaves ſet thereon then in the former, the flowers alſo are ſmaller, and of a cleare red ſhining colour ſometimes, but one of a ſtalke, and ſometimes more eſpecially under hedges and buſhes that may defend it by the ſhadow. Of neither of both theſe have I any true figure, to exhibite here and I am loath to inſert Maſter *Johnſons* figure, becauſe it doth not truely expreſſe it, as alſo that it is *Lobels* figure of a ſmall *Armeria*, which hath leaves among the flowers, which theſe have not.

3. *Caryophyllus arvenſis glaber minimus.*
The ſmalleſt white wild *French* Pinckes.

Somewhat like unto the former two ſorts is this ſmall one alſo whoſe rootes are ſmall, thred like and reddiſh, the ſtalkes are ſlender, ſmal and joynted about a foot or leſſe high, having ſmall long narrow greene leaves, ſet ſingly thereat, and ſpreading at the toppe, into many threddy branches, full of very ſmall white flowers, conſiſting but of two leaves like threds.

4. *Caryophyllus cæruleus Monſpelienſium.*
The blew Pincke of *Mompelier*.

The leaves of this Pincke that are next the ground, are ſo fine and ſmall like Ruſhes that they will be withered almoſt as ſoone as they be gathered, but of a whitiſh greene colour from whence riſe ſundry ſlender ſmooth joyntleſſe ruſhy ſtalkes halfe a foote high, bearing every one a flower at the toppe, out of a ſmall huske, conſiſting of five blew round pointed leaves, finely dented about the edges, but no bigger then thoſe of the ordinary wilde Centory, the whole plant taſteth ſomewhat hot and bitter.

5. *Caryophyllus arvenſis holoſtius hirſutus.*
Wilde hairy Sea Pinckes.

This Pincke groweth very like a garden Pincke, but of a grayiſh or hoary greene colour, and ſomewhat hairy withall, the flowers grow not like Pinkes in long huskes, but more like unto a ſmall wilde Campion, of a reddiſh colour tending to murrey, and give ſmaller ſeede unlike to Pinckes, the roote abideth.

6. *Caryophyllus arvenſis umbellatus.* Wilde Pinckes in tufts.

This wilde Pincke alſo doth much reſemble a wilde Campion, having ſhort broad leaves, ſomewhat like unto *Lobel* his Catchflye, but of an hoary greene colour, the ſtalkes have the like leaves by couples on them, and at the roppe divers ſmall flowers, riſing altogether from one joynt, and each ſtanding on a ſhort footeſtalke, compoſing thereby a kinde of umbell, and are ſome of a reddiſh, and others of a whitiſh colour. I give you here *Gerard* his figure thereof, more to pleaſe others then my ſelfe.

7. *Caryophyllus holoſtius tomentoſus.* Hoary Pinkes.

From a ſmall creeping roote riſeth ſundry ſlender round joynted ſtalkes lying on the ground and dividing themſelves into many branches a foote or two long or more, whereon are ſet leaves by couples, ſome of them broad and long, and others more round, yet all of them hoary white, like unto the leaves of the *Gnaphalium Americanum* called white Live long, or Life everlaſting, bearing white flowers of five leaves a peece round pointed, this abideth long, and ſpreadeth much upon the ground.

7. *Caryophyllus holoſtius tomentoſus.*
Hoary Pinckes.

8. *Caryophyllus anguſtifolius tomentoſus.* Hoary narrow leafed Pinckes.

This ſmall low Pincke that ſcarſe riſeth with the ſtalkes an hand breadth high, which are woolly, branching into two or three parts, hath very narrow long and woolly greene leaves on them, one being longer then another, each of the ſtalkes bearing a white flower, made of five leaves, ſtanding in a greene huske.

9. *Caryophyllus pumilus latifolius.* The low broad leafed Pincke.

This ſmall Pincke hath a ſhort low ſtalke riſing from the roote, preſently dividing it ſelfe into two branches, of halfe a foote high, whoſe lower leaves next the ground are ſomewhat broad and ſhort, but a little longer on the branches, being ſoft and of a pale greene colour, ſet by couples at the joynts: each of the branches bearing but one ſmall pale purpliſh white flower riſing out of a ſmall ſhort huske.

The Place and Time.

Some of theſe as I ſaid grow in our owne Land, ſome in *Germany*, *France*, and *Spaine*, ſome alſo flower earlier then others.

The Names.

Lobel and *Camerarius* call the firſt *Armerius proliferus*, and *Thalius Caryophyllea ſylveſtris quarta.* The ſecond of both ſorts have their titles as beſt beſeemeth them, *Gerard* mentioning the firſt and my ſelfe the other. The third is ſo called by *Bauhinus* as the title beareth. The fourth is called by *Lobel Aphylanthes Monſpelienſium*, and by *Tabermontanus* and *Bauhinus*, *Caryophyllus cæruleus Monſpelienſium*. *Lobel* calleth the fifth *Caryophyllus holoſtius*, and *Tabermontanus* both it and the ſixt *Holoſteum Caryophylleum*. The ſeventh is uſually called with us *Caryophyllus Holoſteus*, and *Holoſteum* ſimply, *Bauhinus* as I take it, meaneth this which he calleth *Caryophyllus holoſtius tomentoſus latifolius*, and ſaid he had not ſeene the flowers: And the eighth alſo *Caryophyllus holoſtius tomentoſus anguſti-*

angustifolium. The last he also calleth as is in the title. I have *Englished* them all Pinckes, not knowing how better to entitle them.

Caryophylli Alpini, Secundus Ordo. The second Ranke of Mountaine wilde Pinckes.

1. *Caryophyllus Alpinus latifolius.* Mountaine broad leafed Pinckes.

THis hath a small white fibrous creeping roote, and from thence rise some bending hairy stalkes, three or foure inches long, with two small broad and somewhat round pointed hairy thicke leaves, at each joynt, and from thence upwards come forth small footestalkes bearing each of them a large white flower of five leaves, standing in a greene huske, whereon afterwards standeth a long huske with seede therein.

2. *Caryophyllus Alpinus angustifolius purpurascens.* Narrow leafed mountaine wilde Pinckes.

The roote of this is creeping like the last, and the stalke being somewhat hairy is three inches long, with paires of small long leaves thereon, pointed at the ends, with two or three purplish flowers at the toppes, laid open like a starre and the greene leaves of the huske, set betweene them.

3. *Caryophyllus Alpinus gramineus.* Mountaine Pincke with Grasse like leaves.

The leavës of this sort are very narrow, and about an inche long, of a darke greene colour like unto grasse, set by couples on the stalkes, as in others, which are a little hairy, thé flowers are white made of five leaves, standing in small greene huske, out of which rise small heads, with small seede in them: the roote is small and white.

4. *Caryophyllus montanus angustifolius albus.* White mountaine narrow leafed Pinckes.

The stalke of this Pincke is small and reddish, three or foure inches long, having long and narrow smooth leaves thereon, and smaller white flowers at the toppe then those of the first, here in this Ranke or Order mentioned.

5. *Caryophyllus montanus Clusij.*
Clusius his mountaine Pincke.

6. *Caryophyllus minimus muscosus nostras*
Our smallest Mosse-like Pincke.

5. *Caryophyllus montanus Clusij. Clusius* his Mountainé Pincke.

Thé leaves of this pincke, are sappy thicke and short, somewhat like to those of Thrift growing thick togethér: from among whom rise sundry slender footestalkes, rather then stalkes, about an inch high, yet having joynts and leaves set by couples thereat, on the toppes whereof stand the flowers, each for the most part by it selfe, whose huskes are large and hollow, greater also then beseemeth the smallnesse of the plant, and of a purplish greene colour, ending in five poynts, out of which start small pale reddish flowers of five leaves apeece.

6. *Caryophyllus minimus muscosus nostras.* Our smallest Mosselike Pincke.

This small plant seemeth more like unto a Mosse, but that it hath some thredlike stalkes about two or three inches high, branching forth diversly, thicke set together and without order, with small short grasse greene leaves, that are very narrow, and more like haires then leaves, seldome exceeding halfe an inch in length, whereof although the most be plaine, yet some also will be parted on the side and forked like hornes at the ends, at the toppes of the branches stand divers very small and scarse to be discerned, greenish white flowers, which turne into small cods with seede in them as small as dust: this spreadeth into many small tufts, rooting afresh as it groweth, but dyeth after seede time, and springing from the seede that sheddeth and abiding in the Winter, with such a tuft of small greene haire like leaves as stand by the sides of it, untill that it encreaseth and groweth bigger, as the whole plant is expressed.

The Place and *Time.*

All these grow on hils and mountainës for the most part, the first and third in *Germany* and *Austria*, the second in *Spaine*, the fourth in *France* about *Mompelier*, the last no where but in mine owne Garden that ever I could know, and doe flower in *July*, giving seede quickely after.

The

The Names.

All these are lately found out, the foure first whereof are recorded by *Bauhinus* in his *Pinax* and *Prodromus*, by the same names they hold here in their tides, but that he addeth *Holostius* unto them. The last is as is said, not mentioned by any before that I know.

Caryophilli saxatiles, tertius ordo. Rocke Pinckes, the third Ranke.

1. *Caryophyllus saxatilis Ericæ folius umbellatis corymbis.* Rocke Pinkes with heath like leaves.

THis Rocke Pincke from a slender crooked and wooddy roote, sendeth forth divers brownish joynted stalkes, halfe ones hand high, having divers short and narrow leaves at their bottomes like unto Heath, and at the joynts two very short and hard leaves: the toppes of the stalkes are furnished with tufts of white flowers, made of foure and some of five leaves a peece, standing close together like unto an umbell.

2. *Caryophyllus saxatilis Ericæfolius ramosus repens aut ei similis.* White or purple Mosse Pinckes, or one somewhat like it.

This kinde of Pincke groweth like Mosse on the ground, and doth somewhat resemble the *Ocinoides Muscosus*, or *Muscus floridus*, set forth in the 78. Chapter of the fifth Classis of this Worke, but yet is not the same: it hath sundry small hard branches rising from a wooddy roote, divided into many other lesser encompassed with small Heathlike leaves, and with a number of large snow white or purple flowers standing at their toppes.

3. *Caryophyllus saxatilis syliquosus.* Codded Rocke Pinckes.

This living or ever greene plant is here thrust in the end of a Chapter, which I thinke did never please his founder to be so placed, I am sure it doth not me, but seeing it hath taken the like place before, let me also for this time not distrancke it: but describe it to shoote forth many leaves next the roote, somewhat like unto Daisie leaves, but much lesse, of a whitish greene colour, and set upon long foote stalkes, among which rise the slender smooth stalkes a spanne long, divided into many long branches, set with a few long and narrow leaves and small white flowers of foure leaves apeece at the toppes, which are followed by very slender, and narrow long pods containing very small reddish seed: the roote continueth and holdeth the lower greene leaves all the winter.

The Place and *Time.*

These grow in the rocky grounds on hills, the first in *France*, the second in *Spaine*, on the *Pyrenean* hils, and the last from among the chinkes of the Rockes in *Harcynia*, and flower when the rest doe.

The Names.

The names of these are likewise mentioned by *Bauhinus*, who hath given them the same titles that they are here set downe, yet I take the second to be called by *Antonio Donati Erica marina Thymefolia.*

The Vertues.

The most of these being of late invention, are of small or no use that we can understand, they must all therefore passe for this time, without being further questioned.

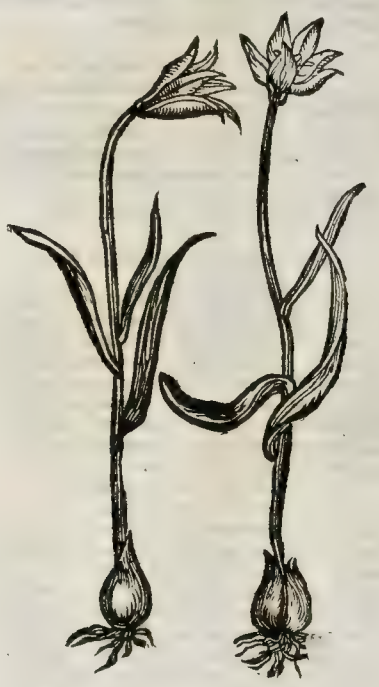
CHAP. IX.

Satyrion & Orchis. Cullions or stones.

OF the sorts of *Orchides* there are such a number that to avoide confusion, and to bring them into some methodicall order, I must distinguish them by severall Rankes or Orders, that is unto those that have round rootes, and into those that have handed rootes; many sorts whereof have beene called *Satyrium* by divers but erroniously, and therefore to avoide that Rocke, I would bring you into the safe Haven, where you may be assured that those rootes which are properly and truely the *Satyrion* of *Dioscorides*, are those which we usually call in these dayes *Tulipa*, as I have shewed in my former Booke (although Mr. *Johnson* in his *Gerard* seemeth not to take knowledge that I had there so declared it before; but delivereth it as if it were the fruite of his owne travels) whereof this age hath produced such an infinite variety, both for time of flowring, and forme of being, but in the placing and distinction of the colour especially, that it is I may say almost impossible to expresse them all. I will therefore here in the first place, before the *Orchides*, but shew you the formes and names of some of them, and referre you to my Booke to bee further enformed of them. Of the round rooted kindes, some have two rootes, some have three, which I would

Satyrion flue Tulipa Bononienſis
The Bononian Tulipa.

Satyrion ſive Tulipa pumilio.
The Dwarfe Tulipa.



Satyrion ſive Tulipa præcox.
The early Tulipa.

Satyrion ſive Tulipa ſerotina.
The late flowring Tulipa.

ſeparate into five parts, as firſt into *Cynoſorchides ſive Teſticulos caninos*, Dogges ſtones. Secondly into *Orchides ſive Teſticulos morionis*, Fooles ſtones. Thirdly into *Tragorchides ſive Teſticulos hircinos vel fœtidos*, Stinking *Orchis* or Goates ſtones. Fourthly into *Serapiadas vel Teſticulos vulpinos*, Foxe ſtones. And fifthly into *Triorchides aut Teſticulos odoratos*, Sweete Cullions or ſtones, in which five Rankes all the ſorts of *Orchides*, that have round rootes, are comprehended. And then there are the handed *Orchides*, to be entreated of laſtly, which are ſo called becauſe their rootes are flat like hands, with the ends of the fingers cut ſhort of, which ſhall be wholly declared together, not making any diviſion of parts in them, and firſt of the *Cynoſorchides* Dogs ſtones, after the figures of the true *Satyrion* or *Tulipa*.

Cynoſorchis Teſticulus canis, Primus Ordo. Dogges Stones the firſt Ranke.

THis kinde of *Orchis* is diſtinguiſhed into two ſorts, the one hath flowers reſembling hoodes, with ſmall things hanging out of the midſt of them, the other hath flowers like unto the bodies of men, with their armes and legs cut ſhort of.

1. *Cynoſorchis major latifolia.* The firſt great Dogges ſtones.

The firſt of theſe greater Dogs ſtones hath five or ſixe broad leaves on the ground, among which riſeth up a round greene ſtalke, halfe a yard high, bare or without leaves, or but one or two ſmaller ſtanding below, at the toppe whereof ſtandeth a ſpiked head of purpliſh flowers, ſet thicke and cloſe together, made like unto open hoods, from the middle whereof hangeth downe, a ſmall body, as it were of a Dog, or other ſuch creature, being of a pale purple colour it ſelfe, ſpotted with deeper purple ſpots and lines, after which come ſomewhat long and round ſmall huskes, containing therein rather ſmall duſt then ſeede it is ſo ſmall: the roote is compoſed of two round white bulbes, ſet together like the two ſtones of a dog, with long fibres at the heads of them, one ſomewhat higher ſometimes then another, and alwayes one of them which is the higher, is firme full and hard, the other lancke, wrinckled and ſoft, which waſteth away to nothing, leaving the firme roote, which ſo abideth all the Winter, and in the Spring another ſpringeth and encreaſeth from the ſide of the old one, and then that beginneth to grow lancke, while the other new one encreaſeth. *Prima Dod. Lugd.*

2. *Cynoſorchis major latifolia altera*, The great purple Dogs ſtones.

This other greater ſort hath ſomewhat narrower leaves then the former, the ſpiked head of flowers, is neither ſo long nor ſo thicke, and the flowers of a whitiſh purple colour, marked with ſome purple ſpots and lines more inward, formed like open hoods, and ſmall bodies hanging forth like the former, the ſeede and rootes are like the former. *Secunda Dod.*

3. *Cynoſorchis major ſpica compacta.* The greater pale purple flowred Dogs ſtones.

The leaves of this are ſomewhat narrower then the laſt, and ſometimes ſpotted, the ſtalke alſo is ſomewhat lower with leaves upon it, and the ſpiked head ſhort and cloſe, with the like flowers for forme, thicke ſet together but ſomewhat leſſe, and of a whitiſh purple colour, ſpotted alſo, the rootes alſo are like the former. *Minor altera Lob.*

1. *Cynoſorchis major latifolia.*
The firſt great Dogs ſtones.

2. *Cynoſorchis major latifol a altera.*
The great purple Dogs ſtones.

3. *Cynosorchis major spica compacta.*
The greater pale purple flowred Dogs stones.

4. *Cynosorchis latifolia minor.*
The smaller pale purple Dogs stones.

6. *Cynosorchis militaris sive Stratiomatica major.*
The greater Souldiers cullions.

8. *Cynosorchis militaris minor.*
The lesser Souldiers cullions.

4. *Cynoſorchis latifolia minor.* The ſmaller pale purple Dogs ſtones.

This groweth as high as the laſt, the leaves alſo ſomewhat narrow like it, and divers in like manner ſet upon the ſtalke, the flowers are not cloſely ſet but more ſparſedly of a pale purple or bluſh colour, ſpotted alſo, the forme likewiſe is with open hoods and bodyes hanging forth. *Majoris altera ſpecies Lobel.*

5. *Cynoſorchis angustifolia hiante cucullo.* Narrow leafed Dogs ſtones.

The ſtalke hereof is not above a ſpanne high, having narrow long leaves below, and one or two above upon the ſtalke, compaſſing it at the bottome, of a pale greene colour: the toppe whereof is furniſhed with a thinne long ſpiked head of purpliſh white flowers in forme as the former, repreſenting open hoods, each flower ſtanding on a long foote ſtalke. *Prodro.*

6. *Cynoſorchis militaris ſive Strateumatica major.*
The greater Souldiers cullions.

The greater of theſe Souldier cullions hath large leaves below, and ſome leſſer on the ſtalke, which is halfe a yard high, the ſpiked head of flowers ſtand ſomewhat ſeparate, each flower being like unto a man, whoſe body had the armes and legs cut off, and a hood ſet thereon, or a legleſſe Souldier with his helmet on, the hood or helmet being white, and the body ſpotted with purple ſpots, the rootes are great and thicke.

7. *Cynoſorchis militaris rubra.*
Red flowred Souldiers cullions.

The leaves hereof are narrower, and the ſtalke ſmaller and lower then the laſt, ſcarſe a foote high, the flowers alſo are ſomewhat like, the laſt, but of a fairer bright red colour,

8. *Cynoſorchis militaris minor.*
The leſſer Souldiers cullions.

This is in all things like the greater of this kinde, but leſſe and the flowers ſomewhat whiter.

9. *Cynoſorchis militaris ſpica rubente conglomerato.*
Round headed red Souldiers cullions.

This groweth higher then the former red Souldiers cullions, and the leaves longer, narrower and but few, the flowers grow in a round forme together, being like them both for forme and colour, but that the lower part of the body hath foure diviſions or ſhort parts, and a very ſmall heele behind the backſide.

10. *Cynoſorchis militaris latior floribus variegatis.*
Party coloured ſmall Souldiers cullions.

This is much ſmaller and lower, both in ſtalke and flowers, then the laſt, the leaves are broader and ſhorter, and the ſmall flowers (which make a much ſhorter ſpike) are finely parted with white and red.

11. *Cynoſorchis militaris Pannonica.* *Hungarian* Souldiers cullions.
Hungrian Souldiers cullions.

Altera Cluſij.

Orchis ſecunda Cluſij.

Strateumatica minor Lobel et Lugdu.

Prodro.

Prodro.

The ſtalke hereof is a palme high or more, with ſome narrow leaves thereon, the ſpiked head hath the ſmall flowers like theſe of this kinde, the hood whereof is of a purpliſh colour, and the body or lippe hanging downe, is divided into foure white parts, ſpotted with purple, and a ſmall ſpurie behinde: this hath a ſmall weake ſent. *Paina 2. Cluſij.*

12. *Cynoſorchis militaris purpurea odorata.* Purple ſweete Souldiers cullions.

This hath a ſtalke about a foote high, ſet with narrow long leaves with a long ſlender ſpiked head at the toppe whoſe flowers are for forme like unto theſe two laſt ſorts going before this, and are differing in colour, ſome being wholly of a fine purple colour without any ſpot, others are white without ſpots, and ſome have the hood or helmet of a deeper purple, the hollow part and the body hanging downe being white, ſpotted with purpliſh, yet all of them have a fine ſweete ſent. *Chif. 3. & Cord. 4.*

13. *Cynoſorchis capitulo globoſo.* Round headed Orchis.

This round headed Orchis hath three or foure broad and ſhort, ſmooth and pale greene ſhining leaves, ſet on the ſlender ſtalke, compaſſing it round at the bottome, bearing a ſhort round head like as Cives doe at the top, and not ſpiked as moſt of the other, each flower being of a purpliſh red colour. *Rotundus Dalecha. Lugdu.*

14. *Chamæorchis Alpina flore viridi.* Dwarfe Orchis with a greene flower.

This low Orchis hath a bare ſtalke about three inches high, above the very narrow long leaves that grow below on each ſide flower, the ſpiked head is about an inch long, with two ſhort leaves under it, and ſundry hooded greene flowers thereon, the roote hath two ſmall round bulbes. *Prodro. 4.*

The Place and Time.

Many of theſe grow in the fieldes of our owne Country in divers places, and many others in *Germany*, where they have beene obſerved by *Cluſius*, they flower from *May* untill the middle of *June* for the moſt part.

The Names.

It is called in Greeke ὄρχις in generall, and κυνοσόρχις, this in particular, in Latine alſo *Orchis*, and *Cynoſorchis* or *Teſticulus canis*: divers have taken ſome kinde or ſort of theſe *Orchides* to be the *Satyrium* of *Dioſcorides*, the *Eryrium*, but *Matthiolus* conteſteth againſt them, in that his *Satyrium* hath but one roote, and therfore he ſet forth the figure of ſuch an one moulded out of his owne conceit, as it is generally thought, for no ſuch thing can ſince be found in *rerum natura*, and I have ſhewed you both in my former Booke, and in the preamble of this Chapter, that the *Tulipa* is the right *Satyrium* of *Dioſcorides*, without peradventure, both the one and the other, and that

the ſeed is like λίβον or rather as I thinke it ſhould be λεπίδιον or κέγχρον. I have given you in the margent againſt every one, the ſeverall Authour (although but one or two at this time) that hath deſcribed it before. I finde that *Tragus* was of a ſtrange conceit about the encreaſe of theſe kinds of *Orchides*. Firſt that they boreno ſeed (for he ſuppoſed that the ſmall ſeede which as I ſaid is like duſt, found in the long heades of them, after the flower is paſt was not the ſeede) for he ſaid the heads that it bore after were idle, containing nothing within them: and ſecondly, he thought that ſeeing they were not procreated by their owne ſeede, but that they were encreated by forraigne ſeed, namely of Blacke birds, and Thruſhes, that in their copulation let fall ſome of their ſperme upon the ground, and that becauſe they are found in greateſt plenty among the woods where theſe birds reſort, and have their chiefeſt food. The *Arabians* call it *Chaſi alkes*, and *Chaſi alchels*, the *Italians Satirione*, and *Teſticoli de cane*, the *Spaniards Cojon de perro*, the *French du Satyrion* and *Couillon de chien*, the *Germanes Knaben kraut Stendelwurtz*, and *Margendrehen*, the *Dutch Knabencruijt*, and *Standelcruijt*, and we in *Engliſh* (of the Apothecaries generally taking all ſorts for their uſe) *Satyrion* and of ſome Dogges ſtones, of others Standle wort, and Standle graſſe, and of ſome alſo Orchis.

The Vertues.

Dioſcorides ſaith of *Cynoſorchis* that the roote thereof being boyled is eaten as other ſorts of bulbes are, and that if men eate the greater, they ſhall beget men children, and if women eate the leſſer they ſhall bring forth women children: And that the women in *Theſſalye* give the ſoft roote in Goates milke to procure luſt, and the dry roote to reſtraine it, and that the vertue of the one is extinguiſhed by the taking of the other. *Pliny* alſo writeth the ſame words out of *Dioſcorides*, yet it is generally held, by almoſt all now adayes, that the firme roote onely is effectuall for that purpoſe, and the looſe or ſoft ſpongy roote to be either of no force or to hinder that effect: but moſt of our Apothecaries doe promiſcuouſly take, not onely both of thoſe rootes to uſe, but of all ſorts of Orchides in generall.

CHAP. X.

Orchis Morio. Fooles ſtones.

Secundus Ordo. The ſecond Rancke.

MAny of theſe *Teſticuli* are referred by divers Authours, unto the former Rancke of *Cynoſorchides*, but in regard the poſture of the flowers have different ſhapes from them, that is of Fooles caps, with eares at them, I have thought good to ſpeake of them apart by themſelves.

1. *Orchis morio mas foliis maculatis.* The greater male Fooles ſtones.

This greater ſort hath five or ſixe broad and ſmooth long leaves like Lillies, ſpotted with blacke ſpots on the up-

1. *Orchis morio mas foliis maculatis.*
The greater male Fooles ſtones.

2. *Orchis morio altera maculata.*
Another Fooles ſtones with ſpotted leaves.

per

4. *Orchis Morio famina.*
The female Fooles ſtone.

per ſide, the ſtalke likewiſe hath ſome thereon, that compaſſe it at the bottome but ſmaller, the ſpike of flowers is ſmall and purple, each of them having an open hood or helmet higheſt, with two ſmall leaves like eares, ſtanding upright at the ſides of them, the belly that is loweſt is whiter, having on the backeſide a crooked heele or horne, the whole flower is ſweete and very comely to behold.

2. *Orchis morio altera maculata.*

Another Fooles ſtones with ſpotted leaves.

The ſtalke of this groweth bigger, the leaves are not altogether ſo large, but lying on the ground ſpotted in the ſame manner, and ſomewhat rounder pointed, the flowers are ſomewhat like the other for the forme, but of a more blewiſh purple colour, with a ſpurre behinde.

3. *Orchis morio non maculoſis foliis.*

Male Fooles ſtones unſpotted.

The leaves hereof are ſomewhat large like the laſt, but not ſpotted, the flowers are either of a deepor or paler purple colour, or ſomewhat bluſh, or altogether white, the belly that hangeth downe, is ſometimes ſpotted with purple ſpots, and ſometimes it hath none, eſpecially in thoſe flowers that are all white.

4. *Orchis morio famina.* The Female Fooleſtones.

The female ſort hath narrower leaves, and ribbed almoſt like unto Ribwort Plantane, lying on the ground, and ſome up higher, compaſſing the ſtalke: the flowers at the toppe of the ſtalke, have gaping or open hoods like the former, but the eares on each ſide ſtand not upright, but lye ſo cloſe thereon, that they are hardly diſcerned, with a heele behind them as the others have: this is found either of a darke violet purple colour, the middle part whiter and ſpotted, or of a pale red, whoſe ſtalke is ſhorter and the leaves leſſer, or elſe of a ſcarlet red colour, the ſcarlet head being thicke and ſhort, and the flowers ſmaller.

6. *Orchis Anthropophora Oreades mas.*
The male Neapolitan Fooleſtones.

Teſticulus morio mas. Dod. Lugd.

Lob. Cynoſorchis delphinia ſeſſilis maculoſuo folijs.

Matthiolus deſcribit.

Teſticulus morionis fem. Lugd.

5. *Orchis*

5 *Orchis morio minor foliis maculatis.* Small Fooleſtones with ſpotted leaves.

Lobel. Icon. This ſmall Orchis hath two or three ſmall long ſpotted leaves upon the lower part of the ſtalke, thoſe up higher being much ſmaller then they, the flowers are purple ſpotted and ſtriped very finely.

6. *Orchis Anthropophora oreades mas.* The male *Neapolitane* Fooleſtones.

Columna. The ſtalke of this is a foote high, having leaves of the length of ones hand, and an inch broad, of a pale freſh greene colour, waved about the edges: the toppe of the ſtalke hath a buſh of flowers, red before they open, and of a faire bluſh colour being blowne, in forme like unto the other, before the hood or helmet open, and ſmall leaves like eares on the ſides, with ſhort armes as it were hanging downe by the body, and the lower part with legs as it were cut of:

7. *Orchis Anthropophora Oreades fœmina.* The female *Neapolitane* Fooleſtones.

Cor. This other Foole of *Naples*, hath longer leaves, but not broader then the laſt, ſpread on the ground, and ſome ſmaller on the ſtalke, which is higher, the ſpike of flowers are not ſo great or thicke, yet in forme like the laſt, but of a pale colour, ſpotted very thicke, as ſmall as ſand, having the hood greeniſh with purple edges.

8. *Orchis Zoophora Cercopithecam exprimens Oreades.* The apiſh Foole of *Naples.*

Cor. The lower leaves hereof are ſhorter but broader, then the laſt, but thoſe on the ſtalke are much longer and narrower, the ſpiked head of flowers is greater then the laſt, each of them being of a reddiſh purple colour, ſo lively expreſſing the forme of an Ape as can be, but that the head is greater, as it were of a monſter, covered with the ſmall white ſilver like eares or leaves that are by it, and both it and the lower part which is biparted is ſpotted very finely.

The Place and *Time.*

All theſe ſorts grow, moſt an end in fields, and by woods ſides, and many in our owne land, and the three laſt on the hils in *Naples*; they flower in *May* as the reſt doe.

The Names.

The names of all theſe are expreſſed in their titles, and the Authours are expreſſed in the margent, that have written of them, as is done in the laſt Chapter, which may ſuffice for this time.

The Vertues.

The properties of theſe are like thoſe in the former Chapter, and therefore whatſoever is ſaid of them may be well refered to theſe.

CHAP. XI.

Tragorchis ſive Teſticulus hircinus. Stinking Goates ſtones.

Tertius Ordo. The third Ranke.

THeſe *Orchies* are ſo named not onely becauſe they have a ſtrong foule ſent like a Goate, but that moſt of them have long tailes like beards hanging downe from them.

1. *Tragorchis maxima.* The greateſt Goates ſtones.

Teſticulus hircus. Dod. & Lob. This greater ſort hath large leaves lying next the ground, ſomewhat like unto Plantaine leaves but

1. *Tragorchis maxima.* The greateſt Goates ſtones.

2. *Tragorchis vulgaris.* The ordinary Goates ſtones.

ſhorter

3. *Tragorchis minor & verior.*
The leſſer but truer Goateſtones.

4. *Tragorchis Batavica Cluſij.*
The *Hollanders* Goateſtones.

ſhorter, the ſtalke likewiſe which is halfe a yard high, hath divers leaves thereon and a ſmall ſpiked head of purple flowers, ſet in a comely row or order, having a long crooked thred or ſtring hanging downe from each of them, and twining themſelves one within another, both the hood and the taile is ſpotted, and have a ſtrong ſent: the bulbes are greater in theſe then in many other.

2. *Tragorchis vulgaris ſive Teſticulus leporinus.* The ordinary Goateſtones or Hareſtones.

This other which is the more common with us, hath longer and narrower leaves, the flowers are ſmaller and whiter, ſpoted with reddiſh ſpots, and the tailes are more twining, the ſmell hereof is as ſtrong as the former, but the bulbes are leſſer. *Teſticulus leporinus vulg. Lob.*

3. *Tragorchis minor & verior.* The leſſer but truer Goateſtones.

The ſmell hereof cauſeth the name of this *Orchis*, which doth neerer reſemble the rancke ſmell of a Goate, then the former doe, but differeth in the leaves being much leſſer, and the flowers being without ſpurres or tailes, and ſomewhat like unto thoſe noiſome wormes that wee call woodlice, for their proportion, the colour whereof is ſomewhat browniſh. *Tragorchis minor & verior Lob.*

4. *Tragorchis Batavica Cluſij.* The *Hollanders* Goateſtones.

This ſtinking *Orchis* of *Holland* that was found about the *Hage*, as alſo about their Sea coaſts, and as fitteſt referred to this Ranke or Order, hath three or foure narrow ſmall leaves, compaſſing a low ſtalke, about a ſpan long, whoſe toppe endeth in a ſhort ſpiked head of flowers of a fine purpliſh red colour on the inſide, and paler without, having a belly or lippe hanging downe, which is cremined in three ſhort and equall parts. *Orchis ſexta Clu.*

6. *Tragorchis altera purpurea.* Stincking Goateſtones of *Auſtria.*

The leaves of this *Orchis* are like Lilly leaves, of a pale greene colour, with ſome ſmaller about the ſtalke which is an hand high, the ſpiked head of flowers is either of a whitiſh or pale colour, without any ſpots, or elſe purple with ſome purple leaves under them, each whereof is hooded and eared with a hanging belly, notched as it were at the bottome: the ſtrong ranke ſmell hereof maketh it one of this ranke, and to be numbred with them which elſe might have beene ſet in another place. *Orchis 8. Clu.*

The Place and Time.

The former three ſorts grow chiefly in clay grounds, the other two are expreſſed in their titles, and flower with the reſt.

The Names.

Theſe kindes are chiefly mentioned by *Lobel* and *Cluſius*, whoſe names I have carolled in the margent how to finde them which ſhall be ſufficient.

The Vertues.

Lugdunenſis from *Dodonæus* ſaith that the rootes of theſe Orchies, are better then any of the other, for the purpoſes aforeſaid, of what other good quality they chiefly partake we cannot out of any ones experience relate unto you.

CHA.

CHAP. XII.

Orchis Serapias sive Testiculus vulpinus. Foxestones.

Quartus Ordo. The fourth Ranke.

THis fourth Ranke or order must comprehend all those sorts of *Orchides* whose flowers doe represent sundry sorts of insects, flyes, or other small creatures, which for their fruitefull generation were anciently dedicated to *Apis*, who was worshipped as a God at *Canope*, not farre from *Alexandria* in *Egypt*, and from thence tooke the name *Serapias*.

1. *Orchis Serapias bifolia latissima.* The greatest twiblade Foxestones.

Clusij & Thal descriptio.

This hath onely two very large leaves, not much lesse then those of the white Ellebore or Neesewort, with divers veines running through them, greene on the upper side and paler underneath, but shining withall, the stalke riseth a cubit high, five square, with a few leaves or skins thereon, closing it as it were about, the flowers grow in a spiked head like unto others, but great and large, being either purple spotted with white, or wholly white: the roores are great and somewhat long like unto small Turneps.

2. *Orchis Serapias latifolia altera.* *Hungarian* twiblade Foxestones.

This other is very like the last, but somewhat lesser, and lower, both in leaves, stalkes, and flowers, and is found also both purple and spotted, and white as the former is.

Clus. Thal. descriptio.

3. *Orchis Serapias bifolia vel trifolia minor.* The lesser twiblade or three leafed Foxestones, or white Butterfly *Orchis*.

Orchis Spongiosophyta Lob. sive Hermaphrodita. Testiculus secundus Lobelij.

This lesser Foxestone hath two or three large leaves next the roote, yet lesser then the last, the stalke is more then halfe a foote high, with two or three peeces thereon, and a small tuft or spike of white flowers at the toppe, thinly set thereon, somewhat resembling white butterflies with their wings spread, each flower having a crooked taile behind it full of a sweete liquor.

4. *Orchis Sphegodes sive fucum referens.* The greater Drone Bee flower.

The leaves of this *Orchis* are five or sixe, long narrow, and ribbed like Ribwort Plantaine, yet somewhat lesse, the stalke is about a spans height, bearing five or sixe flowers at the head thereof, in fashion somewhat like a Bumble, humble or drone Bee, as it is called, having some few small whitish purple leaves like wings above, and a browniish belly or body below.

Minor ejusdem.

There is a lesser sort hereof, whose flower is lesser as well as leaves, and of a more whitish greene colour.

3. *Orchis Serapias bifolia vel trifolia minor.* The lesser twiblade or three leafed Foxestones, or white Butterflye Orchis.

4. *Orchis Sphegodes sive fucum referens.* The greater Drone Bee flower.

4. *Orchis Sphegodes minor.* The lesser Waspe Orchis.

5. *Orchis*

5. *Orchis Sphegodes altera.* The Waſpe Orchis.

7. *Orchis major Sphegodes ſive Teſticulus Vulpinus primus.* The greater Gnat flower.

5. *Orchis Sphegodes altera.* The Waſpe *Orchis.*

The Waſpe *Orchis* hath narrower leaves then the laſt, the flowers ſtand in the ſame manner, and of the ſame faſhion almoſt, but ſomewhat greater and of a browne yellow colour, the wings being a little enclining to purple. This the new *Gerard* maketh the humble Bee *Orchis.* *Sphegodes ſecunda Lob.*

6. *Orchis minor culicem exprimens.* The leſſer Gnatflower.

The leſſer Gnatflower, hath three leaves uſually ſtanding below the ſtalke, with ſome few ſhort ones up higher, the flowers are many but ſmall, much reſembling a ſmall gnat or flye, of a yellowiſh browne colour, whoſe lower part is ſmaller then the greater ſort. *Culices minores Tribylla Lob.*

7. *Orchis Sphegodes ſive Teſticulus vulpinus primus.* The greater Gnat flower. *Teſticulus vulpinus Lob.*

The ſtalke hereof is greater and higher, the leaves alſo are larger then the two laſt and ſmaller upon the ſtalkes, the flowers are fewer at the toppe but larger by much, the colour doth not much differ, but is rather ſadder.

8. *Orchis Melittias ſive apifera.* The hony Bee flower.

The ſtalke hereof is ſeldome a ſpan high, the leaves thereon are few, narrow and ſmall, turning ſometimes inward, ſome riſing upon the ſtalke: at the toppe uſually ſtand two or three flowers, ſeldome many more each whereof is in ſhape much like an hony Bee, that many that have not ſeene it before, would verily beleeve that it were either a living, or the carkaſe of a dead one, but that the upper leaves which are like wings, are of a pale bleiwiſh purple colour, and the head yet paler, the body full and round below, of a darke browne colour with ſome ſpots of yellow thereon, the rootes are ſmall. *Orchis Melittias Lob.*

9. *Orchis Myodes major.* The greater or fleſh flye flower.

This greater flye flower hath three or foure, ſomewhat broad and long ſmooth greene leaves next the ground, the ſtalke riſeth about an hand breadth high, with a few large flowers ſet at the toppe, reſembling a great Fleſh flye made of foure leaves, the three uppermoſt, and a long one loweſt. *Myodes altera flore grandiuſe Lob.*

10. *Orchis Myodes minor.* The leſſer Flye flower.

The leſſer Flye flower hath ſomewhat leſſer leaves and more ribbed, the ſtalke riſeth not fully ſo high, the flowers grow in the ſame manner, very like unto the laſt ſort, but leſſer, and of a little darker colour both the bottome, and about the middle part, but paler betweene the wings, being of a pale colour, enclining to blew. *Myodes prima Lob.*

11. *Orchis Myodes minima.* The leaſt Flye flower.

The leaſt Flye flower hath three leaves narrow and ribbed, growing cloſer to the ſtalke, which is ſmaller and lower then the laſt, having two or three ſmall flowers at the toppe like the other, but ſmaller, and of a browniſh purple colour, ſomewhat ſpotted. *Serapias tertius Do.*

12. *Orchis Myodes lutea Narbonenſis.* The great yellow Fly flower of *Narbone.* *Orchis Myodes lutea Lob.*

This great yellow Flye hath three or foure larger leaves then the laſt, full of ribs, the ſtalke is higher, and the flowers

8. *Orchis Melittias sive apifera.*
The Hony Bee flower.

10. *Orchis Myodes minor.*
The lesser Flye flower.

12. *Orchis Myodes lutea Narbonensis.*
The greater yellow Flye flower of *Narbone.*

13. *Orchis Batrachites.*
Frogge Orchis,

14. *Orchis Arachnitis.*
The Spider flower.

16. *Orchis Ornithophora folio maculoso.*
White or purple Birds flower.

17. *Orchis Myodes angustifolia.*
The narrow leafed flye flower.

flowers much greater, and of a yellow colour, like some flyes with us.

13. *Orchis Bratrachites.* Frogge Orchis, or Frog flower.

The Frogge flower hath broad and short leaves below, and narrower and longer up higher on the stalke, at the toppe whereof grow sundry yellowish flowers, resembling the bodies of Frogs, with the head and wings greenish, from whence it tooke the appellation: the rootes hereof are large, a little longer, and more pointed at the bottome then of others. *Batrachites Lob.*

14. *Orchis Arachnitis.* The Spider flower.

The leaves hereof are more then in the last, narrower also and longer, the stalke is not higher, and bearing but three or foure flowers at the toppe, resembling a spider in the round belly, and the small necke or partition betweene it and the toppe wings. *Andrachnites Lob.*

15. *Orchis Psycodes herbacei coloris.* The greene Butter flye.

This Butterflye hath divers large smooth greene leaves next the ground, and other smaller and longer upon the stalke, the flowers are many and great, resembling Butterflyes with their wings spread abroad, of a kinde of herby greene colour, with a spurre behinde. *Ornithoph. folio lævi Lob.*

16. *Orchis Ornithophora folio maculoso.* White or purple Birds flower.

The leaves hereof are somewhat large and spotted for the most part (for there is much diversity herein, some having broad large or pointed, others narrow lesse or rounder leaves) the flowers are large and like the last, with a spurre also behind them but some are all white, others are purple, and some betweene both, of a purplish white colour, this kinde flowreth with the first sorts. *Ornithoph. folomaculoso Lob.*

17. *Orchis Myodes angustifolia.* The narrow leafed Flye flower.

This hath sundry narrower leaves then many other, standing upon the stalke, up to the toppe, where the flowers resemble a small short flye. *Orchis angustifolia Bau. & Taber. minor.*

18. *Orchis matrophyllos Columnæ.* Narrow leafed Flye flower of *Naples*.

The stalke of this Flye flower is three foote high, having two very long leaves at the bottome, but of an unequall length, those that grow next on the stalke are much longer, some being a foote and a halfe long, and very narrow, but those up higher are shorter and broader, at the top are set divers flowers in a spike to a footes length, each whereof standeth like a crosse hollow pipe, having a broad and long beard thereat, of a fine blush colour, with a more purplish leafe like a tongue, hanging downe broad above and small below: this is found usually but with one round roote (the other as it should seeme being decayed and gone) with some fibres both at the head, and from the sides which is not seene in any sort of Orchis. *Macroph. Colum.*

The Place and *Time*.

All these sorts grow not in one sort of ground or ayre, for some are found in woods, some in clay grounds, others in fertile or barren fields, and in dry sandry soiles most of them in our owne land, yet some are strangers, and doe all flower from before *May* unto the end of it.

The Names.

I have done with these as I have done with the rest, and given you one Author in the steede of many that hath written

written of it, with the names how he calleth it, for it were too tedious to write all the severall titles that severall Authours have given to these sorts of Orchides.

The Vertues.

The properties of these *Serapiaes* are recorded in particular by *Dioscorides* and *Galen*, to be not so effectuall for Venery, but are of force to discusse swellings, and to cleanse foule vlcers and fistulaes, that is, hollow vlcers, and the vlcers of the mouth, and inflammations also, and stayeth those that are eating or fretting, it dryeth much when the roote is dryed, and stayeth the flux of the belly thereby.

CHAP. XIII.

Orchis sive Testiculus odoratus. Sweete Cullions.

Quintus Ordo. The fifth Ranke.

THis fifth and last Ranke of round rooted *Orchides* must comprehend a few small ones, that smell sweete: some whereof have but one, some two round rootes, others three, and some more, as shall be shewed.

1. *Orchis pusilla odorata.* The sweete Muske Orchis.

Testis 7. This sweete Orchis hath usually but three small and narrow greene leaves, the stalke is of an handbreadthes height, having a long narrow spike of pale greene flowers, ending in three points, and smelling like Muske, this hath but one small round roote of the bigneſſe of a peaſe, above which it hath long strings running forth, by which new plants are encreased.

2. *Triorchis alba odorata major.* The greater Sweete Lady traces.

Triorchis alba spiralis Lob. The great Lady traces hath sundry very sad greene shining leaves like unto the lesser Plantane, but sharper pointed, which rise up in *September* after the stalke with flowers is withered which doe abide greene all Winter, and perish in *May*, the slender stalke which crooketh and windeth it selfe a little, riseth up in *August* stored for a great length with many small white and sweete flowers, compassing it round and hanging downe round about it: the rootes grow sometime three, and sometimes foure together, being round and longer then in any of the former Orchides, with divers short fibres set round about them, contrary to the order observed in all the rest.

3. *Triorchis alba odorata minor.* The lesser sweete Lady traces.

Triorchis spiralis minor Lob. The lesser traces hath much smaller leaves lying next the ground, but of the same fashion like unto a very small Plantane, the stalke is little above an handbreadth high, with some small shew of little peeces of leaves, thereon to the flowers which are white dasht over with a thinne blush, standing in thin long spikes, compassing the stalke and are very sweete: the rootes grow by couples, and are small somewhat long as well as round.

2,3. *Triorchis alba odorata major & minor.*
The greater and lesser sweete Lady Traces.

4. *Orchis lutea Leodiensis.*
Lady traces of Liege.

Orchis minor Leodiensis Lob Obse. The leaves of this are somewhat more like unto a broad leafed Plantane, yet smaller and narrower, three or foure at the bottome of the stalk which hath none on it, and hath yellowish flowers like the others at the top, one above another, the roots grow three, and sometimes foure together.

5. *Orchis Frisia littoralis.*
Friesland Orchis or Lady traces.

Frisia Lob This hath but two small round bulbes for the roote, from whence spring up two or three small, somewhat long and hairy leaves, yet shorter then of the Ribwort Plantane, the stalke is above a span high, bearing small yellowish greene flowers like unto the former, and set in the same order. In the same table with this *Orchis* you have the next *Triorchis*, as *Lobel* hath given it us, from *Cornelius Gemma*.

6. *Triorchis lutea altera Gemmæ folio glabro.*
Yellow Traces with smooth leaves.

Triorchis lutea 3. Gem. Lob. obser. This hath longer leaves and smoother then the last, and stalkes and flowers very like, yellow also and sweet, the roote is composed of three small round bulbes.

7. *Chamæorchis latifolia Zelandica.*
The dwarfe Orchis of *Zealand*.

Orchis Lilifolia Lob appendice & forte Pseudorchis Cl. This smal Orchis hath two, and sometimes three round bulbes for the rootes, covered with whitish coates or skinnes, being greenish within, and sweetish in taste, the lower of them being lanke as in others, it hath two faire but small Lilly like leaves, about two inches long rising from them, some three or foure inches high: this peradventure may be the *Pseudoorchis Clusij*.

8. *Orchis*

4. *Orchis lutea Leodiensis.*
Ladytraces of Liege.

5. *Orchis Frisia Littoralis & ejus varietas.*
Friesland Orchis, or Lady traces.

6. *Triorchis lutea altera.*
Yellow Traces with smooth leaves.

8. *Orchis radice repente.*
Small creeping or bastard Orchis.

8. *Orchis radice repente.* Small creeping or Baſtard Orchis.

The roote of this Orchis, if it be one, are unlike all the reſt, being many long and full of ſtrings, growing thicke together, and enterlacing themſelves one amongſt another, yet have they at the upper part thereof next under the leaves as *Camerarius* ſaith, ſome ſhew of ſmall bulbes ſometimes to be ſeene, the leaves that riſe from thence are thicke and ſomewhat broad like Plantane, of a darke greene colour, the ſtalke is ſlender furniſhed at the toppe with divers white flowers ſpotted with blood red ſpots. Why *Gerard* ſhould call this *Palma Chriſti*, I ſee no reaſon, when as it commeth neerer to an *Helleborine* then *Orchis*.

The Place and *Time.*

Theſe kindes of Orchies grow in dry grounds, heaths, and waſte untilled places, and the like, many of them in our Land, and others in other places, and doe all or for the moſt part not flower untill *Auguſt* or *September*.

The Names.

Theſe alſo as the former have their Authours names ſet downe in the margent, and how they called them.

The Vertues.

It is recorded by ſome, that the rootes of theſe kindes of Orchides are marveilous effectuall above any other to incite Venery.

CHAP. XIV.

Orchis Palmata. Handed Orchis.

HAving ſhewed you all the kindes of bulbous Orchides in the Chapters going before, there doth yet remayne the other kinde of handed Orchies to be entreated of, which although they be many, yet I thinke meete to comprehend them all in this one Chapter, without parting of them.

1. *Orchis palmata major mas ſive Palma Chriſti mas.* The great male handed Orchis.

Palma Chriſti mas leviſolia Lob.

This male Orchis hath divers large broad and long ſmooth greene leaves lying on the ground, among which riſeth up a round ſtalke, with ſome ſuch leaves on it, but leſſer up to the toppe, where grow a large head of pale purple flowers, ſpotted with a deeper purple colour, each flower having a heele of the ſame colour behind it: the rootes are flat and broad, two joyned together at the head, like unto handes, parted at the bottome into ſhort peeces, as if the fingers were cut ſhort off by the knockles, with ſome fibres at the head thereof alſo, one of them being firme, and the other looſe or ſpongy, as in the former Orchides, which riſe and decay in the like manner.

2. *Orchis palmata major pratenſis anguſtifolia.* The great male handed Orchis with narrow leaves.

Prodro. The rootes of this are double handed like the former, parted into three parts below: the leaves are long and

1. *Orchis palmata major mas ſive Palma Chriſti mas.*
The great male handed Orchis.

2. *Orchis palmata major pratenſis anguſtifolia.*
The great male handed Orchis with narrow leaves.

narrow

3. *Orchis palmata fœmina sive Palma Christi fœmina maculato folio.* The female handed Orchis.

4. *Orchis palmata pratensis maxima Conopsea dicta.* The greateſt handed and hooded Orchis.

narrow through which the ſtalke riſeth, as through a pipe, to be a cubit high, whereon is ſet a ſpiked head of flowers, of a pale purple colour, with a ſpurre behinde, and a ſmall leafe ſet with every flower at the bottome.

3. *Orchis palmata fœmina sive Palma Christi fœmina maculato folio.* The female handed Orchis.

The leaves hereof are long and narrow, ſpotted diverſly with blacke ſpots, the ſtalke hath likewiſe ſome narrower leaves thereon, and a ſpiked head of hooded flowers, ſome reddiſh, either deeper or paler, or bluſh, or elſe white, the loweſt of them will be ſpotted, yet ſome will have none, the rootes are handed like the other. *Palma Chriſti fœm. Lob.*

4. *Orchis palmata pratensis maxima Conopsea dicta.* The greateſt handed and hooded Orchis.

This riſeth with a ſtalke two cubits high, having ſundry long and narrow leaves ſet thereon, compaſſing it almoſt at the bottome, the flowers whereof are hooded like the laſt, but of a dainty pale purple colour, and ſweet withall, and flower late. *Conopsea Lobelio.*

5 *Orchis palmata minor flore rubro.* Small handed Orchis with red flowers.

This ſmall Orchis hath a ſlender ſtalke, with a few long and narrow leaves ſet thereon, ſmaller above then thoſe below, having a ſpiked head of ſhining red flowers: the roote is ſmall and handed like the reſt. *Serapias minor Lob.*

6. *Orchis palmata anguſtifolia minor.* The leſſer handed Orchis with narrow leaves.

The roote of this ſort is handed but leſſe, and the lower diviſions of them are longer, the leaves are very long and narrow, the ſtalke groweth a foote high, and the flowers thereon are of a pale purple colour, and the whole ſpike ſhorter then others. *Orchis fœ. Tragi icon. Thal. deſcriptio.*

7. *Orchis palmata anguſtifolia minor odoratiſſima.* The ſweete ſmall handed Orchis.

This ſmall ſort hath rootes like the reſt, the leaves are much narrower and long almoſt as graſſe, the ſtalke is a hand high, with very ſmall leaves up to the toppe, bearing thereon a ſmall ſpike of pale purple flowers, very ſweet each having a hood and a lip hanging downe, divided at the bottome into foure parts with a heele behind. *Prodro.*

8. *Orchis palmata caryophyllata.* Handed Orchis ſmelling like Cloves or Gilloflowers.

The leaves of this ſort are long and narrow, the ſtalke ſlender with ſundry ſhort leaves thereon, the ſpiked head of flowers is purple, each reſembling ſmall flyes, and ſwelling as ſweete as a Gilloflower, after which come great heads of ſmall ſeede, the roote is handed, but hath the lower diviſions much longer, running downe into the ground. *Lob.*

9. *Orchis palmata batrachites vel Myodes.* Handed Orchis reſembling frogs or flyes.

The leaves that grow on the ſtalke are ſomewhat ſhort and broad compaſſing it at the bottome, the flowers that ſtand above are ſmall with wings as it were above, and a long ſmall body hanging downe and doth in ſome ſort reſemble a frogge as well as a flye, the roote hath ſhorter diviſions in one part, and longer in another. *Lob.*

10. *Orchis Caſtrata.* Gelded Orchis.

This hath alſo long narrow leaves ſet on a ſlender ſtalke, and ſmaller up to the toppe, where ſtandeth a bending head of white flowers ſpotted, each reſembling a flye, the lower part of whoſe hanging body is more pointed: the roote is made of two long peeces like legs, ending in ſmall pointes, and hath neither hands nor ſtones. *Lob.*

5. *Orchis palmata minor flore rubro.*
Small handed Orchis with red flowers.

7. *Orchis palmata angustifolia minor flore odoratissimo.*
The sweete handed Orchis.

8. *Orchis palmata Caryophyllata.*
Handed Orchis smelling like Cloves.

9. *Orchis palmata hatrachites vel Monoes.* Handed Orchis resembling frogges or flies.

10. *Orchis Castrata.*
Gelded Orchis.

11. *Orchis palmata palustris latifolia.*
Marsh handed Orchis with broad leaves.

12. *Orchis palmata palustris altera.*
Another Marsh handed Orchis.

13. *Orchis palmata lævifolio palustris.*
Another Marsh handed Orchis.

11. *Orchis palmata palustris latifolia.* Marsh handed Orchis with broad leaves. *Serapias palustris latifo. Lob.*

The large and broad smooth greene leaves hereof, are set in order upon the stalke up to the top, growing smaller still upwards unto the large spike of pale blush flowers, with every one a small greenish leafe at the setting on, the roote hath long divisions at the bottomes of the hands, this flowreth more early then the ordinary pature kind of Dogges stones.

12. *Orchis palmata palustris altera.* Another Marsh handed Orchis. *Serapias palustris Leptophyllos Lob.*

The leaves of this are not so long nor broad as the last, sometimes spotted but more usually without, the flowers are thicke set like the last, but of a violet purple colour: this flowreth after the last.

13. *Orchis palmata palustris lævifolia.* Another Marsh handed Orchis. *Cynosorchis palustris lævifolia Lob.*

This differeth little from the last, but in the leaves being without spots, and in the flowers which are more white.

14. *Orchis palmata palustris maculata.* Spotted marsh handed Orchis. *Cynosorchis palustris Lophodes Lob.*

The stalke hereof is tall and strong, the leaves large and full of spots, the flowers purple with greene leaves set amongst them.

15. *Orchis palmata, Pannonica quarta Clusij. Hungarian* handed Orchis. *Orchis Pannonica 8. Clu.*

The lower leaves hereof are like unto those of the white Lilly, and of a whitish greene colour without any spots on them, and of an unpleasant taste, the flowers are large growing spike fashion one above another, of a whitish colour without any spot, resembling a fooles coule or hood, with eares on both sides, and a broad lip hanging downe, and with a broad blunt taile behinde, smelling somewhat strong like Elder flowers: it hath also a small whitish leafe at the foote of the flower next to the stalke: the roote is handed also.

There is another sort hereof whose flowers are purple and the small leafe set at the stalke of the flower, purplish also.

16. *Orchis palmata palustris Dracontias.* The marsh Dragon handed Orchis. *Cynosorch. Dracont. Lob.*

The leaves of this Orchis are like unto those of the Lilly, compassing the stalke almost round at the bottome, the spiked head groweth thicke, with very red and hooded flowers like the last, and greene leaves among them.

17. *Orchis palmata flore viridi.* Small mountaine handed Orchis with greene flowers. *Prodro.*

The roote hereof is handed but small, the stalke is about a span high, the leaves are but few long and narrow, the flowers are small and greene, hooded, and bellyed, parted at the bottome with a small long leafe at each of them.

18. *Orchis palmata montana maxima.* Great mountaine handed Orchis. *Prodro.*

This greater sort hath a stalke two cubits high, whose lower leaves are also te long, and an inch and a halfe broad, and those up higher, smaller and smaller, at the toppe standeth a spiked head of small flowers, an hand breadth long, of a pale purple colour, hooded and heeled, and the lower part of the lippe or belly, parted very much with a leafe at the foote of each likewise: the roote is handed like the rest, with long divisions.

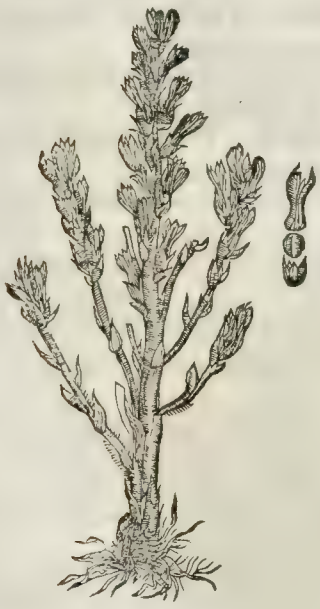
19. *Orchis palmata montana Lobely. Lobel* his mountaine handed Orchis. *Serapias montana Lobelij.*

There is small difference betweene this and the foureteenth, which is the spotted marsh handed Orchis, but that

14. *Orchis palmata palustris maculata.*
Spotted marsh handed Orchis.

16. *Orchis palmata palustris Draconis.*
The marsh handed Dragon Orchis.

18 *Orchis palmata montana maxima.*
Great mountaine handed Orchis.



20. *Orchis palmata montana maculata candido flore.*
Spotted handed mountaine white Orchis.

that the leaves hereof have no ſpots and are more ſmooth.

18. *Orchis palmata montana maxima.* Great mountaine handed Orchis.

Serapias candido flore montana Lob.

Dod Camerarii deſcripto.

20. *Orchis palmata montana maculata flore candido.* Spotted mountaine handed white Orchis.

The leaves of this Orchis are ſomewhat narrow, and ſpotted like unto the female handed Orchis, the ſtalke and flowers alſo are like unto it, and differeth not but in the colour, which is white.

21. *Orchis palmata anguſtifolia Alpina.* Small mountaine handed Orchis.

This ſmall Orchis hath very narrow leaves as ſmall as *Crocus* as *Matthiolus* ſaith, the ſtalke is low and ſmall, bearing ſmall flowers of a ſad purple colour, like unto the purple flower gentle, and of a moſt fragrant ſmell while it is freſh and greene.

The Place and *Time.*

Some of theſe Orchies grow in fieldes and medows, ſome in mooriſh grounds and marſhes, and others upon hils and mountaines, and flower in the moneths of *Aprill*, *May*, and *Iune*, ſome earlyer and later then others.

The Names.

Every one of theſe hath one Authour named in the margent that hath written of it, and how he hath called it: as I have done withall the reſt of this family of the Orchides.

The Vertues.

Theſe marſh ſtones are thought beſt to agree unto the *Serapiades*, and not ſo availeable to Venereous purpoſes, being more heating and drying then the *Cynoſorchides*, and therefore may performe the cures that the *Serapiaes* doth in ulcers and the reſt. *Camerarius* ſaith of this laſt ſort that it is very profitable to ſtay the bloody Fluxe, if the flowers be made into pouther and taken in wine, or the freſh flowers fryed with egges into a Tanſie, and ſo eaten. The rootes of all the other ſorts of *Orchides* being boyled in red wine, and after they are dryed againe, made into pouther and drunke, doth ſtay the bloody fluxe in a ſpeedy manner.

CHAP. XV.

Orchis abortiva ſive Nidus avis. Miſhapen *Orchis* or Birds neſt.

THere are two ſorts of Birds neſt, the one not much differing from the other, but in the colour, the firſt and moſt anciently knowne, of a yellowiſh colour, the other of a purpliſh violet.

1. *Orchis abortiva ruffa.* Ordinary birds neſt.

The common Birds neſt riſeth up with upright ſappy weake ſtalkes, having a ſhew of leaves on them, which are very ſhort thin skins rather then leaves, of the ſame colour with the ſtalkes and flowers, that is of a browniſh dead yellow, the flowers ſtand upon a ſpiked head, like unto that of Orchis, and of the ſame faſhion, with huskes of duſty ſeede following them: the roote is compoſed of a number of fibres, that croſſe and entangle themſelves one within another very intricately.

2. *Nidus avis purpurea.* Purple birdes neſt.

This purple birds neſt groweth ſomewhat lower having ſome longer skinny leaves on the ſtalkes then the former with flowers on a ſpiked head very like unto the laſt for forme, but the whole ſtalke leaves, and flowers are of a violet purple colour, after which follow ſmall ſeede like the other, the roote alſo is like the former.

The Place and *Time.*

Both theſe ſorts are ſometimes found in our owne Land, in Woods and low Copſes, and are in flower in *July* and *Auguſt.*

The

Orchis abortiva ruffa. Ordinary Birds neſt.

The Names.

Dodonæus calleth it *Nidus Neottia, id eſt, Nidus avis*, as it is with moſt now adayes, it is thought alſo to be the *Coagulum terræ* of *Pliny*, *Geſner* calleth it *Orobanche*, and *Lobel Satyrium abortivum & Orchis abortiva*. *Claſius* calleth the laſt *Limodoron* firſt, and then *Pſeudolimodoron*. The *French* call it *Nid doiſeau*, the *Germanes Marghen drehen*, the *Dutch Vogelsneſt*, and we in *Engliſh* Birds neſt, or Gooſe neſt, from the platting of the rootes like the ſtickes and ſtrawes in a Crowes neſt.

The Vertues.

There is no uſe made of either of theſe that I have knowne in Phyſicke, or applyed to any other uſe.

CHAP. XVI.

Orobanche ſive Hæmodoron vel Limodoron.
Kill herbe or herbe bane.

THere hath bin found out of later dayes, divers ſorts of this Excreſſence of the earth (whereof there was but one ſort or two as it is likely knowne to the ancients, or at leaſt, no more expreſt in their writings,) under theſe names, which ſhall be here ſhewed you: but becauſe I have already delivered you two ſorts thereof, the one riſing from Broome, called Broome rape, the other from the *Ciſtus*, called *Hypociſtus*, which may juſtly be referred to this family, I will not further mention them here. I confeſſe they might have been placed neere the Moſſes and Muſhromes as being excreſſences of the earth, as they are, but becauſe their flowers and ſeede doe more neerely reſemble the former *Orchides*, I thought meeteſt to joyne theſe unto them here.

1. *Orobanche major Monſpeliaca.*
Great Herbe bane of *Mompelier*.

This kill herbe hath a long and round ſmall roote without ſcales, and with ſome fibres under it, the ſtalke is great and thicke, with very ſhort leaves thereon from the bottome unto the middle thereof, where the flowers begin to grow, and with every one of them a larger and longer leafe: the flowers are long and browniſh.

2. *Orobanche flore majore purpuraſcente.*
Great purple Herbe bane.

This from ſuch a like roote with fibres thereat as the former, ſendeth forth ſundry ſtalkes with many thicke and ſhort leaves on them ſharpe at the ends, having ſometimes branches riſing therefrom, and ſometimes two or three ſtalkes from the roote, and at the toppes are ſet with longer flowers then thoſe of Broome rape on long foote-

1, 2 *Orobanche major Monſpeliaca & flore majore purpuraſcente.*
Great Herbe bane of Mompelier, and the great purple.

ſtalke,

3. *Orobanche ramosa.* Branched Herbe bane.

4,5 *Orobanche radice dentata sive Dentaria Matthioli major & minor.* Toothwort or Lungwort, the greater and the lesser.

stalkes, each standing in a huske, with a long thred as it were growing out of the flower that turneth up againe; the whole stalke, leaves, and flowers are of a blewish purple colour.

3. *Orobanche ramosa.* Branched Herbe bane.

Although many of these herbes are found with single and unbranched stalkes, yet some are found also that have them much branched, but then for the most part, they grow lower then others, and are of differing colours, some whitish, some more yellow, some browniish yellow, and some blewish or purplish, for such are found in sundry places. *Bauhinus* remembreth a small sort hereof, that groweth lower, under Pine trees, Firre and Pitch trees, differing else in nothing, but in being of a darker colour, and the flowers whiter. *Hypoc ys.*

4. *Orobanche radice dentata major sive dentaria major Matthioli.* Great Toothwort or Lungwort.

Most properly may this herbe be joyned to these formerly set downe, for their neere affinity in many things: it hath for the roote small scales, if it may be so called, like as the stalkes or branches have, which consist likewise wholly of blackish purple, shining thicke scales, lying somewhat closely, compact one upon another: in the beginning of the Spring, there riseth out from the toppes of these scaly branches tender and brittle sappy stalkes, to a span long, without any leaves, but bearing many whitish purple gaping flowers, and blackish inward, standing in huskes, wherein afterwards grow up vessels with small seede in them.

5. *Orobanche radice dentata minor.* Small Toothwort or Lungwort.

This lesser sort consisteth of a smaller lesse scaly, and more white transparent roote, with a tender sappy whitish purple stalke in like manner, without leaves and whitish purple flowers at the toppe, sometimes but two or three, and sometime many more. This varieth in some places being of a more purplish colour.

The Place and *Time.*

The first three sorts grow many times from the rootes of sundry herbes, and by their sappinesse draweth out the nourishment, thereby spoyling them, and sometimes among a field of Corne, Pulse, Hempe &c. sometimes also of it selfe among the grasse and herbes, by the sides of hedges, and under the shadow of trees, and many times also without shadow, the other two most commonly under trees, where they have much shadow, and doe most flourish in *May* and *Iune*, yet some have beene found in flower in *August*.

The Names.

Dioscorides calleth it ὀροβάγχη, and *Orobanche* in Latine, but doth much differ from that *Orobanche*, of *Theophrastus*, which with the clasping branches killeth the *Orobus* that it growes withall, and therefore *Lugdunensis* taketh that pulse which is called *Aphaca*, to be *Theophrastus* his *Orobanche*, as I shewed before in the Classis of the pulses, but out of doubt, it agreeth with *Theophrastus* his *Limodoron*, as some have it, but more truely *Hæmodoron*, some would have it *Limonodorum, pratorum donum*, or else *Limodorum famem adferens*: but ἁιμόδωρον is the truest name in the best copies, or as some thinke ἁιμόδωρον *quod acute tanquam cruore infecta*: for *Theophrastus* describeth his *Hæmodoron*, almost in the same manner that *Dioscorides* doth his *Orobanche*, it is thought also to be *Pliny* his *Cynomorion a canini genitalis similitudine*. Most Writers call them *Orobanche*, and some *Limodoron*. The *Dentaria* is called of some *Squamaria*, or *Squamatia*, and *radix squammata* by *Dodonæus Anblatum*, by *Cæsalpinus Arachidum*, and by *Gesner Aegolethros Plinij*, and saith the people in *Germany* that keepe Vineyards, call it *Malus Henricus*; but generally by all *Dentaria*, and *major*, the lesser being called by *Clusius Dentaria aphyllos*, and *Dentaria coralloide radice*, and *minor* by others. The *Italians* as *Matthiolus* saith call *Orobanche Herba Tora*, because Kine eating thereof will

will presently goe to the Bull, some also as he saith *Herba Lupa*, and some *Coda di leone*. Because we had no proper *English* name for the former sorts, and I thought it improper to call them Broome rapes, as thatis called which groweth from the Broome, I have given them another *English* one, fitting their property as I take it: yet let every one doe as they thinke meetest.

The Vertues.

Dioscorides saith of his times, that it was used to be eaten as other herbes are, either raw or boyled with pulse, which would helpe their digestion: *Galen* saith it is cold and dry in the first degree: our people doe many times use the latter sort in medicines for the Lungs, having received it as a tradition from their ancestours, and therefore called the greater Lungwort: we have no other properties of any of these herbes, to open unto you.

CHAP. XVII.

Cyclamen. Sowbread.

ALthough I have given you in my former Booke a doozen sorts or more, of *Cyclamen* or Sowbread, for whose knowledge I must referre you thereunto, a figure of one or two being here shewed you instead of the rest, yet I have a strange plant to exhibite to your consideration, which was found and sent for a bastard kinde thereof; and withall shew you the properties of the right more amply.

Pro Cyclamino verno spurio missa planta. A strange plant sent for a bastard Sowebread of the Spring.

It had a tuberous roote varying from the forme of the *Cyclamen* roote, being long and thicke, small at the head and bread at the bottome, with a dent in, somewhat like unto the forme of an heart, as it is pictured on the cards, or rather like those pin-pillow-purses, that poore women use to sticke their pinnes round about the brims or edges, having a hard thicke skinne of a brownish colour, with sundry hard long rough fibres underneath, and about it, from the toppe whereof rose divers somewhat round leaves a little pointed, resembling those of the violet but smaller, some being larger and smaller then others, with three, five, or seven nerves or ribs in them, each upon a long footestalke, and of a brownish greene colour, from among which riseth up a reddish stalke, divided from the bottome into three or foure branches, with the like leaves on them; and at the head of every branch, two or three small greenish yellow mossy flowers, much like unto those of the Ribes, or red Currans, with divers yellow threds in the middle.

The Place and *Time.*

This grew on the *Pyrænean* hils, sent by *Venerius* to *John Hogheland*, and other his friends in the low countries, and flowring in the Spring time.

Cyclamen autumnale folijs Hederæ.
Ivy leafed Sowbread.

Pro Cyclamino verno spurio missa planta.
A strange plant sent for a bastard Sowbread of the Spring.

The

The Names.

Venerium sent this for a differing kind of *Cyclamen*, by the title it beareth, but as the description and figure declare, it is much different therefrom, almost in every particular, and therefore not knowing what other denomination befitteth, it must hold the first imposed for me, until I or some other, can better dispose of a more certainty.

The Vertues.

The plant being rare and lately found out and known but to few, I have not yet learned that any experience hath bin made thereof, whether it hath any medicinal or other property therein: but because in my former Booke, I was so briefe in declaring the vertues of the true Sowbread, I think good upon so fit an occasion to expatiate them further here: Although *Mesues* doth determine the degrees hereof to be hot and dry in the beginning of the third, yet *Galen* doth not so, but saith only 70. *Simplicium*, that it cutteth, clenseth & openeth the mouths of the veines, draweth and digesteth, which is plainely seene by the particular operations thereof, for the juyce of it openeth the hemorrhoides or piles, and strongly mooveth to the stoole, being put up in woll, and saith *Mesues*, it avoideth tough flegme used in a glister: it is also mixed with such medicines as discusse swellings, kernels, and other hard knots in any part of the body: it helpeth also the pinne and webbe in the eyes, being infused with honey, as also avoideth it by the nostrils, which *Mesues* also affirmeth, and that by snuffing up the juice, the head and braine is purged from those humours that offend it, the ache also, and daily paines of it, and the Meagrome. *Galen* further saith, that if the belly be bathed with the juice, it will forceably moove it downewards, and kill the birth, or to be put up in a pessary, and although the roote is weaker then the juyce, yet the roote being either drunke or applyed, provoketh the termes, and is profitable for those that have the yellow jaundice, to drive it forth by sweating, if after the taking of three drams thereof in powther, in Meade or honied water, they be carefully ordered to sweate: it helpeth also to cleanse all the deformities or discolourings of the skin, and the freckles and spots thereof: as well fresh, as dry; applyed to the region of the spleene, it easeth the hardnesse thereof: some also saith he gave the dryed roote to them that are pursie or short winded. *Matthiolus* saith that the distilled water from the rootes snuffed up into the nostrils, stayeth their bleeding wonderfully: and that if six ounces of that water be drunke with an ounce of fine sugar, it will stay the blood that commeth from the brest, stomacke or Liver, in a wonderfull manner; or if any veine be broken in them, and this is his attestation: to hinder saith he, the violence thereof in purging, it is fit to mixe therewith some Masticke, or Nutmegge, or a scruple of Rubarbe: many have been holpen of the hardnesse and swelling of the spleene, by the use thereof, which could not be holpen by other things: It easeth also the paines and torments in the bowels, which we call the chollicke; If saith he the roote hereof be beaten with a few Peach stone kernels, and bitter Almonds, and after laid to steepe in *Aquavitæ* for three dayes: a drop or two of the expressed creame therof dropped into the eares that are deafe or have much noise in them helpeth them: the juice mixed with honey or Plantane water, helpeth all maner of sores in the mouth or throate being gargled therewith, and the toothache also. *Dioscorides*, saith many of the same things, and besides that the decoction thereof healeth wounds, the running sores also in the head, bones, or members out of joynts kibes or chilblanes, and the Goute. *Pliny* saith the roote is good against the venome of Serpents, and that it will kill Swine, which is contrary to the received opinion of most, that they are delighted therewith, and greedily devoure the rootes, after they have rooted them up, from whence came the name *Panis porcinus*, Sowbread: yet *Thalus*, saith the roote is fitter for Wolves, and Foxes then Swine, and that it is not to be inwardly taken, but by good advise and caution. *Dioscorides*, and *Pliny* from him say, that if a woman that is with child goe over a plant thereof, it will cause abortion that is, to be delivered before her time; but it is certainely knowne by many experiences that some of the fresh greene leaves, but much rather, the fresh roote which *Theophrastus* also affirmeth, put into a cloth and applyed for a little time to the secret parts of a woman, that is in sore hard and long travaile in child birth, hath holpen them to a speedy and easie delivery: the roote beaten and applyed with honey, draweth forth splinters &c. out of the flesh.

CHAP. XVIII.

Epimedium. Barren wort.

BArrenWort is a pretty shrublike plant shooting forth sundry hard round stalkes, haise a yard or two foote high, each stalke divided for the most part into three branches, and each of them bearing three leaves a peece, which are severally, somewhat broad and round, yet pointed at the endes, hard or dry in feeling, and a little sharpely dented about the edges, of a light greene colour on the upper side and whiter underneath: from the middle of some of the stalkes of leaves, shooteth forth with them from the first rising up of them, a small long footestalke of flowers not much higher then the stalkes of leaves, divided into branches, containing on each of them three flowers a peece, separated into foure parts, as if the flower consisted but of foure leaves, when as each part hath two leaves, one lying close upon another, the inner being yellow and smaller then the lower, which are red. so that the red edge appeareth round about the yellow, making it seeme a yellow flower of foure leaves with red edges: it hath also a few yellow threds in the middle, set with greene, the underside of the flowers, being of a yellowish red colour, stript with white lines, which being past, small long pods appeare, with flattish red seede in them, the rootes are small and fibrous, hard and reddish spreading much underground, and delighteth best in shaddowy, rather then Sunny places; the sent of the plant is rather strong then pleasant.

Alterum Americanum magis fruticosum.

We have had brought us from some of the Northerne plantations of *America*, a certaine shrubby and wooddy plant, bringing forth thrice three leaves, composed in the same manner with the former, but each leafe was twise as bigge: but we never saw it beare any flower or fruite with us, nor did the plant long endure with us but by degrees grew weaker, and in the end utterly perished, so that I cannot determine it as I would, and we could never get the same kinde againe: but the *Hedera trifolia*, set forth in this Worke before, commeth somewhat neere thereunto, but yet is not the same, having onely three leaves at a place upon the stalkes, and not nine, that is thrise threeas that had.

E pimedium. Barrenwort.

The Place and Time.

Cæsalpinus saith it groweth on the mountaines of *Liguria*, *Camerarius* neere unto *Vicenzo* in *Italy*, *Bauhinus* on the *Euganian* hils, and in *Romania*, in shadowy wet grounds, and flowreth from *Iune*, unto the middle of *August*.

The Names.

The Ἐπιμήδιον *Epimedium* of *Dioscorides*, hath beene diversly interpreted by sundry writers, some taking it to be one thing, some another: for *Columna* in his *Phytobasanos*, setteth the *Lunaria minor* for it, but surely erroniously, and saith that neither the *Hepatica trifolia*, nor that *Seseli Æthiopicum*, which is the *Libanotis Theophrasti* with us, which some in and before his time tooke to be it, can be it. *Bauhinus* would seeme to make *Thalius* to meane the *Caltha palustris* to be *Dodoneus* his *Epimedium*, when as I cannot finde in any of *Dodonæus* his workes, that he meant, or set forth any other *Epimedium* then this I here shew you. So that I hereby thinke *Bauhinus* was mistaken to quote *Thalius* to meane *Caltha*, and that *Thalius* also was mistaken in taking that herbe which he gathered as he saith in some place of the *Harcynia sylva*, and kept in his booke of dryed herbes, that had foure round leaves a little dented about the edges, standing each upon a slender foote-stalke, and with a blacke tuberous roote to be *Epimedium Dodonæi*, which neither hath such round leaves, nor such a blacke tuberous roote. *Anguilara* it is thought, first entituled this *Epimedium* (which some in his time called *Lunaria*) whom all others that have set it forth since, have so called, and yet some make a doubt whether it be *Dioscorides* his or no. First in that thee saith, *Epimedium* hath tenne or twelve leaves, when as the triplicity is so conspicuous, that it is a wonder he should omit that, if he meant this: againe he saith it beareth neither flower nor fruite, when as this giveth both, yet hereunto it is affirmed that *Dioscorides* might faile in this, as he did in *Dictamum Tussilago Cynoglossum*, &c. It is likely also that *Theophrastus* should meane this of *Dioscorides*, whichin his seventh Booke and eighth Chapter, he calleth *Epimetrum* and saith it beareth no flowers, which *Pliny* calleth also *Epipetron*, and some *Epimenidium*.

The Vertues.

We have not any late experience hereof to shew but as *Dioscorides*, *Pliny* and *Galen*, have set downe of it, that it is moderately cold and moist, and without any speciall property more then to keepe womens brests from growing over great being made into a cataplasme, with oyle and applyed thereto: and that the report went that the roote would make women barren that tooke it inwardly, as also the leaves made into powther and taken in Wine for sometime.

CHAP. XIX.

Viola Lunaris sive Bulbonach. The white Sattin flower.

Viola Lunaris sive Bulbonach.
The white Sattin flower.

THere are two sorts of this Sattin flower, one that dyeth after seede time, and another that abideth, both which I have so sufficiently declared in my former Booke, that I neede not further to amplifie them. I will therefore referre you thereunto, to be enformed of them, and onely here give you the figure of it.

CHAP.

CHAP. XX.

Aquilegia. Columbines.

I Have ſhewed you in my former Booke ſo many ſorts of Columbines, and of ſo many colours, both ſingle and double, that I then thought there had beene no more to be ſet forth, yet ſince that time I have attained the knowledge of ſome others, which I thinke meete to expreſſe here, eſpecially one out of *Virginia* with a ſingle flower, which Maſter *Iohn Tradeſcant* brought from thence.

Aquilegia Virginiana flore rubeſſente præcox. The early red Columbine of *Virginia*.

This *Virginian* ſort differeth little from the ordinary ſingle ſort, but in theſe particulars: the ſtalke is as tall as ſome *Æquilegia*, although *Cornutus* make it a dwarfe and reddiſh, the leaves are ſmaller and ſomewhat like unto thoſe of the *Thalictrum*, Medow Rue, but of a paler greene colour, the flowers are of a ſad reddiſh colour, and ſingle from the middle of them to the ends, but yellowiſh from thence to the bottomes, the ends of whoſe leaves are not blunt as in ours, but ſtiffe rough, and pointed, within which horned leaves there are five other ſmaller, and of a reddiſh colour alſo, their points bending downewards, having many ſmall white threds in the middle, tipt with yellow, after which come five pointed or horned ſeede veſſels, with blacke ſhining ſeede in them: the roote is long with many fibres thereat. I here alſo give you the figure of the ordinary one, that you may ſee the difference.

Aquilegia flore pleno maculato diverſorum colorum. Double party coloured Columbines of ſundry colours.

As I before ſaid, I ſhewed you all the varieties of colours that I then knew, but ſince I have ſeene and have ſome other ſorts, as firſt a kinde of darke red, which we call a deroy colour, both ſingle and double, and a double with white ſtripes therein, as is the party coloured blew, and white: then have wee a faire double red or crimſon color, ſtriped in the ſame manner with white: another ſpotted as well as ſtriped, very thickely, and of a haire colour, double and ſtriped as the reſt: and another ſtriped and ſometimes ſpotted, of a lived colour, or betweene blacke and blew. Beſides the ſtarre or Roſe Columbines party coloured purple and white, and red and white.

The Place and Time.

The firſt was brought out of *Virginia* by Maſter *Tradeſcant*, and flowreth ſomewhat earlier then any of our Garden kindes uſually by a moneth.

The Names.

I have ſhewed in my former Booke the ſundry opinions of Writers hereon, ſome referring it to one thing, ſome to another of the ancients: but *Cornutus* is definite upon the point, that it was not knowne. And to moove one

Aquilegia vulgaris ſimplex.
The ordinary ſingle Columbine.

Aquilegia Virginiana flore rubeſcente.
The red Columbine of Virginia.

to thinke his ſort that came from *Canada* (which as I take it is the ſame with ours of *Virginia*, howſoever he ſaith his ſcarſe riſe a palme high) would by foulding the leaver, containe Water in them, and therefore would referre the name to *Aquileges* that *Pliny* mentioneth, the pipes that convey water which containeth more conceit then verity.

The Vertues.

The leaves of Columbines are commonly uſed in lotions, for ſore mouthes, and throates, which effect it worketh by the drying and binding quality therein. *Tragus* ſaith that a dramme of the ſeede taken in Wine with a little Saffron, doth open the obſtructions of the Liver, and is good for the yellow jaundiſe, and adviſeth that the parties after the taking thereof ſhould be laid to ſweate well in their beds. *Cluſius* ſaith a Phyſitian in *Bruges* uſed the ſeede for women that were in ſore travell of childe birth, to cauſe a ſpeedie delivery, being taken in Wine, and a ſecond draught to be taken, if the firſt did not the effect. *Camerarius* ſaith that diverſe in *Spaine* did eate a peece of the roote for many daies together, to helpe thoſe that were troubled with the Stone in the reines and kidnies. Others doe uſe the decoction both of herbe and roote in Wine, putting thereto ſome Ambergriſe, againſt theſe ſwounings that the Greekes call ἐλυσμία.

CHAP. XXI.

Hepatica nobilis ſive trifolia. Noble Liverwort, or *Hepatica.*

ALthough I ſhewed you in my former Booke, all the ſorts of *Hepatica* that then I knew, yet ſince Maſter *Tradeſcant*, found one other ſort as I take it growing in Virginia, and brought it home with him, which differeth ſomewhat from the other ſort wee formerly had, this bearing very darke greene leaves, and a ſmall white flower, with a few white and not red threds in the middle, but becauſe I had ſome of the figures by me, I thought good to exhibite them in this place.

Their *Place*, *Time*, *Names*, and *Vertues* are expreſſed in my former Booke, whereunto I referre you, but as I here ſhew you, there is little Phyſicall uſe made of them, elſe I would willingly have enlarged the properties here: theſe being more for pleaſure to the ſenſes then helpes for any diſeaſe.

Hepatica nobilis ſive trifolia ſimplex.
The ordinary ſingle Hepatica or Liverwort.

Hepatica nobilis ſive trifolia flore pleno.
Double Hepatica or Liverwort.

CHA:

CHAP. XXII.

Chrysanthemum & Buphthalmum. Corne Marigolds, and Oxe eye.

THere are sundry sorts of these Golds, or Corne Marigolds, to be entreated of here, some whereof grow plentifully enough, in our Cornefields, others being strangers, we have received from beyond Sea, and some I have set forth in my former Booke, whereof I thinke good to give you the figures, of some of them, and therewith of our garden Marigolds, and referre your to the Booke: and for the neere affinity betweene these and the *Buphthalmum*, I thinke it not amisse to joyne them here also.

1. *Chrysanthemum segetum nostras.* The Corne Marigold of our owne Country.

This Corne Marigold hath sundry tender pale greene herby stalkes, breaking forth into some few branches, with divers long blewish greene leaves, set without order on them, being narrow at the bottome, and broader at the end, cut in a little on both edges: the flowers grow singly at the toppe of every branch, being large, growing out of greene scaly heads, and of a shining yellow colour, both the thrumme and the border of leaves about it, each leafe being broad or flat pointed, and cut into three or foure parts, smelling a little sweete: the roote perisheth every yeare, and riseth from it owne sowing. *Matthiolus* hath set forth one of this sort, with leaves jagged like Feverfew. The chiefest difference in this from the former, consisteth in the leaves, which are whole small, long and round pointed like those of the Daysies. *Bellidis folio*

2. *Chrysanthemum segetum Baticum.* *Spanish* Corne Marigold.

The stalkes hereof are harder and browner then of the former, and stand more upright, the leaves are greener and not so much divided or cut in on the edges, the flowers are not of so shining a yellow colour, but somewhat deeper yellow, the seede is small and whitish, and is bitter as the former is, although the herbe is sweete and eaten as a Sallet herbe, and herein consisteth the chiefest difference.

3. *Chrysanthemum tenuifolium Baticum Boelij.* *Boel* his *Spanish* Marigold.

In the leaves chiefly consisteth the greatest difference, betweene this and the last, for this hath sad greene leaves, very much jagged and cut into very small and fine parts, almost as small as Camomill, the flowers are yellow, and so like that but for the leaves, they could hardly be distinguished.

4. *Chrysanthemum Valentinum Clusij.* *Clusius* his *Spanish* Marigold.

Clusius his *Chrysanthemum* of *Valentia* in *Spaine*, riseth up usually, but with one stalke of a foote high, parted into some branches, beset without order, with finer leaves then the last, but of a hoary colour, the flowers stand singly like the rest, and of a shining gold yellow colour, but unlike in this, that this hath no border of leaves at all about the middle head, but is bare and naked.

5. *Chrysanthemum Hispanicum primum Clusij.* The first Mountaine Corne Marigold of *Clusius*.

This hath many long leaves next the ground, resembling those of the white Wormewood, in the forme and

Chrysanthemum Creticum.
Candy Corne Marigold.

Calendula multiplex, & prolifera.
Double Marigolds, and Jacke anapes on horse backe.

1. *Chrysanthemum segetum nostras.*
Corne Marigold of our owne Country.

4. *Chrysanthemum Valentinum Clusij.*
Clusius his Spanish Corne Marigold.

5 6. *Chrysanthemum Alpinum primum & secundum Clusij.*
The first and second Mountaine Corne Marigold of *Clusius*.

10. *Buphthalmum Matthioli sive vulgare Millefolij folijs.*
The more vulgar Oxe eye.

diuiſions, the ſtalke is a ſpanne high, ſet with finer cut leaues, and at the toppe many yellow flowers ſet together, like unto thoſe of Raggewort, the roote hath many white fibres.

6. *Chryſanthemum Alpinum ſecundum Cluſij.* *Cluſius* his ſecond Mountaine Corne Marigold.

The leaues of this ſort is much more finely cut, moſt like unto thoſe of Southernwood, of a pale greene colour, and of no unpleaſant ſauour, but ſomewhat bitter in taſte: the ſtalkes are diuided into ſome branches, bearing each of them one or two flowers, greater then Camomill flowers, and without ſent, of a yellow colour wholly, both the middle and the border, the roote hath blackiſh fibres.

7. *Chryſanthemum tertium ejuſdem.* His third Corne Marigold.

Differeth little from the ſecond in the leaues, being as fine cut, but are longer, thicker and greater, and the flowers grow more together, and leſſer then the former, and the roote hath white fibres.

8. *Chryſanthemum Hiſpanicum rotundioribus foliis.* *Spaniſh* round leafed Golds.

The greateſt difference in this from the others, conſiſteth in the leaues, which are not diuided at all, but are long and broad, ſomewhat round pointed, and onely dented about the edges, the flowers are greater that grow on the top of the branches and ſtalke, of a ſhining yellow colour, both border and middle thrum: the roote is woody, having many ſtrings thereat.

9. *Chryſanthemum latifolium Braſilianum.* Sweete Corne Marigold of *Braſill.*

This ſweete Marigold ſpringeth up with a ſtalke about halfe a yard high, ſomewhat rough and creſted, having ſundry leaues ſet thereon, of foure or five inches long, and two broad, compaſſing it at the bottome, and growing ſmaller to the end, ſomewhat dented about the edges, with ſharpe dents, from the boſome of whom come forth ſomewhat long footeſtalkes, ſuſtaining each of them a faire yellow flower, ſet in a greene huſke or cup, having ſeuen or eight leaues for a border, dented at the ends, and compaſſing a middle thrumme, conſiſting of long threds, wherein afterwards lyeth the ſeede, very like unto the former *Spaniſh* kinde, the roote periſheth yearely in like manner, the herbe is ſo ſweete that the Slugges and Snailes doe eate it above many other herbes in the Garden.

10. *Buphthalmum Matthioli ſive vulgare Millefolij foliis.* The more vulgar Oxe eye.

The more common *Buphthalmum*, with us, hath ſundry faire greene leaues, diuided very much into ſundry other leaues, ſomewhat reſembling common Yarrow, and ſo taken to be by diuerſe that looke but ſuperficially thereon, but heedfully marked differeth plainely from it, the diuiſions not being ſo thicke or ſmall, the ſtalkes and branches, ſtand not up ſo ſtrongly as Yarrow, and at the toppes of them beare but ſingle flowers, leſſer then the Corne Marigold, but wholly of a deepe yellow, and not ſhining, the ſeede followeth in the thrumme, the roote is fibrous and periſheth yearely, or abiding the ſecond yeare after the firſt ſowing, which the Yarrow doth not.

11. *Buphthalmum alterum Cotulæ folio.* Camomill-like Oxe eye.

The weake ſappy greene bending ſtalkes hereof, grow two foote long ſometimes, with fine Camomill-like leaues ſet diſperſedly thereon, and the branches, every of which beare a flower like unto the former Oxe eye, but the leaues hereof are ſomewhat larger, and fewer, and yellow, the middle thrumme being of a deeper colour, and ſomewhat hollow.

12. *Buphthalmum flore purpuraſcente.* Oxe eye with purpliſh flowers.

This Oxe eye with purpliſh flowers, differeth not much from the laſt, in the manner of growing, or forme of leaues and flowers, but herein chiefly, that the backe of the leaues of the flowers are either wholly purpliſh or elſe

11. *Buphthalmum alterum Cotulæ folio.*
Camomill-like Oxe eye.

12. *Buphthalmum flore purpuraſcente.*
Oxe eye with purpliſh flowers.

publiſh

13. *Buphthalmum peregrinum Alpino.* Shrubby Oxe eye.

14. *Buphthalmum Africum tenuifolium Boelij.* Thinne leafed Oxe eye of Barbary.

purplish in the middle: the stalke also which in the other is greene, is more reddish in this.

13. *Buphthalmum peregrinum Alpino.* Shrubby Oxe eye.

This strange Oxe eye riseth up with divers streight, round, slender, darke greene stalkes, three cubits high, branching forth into divers parts, whereon are many small fresh greene leaves, much divided, and somewhat like to those of Fennell, the flowers are twice as large as those of Camomill, and wholly of a shining gold yellow colour, set in greene heads or huskes, wherein afterwards the small long white seede is contained: the roote is long slender and blackish, abiding fresh and not perishing after seede time. *Alpinus* misliketh that of *Matthiolus*, because the leaves were not like Fennell, nor the flowers bigger then Camomill.

14. *Buphthalmum Africanum tenuifolium Boelij.* Thin leated Oxe eye of Barbary.

Although *Alpinus* supposed that he had set forth the truest Oxe eye of *Dioscorides*, yet as you may see both by the figure and description of this I here give. His is in some things defective, and this in my opinion is the neerest in all things thereunto, it riseth up with one slender stalke, with divers long thinne leaves diversly parted, comming neerer unto Fennell then any before, bearing a large yellow flower at the toppe, where it brancheth forth, and beareth leaves and flowers on them likewise: the roote is full of strings, and perisheth after seede time.

The Place and *Time.*

The Corne Marigolds grow for the most part in the Corne fields, and about the borders of them, or where Corne hath beene sowne formerly, either in our owne land or in others, as by their titles are to be knowne. The Oxe eyes generally grow in the moister grounds, by water courses and the like, in other Countries, but in Gardens onely with us, where they are sowne, and carefully kept, and doe flower in the end of Summer.

The Names.

Χρυσανθεμον in Greeke, is *Chrysanthemum* in Latine: *ab aureo floris colore sic dictum*: there is much controversie among divers, concerning *Dioscorides* his *Chrysanthemum*, which he saith some called also *Buphthalmum*, because whatsoever he had said of *Chrysanthemum*, he said the same in the Chapter of *Buphthalmum*, thereby suspecting the Chapter of *Chrysanthemum* to be thrust into the worke of *Dioscorides*, by some others, and they are the more enduced hereunto, because neither *Plinie*, *Galen*, nor *Ægineta*, make any mention of *Chrysanthemum*, but of *Buphthalmum* onely, as though they knew no other *Chrysanthemum*: but *Matthiolus* evidently cleereth the matter, shewing how *Dioscorides* by their severall markes, doth distinguish them, saying *Buphthalmum* hath Fennell like leaves, which he saith in *Chrysanthemum* are onely cut or jagged: againe the stalke of *Chrysanthemum*, are eaten as other herbes, which he doth not say of *Buphthalmum*: and lastly, the flowers of *Chrysanthemum* he saith are much shining, but he saith of *Buphthalmum*, that they are greater then of Camomill, besides the flowers of *Buphthalmum* made up with waxe, is a salve to dissolve swellings and knots, but of *Chrysanthemum* he saith, simply it discusseth that Imposthume that hath like fat in it. There is no lesse doubt about his *Buphthalmum*, what herbe knowne to us should be the right, some taking the great white Daisie and *Fuchsius* and *Lonicerus*, the May weede to be the right, neither of which can be so, in that they are not all yellow, as *Dioscorides* saith *Buphthalmum* flowers are *Matthiolus* therefore hath set forth one, which is most commonly received by most to be the truest, although both *Lobel*, *Dodoneus* and *Dalechampius* have set forth others, which they tooke to be righteſt. The first

here

here is called *Chrysanthemum* and *segetum* by all Writers almost, yet some and *Bauhinus* with them call it *Bellis lutea*. The second hath no Authour before that expresseth it. The third is very likely to be the second sort of *Chrysanthemum Creticum* of *Clusius*, which *Bauhinus* referreth to the *Achillea montana artemisiæ tenuifoliæ facie* of *Lobel*, and the *Ageratum ferulaceum* of *Lugdunensis*, but neither of them truely. But the first *Chrysanthemum Creticum* of *Clusius*, I take to be that *Chrysanthemum Creticum* that I have set forth in my former Booke, and which *Gesner in hortis* calleth *Buphthalmum alterum partim candido partim luteo flore*: But *Besler in horto Eyst. sensi Chrysanthemum Creticum mixtum*. The fourth is the *Chrysanthemum Valentinum* of *Clusius*, which *Lugdunensis* setteth downe for the *Buphthalmum verum Dalechampij*, but *Clusius* mistaking him, tooke that he referred his *Valentinum* to *Matthiolus* his *Chrysanthemum*, and for it is a little bitter against him, but it was *Clusius* his oversight, for he saith this of *Dalechampius* is diverse from that of *Matthiolus*: *Clusius* his *Valentinum* is also referred to the *Buphthalmum Narbonense tenuifolium* of *Lobel* in his Observations, as *Bauhinus* quoteth it, which *Cæsalpinus* calleth *Chrysanthemum alterum ex Sicilia*: The three next are *Clusius* his sorts of *Chrysanthemum Alpinum*, wherof as I said before, his second is very likely to be also this third sort here expressed, or very like it. The eighth is *Lugdunensis*, his *Chrysanthemum Myconi*, which hee saith the *Castilians* called *Giralda*. The ninth wee received by the same name that *Bauhinus* calleth it by in his *Prodromus*, and is of *Brasill*. The tenth is generally called *Buphthalmum oculus bovis*, by most Writers, and taken to be that of *Dioscorides*, which he saith is called *Cachle* also, yet some entitle it also *Chrysanthemum*, as *Fuchsius*, *Cordus*, *Gesner*, and *Turner*. The eleventh is mentioned onely by *Camerarius* in his *Matthiolus*, and by *Bauhinus* after him. The last is called by *Lobel Buphthalmum folio & facie cotulæ fœtidæ*, both in his *Adversaria* and *Icones*, and is the same with the *tennifolium Narbonense*, in his Observations although *Bauhinus* quoteth them as differing plants.

The Vertues.

I cannot finde that any Authour hath enlarged the properties of Corne Marigold, beyond that which *Dioscorides* hath set downe of it, which is to discusse that Impostume, that hath like fat in it, and that it will helpe them that have the yellow jaundise, to have a good colour if they drinke it for some long time, continually after bathing. And of *Buphthalmum*, the Oxe eye, that the flowers made up with a cerote, doth discusse tumours, and hardnesse, and helpeth the jaundise (as he saith by hearesay in both these) and to get a good colour, to drinke it after bathing by continuance.

CHAP. XXIII.

Tussilago montana. Mountaine Coltsfoote.

THere are two or three sorts of these Coltsfoote of the Mountaine to shew you in this Chapter.

1. *Tussilago Alpina folio glabro.* Smooth leafed Mountaine Coltsfoote.

The roote hereof creepeth under ground like the common Coltsfoote, and will almost spread as much ground, from whence spring sundry round leaves, each rising by it selfe, with a long footestalke under it, and are a little notched or waved about the edges, smooth, and of a darke greene colour on the upperside, and not shining as the other, nor woolly underneath, among which riseth up some stalkes, a spanne long, with a small long leafe or two thereon, and a purplish flower at the toppe composed of threds which when it is ripe hath seede therein, that with the downe sticking to it, is carryed away with the winde.

2. *Tussilago Alpina folio canescente.* Hoary Mountaine Coltsfoote.

This other Coltsfoote differeth not in forme of leaves or flowers, being also purplish, nor in the manner of grow-

1. *Tussilago Alpina folio glabro.*
Smooth leafed Mountaine Coltsfoote.

2. *Tussilago Alpina folio canescente.*
Hoary mountaine Coltsfoote.

ing, but onely that the ſtalke is woolly, and the leaves hereof are very rough, and of a darker greene ſhining colour, on the upper ſide, and more hoary or very woolly underneath. *Cluſius* giveth another figure alſo hereof, not that the one differeth from the other, but to ſhew the full open flower of the one, and the cloſed and decaying of the other.

3. *Tuſſilago Alpina folio oblongo* Mountaine Coltsfoote with longer leaves.

This hath five or ſix ſomewhat long leaves, riſing from a blacke roote, of the bigneſſe of ones little finger, with ſome fibres at it, each ſet upon a long ſtalke of an unequall length, ſome longer then others, hard, rough, hairy, and of a darke greene colour, ſnipped about the edges, from whence riſeth the ſtalke of a cubits height, ſet with two or three narrower leaves, branched ſometimes with a large yellow moſſie flower at the toppe, which being ripe, vaniſheth with the winde.

The Place and Time.

Theſe grow on the *Alpes* of *Auſtria*, and *Syria*, and elſewhere in *Germany*, and on Mount *Baldus* in *Italy*, and flower in *Iune* in their naturall places, but in *Aprill* and *May*, being tranſpoſed into Gardens.

The Names.

Theſe being but of late invention, have no other name impoſed on them then the firſt finders gave them, which is *Tuſſilago Alpina*, for ſo *Cluſius* doth entitle them, the firſt being his ſecond, and my ſecond his firſt, which *Cluſius* as I ſaid in the Chapter of *Aſarum*, ſuſpected to be the *Aſarina* of *Matthiolus*, but aſſuredly was miſtaken therein, for although he ſeeme to determine the queſtion abſolutely to be the ſame, yet he leaveth it for every one to judge as he liſt. The laſt is ſo termed by *Bauhinus* as it is ſet downe in the title.

The Vertues.

Although the forme of the leaves and flowers doe cauſe them to be referred to the Colts foote, yet it is not knowne, or at the leaſt made knowne to us, of any the like faculties, any of them are endued withall, and therefore untill they can ſay more for themſelves let them be held to be mutes.

CHAP. XXIV.

Arctium montanum quibuſdam. A kinde of mountaine woolly plant or Beares wort.

THis plant hath diverſe faire and ſomewhat large long leaves like unto Mullein, ſomewhat greene above, and hoary or very white below, and full of veines: the ſtalke is ſmooth and covered with much wooll, bearing one great head, ſcaly on the outſide, but without any prickles, and with a yellow thrumme for the flower ſtanding within it, which when it is ripe is by peece meale carryed away in the winde, with the ſeede hanging thereat, which is like unto Cummin ſeede, the roote is thicke long white and tender.

Arctium montanum quibuſdam.
A kinde of woolly plant, or Bearewort.

Arctium ex codice Cæſareo.
Cæſars booke *Arctium.*

I have

I have hereunto put the figure that *Dodonæus* saith, hee tooke out of a Manuscript Herball of the Emperours, which whether he tooke to be true or no, he doth not set downe, but surely I thinke both this and all the others he tooke thence, are but *figmenta Botanalogi cujusdam calidi*, they are so artificially composed, although but rudely, according to the times expresst, like unto many others of this name, though much set by by others, for the heads being so like unto burres, sheweth that he would frame it to a kinde of *Arceion*, a Burre, which differeth much from *Arction* or *Arcturon*.

The Place and Time.

This groweth among the Rockes, on the Mountaines in *Savoy*.

The Names.

It is taken by some to be the ἄρκτιον or ἀρκτεῖον of *Dioscorides*, *Galen*, and others, which *Pliny* also calleth *Arctium* and *Arcturum*. *Lugdunensis* onely doth exhibite this to view, under the name of *Arctium quorundam*, which *Bauhinus* calleth *Lappa montana altera lanuginosa*: falling on the same rocke that others before him did, to put no difference betweene *Arceion* and *Arctium*, when as *Dioscorides*, hath so punctually divided them, for assuredly it is *planta sui generis*, and hath no fellow.

The Vertues.

If this be the true *Arctium* of *Dioscorides*, then he saith that the roote and seede boyled in Wine, will helpe the Toothache, if the decoction be held in the mouth: the same decoction is good for burnes, kibes, and chilblanes on the heeles and hands to be bathed therewith: it is also drunke with Wine against the paines of the Hip-gout or Sciatica, and the Strangury. *Galen* confirmeth the same things, saying it is of thin parts, and doth moderately dry and cleanse.

CHAP. XXV.

Melanthium sive Nigella. *Nigella* or Fennell flower.

THere be sundry sorts of *Nigella*, some sowne in Gardens, others growing wilde, most with single, and some with double flowers of the double sorts, and of the Spanish single kinde, I have spoken already in my former Booke, the rest shall follow here.

1. *Nigella Romana sive sativa.* The *Romane* or sweete smelling *Nigella*.

This sweete *Nigella* groweth up to be two foote high, with sundry slender branches, and many finely cut and divided leaves on them, almost as small as Fennell, and very like unto those of the Larkes heeles, at the top of every branch, standeth one flower, made of five blew leaves laid abroad like a starr, without any greene leaves under the flower, as in some single and another double blew sort, with a greene head in the middle, compassed with some few threds, which head groweth to be the seede vessell, being a little long and round, with five small short toppes like hornes, standing at the toppes of the heads, in which lye in severall cells, small blacke, and very sharpe sweete strong smelling seede: the roote is small threddy and yellow, perishing yearely.

1, 3. *Nigella Romana sativa & sylvestris, floribus nudis & foliosis.* The first Romane Nigella, and both the sorts of the wilde.

Nigella Hispanica. Spanish Nigella.

2. *Nigella*

2. *Nigella sylvestris sive Damascena inodora.* Wilde Damaske *Nigella.*

This Nigella groweth very like the former, for the greene leaves, but a little smaller and shorter, the flowers are blew, and like the former, but the head with seede is larger, and the hornes longer, the seede also within is blacke usually, but sometimes a little whitish, or yellowish, and without any sent at all. There is another of this sort as I take it, that differeth onely in bearing single white flowers, and blacke seede without sent.

Alsoone also sowne.

3. *Nigella arvensis.* Field *Nigella.*

This field sort is very like the last, but groweth thinner of branches and leaves, and they shorter also, the heads are smaller and longer, as the flowers are also but of a pale blew colour, the seede is blacke and without any sent. There is of this sort another, differing little from the other, but in the flowers that being single and blew like it, hath greene leaves under them, and the seede being blacke is somewhat sweete.

Alterius capitibus foliosis.

4. *Nigella Cretica inodoro semine. Nigella* of *Candy* without sent in the seede.

This *Candy Nigella* groweth with fine cut leaves like the other, but of a darker greene colour: the flowers are small, and stand singly as others doe, at the toppes of the stalkes and branches, greenish at the first, but blewish afterwards, the ends of the leaves keeping a little greenenesse still in them, with many greenish threds in the middle, tipt with blew: the seede is blacke like others and without sent, that followeth in such like horned heads as others: the roote is fibrous yellowish and annuall.

5. *Nigella Cretica latifolia odorata. Candy Nigella* with broad leaves, and sweete smelling seede.

This broad leafed Nigella riseth up from the yellowish, threddy and annual roote, with one slender weake stalk, divided into some branches, having long and divided leaves set thereon, but not of the forme of the other Nigella, which are Fennell like, or Larkes sparre like, but much broader and parted into divisions, somewhat like unto those of Groundsell, but cut into lesser and finer parts, at the toppes of each of the branches standeth a single white flowers, like unto the other Nigellas, and heads somewhat like them succeeding, containing blacke seede also, but smelling sweetely.

6. *Nigella Cretica altera odorata tenuifolia.* Another sweete *Candy Nigella.*

The rootes of this *Candy Nigella*, are said to be harder then the rest, yet annuall like them, the stalkes that rise from thence are many, upright and slender, parted into severall branches, with but few leaves set thereon, those below being not so finely minced as the former, that are upwards, having smaller yellowish white flowers, at the toppes of them, and cornered blacke seede, sharpe and somewhat sweete, contained in small biformed seede vessels or heads, like two small berries.

7. *Nigella Cretica odorata seminibus biformibus.* A sweete *Nigella* of *Candy* with double formed seedes.

This wonderfull kinde of Nigella (for so it is called) groweth from a small fibrous roote, with many slender stalkes, and few branches rising from them, not much above halfe a foote high, set with long winged leaves like those of Flaxe, opposite each to other, on a middle ribbe, at the toppes of each whereof standeth a large blew flower, somewhat like unto the flower of a Poppy, after which come five cornered heads, containing small blacke

4, 5, 6. *Nigella Cretica inodoro semine latifolia & tenuifolia odorata.* *Candy* Nigella without sent, and two other with sweet smelling seed.

7. *Nigella Cretica odorata foliis Lini seminibus biformibus.* Sweete Nigella of Candy, with double formed seedes.

sweete

sweete smelling seede: but besides these at the joynting of the branches, come forth other sorts of seede clustring together like a bunch of grapes, which are whitish, nature thus providing it with a double issue, least it should faile.

8. *Nigella Citrina flore albo simplici.* Single White Nigella with yellowish seede.

Wee have also in our Gardens, another single sort of Nigella, that hath come among other seedes that hath beene sent from some of our friends beyond Sea, that differeth so little from the other usuall sorts, that it can hardly be discerned, except it be in the fresher greenenesse of the leaves before it come to flower, which then is small like the third wild sort here set downe, but white: the heads also are small but formed alike, having smaller seede within them, not blacke as others are, but yellowish and without sent, and herein it is somewhat like unto the double white kinde, described in my former Booke.

The Place and Time.

The first is usually sowen in Gardens even in *Italy* or else where, the other sorts grow wilde and in the fields of Corne in *Italy*, *Candy*, *Germany*, &c. they are all annuall to be sowne in the Spring, if they doe not sow themselves, and flower in *June* and *July*, giving ripe seede in *August*.

The Names.

It is called in Greeke μελάνθιον and μελάνσπερμον, *Melanthium* also in Latine, and *Nigella a nigro seminis colore ut fertur*, and anciently called *Gith*, divers other bastarde names have beene given it, as *Salusandra* and *Papaver nigrum* from the Greeke word: all late Authours call them either *Melanthium* or *Nigella*, onely *Fuchsius* and *Cordus* tooke it to be the *Cuminum sylvestre alterum* of *Dioscorides*. The *Arabians* call it *Xanim Sunis* or *Sunizi*. The *Italians Nigelle*, the *Spaniardes Axenuz*, and *Niguillia*, the *French Poyurette* and *Nielle*, the *Germanes* one sort St. *Katarinen blumen*, that is, St. *Katherines* flower, the wilde sorts *Schwartz Kumel*, and *Schwartz Kommich*, the *Dutch Nardus saer*, because they and others had a perswasion that the oyle made out of the seede was *Oleum Nardinum*, We call it in *English* either Nigella after the Latine, or Fennell flower, as I doe. For the understanding of the severall Authours of these: the first, second, and third, are mentioned by our later Writers, by those titles they have, or very neere them. The fourth is called by *Bauhinus Nigella Cretica* simply, and by *Clusius Melanthium Creticum*: The fifth is mentioned by *Pona* in his *Italian Baldus*; the seventh by *Alpinus* in his booke of Exoticke plants. The sixt by *Pona* in his *Italian Baldus*. The last as I thinke is not mentioned by any Authour.

The Vertues.

The sweete smelling seedes are effectuall to many diseases, but the first kinde is onely used in medicines, the other that doe not smell well, are in a manner refused, *Galen* saith it is hot and dry in the third degree, and of thin parts, and thereby it helpeth to dry up rheumes and destillations from the head, being tyed in a cloath, and smelled unto, but being put into a cappe among other things for that purpose, it doth much good: being taken inwardly it expelleth winde, the wormes, and womens courses; it helpeth also the shortnesse of breath, and cleanseth the kidneyes of gravell, and the stone, and provoketh urine, being taken with honey, and is a remedy against poyson, and the biting of the Spider *Phalangium*, and the Scorpion, and as it is said encreaseth milke in womens brests, being boyled in Vinegar, it helpeth the tooth ache to be held in the mouth: the same used outwardly helpeth the scurfe, freckles, spots, &c. in the skinne, and hard swellings also, and cleanseth the eyes: being burned, it driveth away flies, gnats, and the like, the seede was familiarly eaten in former times, being strawed on their bread, or put therein as Poppy seede was. *Alpinus* saith, that the use of the fifth sort is very effectuall, both in tertian, and quartane agues, to open obstructions especially, if the seede thereof be boyled with Vinegar and so taken, and killeth the wormes also.

CHAP. XXVI.

Pisum cordatum vesicarium. The bladder heartlike spotted Pease.

Although divers have diversly thought of this plant, some referring it to the kinde of *Halicacabus*, or *Alkakengi*, Winter Cherry, others to other plants, yet seeing it agreeth with none of them all, but in some one thing or other, in others, wanting some one thing or other. And because I could not finde a family whereinto I might thrust it, I have kept it for this place, untill some fellow may be found to match it with. Take therefore the description thereof thus. It riseth up and spreadeth much, if it have good ground to grow in, having sundry slender weake stalkes, which will lie downe on the ground, and entangle it selfe with the claspers it hath, unlesse it be sustained with some stakes, sending forth large long, thinne, and very greene leaves on all sides, upon long footestalkes, being divided either into three or five parts, each whereof is much rent or cut in on the edges: at the joynts with the leaves from the middle of the stalkes almost, upwards, and at the toppes of them likewise, come forth divers small whitish flowers set together upon a footestalke, each consisting of five small leaves apeece, which passe into small fruite, contained in round greene bladders, growing more whitish as it ripeneth, having sixe ridges, whereof three are the more eminent, and open into three parts, in each whereof lyeth one round hard, blackish seede, of the bignesse of a great Pease, spotted on the side with a marke, of the forme of a white Hart, as it is usually set on the cards, or as some compare it to the shaven crowne of Monckes and Fryers, the roote is bushy or stringy, with many fibres thereat, yet perishing every yeare, at the first approach of a Winters day, whether it be ripe or no, and indeede I did never see it beare ripe fruite with us, no not in the hotteste yeare that I have sowne it.

The Place and Time.

It hath come from *Italy*, and other parts beyond Sea, but surely even they have received it from other places also, nor doe I thinke it groweth naturally in any part of *Europe*, it flowreth as is said very late, and the seede ripeneth thereafter.

The Names.

Some as I said have referred it to the *Solanum vesicarium*, or *Halicacabum* of *Dioscorides*, and thereupon have called it, *Vesicaria peregrina*, or *Halicacabum peregrinum*, or *repens*, as *Tragus*, *Fuchsius*, *Gesner*, *Matthiolus*, *Dodonæus*

and others, but *Cordus* on *Dioscorides* earnestly striveth to make it the *Doryenium* of *Dioscorides*, whereunto it seemeth he was led, not onely from the severall parts of the forme thereof, except the leaves, but also from the properties of the seede, which as hee saith, he tryed in himselfe to be dangerous in provoking sleepe, if too much should be taken, although as he saith it causeth a sweeter sleepe then *Opium*: but *Matthiolus* contesteth against him for this his opinion, but sheweth no reasons for it: *Dodonæus* misliking others opinions, bringeth in one of his owne, that this is *Serapio*, his *Abrong* or *Abrugi*, mentioned in his 153. Chapter, in these words: *Abrong* It is a small graine spotted with blacke and white, and like unto the graine *Maiz*: *Lobel* assenteth unto such of his friends as tooke it to be *Dioscorides* his *Isopyrum*, whereunto it commeth neerer as he saith, then unto any sort of *Melanthium*, such as *Matthiolus* gave it for, or as *Dodonæus* in his *French* Herball, *Trifolium palustre*: but all alike, every one wanting some thing or other. *Lobel* calleth it therefore as it was usuall, *Cor Indum*, or *Pisum Indicum*, *Cordus granum cordis*, and *Tabermontanus Cardiospermon*: *Tragus* also saith it was called with them *Muncks Kopfflin id est*, *Monachi calvaria*, or as *Gesner* saith, *Caput Monachi*. *Lobel* also calleth it *Pisum Cordatum*, but *Bauhinus* putting it among the Pease, as a sort thereof, calleth it *Pisum vesicarium fructu nigro alba maculata notato*.

The Vertues.

Some *asignatur* would make it availeable for faintings and other diseases of the heart, but without experience as I thinke. *Cordus* saith as is before related, to be a great provoker to sleepe, even to the danger of life, if the quantity be not proportioned: I find not any of the other Authours that hath written of it, hath set downe any property they knew, or heard to be in it.

Pisum Cordatum vesicarium.
The bladder hart like spotted Pease.

CHAP. XXVII.

Delphinum sive Consolida regalis.
Larkes spurres or heeles.

I Have in my former Booke shewed you all the sorts of Larkes spurres, both tame and wilde, both single and double, both simple and severall colours, and party coloured, that I have not any more to bring to your consideration: Yet I thinke good here to present you with some figures of them, that I had by mee, and with them a kinde of different *Nasturtium Indicum*, in the forme of the leaves, which *Lobel* had formerly set forth, taken as it is likely, to the life of the viewed plant, how soever it hath beene since misliked by many others, who since his time have not obtained the like to see againe, yet that hindereth not much the verity of the thing, no more then the relation of *Hondius* the younger, of a white flower of this kinde, which wee have not as yet seene neither.

Delphinum sive Consolida regalis sylvestris.
Wild Larkes Spurres.

CHAP.

Delphinum sive Consolida regalis latifolia.
Larke spurres with broader leaves.

Nasturtium Indicum.
Indian Cresses.

CHAP. XXVIII.

Pæonia. Peony.

ALthough in my former Booke I have shewed you some sorts of Peonies, which were the male; two sorts of double, and three of the female single, yet not all that are extant, those that wanted there shall be supplyed here, with the Vertues more largely amplyfied. Of the male kinde I know but one sort, which is single and not double, howsoever *Besler in horto Eystetensi*, erroniously hath entituled many therewith, wherefore I thinke it not amisse to give you the figures of both sorts, that the rest may be knowne by them.

1. *Pæonia fœmina Hispanica pumila.* The Spanish dwarfe Peony.

This dwarfe Spanish kinde as *Clusius* saith, rose with him from the seede he received thence, growing with leaves that were more finely cut into divers parts and more pointed also, greene on the upper side, but not shining as others, and hoary white underneath, among which sprang slender pale greene stalkes, lower then others, and at the toppes of each a smaller flower, made of eight leaves, of a more purplish colour, then the ordinary double Peony and as sweete, with many white threds tipt with yellow, standing about the middle bicornered head, which growing ripe, containeth within it, blackish blew seede: the roote is glandulous like other female Peonies but smaller.

2. *Pæonia fœmina Aquilinæ foliis.* Columbine leafed Peony.

This hath sundry dissected leaves rising from the roote, which hath many long clogs hanging thereat, as other sorts of female Peonies have, parted into three divisions, each producing three rounder pointed short leaves then in any other, cut likewise in on the edges, of a pale greene colour on the upperside, and woolly or hoary white underneath, so neerely representing Columbine leaves, that it will soone deceive one that is not well verst in these things, *Clusius* saith that *Hogheland* from whom he received the plant, which as then had not borne flowers and therefore could not describe them; signified unto him that it was a kinde of male Peony: but I thinke hee was therein deceived, the forme of the rootes beings as others of the female kinde, contradicting that opinion.

3. *Pæonia fœmina versicolor.* The party coloured Peony.

The difference of this from the others consisteth chiefly in the flowers, which are sometimes of a pale red, and sometimes of a deeper red colour wholly, and sometimes parted with both these colours, either to the halves, or with stripes and veines.

4. *Pæonia fœmina Leucanthemos & Ochranthemos.* The female white and pale yellow Peony.

Both these sorts of Peonies I must deliver you but upon trust of others fidelity, that have related them, the white

Peony having two witneſſes, the one *Bellonius* in his Obſervations, the other *Honorius Bellus*, each of them atteſting that in the Mountaine *Ida* in *Candy*, there groweth in great plenty, a white Peony, and *Honorius Bellus*, that in the whole Iſland there is no other ſort of Peony to be found, but yet is a *promiſcuous* or doubtfull ſort, and yet ſince their time we have not heard of any hath enjoyed one of ſuch a colour, unleſſe *Beſler in horto Eyſtetenſi* ſhould meane it that he calleth *Pæonia mas flore albo*. But *Camerarius* ſaith that that which paſſeth under that title, is not perfit white, but whitiſh with ſome redneſſe among it, which maketh a faint bluſh colour. For the pale yellow, *Camerarius* alſo ſaith, that one by ſuch a name he had out of the *Lantsgrave* of *Heſſen* his Garden, but had not as then when he wrote thereof flowred with him, neither yet to this time that I write this, can I heare of any that hath it, but words enough I heare.

5. *Pæonia fœmina promiſcua.* The doubtfull female Peony.

Becauſe the leaves of this Peony have ſome reſemblance to thoſe of the male, it cauſed *Lobel* to entitle it *Promiſcua ſive neutra*, ſaying, if you behold what growes above ground, you would ſay it were a male, but if the rootes underground, a female, and ſaith that *Pliny* made this the *mas*, but *Dodonæus* referreth it to the other ſort, which hath longer and ſmaller rootes, calling it *fœmina altera*, whereby it is plaine that one of them was deceived therein alſo, & as I thinke a tranſpoſition of the figures in *Lobel*, for that figure in *Lobels Icones*, that beareth the title *Promiſcua* is the firſt female in *Dodonæus*, which hee ſaith was moſt common with them, as it is with us, the other being brought in afterwards, which I thinke doth neerer reſemble the leaves of the male, let the judicious conſider this well, and gaineſay it if it be erronious, for although *Bauhinus* taketh *Dodonæus* his *fœmina altera*, to be the moſt common, yet ſurely I can not finde it ſo with thoſe plants, that are the moſt common female in our Country, and ſo he doth *Beſler* his errour of divers ſorts of the male, and of divers colours, and the white one likewiſe, among the reſt, which he calleth *Pæonia mas flore albo*: but as *Dodonæus* ſheweth, *Dioſcorides* doth plainely diſtinguiſh betweene the male and female Peony, firſt by the leaves, the male to be whole and not divided, but like unto thoſe of the Wallnut tree, and ſecondly in the rootes, that they are ſingle and not glandulous, as is the female, which truth will utterly confound both *Beſler* and *Bauhinus* opinions therein, and *Lobels* and *Camerarius* alſo, to make any *promiſcua*, all the other ſorts ſhewing themſelves to be females by their rootes.

6. *Pæonia fœmina ſimplici flore & pleno, ex ſemine floris plenirubri vulgaris Cluſio natæ.*

Certaine ſingle and double female Peonyes, that ſprang with *Cluſius* of the ſeede of the double red.

Cluſius ſaith that having in ſome yeares ſeede from the ordinary double red Peony (which is not uſuall) hee ſowed them, and within three yeares he had plants that bore flowers, ſome ſingle and ſome double: of the ſingle ſorts, one bore flowers for colour moſt like unto the mother, but was ſingle, conſiſting onely of ſix leaves, as the ordinary female doth: Another bore a larger flower of eight leaves, whoſe colour was of a deeper red, drawing ſomewhat to blackneſſe: A third bore a double flower, as great as the mother plant or greater, and of the ſame colour: but he had alſo as he ſaith another like the mother plant in leaves, &c. whoſe flower was double, but leſſer and not ſo thicke of leaves, the colour whereof was of a deepe red, being neere the bigneſſe of the double bluſh, having ſome blacke veines in thoſe leaves that grew in the middle.

Pæonia fœmina vulgaris flore ſimplici.
The ordinary ſingle female Peony.

Pæonia fœmina flore pleno purpureo.
The ordinary double red Peony.

7 Pæ-

Pæonia mas. The male Peony.

1. *Pæonia pumila Hispanica.* The dwarfe Spanith Peony.

7. *Pæonia fœmina flore pleno carneo major.* A greater double bluſh Peony.

From *Count Aremberg*, and *John Boiſot*, perſons worthy of credit ſaith *Cluſius*, I received intelligence, that at *Bruſſells* in the garden of the Lady *Tiſenac*, who was the *Preſidents* Widdow, they ſaw growing a bluſh double Peony, greater then the ordinary, and as great as the ordinary double red, yet holding the naturall property of the other double bluſh flower, which is to grow whiter by ſtanding, and to hold the leaves without ſhedding for a long time.

The Place and Time.

The places of the moſt of them are declared in their titles, or deſcriptions, and their flowring, &c is about *May*, with the other ſorts.

The Names.

It is called in Greeke παιονία και ρυνοσέλινον, in Latine alſo *Pæonia*, many other names are given it both in Greeke and Latine as *Pentorobos*, (yet ſome have it *Pentoboros*) *Orobelion*, *Hæmagogon*, *Pæonion Panthixeraton*, *Theodonion*, *Selenion*, *Selenogonon*, *Pthiſis*, *Aglaophotis*, *Idæus dactylus*, and ſome others: in Latine alſo *Roſa ſatuina*, *Herba Caſta*, *Haſta regia*, *Roſa aſinarum*, and *Glycyſide* or *Dulciſida*, from the red graines in the P mgarner, called *Sida* in Greeke, but *Pæonia* from *Pæon*, that famous Phyſitian in his time. And *Aglaophotis* from the ſhining redneſſe of the red graines or ſeedes, from whence ſo many fabulous and deteſtable illuſions of *Ælianus* his *Aglaophotis*, and *Ioſephus* his *Baciaras* are referred and reported of Peony, as may be ſeene in the Writings of the Auncients. *Tragus* ſheweth that in his time the male Peony rootes were ſold for *Dictamnus albus*, but I thinke *Tragus* was therein deceived, for I verily thinke they were the ſame white rootes which now are taken and called *Dictamnus albus*; when they are the rootes of the *Fruxinella* as I ſhewed before in that Chapter, for the rootes of the male Peony are not ſo white as they, which confirmeth me the more herein, becauſe *Tragus* ſaith, the leaves of that Peony which he tooke to be the male, had leaves like an Aſh, or Licoris, and ſuch are the *Fraxinella* leaves, which alſo himſelfe deſcribeth reaſonable exactly, in the ſeventh Chapter of his firſt Booke, with *Dictamus Cretenſis*, but much miſtaken in the ſent to be like Cinamon, unleſſe it be divers in the *Rhyne* tract from others. And I have ſhewed before alſo, that we want not couzeners, and deceivers, to ſell the white rootes of the greater *Oenanthe*, for white Peony rootes. There needeth not any further explication of theſe ſorts of Peonies, ſince *Cluſius* hath made mention of all ſave one, and that *Camerarius* in *horto*, and *Bellonius* doe expreſſe, which is the fourth. The *Arabians* call it *Feonia*, the *Italians Peonia*, the *Spaniards Roſa del monte*, and *Roſa Albardeira*, the *French Pivoine*, the *Germanes Peonien Roſen*, *Benedicten Roſen*, *Pfingſt roſen*, *Kunigs blumen*, and *Gichtwurtz*, the *Dutch Pioenen ende Maſt bloemen*, and we in *Engliſh Piony*, or *Peony*.

The Vertues.

It is ſaith *Galen* of thin parts, and drying, yet not very notably hot, but according to our owne ſymmetry, or conſtitution, or rather a little hotter, an aſtringent quality alſo, with ſome ſweeteneſſe it hath, and ſome acrimony likewiſe, and bitterneſſe joyned together, whereby it is effectuall to procure womens courſes, if the bigge-

neſſe of an Almond, in powder be taken in honied Wine: by the acrimony and bitterneſſe therein, it is good to open the obſtructions of the liver, and kidneyes, and the yellow jaundiſe and ſtone: and by the aſtringent quality to ſtay the fluxes of the belly; but the more effectually if the decoction thereof be taken, that is made with harſh or red Wine: by the notable drying quality therein alſo, ſaith he, I doubted not to helpe children therewith that had the falling ſickneſſe, by tying it about their neckes. And indeede I ſaw a childe freed from that diſeaſe, that had for eight whole moneths together, worne a good peece of the roote about him, and that as ſoone as that peece by ſome chance fell from about his necke, or was taken away for tryall of the matter, he fell into the diſeaſe againe: but having a freſh one applyed to him againe, he became perfectly well: the reaſon whereof may be, that the Spirits thereof drawne into the pores by the inward heate, and outward aire, pierced the places, effected with the diſeaſe, and cured it: for after the ſame manner doth the *Succus Cyrenaicus*, that is the beſt *Laſer*, or *Laſerpitium*, cure the uvula, or palate of the mouth as we call it, when it is ſalne downe, or ſwolne through rheume: or as Nigella ſeede being fryed, and bound in a thinne warme linnen cloath, doth dry up the thinne and troubleſome diſtillations of rheumes, by the hot breath thereof riſing through the noſtrils: as alſo if divers threds dyed in the purple fiſh colour, be bound about a Viper or Adders necke, and it thereby ſtrangled, and they afterwards bound about their neckes that have ſwellings or other diſeaſes in their neckes and throates, doe marvailouſly helpe them: theſe be *Galens* words: but our age hath not onely found *Galens* experiments true on children, the roote (of the male rather then the female, yea the male not the female, and that freſh and not dry, if you meane it ſhould doe good) is to be hanged about their neckes, and that the decoction thereof is to be taken inwardly, to make it the more availeable, and that alſo in older perſons, if the diſeaſe be not growne too old and paſt cure, for whom the roote of the male kinde waſhed cleane, ſtamped ſomewhat ſmall, and laid to infuſe in a ſufficient proportion of Sacke for twenty foure houres at the leaſt, after ſtrained, and given firſt and laſt, a good draught for ſundry dayes together, before and after a full moone, cureth that ſickneſſe, if there be a due and orderly preparation of the body afo-ehand with poſet drinke made of Betony, &c. as the learned Phyſitian can beſt appoint: the roote alſo is effectuall for women that are not ſufficiently cleanſed after child-birth, and for ſuch alſo as are troubled with the mother, for which likewiſe the blacke ſeed being beaten to powder is given in wine, the red ſeedes being taken for fluxes: the blacke alſo taken before bed time, and in the morning alſo is very effectuall for ſuch as are in their ſleepe troubled with the diſeaſe called *Ephialtes*, or *Incubus*, which *Pliny* calleth *ſuppeſſio nocturna*, we uſually call it the night mare, which is a ſuppreſſing both of voice and breath, and oppreſſing the body as it were, with ſome heavy burthen, ſtriving to be eaſed thereof, but ſeeming not to be able nor to call for helpe, Melancholly perſons being for the moſt part ſubject to this diſeaſe: it is alſo good againſt melancholly dreames, *Matthiolus* doubteth whether our Peony, be that which *Galen* uſed, becauſe many Phyſitians as he ſaith in his time failed in the tryall thereof on young children, and I am in doubt that *Tragus* his male Peony ſpoken of here before, was that which they uſed, and then no marvaile if it proved not effectuall as they expected, yet ſaith *Matthiolus* our Peony ſeedes is availeable to reſtore ſpeech to thoſe that have loſt it, if thirty graines husked be made into powder and given in Wine: it is alſo ſaith he, good againſt the bitings of Serpents not onely to be drunke but to be laid on the bitten place, which thing *Tragus* ſaith of his male Peony, which as I ſhewed you before, is the *Fraxinella*. The deſtilled water or Syrupe made of the flowers, worketh to the ſame effects that the roote and ſeede is applyed before, although more weakely. The male kinde being ſo ſcarſe a plant and poſſeſſed but by a few, and thoſe great lovers of rarity in this kinde, and the Female being more frequent, the one is uſually put inſtead of the other.

CHAP. XXIX.

Pappas ſive Battatas. Potatoes.

THere are divers ſorts of rootes that are called Potatoes with us, ſerving for foode or delight, more then for medicine, whereof all that are truely knowne to us, what face or forme of leaves and flowers they beare are expreſſed in my former booke: there are many more of the ſame quality; beſides others that ſerve in ſtead of bread, familiar to the Natives both of the Eaſt and Weſt Indies, whoſe names or ely are extant in thoſe Authours Workes that have written of them, without any further declaration either of forme or any property, but that the rootes are eaten by them, ſome being of better taſte then others & longer laſting, among whom as I take it the *Igname* or *Inhame*, is a principall one, whereof *Scaliger* firſt, and *Cluſius* afterwards, have given us the beſt information. *Cluſius* ſaying it is alſo called by ſome *Camotes*, *Amotes* and *Aies*. All he ſaith of it is this, that ſome *Portugall* Ships that were taken by the *Hollanders*, had divers of theſe rootes in them ſome bigger then others: for ſome as he ſaith were as bigge as ones arme, and of a foote long or more, others leſſer, and ſome thicke and ſhort having ſome ſmall tubers thruſting out at the lower parts of them, but all of them covered with an uneven and rugged barke, with many fibres at them: the ſubſtance of the roote within, being white, ſoft, ſappy, tender, and as it were kernelly, and of no unpleaſant taſte (that is the raw roote for he ſaith he taſted it) at the firſt, but a little rough and ſharpe afterwards: but being roſted under the embers it taſteth more tender then any Cheſnut, and ſomewhat like a Peare, but ſaith he what ſtalke or leafe it bore hee could not underſtand of any: onely he ſaith he received one that was ſent him that had a ſprout at the head of it, which was broken off in the carriage, as the figure here expreſſeth it unto you, but *Lobel* in his *Adverſaria*, ſaith he underſtood that thoſe rootes of the *Inhame*, that were brought from *Æthiopia* and *Guiney*, bore Mallow-like leaves (and differeth from thoſe of *Spaine*, and the *Canary* Iſlands, which are our ordinary great Potatoes) and ſuch like leaves doth *Lugdunenſis* give to an *American* plant called *Hetich* whoſe roote is ſomewhat like it and edible. *Cluſius* alſo ſpeaketh of another ſort of theſe *Inhames*, which as he ſaith ſome called *Team Peru*, but the *Portugals Inhame* as the former, which although it were like the other, yet the barke was more uneven, and ſome as it were ſome knobbes thereon, with ſmall fibres going from them, and from the head of the roote, went but hard great ſtringes, of a foote long, which were prickly for the moſt part. *Cluſius* ſeemeth to referre the *Virginia Potatoes*, to the *Arachidna Theophraſti*, and *Lugdunenſis* ſaith ſome did the *Manihot*, and that this *Inhame* was referred

Battatas de Canada.
The Frenches Battatas, or *Hierusalem* Artichokes.

Battatas Virginiana.
Potatoes of Virginia.

Battatas Occidentalis Indiæ & Inhame Orientalis Lusitanorum.
The West Indian, and the Negros Potatoes.

referred to *Theophraſtus* his *Araco ſimilis*. But *Bauhinus* his *Ovingum*, or *Vingum*, and *Oetum* by *Pliny*, ſo variable are mens conceites, eſpecially in things obſcure or unknowne, or when they doe *raptim* without due conſideration *ſententium proferre*. But *Scaliger Exercitat.* 181. 17. ſeemeth to know three other ſorts, beſides the ordinary, which will abide good without periſhing for a whole yeare, and therefore the *Spaniards* uſe to bring them to Sea with them, and call it *Ignames cicorero*: the other will laſt nothing ſo long, whereof that which groweth in the Country of *Benim*, is of an excellent reliſh, but that of *Manicongo* is the worſt, and that of Saint *Thome*, which is as yellow as a Carrot, is of moſt eſteeme: the planting hereof ſaith he, is wonderful, for it is not done by putting the rootes into the ground, but a ſtalke taken therefrom cut in long peeces, and holding ſome barke thereon, and ſo thruſt into the ground, will in five moneths be good to be gathered: it hath ſaith he, a leafe ſomewhat like unto that of the Citron tree, both in forme and luſter, but ſmaller and thinner: it runneth on poles that are ſet for it like Hoppes: the roote like the Reede, or Dragons hath foure or five ſuckers joyned to it: this manner of planting this *Inhame* favoureth ſomething of that of the *Manihot* or *Iucca*, whereof the Caſſavi is made: if there be not a miſtake, it is wonderfull that two rootes ſhould be ſo propagated.

CHAP.

CHAP. XXX.

Rosa Hiericontea. The Rose of *Hiericho.*

THere hath beene obſerved two ſorts of this ſmall plant, called the Roſe of *Hiericho*, thē one accountēd a wilde ſort, and yet the one groweth in as barren places as the other.

1. *Roſa Hiericontea vulgo dicta.* The vulgar Roſe of *Hiericho.*

The Roſe of *Hiericho* is a ſmall buſhy plant growing full of wooddy brittle branches, ſet in a round compaſſe, and ſundry ſmall leaves on them, farre leſſer then thoſe of the Willow, and more neere unto the Privet: the flowers ſtand thicke cluſtring together, made of foure white leaves growing out of long huskes, wherin afterwards is contained two ſmall ſeede, the roote is long and wooddy. This is ſaid to ſmell ſomewhat ſweete, but I could never finde it ſo, and to taſte ſomewhat ſharpe.

Roſa Hiericontea.

2. *Roſa Hiericontea ſylveſtris.*
The wilde Roſe of *Hiericho.*

The wild ſort groweth in the ſame manner, as the former, but the wooddy ſtalkes are ſtiffer and harder to breake, and hath (as it is ſaid) neither ſmell nor taſte.

The Place and Time.

Both theſe ſorts grow in *Syria* and *Arabia*, as *Bellonius* and *Ranwolfius* have obſerved in their travailes.

The Names.

It is called *Roſa de Hierirho*, and *Hiericontea*, and *Roſa Mariæ*, by all that have written of it, (the Monkes as *Bellonius* ſaith, being the firſt inventers, of the name, and of the ſuperſtitions they added to it, when as he ſaith he found none hereof growing about *Hiericho*, but onely in *Arabia*, in the deſart land neere the red Sea) except *Cordus* and his Father before him, who tooke it to be *Amomum*, but ſaith *Anthonius Muſa* contraryed that opinion for divers reſpects, and yet hee contumatiouſly would uphold his fathers error, which ſheweth how neceſſary it is to ſee the face of things growing as *Camerarius* and others, who having ſowne the ſeede, doth ſay it doth in ſome ſort repreſent a *Thlaſpi*, having but a little ſharpe taſte in the branches onely and roote. *Ranwolfius* ſaith he found the other ſort in *Syria*, growing among the rubbiſh, and on the houſes, and therefore called it a wilde kinde. *Cordus* to put a diſtinction betweene theſe two ſorts, called the former *Amomum*, and the later *Amomis*, comparing and fitting the deſcription of *Amomum* in *Dioſcorides*, unto the forme and parts thereof, yet how like ſoever he would make it, it commeth farre ſhort of the true *Amomum*, as it is well knowne now adayes. *Gerard* on the contrary ſide would referre it to a Heath, who is as farre wide as the other.

The Vertues.

It is not found uſefull in phyſicke for any reſpect that I can learne: this onely property is in it, that how dry ſoever the plant is, being brought from beyond Sea, yet if it be ſet in water for a while, it will dilate and open it ſelfe abroad, that all the inward parts may be diſtinctly obſerved how it groweth, and although the leaves are all loſt, yet the ſeede and the veſſells remaine, from whence if it be freſh, the ſeede taken hath growne, and will cloſe up againe after a while, that it is taken out of the water, not as the ſuperſtitious Monkes, falſely fained that it did open miraculouſly, that night that our Saviour was borne, and that it would doe ſo in what houſe ſoever it is, when the woman with childe abiding therein, ſhall be neere her time of delivery: for with moyſture as I ſaid it will open, and not without it.

ARBO-

ARBORES, ET FRVTICES.
TREES AND SHRVBS.
CLASSIS DECIMASEXTA.
THE SIXTEENTH TRIBE.

CHAP. I.

Quercus. The Oke.

IN this Classis, I am to shew you all those kindes of Trees, whether they be tall and great, or lesser, usually called Shrubbes, which grow naturally in these Countries of *Asia minor*, the hether part of *Africa*, best and longest knowne to us, and *Europe*, and that have not beene dispersedly already spoken of heretofore: For the infinite kindes that grow in *Asia major*, the East India, and *America*, the West India, besides that we want the knowledge of the most of them; would furnish a capacious volume by themselves: and therefore in my last Classis I will onely give you a hint of some, either of best use, or best knowne, and in this, as I thinke is fittest, begin with the Oke.

The Trees that beare Acornes, called in Latine *Glandiferæ arbores*, doe comprehend five severall kindes, which are *Quercus*, *Ilex*, *Suber*, *Smilax Arcadum glandifera*, and *Phellodrys*, and for want of fit *English* names to sort unto each, we are forced to call them all Okes, and to distinguish them, give them severall epithites, according to their qualities. The *Quercus* or Oke is parted againe into five sorts, all of them having divided leaves, called first, *Platyphyllos Latifolia Quercus*, *Hemeris sive Etymodrys Veriquercus* or *Robur*, *Phagos Esculus*, *Ægilops Cerrus mas vel majore glande*, and *Haliphlœos Cerrus fœmina sive minore glande*: Of these and their severall *species* in this Chapter, and of the rest in the succeeding, every one in their order.

1. *Quercus latifolia.* The broad leafed Oke.

This Oke, which as I take it is the most common in our Land, groweth to be a great tree, and of long continuance, especially if it grow in a fertile soyle, the truncke or body whereof is covered with a thicke rough barke, full of chops and clifts: the armes or boughes likewise are great, dispersing themselves farre abroad, and bluntly cut in or gashed about the edges, smooth, and of a shining greene colour, whereon is often found a most sweete dew, somewhat clammy, and upon divers of them are found growing a round spongye substance, called an Oke Apple, whereof I shall speake more hereafter, among the sorts of excrescences. It beareth small, yellowish mossie flowers, standing close together upon long stalkes, which wholly fall away in the beginning of the Spring. The fruite or Acornes rising up in sundry other places, upon short stalkes, two or three for the most part joyned together, whose outer rinde or skinne is browne being ripe and tough, the lower end being set or placed in a small rough hollow cup, the nut or kernell within being hard, cleaving into two parts, and of a reasonable sweete taste. The roote is great, and spread farre and deepe, some thinking that they runne as deepe into the ground, as they grow high above it. The timber or wood is firme, strong tough and yellowish, with a smooth great graine, yet smoother and firmer in some places then in others, being the most durable either above ground or under, on the land, or in the water, beyond any other kind of timber almost, and enduring both moisture and drougth above all: the outer part being called the sappe, is as all know whiter and lesse durable.

Some have made one or two sorts more of this kinde, one with greener, yet more hairy or woolly leaves, and with so many deepe cuts therein, that they seeme as curld thereby; another with a shorter leafe and more jagged at the bottome, both of them with smaller Acornes then the former. *Clusius* also saith that he found a dwarfe kinde hereof most likely, not farre from *Lisbborne* not above a foote high, bearing broad leaves with sharper edges, whose acornes were as great as those of the common Oke, but very bitter, standing in a smoother cuppe, and saith also that on the hils neere the Straights or *Hercules* pillars, there are some growing that hold their green leaves all the Winter, and *Dalechampius* reporteth the same to be found on the *Apenine* hils, and those that are

Altera species.

Humilis.

Semper viri.

called

1. *Quercus [illegible] & fructum ferens.*
The Oke bearing Bullomes and Acornes.

1. *Quercus humilis.*
The dwarfe Oke.

2. *Gallæ cum Galla altera rugosa.*
The greater rugg Gall of the Gall tree.

2. *Gallæ major altera lenis.*
Another great Gall that is smooth, of the Gall tree.

called *Audes*, bordering on *France*, as *Plinie* out of *Theophraſtus* ſpeaketh of one in *Thurino agro ubi Sybaris fluit* that did not ſpring till Midſommer, and kept the greene leaves in the Winter.

2. *Hemeris ſive Robur.* The ſtrong or Gall Oke.

The ſtrong or Gall Oke (call it which you will, for both names fit it well, the one from the Latine word *Robur* that is ſtrength, and the other becauſe it eſpecially beareth Galles) groweth not ſo high or great as the former, but ſhorter and more crooked, yet ſpreading faire branches, ſet with long leaves like the former, but more cut in on the edges, and hoary underneath: they flower and beare Ackornes like the former, but not ſo plentifull, and are greater, ſtanding on longer ſtalkes, being ſweeter alſo, beſides which Ackornes, it beareth alſo a round wooddy ſubſtance which is called a Gall; the wood or timber hereof is hardly to be bored.

Of this kinde there are divers ſorts ſome growing much lower then others, ſome having their leaves leſſe cut in or jagged on the edges, and ſome bearing more ſtore of Galles, others no Ackornes at all, ſome againe beare great Galles, other ſmaller, ſome knobbed or bunched, others ſmooth: ſome of one faſhion, others of another, and of colour ſome white, ſome reddiſh, others yellow, and ſome ſmall and greene, which is the *Omphacitis*. *Galle diverſe.*

3. *Phagus ſive Eſculus.* The ſweete Oke.

This ſweete Oke called in Latine *Eſculus* (*ab eſca vel ab eſu* becauſe the Ackorne is the ſweeteſt in taſte, and fitteſt to be eaten of any) hath a ſhort truncke or body in compariſon of the firſt Oke, and like unto the Gall Oke, growing with thicker and more buſhing branches, full of leaves which are thicker and narrower, and with more ſeparate gaſhes, of a darke greene colour on the upper ſide, and whiter underneath: the Ackornes grow ſeldome two together on a ſhort thicke ſtalke ſlenderer, more pointed and ſticking faſter in the rough prickly cuppes to the middle of them, but as I ſaid is the ſweeteſt of any other, comparing with the Cheſnut, when it is roſted or ſod, and in many places in *Spaine*, ſerve for the poore to feede on as their daily food, and the Rich for junkets at their table, as we uſe to doe with fruite of all ſorts, according to the time of the yeare, and will as much intoxicate the braine as Darnell in bread. There is another differing ſort hereof, whoſe Ackorne is greater, and will more eaſily fall out of the cuppe, by reaſon of the heavineſſe of the Ackorne. They have in *Virginia* a goodly tall Oke, which they call the white Oke, becauſe the barke is whiter then of others, whoſe leafe becauſe it ſo neerely reſembleth this ſweete Oke, I have joyned with it, the Ackorne likewiſe, is not onely ſweeter then others, but by boyling it long, it giveth an oyle which they keepe to ſupple their joynts. *Altera glande minore.* *Altera Virginiana.*

4. *Ægilops ſive Cerrus mas.* The male bitter Oke.

The male bitter Oke ſo called of the extreame bitterneſſe of the Ackornes, ſeldome groweth neere any habitable places, but moſt uſually in great woods, and riſeth up with a tall ſtraight body, ſpreading large armes and branches, whereon grow thicke long leaves, with deeper gaſhes therein then in any other: the Ackorne is ſmall ſhort and blunt, and very bitter, almoſt wholly covered in the rough flat huske, which is ſet with ſharpe prickles, of a grayiſh colour: the wood or timber is ſtrong if it ſtand upright, and durable being kept dry, but in that it is of a looſer ſubſtance it quicklyer rotteth, yet is a fit fewell for coales and the fire, if it doe not require any great heate.

2. *Galla minor.*
The leſſer Gall of the Gall tree.

3. *Phagus ſive Eſculus noſtras & Folium Quercus albæ Virginianæ.*
The ſweete Oke, and a leafe of the white Oke of Virginia.

diverſi

4. *Ægilops ſive Cerrus mas majore glande.*
The male bitter Oke.

5. *Haliphlœos ſive Cerrus fœmina minori glande.*
The female bitter Oke.

divers through neceſſity eate of the Ackornes, notwithſtanding the bitterneſſe, but they doe engender much headache: Dyers alſo uſe this to ſtrike a blacke colour, but it will hold leſſe then that which is made with Galls by much.

Cerri fœminæ glans immatura.
The unripe Ackorne of the female bitter Oke.

5. *Haliphlœos ſive Cerrus fœmina.* The female bitter Oke.

This other bitter Oke (which from the Greeke name, might be called the thicke barkt Oke, or elſe from the thickneſſe of the barke be reckoned a kinde of Corke tree, but that other things doe not agree thereunto) hath a reaſonable tall thicke, but ſomewhat crooked body, covered with a very thicke aſhcoloured grayiſh barke, having ſuch ſhort branches, that it ſeemeth as continually kept lopt and poled, the leaves are like to the male kinde, but narrower and longer, whoſe cuts or gaſhes are not ſo broad open being hard, rough, and of a darker greene colour: the Ackorne hereof is ſmaller then in any other, except the Scarlet Holme Oke, hereafter ſet forth, and is ſo ſhort that it ſcarſe ſheweth it ſelfe out of the ſharpe and prickly cuppe, like to the male kinde, and is almoſt as bitter, the wood or timber hereof is looſe, weake, and ſoft, neither firme nor ſtrong, whereby it is the more ſubject to putrefaction, and unfit for building, or any other but ſmall worke.

There is another ſort obſerved hereof in ſome woods, whoſe leaves are not ſo much gaſhed, and the Ackornes being greater, grow three or foure together, without any ſtalke, whoſe huske or cup is as ſharpe and prickely as the other of theſe kindes.

The Place and Time.

The firſt Oke is the moſt generall throughout the land, growing on high or low grounds indifferently, yet flowriſh beſt in a fruitefull ground: the other kindes that I can heare of, are not growing any where with us, although there is ſome variety found in the timber of ours, ſome being of a finer graine, and ſmoother, ſhorter, and whiter wood, others a courſer graine, tougher, ſtronger and more coloured: but they are moſt frequent in *Italy*, *Spaine*, and other hot climates, their long catkins or bloomings come forth early in the Spring, and fall away for the moſt part, before the leaves doe come forth, the fruite or Ackornes are not ripe untill *October*.

The Names.

The Oke is called in Greeke δρῦς, and is a generall word for all trees that beare Ackornes, as the Latines *Quercus* is, but more ſtrictly taken, it ſignifieth this Oke, which is called by moſt in Greeke πλατύφυλλος, in Latine *Latifolia*, after *Gaza*. The *Italians* call it *Quercia*, the *Spaniards Quenigo*, the *French Cheſne* and *Queſne*. *Dodonæus* calleth it *Hemeris quercus quaſi ſativa vel vobana*, and the ſecond he calleth ἄγρια ſylveſtris, or *Robur*, when as the

as the beſt Authours that I read make *Hemeris* to be *Robur*, *Gaza* tranſlateth it ſometimes *Placida*, and ſometimes *Quercus*. *Theophraſtus* ſaith that the *Macedonians* in his time called it ἁμάδρυς *Etymodrys*, and by *Gaza Veri quercus*, and of ſome *Quercus robur*, and *Galla arbor*: the *Italians* call it *Rovero*, the *Spaniards Euzina*, and ſome *Portugalls Carvalla*, the *French Roble*, and *Roure*, in *Dutch Eyckenboom*. The third is called in Greeke Φηγὸς *Phagus* in Latine *Eſculus*, ἀπὸ τῦ φαγεῖν, as the Latines doe *ab eſca vel eſu*: *Gaza* in tranſlating this unto *Fagus*, according as *Pliny* had ſo done before him, hath beene the cauſe why ſo many have erred in taking this *Phagos* of *Theophraſtus*, to be the *Fagus* of the Latines, which is in *Engliſh* the Beech tree, when as they might plainely ſee that *Theophraſtus* reckoneth it as a kinde of Oke, and that beareth the ſweeteſt Ackones, but *Fagus* the Beech tree beareth no Ackornes, but a three ſquare nut like a cheſnut: The *Italians* call it *Eſchia*, the *Romanes Eſculo*, the *Spaniards Euzina*, and the Ackornes *Vallotas*. The fourth is called in Greeke Αἴγιλωψ *Ægilops*, of the *Macedonians* ἄσπρις; *Aſpris*, in Latine *Cerrus*, or *Cerris* as ſome have it, yet *Pliny* maketh mention both of *Ægilops* and *Cerrus*, ſome doe call it *Cerrus mas*, & *Cerris majore glande*, in comparſon of the next, *Gerard* calleth it the Holme Oke, and his Corrector letteth it ſo paſſe, when as the *Ilex Coccigera* is more fitly to be ſo called, becauſe the leaves thereof are much more like unto the Holme or Holly buſh, then this is; the *Italians* call it *Cerro*, they of *Cyprus Sio*, and other places in the bottome of the Straights, call the Ackornes hereof *Galliones*: the Word *Ægilops* doth alſo ſignifie a kinde of wilde Oates, as is declared before among the Graſſes. The laſt is called in Greeke Ἀλίφλοιος ἢ ἔυπτερος, or as ſome read it εὐφλοιος, in Latine alſo *Haliphleus*, but of moſt *Cerrus famina*, and of ſome *Cerris minore glande*, *Gaza* tranſlateth it *Salſicortex*, thinking it tooke the name from ἅλς which is *ſal*, and φλοιὸς *cortex*, but the barke hereof is not more ſalt, but more thicke then others, and therefore it is derived from ἅλις and φλοιὸς, *a corticis craſſitudine*, the *Italians* call it *Farnia*.

The fruite of the Oke is called in Greeke βάλανος *Balanus*, in Latine *Glans*, but both Greekes and Latines referre the word to divers other fruites of trees, as Διὸς βάλανος, *Iovis glans* the Walnut, and Σαρδιάνα βάλανος; *Glans Sardinia* the Cheſnut, and Φοινικοβάλανος, *Glans Phœnicea*, or *Palma* the Date, and βάλανος μύρεψικη *Balanus Myrepſica*, os *Glans unguentaria* or *Nux ben*, the oylie Nut Ben, in *Italian Chiade*, in *Spaniſh Bellotas*, in *French un ghand*, in *Dutch Eekel*, in *Engliſh* Ackorne, and Maſte, which yet is ſaid to be the fruite of the Beech, and ſome other trees. The cup or huske wherein the Ackorne ſtandeth is called in Greeke κύπελλος, in Latine *Calyx glandis* in the Apothecaries ſhops *Cupula glandis*.

The Vertues.

The leaves and barke of the Okes, and the Ackorne cups doe binde and dry very much, and are ſomewhat cold withall, but the Ackornes themſelves are neither ſo cold nor ſo much binding, yea we have a generall received opinion that Ackornes in poucher drunke in wine are good to helpe ſtitches and paines in the ſides, but they uſually put a few bay berries unto them in the taking: the inner barke of the tree, and the thinne skinne that covereth the Ackorne, are moſt uſed in Phyſicke to ſtay the ſpitting of blood, and the bloody flix: the decoction of that barke and the pouther of the cups doe ſtay vomitings or caſtings, ſpitting of blood, or bleeding at the mouth or other fluxe of blood in man or woman, laskes alſo, and the involuntary fluxe of naturall ſeede: the Ackornes in pouther taken in wine, provoketh urine, and reſiſteth the poyſon of venemous creatures, and the decoction of them and the barke made in milke and taken reſiſteth the force of poyſonous herbes, and medicines, as alſo the virulency of *Cantharides*, when as by eating them, the bladder is exulcerated, and they piſſe blood. *Hipocrates* ſaith he uſed the fumes of the Oken leaves to women that were troubled with the ſtrangling of the mother: and *Galen* ſaith he applyed them being bruiſed to one that had a wound with an axe or hatchet, not having any thing elſe neere at hand, and thereby ſodered up the wound, and kept it from inflammation. The cups of the Ackornes are more binding then the Ackornes by much in any thing. The diſtilled water of the Oken budds before they breake out into leaves, is good to be uſed either inwardly or outwardly, to aſſwage inflammations, and to ſtay all manner of fluxes in man or woman. The ſame water is ſingular good in peſtilentiall and hot burning fevers, for it reſiſteth the force of the infection and alayeth the extreame heate: the ſame water alſo drunke as *Matthiolus* ſaith, cooleth the heate of the Liver, breaketh the ſtone in the kidneyes, and ſtayeth womens courſes: the decoction of the leaves worketh the ſame effects. The water that is found in the hollow places of old Okes is very effectuall againſt any ſoule or ſpreading ſcabbe: the Ackornes ſaith *Galen* being eaten are hard of digeſtion, breede windineſſe, cauſe headache and a kinde of giddineſſe, to avoid ſuch inconveniences they are boyled or roaſted, before they be eaten, and thereby they become leſſe windy and more pleaſant, yet it is extant by the teſtimony of Hiſtorians and Poets, that the elder age before it knew the uſe of corne and bread thereof, lived upon Ackornes and were ſuſtained thereby, yea they had the Oke in that honour that they dedicated it to *Iupiter*, eſpecially that kinde called *Eſculus*, becauſe that *Iupiter* himſelfe fed thereon and was nouriſhed by them, and the uſe of them is not every where yet utterly extinguiſhed, for that as I ſaid before, the poore people in *Spaine* in ſome places, make theſe Ackornes a part of their feeding, and the rich have them ſerved to their Tables for an after courſe, as with us is uſed with Apples, Nuts, and ſuch like fruites as the ſeaſons require. There is ſaid to be a great Antipathy, betweene the Oke and the Olive, as alſo betweene the Oke and the Walnut, the one not to grow neere where the other is planted: the cuppes of the ſweete Oke or Acorne, as *Bellonius* ſaith in his Booke of Obſervations, are uſed in *Greece* and *Aſia* the leſſe, and *Natolia* to tanne or thicken their raw hides, as our Tanners uſe to doe with Oken barke, and I doe not thinke but the cuppes of our Ackornes would doe as much, if any would make the tryall. He alſo ſaith that the Turkes in *Macedonia* and other places in *Turkie*, uſe the leaves of *Sumach* for the ſame purpoſe, and they of *Ægypt* and *Arabia*, uſe the cods of *Acacia*, the prickly binding tree, they of *Phrygia* and *Leſbos*, the barke of the Pitch tree, and they of *Illyria*, the leaves of the Mirtle tree, that beareth blacke berries: ſo that it ſeemeth many things may worke that effect, ſeeing every Country taketh that which is familiar to it.

CHAP. II.

Excreſſentia Quercuum. The Excreſſences of theſe Okes.

THere are a great many things that breede upon ſundry of theſe Okes, ſome of one faſhion ſome of another, and ſo in ſubſtance likewiſe, ſoft or hard, beſides the Oke Apple and the Gall, whereof I intend to ſpeake firſt. I have given you the deſcription of the tree in the Chapter laſt going before this, I will but onely ſhew you here the diverſities of the Galles, and the good uſes they are put unto for medicine, or other purpoſes, and I cannot underſtand that any of the other former kindes doe beare Galles but thoſe that are here ſet downe by the name of *Robur*, which is the ſecond ſorte: for although divers of them have a ſhew of Galles, which made *Pliny* to ſay that all Ackorne bearing trees, bring Galles likewiſe, yet they are but ſpungy balls for the moſt part, and none ſo good and hard Galles as they.

Debili vice Bullæ.

The Galles are of two ſorts, ſmooth, and rugged or knobbed, both of them round and hard almoſt as wood, but all a little hollow within, and when they are dry, are either whitiſh or yellowiſh, but while they are greene and freſh upon the trees they are ſomewhat ſoft and tender, and reddiſh towards the Sunne ſide: all of them ſtand cloſe to the branches, and ſtalkes without order, and ſometimes one joyning cloſe to another, without any ſtalke under them. There is alſo a blacke Gall as bigge as an apple, ſometimes full of a Roſſin like fatneſſe, which will flame being ſet on fire.

1. Galla cui lvm levis epidermis viridis.

2. Galla quercus.

The Oke apple groweth upon ſundry ſorts of theſe trees, and not on any one alone, for although in our Country ours are for the moſt part round and ſoft, being freſh and full of wateriſh ſubſtance, but being dryed do ſhrinke and are wrinckled, yet in other places ſome are found ſticking to the backe of the leaves, and containe in them a cleere water and flyes therein, and are white, and as it were tranſparent before they be dry and grow hard.

3. Aquoſa. & Capillata.

Others are called *Capillatæ*, becauſe they are all hairy, and containe within them a hony like liquor in the Spring time, yet not put to any uſe.

4. Echinata.

One I had out of *Virginia* with round hard rough or prickly balls on the leaves.

5. Lanata.

Others are called *Lanatæ*, for that within an hard huske or ſhell, they containe certaine flockes of wooll, which are fit for Lampes, but not without oyle or other unctuous matter as *Pliny* ſaith it will.

6. Nuces.

They that are called *Seſſiles* grow under the joynts, at the ſetting to of the leaves cloſe to them without any ſtalke, the navell being white, and a little ſwelling forth, and ſometimes of ſundry colours, and ſometimes blacke, and ſhining red in the middle: being hollow within, with a putride vacuity.

7. Foliacea.

They are called *Foliaceæ*, or *Folioſæ*, that are made as it were of ſcaly leaves, like unto the head of the Knapweed that groweth wild abroad in the fieldes.

1. *Quercus cum pilulis ſive fungoſis excrementis.*
The Oke with the Oke Apples.

Quercus Excrementa.
The Okes Excreſſences.

Anno-

Another thing groweth on the branches under the leaves, that is like unto the cuppe or huske that containeth the flower of the Pomegarnet or such like. 9. *Calix.*

Sometimes there hath beene small soft stones found like pumice stones, yet not often seene. 10. *Pumex.*

A round thing also hath beene found, which *Theophrastus* calleth *Sycaminodes*, and is somewhat like unto a Mulberry, differing onely in the colour, hardnesse to be broken, and the harsh taste. 11. *Morum.*

Another thing also like to the privy members of a man, both the yard and the testicles. 12. *Genitale virile.*

There is againe another thing found growing thereon like a pricke in the beginning, called by him but afterwards growing hard, taketh the forme of a Bulles head with a hole in it, and being broken hath like an Olive stone within it. Nitar also as *Theophrastus* saith, is made of the ashes of the Oke, which *Pliny* altereth in this manner: It is certaine that the ashes of the burnt Oke is like unto Nitar, he saith, *Cinerem nitrosum*, and *Gaza* translateth it after *Pliny* in the same words. 13. *Caput Tauri.* *Nitar.*

The Acornes of *Esculus* the sweete Oke, and of *Cerrus femina*, the female bitter Oke, have certaine small stones sometimes found in them, either at the end of the Acorne, or on the shell, and sometimes in the nut it selfe. 14. *Lapides.*

The Oke also beareth a *Cachrys*, which *Theophrastus* in his third Booke and seventh Chapter, expoundeth to be a round conception or gathering together of leaves, growing betweene the last yeares shoote, and the young bud for the next to come. *Cachrys* also as *Dioscorides* sheweth in the Chapter of *Libanotis*, is the seede of the fruite bearing *Libanotis*, which burneth the tongue being chewed: but *Pliny* being deceived by this double acception of the word, confoundeth them both together, and maketh them both but one thing, saying *lib. 16. c. 8.* the Oke beareth *Cachrys*, which is a small ball that hath the property of a cauteriall medicine: but *Theophrastus* sheweth in the place before set downe, that the Firre treee, Larch, Pitch, Line, Nut and Plane trees, doe beare a *Cachrys* after the leaves are falne, abiding on all the Winter. 15. *Cachrys.*

19. *Uva quercina.* The Oke grape. 10. *Pumex.* 11. *Morum* 12. *Genitale virile.* 13. *Caput Tauri.* *Nitar.* 14. *Lapides.* 15. *Cachrys.*

There is growing on the Okes in *Cilicia* as *Dioscorides* saith in the 43. Chapter of his fourth Booke a *Coccus* or graine, which the women there gather with their mouthes, and is like unto small Cockles or Snailes: this seemeth not the same, which he in the same Chapter calleth *Coccus Baphica*, and groweth on a small shrubbe, &c. as you shall understand hereafter: but some learned Writers have taken them to be both one, namely the Scarlet graine, gathered from the lesser Holme Oke: but surely *Dioscorides* meaneth another kind of graine, which from the use in Dying was called *Coccus*, and may peradventure be the same that *Matthiolus* saith he saw growing about the bodies of great Okes in *Bohemia*, not farre from *Poggibrot*, in a Hare Warren of the Emperours, which was neglected there and lost, but was carefully kept in *Polonia*, where it groweth also: or else that which *Lobel* speaketh of in the end of the Chapter of the Scarlet graine, which he saith groweth in the middle of the leaves, and on the bodies also sometimes of Okes, which graine is bigger then the other, and is round, reddish or yellowish, and which he also saith groweth on the Okes in the Woods by *Bassill* in *Germany*, and in divers other places of *Italy*, *France*, and *Germany*. 16. *Coccus alter.*

There are sundry Mosses also growing on these Okes, some sweete and some not, whereof I have spoken already among the Mosses: as also some Mushromes mentioned among the Mushromes, whereof it is needelesse to speake further here: but there groweth at the rootes of old Okes in the Spring time, and sometimes also in the very heate of Summer, a peculier kinde of Mushrome or Excrescence, called *Uva quercina*, swelling out of the earth, many growing one close unto another, of the fashion of a grape, and therefore tooke the name, The Oke grape, and is of a purplish colour on the outside, and white within like milke, and in the end of Summer becommeth hard or Wooddy. 17. *Musci.* 18. *Fungi.* 19. *Uva quercina.*

There is a certaine venemous Serpent called *Drymus*, taking his name from the place of his breeding and chiefe abiding, which is the rootes of Okes. *Theophrastus*, *Dioscorides*, *Galen*, *Nicander*, and *Ætius*, have all made mention of the wondrous venemous quality of this Worme or Serpent, and of the cure of the poyson. 20. *Drymus.*

The worme named *Rauca arãucedine forte*, breed in the rootes of Okes: and so doe those called *Galbæ*, but especially on the *Esculus* or sweete Oke. 21. *Rauca arãucedine.* 22. *Galbæ.*

There is lastly found in our owne Land, a browne kinde of Gumme growing on Okes, which Master *Edward Hassellwood* found in *Nottingamshire*, and sent some of it to me. 23. *Gummi.*

There are also found growing upon Okes, Misselto, Pollipody, Agaricke, Mushromes of sundry formes and substances, as Tonchwood, &c. And the two first figures expressed in the Table, are of a differing forme from others. Manna also, or a kinde thereof, which we call in *English* a hony dew, found more plentifully on the Oken leaves then on any other trees: but because they are not peculier onely to the Okes, but grow upon other trees also, and that I have spoken of most of them in other places of this Worke, I forbeare further to mention them here, leaving the rest that have not yet beene entreated off, to their fit places. 24. *Fungi peculiares.*

Their *Place* and *Time* are sufficiently expressed in their descriptions, and so are their *Names* also, saving that the Gall it selfe is called in Greeke κῦνος, and in Latine *Galla*, whereof one kinde fit for medicines is called *Omphacitis*

both in Greeke and Latine, not that it is an unripe Gall, but that it hath more acerbity and stipticity in it, then the greater and the yellower have: the Oke Apple also is called of most Writers *Pilula Quercina*, *Galla viridis* also, and *Mollis*.

The Vertues.

The small Gall called *Omphacitis* is dry in the third degree, and cold in the second as *Galen* saith, and being a sowre harsh medicine is fit to draw together, and fasten faint and loose parts, as the overgrowing in the flesh: it repelleth and dryeth up rheumes, and such like fluxes, by staying them effectually, especially those that fall upon the gummes, almonds of the throate, and other places of the mouth: the other whiter Gall doth also binde and dry, but so much lesse then the former, by how much it hath a lesser quality of sowre harshnesse in it, and is good against the dissentery or bloody Flixe: the decoction of them in water is of a meane attriction: but in Wine is stronger, and in harsh or red Wine stronger then it: if women sit in or over this decoction being warme, that are troubled with the falling downe of the mother, it will helpe them: the Galles themselves after the boyling, being bruised and applyed to the fundament that is falne downe, or that hath any hot swelling or inflammation doth wonderfully helpe them: the coales of them when they are burned and quenched hot in Wine or Vinegar, are good to be applyed to stanch bleedings in any place, they also dye the haires blacke, and with them is made our writing incke, and the Dyers a blacke Dye as all know: the Oke Apple is much of the nature of the Gall, yet inferiour thereunto, but may be used in the want of Galles, for rheumes, fluxes, and such other like diseases, and that to good purpose. *Matthiolus* reciteth a tale of his Country *Italians*, as *Gerard* doth of our *Kentish* men, much to one purpose, saving that *Matthiolus* hath it of Galles, and *Gerard* of Oke Apples, but both a like true, as are a number of such prognosticating tales, of Saint *Pauls* day, and Saint *Swithens* day, and the like, which favour more of Paganisme then Christianity, to drive us from the confidence of Gods providence, to relye on such vaine and weake signes, or speculations, and yet maintained stiffely by a great many, which is, that in the Gall (in the Oke Apple saith *Gerard*) there breedeth three small creatures, which will prognosticate the course of the succeeding yeare (in every Country, for the Gall or the Oke Apple doth grow I thinke in every Country) if a Flye saith *Matthiolus*, it presageth Warre, if an Ant saith *Gerard*, plenty of graine: if a creeping Worme be found in the Gall saith *Matthiolus*, it foretelleth scarsity of victuals: if a white worme like a magot saith *Gerard*, a murraine of beasts and cattle: but if a Spider say they both there will follow a pestilence or mortality: but least I grow too tedious in this discourse, little pertinent to this our History of Herbes, I must passe no further, but leave it to every man as his minde is affected, and to God the Judge of all mens affections. The Oke grape doth binde all fluxes, whether of blood or humours, and preferred by some, before either Gall or Oke Apple, especially by *Encelius*, who is the first that I know hath written of it. Most of the rest of these Excrescences are seldome used, but those that are, have the same quality of binding that the Gall or Oke Apple hath. The red graine that is found on the Okes in *Polonia*, and other places, is altogether used by the Dyers, but not used in any medicine, by any that I have read or heard.

CHAP. III.

Viscum. Misselto.

BEcause the best Misselto groweth upon Okes sometimes, but more usually on other trees, I thought good to entreate hereof next unto the Gall, and the other excrescences of the Oke, yet in a Chapter by it selfe, not onely for the causes before alledged, but for that there are some varieties found herein.

1. *Viscum vulgare.* The ordinary Misselto.

Misselto riseth up from the branch or arme of the tree whereon it groweth with a wooddy stemme, parting it selfe into sundry branches, and they spreading againe into many other smaller twigges, enterlacing themselves one within another, very much covered with a grayish greene barke, having two leaves set at every joynt or knot and at the end like wise, which are somewhat long and narrow, small at the bottome but broader toward the end: at the knots or joynts of the boughes and branches, grow small yellowish flowers, which turne into small round white transparent berries, three or foure together, full of a glutinous moisture, with a blackish seede in every of them, which was never yet known to spring, being put into the ground or any where else to grow.

Policoccon. *Camerarius* maketh mention of one sort hereof, that had many more berries growing together at a knot, then the former, but not to differ in any thing else.

Baccis rubris. *Clusius* and *Bellonius* have each of them recorded in their writings, to have found Misselto growing on Olive trees in sundry places, both in *Spaine* and in *Turkie*, that bore red berries not varying much in any other thing, but it maketh the trees barren that hath it growing on them.

2. *Viscum Indicum.* The Misselto of *India*.

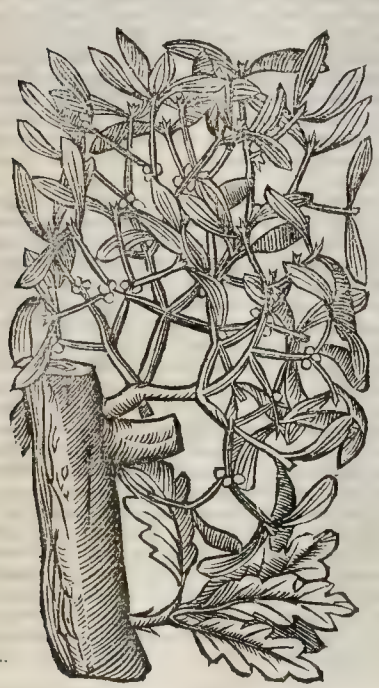
The Indian trees Excrescence (which for want of a fitter name was called Misselto because it groweth on their trees) doth as it were runne or creepe upon the boughes, shooting up sundry whitish greene stalkes with foure or five joynts thereon, like to those of Grasses, but without any leafe at them, saving at the very toppe, where groweth one large leafe like the Misselto leafe, but twice as great thicke and fleshy as it, with sixe round circles on either side of the middle ribbe toward the upper end: from the bottome likewise of each of these leaves riseth up a long spiked head of small leaves as it were, which abide greene all Winter long.

3. *Viscum Peruvianum.* Misselto of *Peru*.

This other strange plant also, that is referred to the Misselto groweth like a bush of small rush like sprigges with broad scales foulded one over another at the bottome, as broad as ones hand, where it is fastened to the branch whereon it groweth, with small rootes like those of Onions, but ending in small points, all which doe encompasse an hollow reddish striped branched stalke, two or three cubits high, representing the chaffie tuft or eare of Oates, for the fashion, but *Asclepias* for the bignesse, and the silken downe with small seede therein like *Conyza*, of a salt-ish unpleasant taste like Niter, perhaps taken from the Sea aire it feeleth.

The

Viſcus quercinus.
Miſſellto of the Oke.



2. *Viſcum Indicum & Policoccon.*
The Miſſellto of India, and that with many berries together.

The Place and Time.

The firſt groweth very rarely on Okes with us, but upon ſundry other as well timber as fruite trees, plentifully in Woods, Groves, and the like, in all the Land, but that with many berries in *Germany*, &c. the other two grow in the Weſt Indies, from whence onely ſome branch or other was brought by a friend. Our Miſſellto flowreth in the Spring time, but the berries be not ripe untill *October*, and abide on the branches all the Winter, unleſſe the Blacke birds, and other birds doe devoure them.

The Names.

It is called in Greeke ἰξὸς by *Dioſcorides*, and ſo is the Birdlime made thereof alſo, and ἰξία by *Theophraſtus* who ſaith alſo that in *Euboea* it is called *Stelis*, and in *Arcadia Hyphear*: yet *lib.* 3. *c.* 16. of his Hiſtory, he ſaith that *Stelis* groweth on the North ſide of the *Ilex*, and *Hyphear* on the South, & ſo they differed one from another in ſome thing, which he hath no where expreſt, in Latine *Viſcus* and *Viſcum*, and ſo alſo the Birdlime made of the berries, as are all theſe ſorts called by all Writers, that have written either of the two laſt, ſince *Lobel*, with their ſeverall adjunctes. The *Arabians* call it *Debach*, *D'abuch* and *Hale*, the *Italians Viſchio*, the *Spaniards Liga mordago*, the *French Guy*, the *Germanes Miſtel*, and *Eichen miſtel* and *Vogellem*, the *Dutch Marentacken*, and we in *Engliſh* Miſſellto. There are ſundry controverſies to be decided about this *Viſcum*, firſt whether it be produced from its owne ſeed or no, for many have held that Blacke birds eating the berryes and lying in their bellies, by dunging on the trees the ſeede hath thereby beene made the fitter to grow, which elſe is not, and ſo doth *Pliny* from *Theophraſtus* ſet it downe, *turdus ſibi exitium cacat*, that the Blacke birds voydeth that whereby it is brought to death, but it is ſince found by experience, that there is no ſhew of ſeed in that dung, they voyde upon the trees or elſewhere, being wholly altered in their bellies before the voyding, and further that Miſſellto groweth on trees from their owne ſuperfluous moyſture. which made *Ion* the Poet to call it *Sudor quercus*, even as Galles doe, and Oke Apples from other ſort of Okes, and have no ſeede of their owne, and to this purpoſe *Virgil ſexto Æneidos* ſaith:

Quale ſolet ſylvis brumali frigore, Viſcum
Fronde virere nova, quod non ſua ſeminat arbos.

Theophraſtus alſo ſaith that the Miſſellto looſeth the leaves in Winter if it grow on thoſe trees that ſhed their leaves then: but holdeth them growing on ever greene trees, the reaſon whereof ſaith he is the tenacious humidity in the one, which the other wanteth: but the experience of our times hath ſhewed that it keepeth the leaves

3. *Viſcum Peruvianum.*
Miſſellto of *Peru*.

freſh and greene in Winter, when the trees whereon they grow have not any of their owne leaves left on them in theſe parts of *Europe* generally. Secondly about *Ixos* and *Ixia*, whether they be both one thing, *Dioſcorides* calleth both the buſh and the Birdlime made thereof by one name *Ixos*, as the Latines doe *Viſcum*, as you heard before, and ſaith further that it is alſo found on the rootes of other ſhrubs which cannot be underſtood of the Miſſellto, to grow from other ſhrubs, but is meant of that kinde of Gumme or glew called *Ixos Viſcum*, that is gathered from the rootes of the white Chameleon Thiſtle, as is ſhewed before in the Chapter of the Chameleon Thiſtle, but *Ixia* cannot be underſtood to be either Miſſellto, or the Birdlime made thereof, which is called *Ixos*, as is before ſaid, although *Dodoneus* doth much inſiſt upon it, becauſe the qualities of Birdlime are dangerous to be taken inwardly, for as I ſhewed in that Chapter of *Chameleon*, *Ixia* is either the roote of the blacke Chameleon Thiſtle, which *Galen* ſaith is very pernitious, or another very like it as *Columna* thinketh.

The Vertues.

Miſſellto is hot and dry in the third degree, the leaves and berryes doe heate and dry, and are of ſubtill parts, for ſome acrimony is in them, which overcommeth the bitterneſſe, the Birdlime doth mollifie hard knots, tumours, and Impoſthumes, ripeneth and diſcuſſeth them, and draweth forth thicke as well as thinne humours, from the remote places of the body, digeſting and ſeparating them: but is not of that property to heate ſuddainely, but after ſome time as *Thapſia* doth, and being mixed with equall parts of Roſſin and waxe doth mollefie the hardneſſe of the ſpleene, and healeth old ulcers and ſores: being mixed with Sandarack and Ortment, helpeth to draw of foule nailes, and if quicke lime and Wine lees be added thereunto it worketh the ſtronger. The Miſſellto it ſelfe of the Oke as the beſt, (or of the Cheſnut tree as *Matthiolus* ſaith to be as good) made into pouther, and given in drinke unto thoſe that have the falling ſickneſſe, doth heale them as *Matthiolus* ſaith, and that he had tryed it and healed many aſſuredly: but it is fit to uſe it forty dayes together: and with this caution, that the wood after it is broken from the tree, doe not touch the ground, which is in my minde too ſuperſtitious, as is their conceit alſo, that it hath power againſt Witchcraft, and the illuſion of Sathan, and for that purpoſe, uſe to hang a peece thereof at their children's neckes: *Gentilis Fulginas* and others have ſo highly eſteemed of the vertues hereof, that they have called it *Lignum ſanctæ crucis*, beleeving it to helpe the falling ſickneſſe, Appoplexy, and Palſie very ſpeedily, not onely to be inwardly taken, but to be hung at their neckes, and ſome to hang it at their neckes, or weare it on their arme to helpe them to conceive: and ſaith *Matthiolus* I have knowne ignorant emperickes, to have given the Birdlime made into pilles to perſons to ſwallow inſteade of the wood: and further ſaith that he knew the Miſſellto that grew on a Pearetree, given to one that had the parts of his body drawne together, to doe him much good and divers doe eſteeme of the Miſſellto that groweth on Haſſell nuts, or Peares, as effectuall as that on the Oke, ſo it touch not the ground, for the falling ſickneſſe, to be taken in Wine. *Tragus* ſaith that the freſh wood of any Miſſellto bruiſed, and the juyce drawne forth, and dropped into the eares that have Impoſthumes in them, doth helpe and eaſe them within a few dayes: the leaves are often given to cattell ſaith *Plinie*, to fatten them and purge them firſt: but if they be diſeaſed they cannot continue long, this manner of curing them laſteth for forty dayes in Summer.

CHAP. IV.

Ilex. The Holme Oke.

OF theſe Holme Okes there are three ſorts, two that are great trees, and the third a ſmall ſhrubbe, whoſe deſcriptions I meane to give you in this Chapter, and becauſe there are divers Excreſſences growing upon theſe Okes, which are not found upon any of the other: I thinke it fit to entreate of them in a Chapter by themſelves, that ſo they may be the better underſtood of all, and I the more ſcope to handle them.

1. *Ilex major aculeata.* The greater prickly Holme Oke.

This groweth uſually to be a very great tree, yet ſometimes groweth not ſo high, covered with a blackiſh red barke, as are alſo the boughes and branches, ſpreading farre abroad like unto a meane Oke: the leaves are like unto the Corke tree, but ſomewhat leſſer and rounder, with prickely edges eſpecially in the younger trees, which are wholly prickely, but in the elder doe grow ſmooth on the edges without prickles, greene above and grayiſh underneath, which do alwayes abide greene: the yellow moſſie catkins ſtand at the toppes of the branches upon long footeſtalkes like to thoſe of the Oke, and fall away in the ſame manner: the fruite or Acorne commeth not where the flowers ſtood, but in other places on the branches, upon ſhort ſtalkes incloſed in a rough cuppe like a common Acorne, in ſome places bigger then the others, and ſhorter alſo, very pleaſant in ſome places, that many delight much to eate them: the wood or timber is of a browniſh red colour and very hard, not eaſie for an Axe, but for a Saw to cut it: the coales whereof are very durable above others: the roote groweth very deepe into the ground, and ſpreadeth much likewiſe.

2. *Ilex major non aculeata.* The great ſmooth Holme Oke.

This other or ſmooth kinde riſeth alſo to be a great tree equall to the former, and like thereunto in ſtocke or body, barke, branches, flowers and fruite, onely the leaves hereof are longer and narrower, pointed at the ends, and not prickely on the edges, but finely ſnipt or dented onely, ſomewhat rough underneath, and greene and ſmooth above: the timber likewiſe being as hard and heavy as the former.

3. *Ilex aquifolia ſive Coccigera.* The leſſer or Scarlet Holme Oke.

The leſſer Holme Oke or Scarlet Holme Oke, is a ſmall tree in manner of a hedge tree, the ſtocke or body whereof at the bottome is ſeldome bigger then of an old Roſe tree, and that if it be ſuffered to grow without pruining: the branches are faire and many, three or foure foote high, covered with a pale reddiſh barke, having many ſmall thicke and freſh greene leaves ſet thereon, but hard and very prickely on the edges like unto the leaves of Holly, yet farre leſſe and abide alwayes greene as the former doe: it beareth yellow flowers like the other but ſmaller, and ſmaller Acornes alſo, more bitter and pointed at the end, and almoſt wholly covered with a very ſharpe prickly huske

1,2. *Ilex major aculeata & absque aculeis.*
The great Holme Oke with prickles and without.

3. *Ilex aquifolia cocciferam glandibus & cocco.*
The Scarlet Oke with Ackornes, and the graine

ly huske or cup, but thus it doth onely when it is neglected, and not pruned and cut low, to cause it beare the Scarlet graine more plentifully, as shall be shewed hereafter, and which else it would not doe.

The Place and Time.

The first is more plentifull in *Spaine* and *France* then the second, and the second in *Italy* where the first is scarse found: they grow also in divers other Countryes, and are planted for the rarity in sundry places in this Land, one whereof may be seene in the Kings privy Garden at White Hall, just against the backe gate that openeth into the High streete over against the Tennis Court there, which both flowreth and beareth fruite, as my selfe can witnesse, who have gathered the Acornes under the tree, which *Clusius* not observing when he was here, doubted to be barren: the lesser groweth in many places as, *Spaine*, *Portugall*, *Italy*, and *Provence* in *France*, in *Africa* likewise and *Asia*, both the greater and the lesser, as *Armenia*, *Cilicia*, *Syria*, *Pisidia*, and *Galutia*, in *Candy* also, as *Bellonius* hath recorded, and in *Virginia*, *New England*, &c. likewise: they all flower although divers doe deny it, in *May*, and their fruite is ripe in the end of *September*: The Scarlet graine commeth forth in the middle of *April*, and is gathered in the end of *May*, and in *June*.

The Names.

Ilex is called in Greeke πεῖλος quia serra propter duritiem fecanda sit. Some called it in Latine *Ilex major*, and *Ilex arbor*, and *Ilex glandifera*, because the lesser is called *Ilex coccifera* or *coccigera*. The first is called *Ilex major spinosa*, or *aculeata*. The second *non spinosa* or *aculeata*, and simply *Ilex* by *Matthiolus*, *Lugdunensis* and others, and *Ilex arborea* by *Lobel*, all which *Bauhinus* transferreth to the first. *Clusius* taketh it to be *Smilax Arcadum Theophrasti*, but *Theophrastus* maketh the timber of *Smilax* to be soft and easie to be wrought on, but the timber of this is as hard as the former. The last is called *Prinos* by *Theophrastus*, indifferently with the first, by *Dioscorides* πρῖνος & βαφικὴ *Coccus Baphica*, and so he calleth also the graine, in Latine *Ilex aquifolia*, and *Ilex coccifera* or *Coccigera*, and some *Phellodrys coccifera*, in *Spanish Coscoya*, taking the name from *Cusculium*, one of the names given by *Pliny* thereunto. The Acorne of the first is called in Greek ἄκυλος, and *Acylum* and from hence commeth the word *Acylaca*, which *Bellonius* maketh mention in sundry places to beare Acornes, in *Spanish Bellota*, and *Abellota*.

The Vertues.

The greene leaves of this Holme Oke, as *Galen* saith, have a greater force to coole binde and dry, then have the leaves of any other Okes: being beaten and applyed they are good against soft swellings, and strengthen weake members as *Dioscorides* saith: the rootes hereof bruised and laid on the hurts that the Serpent *Drymus* hath made, is very good to represse the venome, and to stay the paines that come thereby. The Acornes of this *Ilex*, which *Hipocrates* calleth *Acylon*, and of the first Oke, and *Phagus* of the sweete Oke, either fresh or rosted doe binde the belly, but if they be boyled they do losse: the young rootes boyled in wine or water, till they be tender, and then made into a paltis and applyed to any place burned or scalded doth helpe it: the Acornes of these greater Okes are generally eaten in *Spaine* where they grow, of the Rich as well as poore, in the same manner that they doe with

with the Acornes of *Phagus* or *Esculus* the Sweete Oke. The *Ilex* or Holme Oke, as *Pliny* and other Authours make mention, is of an eternall durability or not decaying in many hundreds of yeares, he reciteth one that made almost a wood alone, divided into ten bodies or trees, and contained thirty five foote in compasse, and each of a large greatnesse: and of another that grew on the *Vatican*, that was older then the City of *Rome* it selfe: the Crowne or Garland that was given to a Citizen, for any worthy act in former times, was made of the branches of this tree, although afterwards it was made of *Esculus* that was dedicated to *Iupiter*, the properties of the lesser Holme Oke, are chiefly remaining in the berries, of the juyce whereof you shall heare in the following Chapter.

CHAP. V.

Illicum excrescentia. The Excressences of the Holme Okes.

THere are five severall Excressences growing on these Holme Okes, differing from the former, and none of them found upon any of the other Okes, which are fitly reserved for this place, as you shall finde them set downe in order: and first of the Scarlet graine as the most worthy.

1. *Chermes seu Coccus infectorius.* The Scarlet graine.

This graine or berry (is not the proper fruite of the lesser Holme Oke, for that is an Acorne as the others have) is a kinde of Excressence that nature thrusteth forth upon this tree, while the branches are young and not growne old or neglected and not pruined, which then grow barren, and with few or none upon it, and groweth all along the branches at the severall joynts and footestalkes of the leaves, being as big as a Pease, of a reddish ashcolour, before they are ripe, but of the colour of the Holly, or Asparagus berries, when they are ripe or somewhat darker, but are gathered for the most part before they be too ripe, when as they will containe within them a cleere juyce of a crimson colour, as deepe as any pure fresh blood, which by the heate of the Sunne breede small red wormes little bigger then fleas at the first, but being suffered to grow great, consume the inner substance of the berry or graine, creeping away and leaving the huske or shell empty, which empty shells are the *Kermes* berryes that are found in the Apothecaries and Drugists shoppes every where, and which made *Matthiolus* who never saw them growing, to thinke that they were not the true *Chermes* of *Dioscorides*, but some other kinde of berry, because *Dioscorides* saith that they are like unto Lentils: before these are ripe, or that any wormes are bred in them, they are gathered for the Apothecaries use, that make the soverainge cordiall confection called *Alkermes*, which is *cordi amica*, and presse forth the juyce, which being boyled up with a proportion of Sugar, fit to preserve it from sowring, is kept for a whole yeare after: but when they are somewhat more ripe, yet before the wormes are ready to breake the shell to runne away, they are gathered for the Dyers use to Dye fine Scarlet cloath withall, and are brought into powder in this manner. When these graines or berries are gathered in their fit time, they cast them on a sheete or other such thing, sprinkling them with a little Wine or Vinegar, borne up from the ground by the sides or foure corners, and set them in the hot Sunne who feeling the heate of the Sunne begin to stirre, and would creepe away, but that one that is appointed to looke to them, with a small wand or sticke by striking the sides of the sheete causeth them to fall downe into the middle againe which worke is continued so long untill they be all dead, and dryed sufficient with the heate of the Sunne, and are afterwards brought to the market and sold to the Merchants, that will buy them. Some doe this in a bagge or boulter, shaking them in the Sunne, or drying them in an oven. *Bellonius* sheweth the way that they use in *Candy*, is to make two sorts of Dyes of them, the one of the pulpe the other of the bladders or shells and because the pulpe maketh the richer Dye it is sold at foure times the deerer rate.

2. There is also found upon the branches of the greater Holme Oke, scattering'y here and there, and nothing so plentifully as in the other, certaine small round graines of a darke red colour which for the most part are neglected and so soft.

3. There is likewise found a kind of grayish Mosse made like unto a small long bush or locke consisting of grayish hoary haires but not sweete.

4. There is a gum also found sticking to the Acornes of the great Holme Oke, which is somewhat hot in taste, but not unpleasant.

5. *Theophrastus* maketh mention of *Hyphear*, to grow as well as Misseltto, on the *Ilex*, and that on the Southside thereof; which cannot be but a differing thing from Misseltto.

The Place and Time.

The place of growing of these berries, hath beene set downe in the Chapter before, and they beginne to appeare in *Aprill*, and are gathered in *May*, the rest in *Greece*, *Italy*, *Spaine* and *France*, and are chiefely seene in the Summer.

The Names.

The Scarlet graine is called by *Theophrastus* in Greeke κόκκος φοινικὸς *Coccus Phanicea*, by *Dioscorides* κόκκος and κόκκος βαφικὸς, *Coccus Baphica*, in Latine of *Pliny*, *Granum*, *Coccum*, *Quisquilium*, *Cusculium*, *Scoletium*, and *Vermiculum*, as also *Hysginum* both by him and *Vitruvius* taken from the word *Hys*, whereby as *Pausanias* saith the *Galatians* beyond *Phrigia* did call it, of the latter Writers, *Coccus infectorius Granum infectorium*: in shoppes *Grana tinctorum*, and *Chermes* or *Kermes*, and *Grana kermes* after the *Arabian* name, by the *Italians* *Grana di tintori*, in *Spanish* *Grana de tintoreros* and *Granaen grano*, in *French* *Vermillon*, and *Graine de scarlate*, by the *Germanes* *Scarlackbeer*, and in *English* the Scarlet graine, or Chermes berry. The second is called *Granum Iligneum*. The third *Museus Iligneus*. The fourth *Gummi Iilgneum*. And the last as is said *Hyphear*.

The Vertues.

The Scarlet graine is used to heale greene wounds, and sinewes that are cut, to be mixed with vinegar or Oxymell, and is much commended and given by the later Physitians to women with child, who by infirmity or other casualty are subject to miscarry with their children, by untimely travell and birth: but especially the confection which is called *Alkermes*, which is made of the juyce of these berryes is effectuall for that purpose, and is also a

soveraigne

Soveraigne Cordiall to ſtrengthen and revive the fainting ſpirits of the heart, and to drive away melancholly. This confection alſo is dayly commended and uſed with good effect, againſt the trembling and ſhaking of the heart and againſt ſwounings, it is often uſed likewiſe againſt Melancholly paſſions and ſorrow proceeding of no evident cauſe, and to procure mirth as much as Phyſicall meanes may effect, but there hath beene formerly many errours committed in the compoſition of this confection, firſt in the *Lapis Lazuli* (firſt put in by *Meſues* the *Arabian* againſt Melancholly) ſome condemning the uſe of it, and ſome fearing the operation thereof by forcibly purging Melancholly, have wholly left it out, and others have put it in, but without that due preparation it ought to have: a ſecond errour is concerning the ſilke that is appointed to be put into it, ſome taking crimſon ſilke dyed as our Dyes uſe it, which may be dangerous in that they uſe divers things to ſtrike that Dye that is not ſafe to be uſed inwardly, and therefore ſome uſed to draw a tincture out of the dryed berries: but our later age hath appointed a ſafer courſe, namely to ſteepe the raw cods of ſilke that hath felt no art paſſe upon them in the true juice of the *Chermes* berries, wherewith being imbibed and ſufficiently tincted, the juyce after boyling and ſtraining, is then fit to be uſed to make this confection: a third errour roſe from *Dodonæus*, that miſtooke *Sericam*, and made it *Seta*, whoſe errour Doctor *Prieſt*, that tranſlated him into *Engliſh* did follow, and gave occaſion to *Gerard* ſo to publiſh it ſo in his Herball, in that *Gerard* received that tranſlation from Mr. *Norton* to finiſh: a fourth errour hath riſen from the Monckes that wrote Comentaries upon *Meſues*, who affirmed that that kinde of Crimſon graine that is gathered from the rootes of Burnet is this *Kermes* of the *Arabians*, but *Matthiolus* hath confuted their opinion ſufficiently: a fifth errour is in many mens miſtaking *Cochenille* (a certaine graine or rather flye knowne but of late dayes, and brought from *America*,) for *Kermes*, of ancient and ſpeciall uſe with the old *Arabian* and Greeke Writers: but now all theſe errours being taken away, men may ſafely repoſe confidence in the goodneſſe of this confection, the faithfull preparations of the ingredients hereof, as well as of other compoſitions, being ſo carefully overſeene by the guardians of the Apothecaries, ſince they were joyned into a corporation, that it may juſtly now compare (who were farre behinde before) with the moſt famous and expect in the art wherſoever: the berries that are found on the great Holme Oke ſaith *Matthiolus*, being bruiſed with vinegar, are good to be applyed to greene wounds and put alſo into thoſe eyes that are blood-ſhotten doe much good: the other excreſſences are not put to any uſe that I know.

CHAP. VI.

Suber. The Corke tree.

OF the Corke tree there are three ſorts obſerved by divers, which yet may well be reduced into two; in that the difference is not fit in my minde to make a ſpeciall ſort as you ſhall here.

1. *Suber latifolium.* The broad leafed Corke tree.

The broad leafed Corke tree, groweth to be a great tree in many places, but not ſo high as the *Ilex* or Holme Oke, nor ſo farre ſpread, but with a thicker body, and fewer boughes, yet in ſome places it groweth much lower, for *Pliny* ſaid it was a ſmall tree: the leaves hereof are very like unto the leaves of the *Ilex*, but uſually greater, broader and more prickely then thoſe of the elder Holme Okes, and in moſt places abide alwayes greene on the trees, but in ſome few doe fall away, as the ordinary Okes doe, which therefore being but peculiar to few, cannot I thinke conſtitute another *ſpecies*. The flowers are like the other Okes, and the Ackornes ſmaller then thoſe of the *Ilex*, ſofter alſo as it were ſpongy and more unpleaſant, ſtanding in very rough prickly cups: the barke hereof is very thicke, rugged and full of clifts if it grow too long upon the tree, and will cleave and fall off of it ſelfe by peecemeale: but being taken in due time, that is every third yeare, the new barke will appeare very red, as if it were painted, and if any raine ſhould happen in the barcking time, they would all wither and dye, but the Country men doe carefully obſerve a fit time for that purpoſe, and when they have taken it away they bring it to the fire to make plaine and flat, and let it lye thereon untill it be thorow hot, which then with weights they preſſe untill it be cold which ſo abideth afterwards: the timber or wood hereof is ſtrong and fit to build withall, for *Pliny* ſaith, it doth *tardiſſime cariem vetuſtatemque ſentire*, abide longeſt without rotting.

1. 2. *Suber latifolium, & anguſtifolium.*
The broad and narrow leafed Corke tree.

2. *Suber anguſtifolium.*
The narrow leafed Corke tree.

This other Corke tree is like unto the former, growing to be a great tree, ſpread abroad with many armes and branches which are more plyant and eaſie to be bowed, whereon grow longer, narrower and ſharper pointed leaves then the former but not endented or prickly on the edges at all: in all other things it is like unto the former.

The Place and Time.

The firſt groweth in many places of *Greece*, *Spaine*, *Portugall* (where in ſome places it groweth low) in *Italy* alſo

and *France*, the other ſort whereof that loſeth the leaves in Winter, groweth in *Aquitaine* neere the *Pyrenean* hils where *Theophraſtus* did obſerve it to grow: the other about *Piſa* more plentifull then any where elſe in *Tuſcany* as *Matthiolus* ſaith: although *Pliny* denyeth any *Suber* to grow in *Italy* or *France*, they flower and beare their fruite later then other Okes.

The Names.

The tree is called in Greeke φήλλος *Phellus*, in Latine *Suber*, and *Ilex famina* of ſome as *Pliny* ſaith. The firſt is by *Matthiolus*, *Lobel*, and others called *Suber latifolium*, but that whoſe leaves fall in Winter (which *Bauhinus* maketh another *ſpecies*, but he might as well make the low one of *Pliny* to be another ſort likewiſe) *Suber Aquitanicum folio deciduo*. The other is called *Suber anguſtifolium* by the ſaid Authours. The *Italians* call it *Sugaro*, the *Spaniards Alcornoque*, and the barke *Corcha de alcornoque*, the *French Liege*, but ſurely this is not that *Liege* that *Bellonius* ſaith the fruite is edible, the *Germanes Pantoffelhoult*, and *Vlothout*, the *Dutch Corke*, as we doe.

The Vertues.

The Corke hath a manifeſt drying and binding faculty, more as it is thought then the barke of any other Oke: the aſhes of the burnt Corke ſtancheth any fluxe of blood, whether in men or women as *Severinus* ſaith:

Quacunque ſiſtit vis immoderata cruoris.

Being drunke in Wine or any other convenient drinke. Corke is profitably uſed for many purpoſes to ſtoppe all ſorts of veſſels, to peiſe fiſhermens nets, and to be put into ſhooes and ſlippers to keepe our feete warme and dry.

CHAP. VII.

Smilax Archadum major glandifera. The great Laurell Oke.

VNto the kindes of *Ilex* divers have joyned this *Smilax* for ſome likeneſſe, but differing in more, being unknowne to many of our moderne Writers for they ſtill underſtood the Yewe tree to be meant by this name, and no other: of this there are two ſorts, one greater and the other leſſer, both which ſhall be ſhewed in this Chapter.

1. *Smilax Arcadum glandifera major.* The greater Laurell Oke.

This greater kinde riſeth up to a reaſonable height like an indifferent tall tree, covered with a grayiſh ſmooth barke, and the younger branches, with an hoary ſoft downe, the leaves are very like unto Bay leaves, or as *Theophraſtus* ſaith like unto the ſmooth *Ilex*, being greene above, and with a ſoft white woollineſſe underneath, without any dents or prickles on the edges: it beareth yellow flowers on long ſtalkes as all other Okes doe, and fall away in like manner bearing ſmall Acornes like the great Oke.

1,2. *Smilax Arcadum glandifera major & minor.*
The greater and leſſer Laurell Oke.

2. *Smilax glandifera minor.*
The leſſer Laurell Oke.

The leſſer ſort that never groweth high, but ever remaineth like a low ſhrubbe, hath longer leaves then the former, and narrower alſo, but as white and woolly underneath, in other things they are alike.

The Place and Time.

The firſt groweth plentifully about *Mompelier*, and in many places in *Italy* and *Spaine*, the other upon the hills about the river *Rhodanus*, that runneth through *Provence*, and flower and beare fruite when the others doe.

The Names.

The old *Gretians*, and eſpecially the *Arcadians*, as *Theophraſtus* ſaith called this tree σμίλαξ and μίλαξ, *Smilax & Milax*, but they that live in thoſe Countries now, doe call both the Tree and the Acorne thereof *Acylaca*, by corrupting the word ἄκυλον, as it is very probable, *Bellonius* ſaith that the tree, which the *Cretanes* call *Acylaca*, they of mount *Athos*, keeping the old name doe call *Aria*, keeping the leaves alwaies greene, whereby *Bellonius* ſheweth how much we are miſtaken herein, for *Theophraſtus lib. 5. c. 5.* doth number *Aria*, among the everliving trees, ſuch as the *Ilex* that beareth *Acylaca* is, but not among ſuch as beare ſowre harſh berries, as the Service tree doth, unto the kindred whereof *Aria* is referred by our moderne Writers, and beſides *Theophraſtus* in his 4. Booke and 8. Chapter ſaith, *Laurus Ariæ ſimilis ex toto*, ſo that this *Smilax* or Laurell Oke is moſt likely to be that *Acylaca*, and their *Aria* alſo, and but the wood hereof is white and looſe as *Theophraſtus* ſhewēth, much differing from *Ilex*, which is firme and browne, it might be accounted a *ſpecies* thereof, and *Cluſius* indeed doth referre the great *Ilex* that he ſaw in *Spaine*, to be this *Smilax*, and ſo doth *Bauhinus* alſo, the vicinity of their

names

names of *Smilax* and *Ilex* peradventure moouing somewhat thereunto, for *Bauhinus* doth not account this *Smilax* to be a proper species of Oke it selfe, but putteth it among the *Ilices*, calling it *Ilex folio rotundiore molli modiceque sinuato sive Smilax Theophrasti*: the word *Smilax* is of a large extent, comprehending under it divers sorts of trees and herbes, as first this *Smilax* of the *Arcadians*, which we therefore call *glandifera*, to distinguish it by a severall epithite, from *Taxus* the Yewe tree, which is also called *Smilax*, but *baccifera*, the better to be understood: then is there *Smilax aspera, & levis* among the binde weedes, and lastly *Smilax hortensis* of *Dioscorides*, which is accounted to be *Phaseolus* the kidney Beane.

The Vertues.

This Laurell Oke is of a like binding quality with the other sorts of Okes, as *Galen* sheweth in his 6. Booke and third Chapter, *de compos. medic. secundum locos*, where he doth shew those things that are fit to use for the meane inflammations of the pallate, appointing the decoction of Mirtles and the berries to be stronger remedies then were before remembred, as also of lowre Quinces, and likewise the young and tender branches of the *Ilex*, *Arbutus*, *Smilax* and *Phagus*, which *Cornarius* in commenting upon seemeth to wonder at, that *Galen* should appoint the *Smilax*, which is *Taxus* a dangerous and deadly tree as *Dioscorides* and *Pliny* doe witnesse to be used inwardly, and thereupon thinketh that the *Taxus* may be lesse dangerous in one place then another, and then that to be taken, but *Matthiolus* taxeth him for that opinion, saying that if he had taken better Counsell of his *Theophrastus*, with whom he was so conversant, who sheweth a kinde of *Smilax* that is like unto *Ilex*, he would have beene of a better judgement: and *Galen*, as you heare placeth it with other Acorne bearing trees.

CHAP. VIII.

Phellodrys. The Corke Oke.

There are five sorts of this kinde of Oke, as *Dalechampius* in *Lugdunensis* hath observed and recorded, although *Theophrastus* and *Matthiolus* have made mention but of one, which shall briefely be declared here.

1. *Phellodrys alba angustifolia.* The narrow leafed white Corke Oke.

The first white leafed Corke Oke groweth reasonable great, and almost as tall as the Corke tree, covered with a smoother and whiter barke then either the Corke or the Oke: the leaves are somewhat long and narrow, greene aboue and gray underneath, dented about the edges but not very deepely, and rather hard then prickly, the flowers and fruite are like the other Okes, but the Acornes are of a darker yellow colour. There is also a sort hereof whose leaves have no dents or very few the timber or wood is not so hard as the *Ilex*, and not so soft as the Oke. *Altera.*

2, 3. *Phellodrys alba angustifolia & latifolia.*
The narrow and broad leafed white Corke Oke.

4 5 *Phellodrys foliis latissimis & foliis muricatis.*
The broadest greene leafed Corke Oke, and the prickly one.

2. *Phellodrys*

2. *Phellodrys alba latifolia.* The broader leafed white Corke Oke.

This other white leafed Corke Oke is like unto the former in growth, and differeth in the barke, leafe and Acorne of the tree, the leafe is white on the underside as the former, but broader then it, and lesse hard, and lesse dented also, the barke as well of the branches as of the Acornes, are of a blackish red colour.

3. *Phellodrys nigra mediocrifolio.* The greene leafed Corne Oke.

This greene leafed Corke Oke groweth not so high as the former, the barke of whose branches are grayish, the leaves are of a meane size, of a darke greene colour, and not at all white underneath, with but few snips or dents, and those not deepe, and very little prickly at the edges, the Acornes are of as bright a yellow colour as the first.

4. *Phellodrys nigra latissimis foliis.* The broadest greene leafed Corke Oke.

This differeth from the last in the leaves, being larger and broader then the last, and more deepely dented and very prickly, but greene as it is: the cups of all these Acornes are onely rough as the ordinary Acornes, and not prickly.

5. *Phellodrys muricata foliis.* The prickly Corke Oke.

The prickly Corke Oke hath a grayish barke on the body and armes, the leaves are smaller, and of a pale greene colour, deepelier dented and with sharper prickles: the Acornes hereof are like the other, but the huske or cuppe is much more prickly then any of the rest.

The Place and Time.

These doe all grow on the hills neere the *Rhodanus* in *France*, in *Italy* also by *Siena* as *Matthiolus* saith, and in many places of *Portugall* also, where the two former sorts doe beare Galles likewise, they keepe the same time with the rest.

The Names.

It is called in Greeke φελλοδρυς *Phellodrys quasi Suberi quercus* in Latine, but *Theophrastus* saith it is a meane betweene the *Ilex* and the Oke, and therefore some did call it *Ilex famina*. But because the *Suber* or Corke tree is so like unto the *Ilex*, it may as well be said to partake of the one as well as the other. The first is the *Phellodrys* of *Matthiolus*, *Lobel* and others, and is the *Phellodrys alba angustifolia folio serrato* of *Lugdunensis*, the rest are onely mentioned in *Lugdunensis*, and *Paulus Aegineta* from him, the Greekes doe promiscuously call these sorts *Aegilops*, as they doe those in the last Chapter The *Italians* call it *Cerrosugaro*, as partaking of *Cerris*, and *Suber*, it is not distinguished by any *French* name that I know of.

The Vertues.

There is nothing remembred of the faculties hereof, but as *Matthiolus* saith, it is of the like properties, and differeth not from the other Okes.

CHAP. IX.

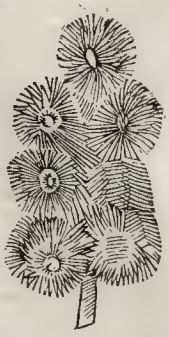
Castanea. The Chesnut Tree.

ALthough the fruite of the Chesnut tree is not an Acorne, yet because some of the ancient Writers have assimiled it thereunto, and have given it the name of *Sardinia glans*. I thought it fittest to joyne it next unto them, whereof there are foure especiall sorts, yet one is not of ours, but the new world, and there-

1. *Castanea vulgaris.* The ordinary Chesnut tree. 2. *Castanea equina.* The Horse Chesnut.

fore

4.3. *Caſtanea Peruana, & Caſtanea humilis.* The Cheſnut of Peru, and the dwarfe Cheſnut.



fore I ſhall give yon but a bare deſcription of the Nut, and not of the tree untill we can learne more of it.

1. *Caſtanea vulgaris.* The ordinary Cheſnut.

The ordinary Cheſnut tree groweth very great and high, equalling many times great and large ſpread Okes, the leaves are long great rough and wrinckled dented about the edges, the bloomings or catkins are long and ſomewhat like the Oke, but more greeniſh yellow: the fruite groweth betweene the leaves and the branches, towards the end of them, incloſed within three ſeverall huskes, the outermoſt whereof is the whitiſh vrchin prickly huske, hairy and ſmooth on the inſide, which when it is ripe openeth it ſelfe, and ſheweth the nut being flat on the one ſide, and round, bunched out on the other whoſe ſhell or huske is ſmooth browne, and ſhining as it were on the outſide and hairy within, tough alſo and not eaſie to breake, within which lyeth the nut it ſelfe, covered with the third huske, which is a thinne reddiſh bitter skinne or peeling, the kernell being of a firme ſubſtance and white, ſweete and pleaſant in taſte, formed ſomewhat like unto an heart: the timber or wood hereof is rough and of a browniſh colour. Some have made divers ſorts hereof greater and leſſer wilde and tame, but I doe not hold them differences, but as the climate cauſeth it.

2. *Caſtanea Equina.* The Horſe Cheſnut.

The Horſe Cheſnut groweth likewiſe to be a very great tree, ſpreading great and large armes and branches; the leaves are very beautifull, ſet by couples, and divided into five, but moſt uſually into ſeaven diviſions, every one being dented about the edges: the flowers grow at the toppes of the branches, on long ſtalkes conſiſting of foure white leaves a peece, the two uppermoſt whereof are larger then the two undermoſt, and have a round purpliſh violet coloured ſpot in the middle of the leafe, with many yellow threds and gold yellow tips riſing from the middle: the fruite is contained in rounder and thicker prickely huskes, the nut within this huske is rounder then the other, and covered with a thicker and browner ſhell, and having a whitiſh marke or ſpot at the head, where it is joyned to the outer huske: the nut within this ſhell is white, without any ſuch thin skin or peeling as the former hath.

3. *Caſtanea humilis.* The dwarfe Cheſnut.

The dwarfe Cheſnut tree doth alwayes grow low in compariſon of the former, being like in leaves and fruite unto the former, but that they grow more together, and the nuts are no bigger then Hazell nuts, having alwaies more then one encloſed in every prickely huske, and is unpleaſant in taſte ſcarſe fit to be eaten.

4. *Caſtanea Peruana.* The Cheſnut of *Peru.*

What manner of tree this is that beareth theſe Cheſnuts, or what forme the leaves carry that grow thereon, is not knowne I thinke to any in theſe parts, I muſt therefore as I promiſed in the beginning ſhew you of the fruit that it is almoſt round, yet a little pointed toward the ſtalke covered with a thicke barke eaſie to be broken, yet ſomewhat ſpongy, of a darke or browniſh yellow colour, under which grow a number of prickles, ſticking to the inner huske, that covereth the nut or kernell it ſelfe, which inner huske is tough and hard to breake, and containeth within it a nut like an Almond out of the ſhell, both for colour and bignеſſe, but of the forme of a ſmall kidney, and of a reaſonable ſweete taſte like an Almond or the common Cheſnut.

5. *Caſtanea Americana Cathartica.* Purging Cheſnuts of *America.*

This tree ſaith *Monardus* groweth in the Continent of *America*, great and vaſte, whoſe fruite is like unto a Cheſnut but that the outer huske is ſmooth and not prickly, nor having any rough ſhell, but a thin skin that both compaſſeth the whole fruite which is almoſt foure ſquare, and divideth it in the middle into two parts.

The Place and Time.

The firſt groweth on mountaines and in woods uſually, both in the South and Northerne Countries, but the warme Countries for the moſt part breede the greater nuts. The ſecond groweth in the Eaſterne Countries of *Turky*, for our Chriſtian world hath firſt had the knowledge of it from *Conſtantinople*. The third groweth not farre from the Hill by *Lyons* in *France*, called *Pilates* hill, and not elſewhere as is knowne. The fourth in *Peru* in the Weſt Indies. And the laſt neere the ſhore of *Nicaragua*, &c. And flower in *Aprill*, after the leaves be come forth, the fruite is ripe in Autumne.

The Names.

It is called in Greeke κάστανα and καστάνεια, *Caſtana* and *Caſtanea*, and *Caſtanea* in Latine, the fruite is alſo ſo called, and σαρδιανὰι βάλανοιὴ Διὸς βάλανοιὴ λόπιμα, that is, *Sardianæ glandes Iovis glandes & Lopima*: It hath alſo ſome other names given it, as *Euboida* or *Euboica*, and *Heracleoticanux*, yet *Gaza* tranſlateth it out of *Theophraſtus Nux*

avellana Agelochus as *Athenæus* saith, called it *Mota* and *Amota*: *Pliny* maketh divers sorts hereof, as by the names he giveth them should seeme, as *Tarentina, Salariana, Meterana, Coreliana, Balanitis, &c.* When as the climate and soyle, make this diversity as it is in our dayes that the *French*, and *Spanish* great nuts, that are of a sweeter relish are called *Marrons*, which hath caused *Matthiolus, Ruellius* and others, to set downe two sorts of it, one to be wilde, and another tame, because one is greater then another, The first is generally called by all Writers *Castanea*, and the fruite *Nux Castanea*. The second is also called *Castanea equina*, by all Authours that have written of it, not being knowne as it is thought, to any of the auncient Writers, unlesse as *Cæsalpinus* thinketh, it may be the *Myrobalanus folio heliotropij* of *Pliny*, *lib.* 12. *c.* 21. The *Turkes* call it *At* or *Adcastanesi*, which doth signifie as much as *Castanea aquina*. The third is called *Castanea humilis* by *Lugdunensis*, and *Iohannes de Choul* in his *Historia montis Pilati*. The fourth is remembred onely by *Clusius*, who had it from *Abramus Ortelius*, who received it from *Benedictus Arias Montanus*, brought out of the West Indies. The last *Monardus* called *Fructus Cholugogus*, and *Lugdunensis* from him, but *Castor Durantes, Castanea purgatrix*, and *Bauhinus* from him. The *Arabians* call it *Sadianalach Castal* and *Stebulot*, the *Italians Castague*, the *Spaniards Marrons*, and so doe the *French*, as is before said, and *Castaignes* also, the *Germanes Kesten*, and the *Dutch Castanieboem*.

The Vertues.

Our Chesnuts are much of the property of Acornes, being hot and dry in the first degree, with a certaine windinesse in them, which is perceived by those that are put into the fire to rost, by skipping thereout suddenly with a great cracke or noise, but will not doe so if it be a little slit by thrusting the point of a knife into them, whereby the heate may expell the windinesse. Of all the kinds of Acornes saith *Galen* the Chesnuts are the best, and doe onely of all wild fruites yeeld unto the body commendable nourishment, yet not to be overmuch eaten, in that as he saith they breede thicke blood, and being windy procure headache, are hard of digestion, and binde the body by an astringent quality, whereof they pertake not a little. The inner skinne that covereth the white nut is so astringent, that if the decoction thereof in wine or water, or the pouther thereof be taken in some convenient drink it will soone stay any super-purgation, or any flux of blood in man or woman. *Dodonæus* saith that if the meale of Chesnuts be made into an Electuary with hony, it is very profitable for those are troubled with a cough or with spitting of blood. In many places where there are great store growing, they fatten up their hogges with the nuts as we doe in *England* with Acornes, and Beech-mast. The Horse Chesnuts are given in the East Country, and so through all *Turkie*, unto Horses to cure them of the cough, shortnesse of winde and such other diseases: the low or dwarfe Chesnuts by reason of the unsavoury taste, are not used by any: and the Chesnut of *Peru*, is not recorded of what quality it is more then that *Clusius* as is before said, saith the taste is like an Almond or an ordinary Chesnut. The last sort *Monardus* saith purgeth gently, and choller especially, eaten when it is fresh, or bruised and drunke in Wine, but being dryed the pouther is given in broth, and if it be rosted it purgeth the lesse: but this is to be observed saith he, that the thinne skinne is to be taken away howsoever you take it, least it procure vomittings, laskes, and other daungerous symptomes.

CHAP. X.

Fagus. The Beech tree.

BEcause this tree beareth fruite somewhat like unto a Chesnut, having beene reckoned also a kinde of Acorne bearing tree, I thought it fittest to place it next after the Chesnut, both because it is found growing in woods among Okes, and that the fruite serveth as Acorne mast to fatten up swine. *Theophrastus* maketh two sorts, *montana* and *campestris*, the former white, the other blacke, but wee can finde no such diversity in those that grow with us. Our Beech therefore groweth to be a great and a tall tree, spreading the boughes and branches on every side, whereby it maketh a goodly large shadow, unlesse it be shred below to make it spring up higher, covered with a smooth white barke, whereon are placed many broad smooth leaves, almost round yet pointed at the end, and a little finely dented about the edges, of a sad greene colour, which usually turne yellow before they fall away, and whereon are often found certaine small round hollow berries pointed at one end, greene at the first and red afterwards, wherein are found small wormes: The blowings or catkins are small and yellow, like those of the Birch tree, but lesse, and quickely falling away: The fruite is contained in a rough huske somewhat like the Chesnut, but not prickly sharpe at all, which being ripe openeth it selfe into three parts, and sheweth a small three square nut, covered with a smooth soft skin, browner then the Chesnut, and under it a sweete white kernell like the Chesnut, but more astringent: the rootes grow not deepe, nor yet spread farre; the timber is smooth and white, but brittle, yet profitable to many uses.

The Place and *Time.*

This groweth through most Woods in *England*, among the Okes and other trees, and is planted also in Parkes, Forrests, and Chases, to feede their Deere, but in other places to fatten Swine, whose fat will bee softer then theirs that are fatted with Acornes: it bloometh in the end of *Aprill* or beginning of *May* for the most part, and the fruite it ripe in the end of *September*.

The Names.

It is called in Greeke ὀξύη *Oxya*, in Latine *Fagus*, *Gaza* translateth it *Sciſſima quod ſit in Laminas Sciſſilis*, it is easie to be cloven: yet he also translateth the φηγὸς of *Theophrastus* which he numbreth among the Okes, to be *Fagus*, whose ill sample *Tragus, Fuchsius, Ruellius, Matthiolus. Dodonæus*, and almost all other Writers thereof since his time have followed as I said before in the Chapter of Okes, whose difference many yet have acknowledged, but none before *Dalechampius* have plainely detected: another errour also hath spread among many, in taking ὀστρὺς or ὀστρία, *Ostrys* or *Ostrya* of the Greekes, whereof *Pliny* speaketh *lib.* 13. *c.* 21. to be this *Oxya* but *Pliny* sheweth plainely in the description of *Ostrys* that the fruite or seede is like unto Barley, which they would correct, and make it to be like the Chesnut, thus one errour begetteth another: but *Ostrys* or *Ostrya*, as shall be shewed hereafter is rather a kinde of Elme, yet unproperly he calleth it *Carpinus*, when as the *Carpinus* of the ancients is a kinde of Maple, as shall be shewed, and *Dodonæus* to mend the matter placeth the *Ostrys* among the Maples, under the

the name of *Carpinus*: but the truth is that φηγὸς, ὀξύα and ὄστρια are three ſeverall trees, and *Carpinus* the fourth, of ſeverall kindes, and not to be ſo confounded together. The *Italians* call it *Faggio*, the *Spaniards Haia*, the *French Fau Fonſtean*, and *Heſtre*, yet *Bellonius* in the 52. Chapter of his firſt Booke of Obſervations doth diſtinguiſh *Heſtre* from *Fonſtean*, ſaying that the Greekes *Oſtrya* is The *Frenches Haiſtre* & their *Oxya* the *Frenches Fonſteau* both of them growing wilde in the woods, upon the mountaines or hils of *Sidero capſa* in *Macedonia*, the *Germanes* call it *Buch baum*, the *Dutch Buickenboom*, and we in *Engliſh* Beeche.

Fagus. The Beech tree.

The Vertues.

The leaves of the Beeche tree are cooling and binding and are therefore applyed unto hot ſwellings to diſcuſſe them: the nuts are hot and moiſt in the firſt degree, and thereby nouriſh much all creatures that feed thereon. *Petrus Creſcentius* writeth, that the aſhes of the wood is good to make glaſſe. *Tragus* ſaith that he hath prooved by good and often experience, that the water that is found in the hollow places of decaying Beeches will cure both man and beaſt of any ſcurfe or ſcabbe, or running tetters, if they be waſhed therewith: *Ruellius* reporteth that if a Viper or Adder be ſtrucken with a rod of the Beech tree, or if it be but onely put unto it, it hath ſuch power as to ſtay the Viper from getting away while it is by it: the barke of the Beech tree is ſo flexible, that many Country people doe double it, with a ſticke thruſt through both ſides at the toppe, to carry Cherries, Strawberries, and many other ſuch like things therein, which *Pliny* alſo noteth was uſed in his time.

CHAP. XI.

Ulmus. The Elme.

THeophraſtus, *Columella*, and many alſo of our moderne Authours, have made mention onely of two ſorts of Elmes, *Pliny* hath made foure ſorts, which notwithſtanding may be reduced into the former two: we have obſerved in our Country three ſorts, and Maſter *Goodier* a fourth, beſides another very like unto them, but yet notably differing, which ſhall therefore bee ſet downe in the Chapter following by it ſelfe.

1. *Ulmus vulgaris.* Our common Elme.

That Elme which is moſt frequent and beſt knowne in generall throughout the Land, groweth more upright, and not ſo much ſpreading as the reſt, to bee a very great tree, with a body of a very large ſize covered with a thicke rough barke, chapt or crackt in many places, but that on the branches is ſmoother, the bloſſomes that appeare before the leaves come forth are like ſmall taffells of red threds, which falling away there come up in their ſtead, broad, flat, whitiſh skinnes, which are the ſeede being not much unlike to the ſeede of the white Garden *Arrache*, which doe fall away by degrees, ſome quickely, and ſome holding on a good while after the leaves are fully come forth, the leaves are of a ſad greene colour, broad, ſomewhat round and pointed at the the ends, rough and crumpled for the moſt part, and dented about the edges, one ſide of the leaſe next to the ſtalke being longer then the other, and more eaten by all ſorts of cattle then any of the reſt, having certaine ſmall bladders or bliſters thereon, which containe ſmall wormes in them: the wood or timber hereof is of a darke reddiſh yellow colour, and is very tough, fit for many uſes, where it may be either continually wet or dry, but not enduring both ſo long as the Oke. *Figur Trag. pro floribus.*

2. *Ulmus latiore folio.* Broad leafed Elme or Witch Haſell.

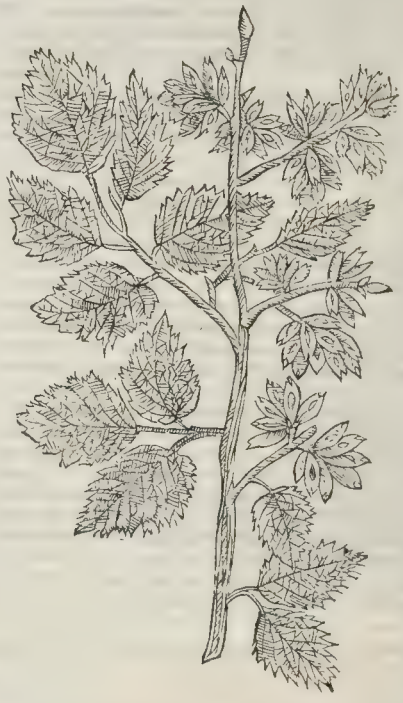
This other Elme groweth alſo to be as great a tree as the former, but ſpreadeth the branches more and falling downewards, not growing ſo upright as the former, the bloomings and ſeed hereof is like the former in all things but greater: the leaves hereof are much larger then it, but crumpled and rough or hard, and like unto the leaves of the Haſell nut, from whence it became to be called Witch haſell, and hath ſuch like bladders thereon as the former: the wood or timber of this is not ſo tough as the former, but is more ſhort and will bee more eaſily cleft,

3. *Ulmus folio glabro.* Smooth leafed Elme or Witch Elme.

The Witch Elme groweth more like to the laſt then the firſt, in the bending boughes and great body, the blooming and ſeede alſo is like though leſſe: but the leaves hereof are nothing ſo large as the laſt, but neereſt in bigneſſe unto the firſt yet not rough or crumpled, but ſmooth and plaine and without any bliſters on them, as the former two have, the timber hereof is as ſtrong and as tough as the firſt or rather more, and is accounted of workemen the ſtronger and more ſerviceable kinde.

1. *Vlmus vulgaris cum samaris præ semi. nibus suis.*
Our Common Elme with his seede.

2. *Vlmus latiore folio.*
Broad leafed Elme or Witch Hafell.



3. *Vlmus folio glabro*
Smooth leafed Elme, or Witch Elme.

4. *Vlmus minor.* The leſſer Elme.

4. *Vlmus minor*. The leſſer Elme.

There is in ſome places of this land found a ſort of Elme ſomwhat differing from thoſe before, in that it groweth lower and leſſer, and with ſmaller leaves that are as rough on both ſides as the firſt, and eaſie to be diſtinguiſhed if they be heedefully obſerved.

The Place and Time.

All theſe ſorts are as is ſaid, found in our owne Country yet the firſt is the moſt frequent, and the ſecond in ſome Countries as much or rather more then the firſt. the third is to be ſeene in many woods in *Eſſex*: they all bloſſome as is ſaid before the leaves come forth, and the ſeede not long after their firſt ſpreading at large.

The Names.

It is called in Greeke πτελέα in Latine *Vlmus*, *Theophraſtus* and *Columella*, as I ſaid, mention but two kindes *Theophraſtus*, *Montiulmus*, or *montoſa Vlmus*, and *campeſtris Vlmus*, *Columella* hath *Vlmus Gallica*, and *Vernacula*, which is *Italica*. *Pliny* hath foure ſorts, *Attinia*, *Gallica*, *Noſtras*, and *Sylveſtris*, which will thus be reduced into the two ſorts, his *Attinia* and *Gallica*, are both one ſort, as *Columella* plainely ſetteth downe, and is the ſame with *Theophreſtus* his *montoſa*, which is *excelſiſſima*: *Pliny* his *noſtras* and *ſylveſtris*, are both one likewiſe, and the ſame with *Columella's Vernacula*, which as I ſaid is called *Italica*, and the ſame alſo with *Theophaſtus* his *Vlmus campeſtris*, ſo that our third ſort with ſmooth leaves, was knowne to none of them, nor yet ſcarſe to any of our moderne Writers, unleſſe they put it for the *Carpinus* as it is uſually called, or for *Ornus* as *Tragus* calleth it, as ſhall be ſhewed in the next Chapter: ſo that our firſt here ſet downe agreeth with the *Attinia* of *Pliny*, *Gallica* of *Columella*, and *Montoſa Vlmus* of *Theophraſtus*, and our ſecond with the *campeſtris* of *Theophraſtus*, *Vernacula* of *Columella*, and *noſtras & ſylveſtris* of *Pliny*, and called alſo *latifolia* by divers, but *Bauhinus* in my judgement hath much confounded them, putting one for another, the ſeede of the Elme is called *Samarra*. The *Arabians* call it *Didar*, *Dirdar*, and *Luzach*, the *Italians Olmo*; the *Spaniards Vlmo*, the *French Orme*, the *Germanes Ruſtholtz*, *Ulmerbaum*, *Iffenholtz*, and *Lindhaſt* as *Tragus* ſaith, the *Dutch Olboom*, and we in *Engliſh* the Elme tree.

The Vertues.

All the parts of the Elme are of much uſe in Phyſicke, both leaves, barkes, branches and rootes: the leaves while they are young were wont to be boyled or ſtewed, and ſo eaten by many of the common people. *Marcellus* ſaith that the leaves hereof beaten with ſome pepper, and drunke in Malmeſie doth helpe an old rotten cough to be taken faſting, both *Dioſcorides* and *Galen*, upon his owne experience ſay, that greene wounds are healed by applying ſome bruiſed leaves thereto and bound upon with the barke of the Line or Linden tree, or with it owne barke, the leaves uſed with vinegar cureth the ſcurfe and lepry very effectually, ſo doth the barke alſo in vinegar as *Galen* ſaith, *Dioſcorides* and *Columella* do both ſay, that the outer bark of the Elme drunk in wine hath a property to purge flegme, which I know of none in our time hath tryed to confirme it: the decoction of the leaves, barke or roote being bathed, healeth broken bones: that moiſture or water that is found in the bladders on the leaves, while it is freſh is very effectually uſed to cleanſe the skinne and make it faire, whether of the face, or of any other place. *Matthiolus* ſaith, he hath ſufficient tryall that the water in the bliſters on the leaves, if clothes often wet therein and applyed to the ruptures of children will helpe them, and they after well bound with a truſſe. The ſaid water put into a glaſſe and ſet in the ground, or elſe in dung for 25. dayes, the mouth thereof being cloſe ſtopped, and then the bottome ſet upon a lay of ordinary ſalt, that the feces may ſettle, and the water become very cleare, is ſo ſingular and ſoveraigne a balme for greene wounds, that it is a wonder to ſee how quickly they will be healed thereby, being uſed with ſoft tents; the decoction of the barke of the roote fomented, mollyfieth hard tumours, and the ſhrinking of the ſinewes: the rootes of the Elme boyled for a long time in water, and the fat riſing on the toppe of the water, being cleane ſcummed off, and the place annointed therewith that is growne bald, and the haire faine away, will quickly reſtore them againe: the ſaid barke ground with brine or pickle untill it come to the forme of a pultis and laid on the place pained with the gout, giveth a great deale of eaſe. It hath been obſerved that Bees will hardly thrive well where many Elmes doe grow, or at leaſt if they upon their firſt going abroad after Winter doe light on the bloomings or ſeed thereof, for it will drive them into a looſeneſſe that will kill them all, if they be not helped ſpeedily.

CHAP. XII.

Oſtrys ſive Oſtrya Theophraſti. The Horne beame tree.

THis tree which as I ſaid before, is ſo like unto the Elme, but notably differing from it riſeth up to be a reaſonable great tree with a whitiſh rugged barke, ſpreading well, and bearing ſomewhat longer and narrower leaves then the ordinary Elme, and more gentle or ſoft in handling, reſembling in ſome ſort the Beech leaves, turning yellow before they fall, for which cauſe ſome have taken it as a kinde of ſmall Beech: at the end of the branches hang downe a large tuft of whitiſh greene narrow and long leaves, being almoſt three ſquare ſet together, among which rife ſmall round heads, wherein are contained ſmall yellowiſh ſeede like unto barley cornes, the timber or wood hereof is whitiſh like the Beech, but tougher and ſtronger then any Elme and more durable in any worke, growing as hard as Horne, whereon came our *Engliſh* name.

Cæſalpinus ſeemeth to ſet forth another ſort differing in the heads of ſeede which in *Italy* are ſmaller and cloſer, and in *Germany*, and with us more looſe and larger. *Altera Italica.*

The Place and *Time*.

This groweth in many Countryes in this Land, where as I ſaid ſome take it for a kinde of Beech, and ſome for a kinde of Elme: the tuft of leaves appeareth in *June*, and is ripe in the end of *Auguſt*, or in *September*.

The Names.

This tree hath found almoſt as many names as there have beene Authours that have written of it, but by the judgement of the beſt it is the ἴπος or ἔρεια, of *Theophraſtus*, which he deſcribeth ſo plainely in his third Booke and tenth Chapter, that it is a wonder that ſo many learned men as have called it otherwiſe ſhould not better heede it, but led by tradition or conceit have rather taken it to be any other thing then what it is, *Pliny lib.* 13. *c.* 21. de-

scribeth it but maketh it like to *Fraxinus* which is an errour in him, when he should rather have set *Fagus*, for it no way resembleth the Ash, but very much the Beeche. *Tragus* taketh it to be *Ornus*, and saith he cannot agree to *Ruellius*, who said that *Ornus* was a *species* of *Fraxinus*. *Matthiolus* calleth it *Carpinus* when as *Pliny* sheweth that *Carpinus* is a kinde of *Acer*, yet *Dodonæus*, *Lobel*, and others, call it so after him. *Dodonæus* also in making this to be *Carpinus*, he calleth it *Zygia quasi conjugalis* of *Pliny*, and *Gerard* doth the like *verbatim*, his Corrigider letting him so passe as if it were no fault or errour in him, when as the true *Carpinus* or *Zygia* is not knowne what tree *Pliny* meant by it, for the other Maples that are knowne, are in leaves one like another, yet *Dodonæus* in his *Dutch* Booke maketh it his third kinde of Elme, and doubteth if it be not the *Vlmus sylvestris* of *Pliny*. *Lugdunensis* giveth us the figure of it for *Vlmus Attinia*, but *Cordus* or *Dalechampius*, as I said before, as I take it, first tooke it to be *Ostrya* and so *Gesner* after him, and *Bellonius*, *Thalius*, *Clusius* and *Camerarius*, doe all hold it to bee the right, and so call it, yet *Gesner in hortis* calleth it *Fagus sepiaria*, *Lobel Betulus*, and *Clusius Fagulus herbariorum*. The *Italians* call it *Capino* according to *Matthiolus*, and the *French* in taking it to be *Carpinus*, call it *Charme* and *Charpene*, but *Clusius* saith that his Country men of *Arras* called it *Hestre*, the *Germanes Hanbuchen*, and *Hagenbuchen* or *Hainbuchen*, and we in *English* Hornbeame, and Hardbeame tree.

Ostrys sive Ostrya Theophrasti.
The Hornebeame tree.

The Vertues.

We have not learned that any Author hath knowne this tree to be applyed to any Physicall use, but as a wood for many necessary imployments, both for Milles and other smaller workes in good account for the hardnesse, strength, and durability.

CHAP. XIII.

Tilia. The Line or Linden tree.

THe Line tree is accounted to be of two sorts, the male and the female: that which we call the female is in great request both for the large growth and goodly verdure and greene shade that it maketh, as also for the sweete sent it yeeldeth, especially in the blooming time, when as it is much pleasure to rest under it, besides the Physicall vertues, but the male as it is more strange and lesse seene, so likewise of lesse respect and use, besides that many doe suspect it not to be a *species* thereof, but rather a kinde of Elme, it is so differing in forme and substance.

1. *Tilia mas.* The male Line tree.

The male Line tree, groweth to be a great tree, and spreadeth the boughes largely, yet not so much as the female, covered with a thicker barke, nothing so flexible and fit to binde things withall, because it is harder and more easie to breake: the leaves are somewhat like unto Elme leaves but somewhat smaller and longer, hard in handling and on every one for the most part grow small bladders or blisters, full of small wormes or flyes, which being ripe doe flye away, (but *Dodonæus* conceyveth it to have any bladders on the leaves, and that they are deceived which so picture it, but he might be deceived therein, for although transplanted it bore none, yet naturally it might) this very seldome beareth either flower or fruite, and therefore it is held to be barren, not bearing any thing: yet when it doth beare, it carryeth round and flat huskes, many growing close together, each whereof hangeth on a small long footestalke by it selfe, with a notch or cleft at the head or end: the wood or timber hereof is harder, more knotty also and yellower then the female, and comming neerer unto the Elme, whereupon many have judged it to be rather a kind of Elme. *Bauhinus* maketh another sort hereof with larger leaves which he taketh to be that which *Thalius* setteth downe in his *Hercynia sylva*, to have found there wilde, and calleth *Tilia silvestris sive montana*, but surely I thinke it differeth not from *Tragus* his *Tilia silvestris*, which both he and *Bauhinus* reckon a *species* of the female kinde, and therefore cannot fitly be referred to the male, because he never saw it beare fruite.

2. *Tilia fœmina major.* The greater female line tree.

This greater Line tree groweth greater then the former (especially if it light in good ground, for I saw at *Cobham* in *Kent*, a tree whose branches were led into two severall arbours one above another, besides that on the ground under the branches, which was a goodly spectacle, and a large shadow that it yeelded) covered with a darke coloured barke, the next thereunto being very obsequious, and pliant to bend and binde, having some other thin rindes within it, whereof are oftentimes made baskets, and as *Bellonius* saith, the Greekes doe bottles, which being pitched or lined with melted rosin, serve to carry wine or water in from place to place, as also to make cords, ropes or the like: the leaves are faire and broad, greener, smoother, gentler and rounder then Elme leaves, but with a longer end, dented also about the edges and of a reasonable good sent: at the ends of the branches oftentimes, and from the foote of the leaves also come forth long and narrow whitish leaves, alongst the middle

1. *Tilia mas.* The male Line tree. 2. *Tilia femina major.* The great female Line tree.

dle ribbe whereof ſpringeth out a ſlender long ſtalke, with divers white flowers thereon, ſmelling very ſweete, after which follow ſmall berries wherein is contained blacke round ſeede: *Gerrard* ſaith it beareth cornered ſharpe pointed nuts of the bigneſſe of Haſell nuts, (but ſuch I never ſaw) and ſaith that the male kinde doth beare round pellets cluſtring together like Ivy berries, wherein is blacke ſeede, wherein hee transferreth that to the male kinde, which is proper to the female; the wood is whitiſh ſmooth and light, the coales whereof is fitteſt to make Gunpouther withall. At the rootes and under the old trees of this Linden, *Tragus* ſaith he ſometimes obſerved to grow a certaine Excreſſence like unto the Oke grape, whereof he knew no uſe. *Vue Quercine ſimile.*

3. *Tilia femina minor.* The ſmaller female Line tree.

This leſſer Line tree agreeth with the laſt in all things, ſaving that it groweth ſmaller both in body, leaves and flowers, the leaves being of a darker greene colour, and beareth no fruite after the flowers, becauſe they appeare later then the former.

The Place and *Time.*

They all grow on the hills and high grounds, yet for the moſt part in the moiſter places, and are often found alſo in vallies: with us the greater female kinde is planted in many places of our Land, chiefly for the large ſweete ſhadow it maketh, and flowreth uſually in *May*, the other are very great ſtrangers in this Land, ſcarce to be ſeene any where.

The Names.

It is called in Greeke φίλυρα *Philyra*, but not φιλύρεα as *Pliny*, that confoundeth *Dioſcorides* his *Philyrea*, with *Theophaſtus* his *Philyra*, ſo called becauſe it is brought into *tenues aſſulas ſive philyras* ſmall thin ſheetes or leaves, ſuch as in the elder times they uſed to write on: in Latine *Tilia*, the one is called *mas*, and the other *femina* by all Writers, but that *Bauhinus* addeth unto the title of the *mas*, *Ulmifolia*, and further ſaith, that the figures thereof extant, are rather of the Elme then of it. *Tragus* onely and *Geſner* in *hortis*, have made mention of the laſt, as of a differing ſort from the ordinary female kinde. The *Italians* call it *Tilia*, the *Spaniards Teies*, the *French Tillet*, *Teillen* and *Teil*, the *Germans Linden*, and *Lindenbaum*, for the ſmoothneſſe and ſoftneſſe thereof, the *Dutch Linde*, and *Lindeboem*, and we thereafter the Line or Lindentree, and in ſome places, broad leafed Elme. *Pliny* in his 10. Booke and 16 Chapter, ſheweth that among the *Tiburti*, the Line trees were ſeene to beare ſundry ſorts of fruits for on one arme grew Nuts, on another Grapes, on another Peares or Figs, or Pomegarnets, and divers ſorts of Appples, but they all were not of long continuance.

The Vertues.

The male kinde is quite without uſe for any thing that I know, nothing being extant thereof in any Authours writings. The female is of much uſe, for the decoction of the leaves is a good Lotion to waſh ſore mouthes, or that have canckers in them: the leaves alſo being bruiſed after the boyling, and applyed to their legges or feete that have tumours in them by falling of humours, doth much helpe them. the inner barke likewiſe performeth the like effect: the flowers of the Line tree, and of Lily Convally, being deſtilled together, the water of them is much commended againſt the falling ſickeneſſe: the deſtilled water of

the

the barke is of the ſame effect, and is alſo of very good uſe againſt the fretting humours that cauſe the bloody fluxe or griping paines in the belly: the ſaid inner barke being ſteeped in water for a while, cauſeth the water to become thicke or *muſcilagye*, which being applyed with clothes wet therein, will helpe any place that is burned with fire: the wood or coales of the Line tree, while they are burning hot quenched in vinegar, and afterwards ground with a certaine thing or drugge, called *Oculi cancri* and drunke, is found by good experience to be wonderfully good for thoſe that by ſome fall or bruiſe, or by blowes doe ſpit blood: *Tragus* ſaith that he thinketh the flowers hereof, whereon Bees doe much deſire to feede are good for them.

CHAP. XIV.

Betula. The Birch tree.

THe Birch tree groweth to be a goodly tall ſtraight tree with us, fraught with many boughes and other ſlender branches, bending downewards, the older ones being covered with a diſcoloured rough chapped barke, and the younger being browner by much, under which there is another fine white thinne rinde or barke, much uſed to write upon, before paper was uſed, the leaves at their firſt breaking out are crumpled, and after are ſomewhat like unto Beech leaves, but ſmaller and greener, and dented alſo about the edges: it beareth ſmall and ſhort catkins, ſomewhat like to thoſe of the Haſell nut tree, which abide on the branches a long time, untill growing ripe, they fall on the ground and their ſeede with them.

Betula. The Birch tree.

The Place and *Time.*

This uſually groweth in woods, as well on the higher as lower and moiſt grounds, every where generally throughout the land, the catkins come forth in *April*, and the leaves ſoone after, the ſeede is ripe in *September*.

The Names.

It is called in Greeke σημύδα by *Theophraſtus, lib. 3. c. 14.* yet he giveth it to be *folio Caryæ*, and ſome read ἡσχλευπικὴ κάρυα but others doe thinke that it ſhould be *folio Oxyæ*, whereunto it fitly agreeth, in Latine *Betula*, and with ſome *Betulla fortaſſe quia bitumine ſcatent*: all Authours call it *Betula*. The *Italians* call it *Bettola*, the *French Bouleau* and *Bes*, the *Germanes Birchenbaum*, the *Dutch Berckenboom*, and wee in *Engliſh* Birch tree.

The Vertues.

The Birch is in our dayes applyed to little phyſicall uſes, yet the juyce of the leaves while they are young, or the deſtilled water of them, or the water that commeth out of the tree of it owne accord, being bored with an auger, or deſtilled afterwards, any of theſe being drunk for ſome time together, is held availeable to breake the ſtone in the kidnies or bladder, and is alſo good to waſh ſore mouths, a lye made of the aſhes of Birch tree barke, is effectuall for the ſame purpoſes. Many other civill uſes the Birch is put unto, as firſt to decke up houſes and arbours, both for the freſh greenneſſe and good ſent it caſteth, it ſerveth to make hoopes to binde caskes withall; the young branches being freſh are writhed, and ſerve for bands unto faggots: of the young twigges are made broomes to ſweepe our houſes, as alſo rods to correct children at ſchoole, or at home, and was an enſigne borne in fundels by the Lictors or Sergeants before the Conſulls in the old *Romans* times, with which, and with axes borne in the like manner, they declared the puniſhment for leſſer, and greater offences, to their people.

CHAP. XV.

Alnus. The Alder tree.

OF this Alder, I have to ſhew you two or three varieties more then others have expreſſed, which are theſe following:

1. *Alnus vulgaris.* The uſuall Alder tree.

The ordinary Alder tree groweth to a reaſonable height, and ſpreadeth much if it like the place, covered with a browniſh barke, and the wood under it more red then Elme or Yew: the boughes and branches whereof are more brittle then any other wood that groweth in or neere water: the leaves are round almoſt, full of ribs, rugged, thicke and clammy, by reaſon of a ſticking dew that continually lyeth upon them, yet ſhining and dented about the edges, ſomewhat like unto the leaves of the Haſell tree, but of a darker greene colour: it beareth ſhort browne aglets like the Beech or Birch, which fall not away before the ſeede is ripe within them, and

and then they are hard and scaly, a little long and round like unto an Olive: the timber is everlasting, if it be either under the water or in a watry moist place, for being made into piles it is the surest and strongest to uphold either bridge, or building thereon, but it is quickly subject to rot if it be kept dry. Vnder this Alder in sundry places is found such a like Excrescence, as is the Oke Grape. *Bauhinus* saith there is another sort observed whose leafe is longer then the ordinary sort, not differing in any thing else.

2. *Alnus folio incano,* The hoary Alder.

The hoary Alder is a lesser tree then the common sort, whose barke is whiter, and leaves likewise are somewhat longer, greater, and more pointed then it, not so greene nor clammy on the upperside, but hoary, by reason of the small haires are to be seene thereon, if they be well observed, or else not, but much more hoary underneath, that it seemeth to be of an ash colour, the footestalkes of them also being hoary in like manner, the catkins or aglets hereof are shorter and not so round as the former, but somewhat long untill it have given ripe seede.

3. *Alnus Alpina minor.*

The small Mountaine Alder.

This small Alder, groweth in each part like the common Alder, but lesser and lower both in leafe and other things, and hath not the leaves bedewed with so clammy a moisture.

The Place and Time.

Both Place and Time are in a manner sufficiently expressed in their descriptions to be delighted to grow in moist woods, and in other watery places, and the last upon the hils in *Austria*, flowring in *Aprill* or *May*, and giving ripe seede in *September*.

The Names.

It is called in Greeke by *Theophrastus* ἄλνος, but not mentioned by *Dioscorides* or *Galen*, in Latine *Alnus quod ab amne alatur*, *Theophrastus lib.*3.*c.*14. saith this tree is barren, *Pliny* from him, that it beareth neither flower nor seede, and yet in the sixth Chapter of the same Booke he sheweth among other trees, when their fruite is ripe, that the Alder, the Wallnut, and a kinde of Peares, doe ripen in Autumne, which declareth that he is contrary to himselfe, in saying it is barren: Some of the Poets fained that the three sisters of *Phaeton*, after three moneths mourning for their brothers death, whom *Apollo* slew with thunder for ill guiding the Chariot of the Sunne, were turned into Popler trees, but *Ovid* in his second booke of *Metamorphoses*, and *Virgil* in *Æglogasexta*, in these Verses following sheweth (yet both true alike) that they were Metamorphosed into Alder trees.

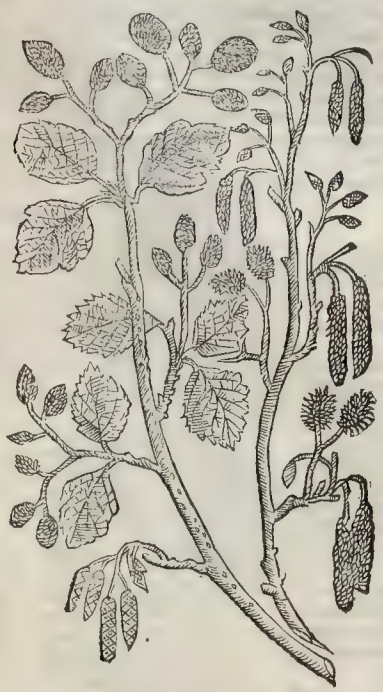
Tum Phaetontiadas musco circundat amarae
Corticis, atque solo proceras erigit Alnos.

The first is called *Alnus* and *vulgaris* by all our moderne Writers, but onely *Cresscntius*, who calleth it *Amedanus* as he doth the *nigra ac baccifera Avornus*. The second is called *Alnus altera* by *Clusius*, but giveth *Lobel* his figure of the ordinary *Alnus* for it, as the new *Gerard* doth also: but *Bauhinus* in his *Matthiolus* giveth the true figure of it, set forth by himselfe and there calleth it *Alnus hirsuta*, whose figure being left out here you shall have in the Appendix. The last is remembred onely by *Bauhinus* by the same name is in the title. The *Italians* call it *Auno*, and *Onio*, the *Spaniards Aliso*, the *French Aulne*, the *Germanes Erlenbaum*, and *Elernbaum*, the *Dutch Elsen*, and we in *English* Aller, and Alder tree.

The Vertues.

The leaves and barke of the Alder tree, are cooling, drying and binding: the fresh leaves laid upon tumours dissolveth them, and stayeth the inflammations: the leaves put under the bare feete of travellers, that are surbated with travelling, are a great refreshing unto them: the said leaves while they have the mornings dew on them, laid in a chamber troubled with fleas will gather them thereinto, which being quickely cast out, will ridde the chamber of them: of the barke is made a blacke dye, for the courser sorts of things, and with it, or the greene fruite instead of galles, is made writing incke, by adding gum and coperas to it.

Alnus vulgaris. The usuall Alder tree.



Folio oblongo viridi.

CHAP. XVI.

Populus. The Poplar tree.

THe Poplar tree hath beene aunciently accounted, but of two sorts, blacke and white, but by *Pliny* distributed into three sorts, the white, the blacke, and the Libian or Aspen tree, unto these I must adde two other out of *Lobel*, which are as followeth.

1. *Populus alba.* The white Poplar tree.

The white Poplar tree groweth great and reasonable high, covered with a thicke smooth barke, and white, especially the branches, having large leaves cut into severall divisions, almost like unto a Vine leafe, but not

of

of ſo deepe a green on the upper ſide, and hoary white underneath, of a reaſonable good ſent, the whole forme repreſenting the leafe of Coltsfoote: the catkins which it bringeth forth before the leaves, are long and of a faint reddiſh colour, which fall away like unto others bearing ſeldome good ſeede with them: the wood hereof is ſmooth, ſoft, and white, very finely waved, whereby it is much eſteemed and uſed in many workes. Vnder this tree alſo is found ſometimes the like *Vvæ* or berries that are found under other trees.

Uva populi.

2. *Populus alba minoribus foliis.*

The ſmaller leafed white Poplar tree.

This other white Poplar groweth like the former, but the branches are more knotted then the former, and the barke more rough and white: the leaves come forth at the ends of the branches and ſprigs, being both ſmaller and leſſe divided on the edges, the catkins are ſmaller and ſhorter, and nothing ſo red, but tending to a browniſh dead colour.

3. *Populus nigra.*

The blacke Poplar tree.

The blacke Poplar groweth rather higher, and ſtraighter then the white, with a grayiſh barke, bearing broad and greene leaves, ſomewhat like to Ivy leaves, not cut in on the edges like the white, but whole and dented, ending in a point, and not white underneath, hanging by ſlender long footeſtalkes, which with the ayre are almoſt continually ſhaken, like as the Aſpen leaves are: the catkins hereof are greater then of the white, compoſed of many round greene berryes, as it were ſet together in a long

1. *Populus alba.* The white Poplar tree.

3. *Populus nigra.* The blacke Poplar tree.

2. *Populus alba minoribus foliis.*
The ſmaller leafed white Poplar tree.

cluſter;

4. *Populus Lybica.* The Aſpen tree.

5. *Populus rotundifolia Americana.* The round leafed Indian Poplar tree.

cluſter: wherein is much downy matter contained, which being ripe is blowne away with the wind: the eyed or clammy buds hereof, before they ſpread into leaves (and not of the white, as ſome have thought, nor yet the *Vvæ* or berries that each of them have growing under them) are gathered to make the *Vnguentum Populeon*, and are of a yellowiſh greene colour, and ſmall, ſomewhat ſweete but ſtrong: the wood is ſmooth tough and white, and will quickely be cloven to make ſhingles or cleft pale or the like. On both theſe trees groweth a ſweete kind of Muske, which in former times was much uſed to be put into ſweete oyntments, and commended by *Galen* and others to bethe beſt next unto that of the Codar tree.

4. *Populus Lybica.* The Aſpen tree.

The Aſpe is ſomewhat like unto the blacke Poplar for the growing, but leſſer then either it, or the white, and with a darker coloured barke: the leaves are alſo blacker, harder and rounder, then thoſe of the other, and a little unevenly dented about the edges, and in ſome places ſpotted with white ſpots, hanging by longer and ſlenderer footeſtalkes, which by their continuall ſhaking and ſtriking one againſt another, make a noyſe although the aire be calme: the catkins hereof are longer, and of a browniſh aſh colour, which continue a while and then fall away with the ſeede in it; the wood is white but nothing ſo tough. This tree ſaith *Pliny* hath the beſt Muſhromes growing under it.

5. *Populus rotundifolia Americana.* The round leafed Indian Poplar tree.

The branches onely of this tree were brought from the Weſt Indies, unto Mr. *Morgan*, who was Queene *Elizabeths* Apothecary, and by Doctor *Lobel* cauſed to be drawne to the life, which he exhibited in his *Adverſaria* and *Dutch* Herball, the branches were a little crooked, full of joynts, at three or foure inches diſtance, and at each a large perfect round leafe, without any dent on the edges, but where it is ſet on the ſhort footeſtalke, being thicke rougher and broader then the leaves of *Arbor Iudæ*: at the ſetting to of every which leafe commeth forth a ſmall long catkin like a thong compaſſed with many ſmall graines much reſembling thoſe of the Poplar for which cauſe he called it a Poplar, the taſte whereof was very aſtringent, ſomewhat heating and ſaltiſh.

The Place and *Time.*

The foure former ſorts grow in moiſt woods, and by waters ſides in ſundry places of the land, yet the white is not ſo frequent as the other. The laſt is declared of what Country breeding it is: their time is likewiſe expreſſed that the catkins come forth before the leaves, and ripen in the end of Summer: but it ſhould ſeeme that the laſt hath leaves and catkins altogether.

The Names.

The white Poplar is called in Greeke λεύκη, becauſe of the whiteneſſe, in Latine *Populus alba*: and *Farfarus* of the Ancients, the blacke is called *μέλαινα Populus nigra*, but with *Tragus* it is his firſt *Populus alba*, the Aſpe is taken by many good Authours to be κρανία of *Theophraſtus*, becauſe he joyneth it next unto the two former, *lib. 3. c. 14.* ſaying it is like unto the white Poplar, which may breede ſome doubt whether he meaneth the Aſpe or no, which hath no ſuch divided leaves as the white hath, *Gaza* tranſlateth it *Alpina*, which it ſeemeth he doth from *Pliny*, who

who called it *montana*, as well as *Lybica*, the other are expreſſed to be of *Lobel* his declaration, and of none before him, *Homer* in his fifth *Iliad*, calleth the white Poplar ἀχερωΐδα *ab Acheronte*, becauſe wheen *Hercules* had overcome *Cerberus*, he came crowned with this Poplars branches, which he found growing by the river *Acheron*, in triumph of that victory, and from his example, all that with glory have conquered their enemies in fight, were wont to weare a garland of the branches thereof; their errour that *Succinum*, yellow Amber was the gum of the blacke Poplar is ſo ridiculous, that but to name it is ſufficient confutation. eſpecially ſeeing *Matthiolus* hath done it before. The *Arabians* call the white and blacke Poplar *Haur*, and *Haur romi*, the *Italians Popolo bianco* and *nero*, the *Spaniards Alamo blanco*, and *nigrillio*, the *French Abeau*, and *Peuplier*, and *Tremble*, the *Germanes Bellen*, *Poppelbaum* and *Sarbaum*, the *Dutch Abeelboom*, and *Popelier wort*, and we in *Engliſh*, the white and blacke Poplar tree, and the other the Aſpe or Aſpen tree.

The Vertues.

The white Poplar ſaith *Galen*, is of a mixt temper, that is, of an hot watery, and of a thinne earthy eſſence and therefore it is of a cleanſing property, the weight of an ounce in pouther of the barke of the white Poplar being drunke ſaith *Dioſcorides*, is a remedy for thoſe that are troubled with the Sciatica or the Strangury, and thereupon *Serenus* hath theſe Verſes:

Sæpius occultus vitia coxendice morbus
Perfurit, & greſſus diro langnore moratur,
Populus alba dabit medicos de cortice potus.

The juyce of the leaves dropped warme into the eares, eaſeth the paines in them: the young bourgeons or eyes, before they breake out into leaves, bruiſed and a little honey put to them, is a good medicine for a dull ſight: The blacke Poplar is held to be more cooling then the white, and therefore ſome have with much profit applyed the leaves brui ed with vinegar, to the places troubled with the gout, the ſeede is held good againſt the falling ſickneſſe to be drunke in vinegar: the water that droppeth from the hollow places of the blacke Poplars, doth take away warts, puſhes, wheales, and other the like breakings out in the body: the young blacke Poplar buds ſaith *Matthiolus*, are much uſed by women to beautifie their haire, bruiſing them with freſh butter, and ſtrayning them after they have beene for ſome time kept in the Sunne: the oyntment called *Populeon* which is made of this Poplar is ſingulas good for any heate or inflammation in any part of the body, and doth alſo temper the heate of wounds: it is much uſed to dry up the milke in womens breſts after their delivery, or when they have weyned their children. The Aſpen leaves are in the like manner cooling, and are uſed for the ſame purpoſes that the blacke is, but are in all things farre weaker. *Tragus* it ſeemeth putteth the blacke Poplars inſtead of the white, and the Aſpen inſtead of the blacke, as his deſcriptions and figures declare.

CHAP. XVII.

Taxus. The Yew tree.

THe Yew tree groweth with us in many places to be a reaſonable great tree ſpreading many large branches, which make a goodly ſhadow covered with a reddiſh rugged barke, the body, and elder boughes being more grayiſh, and the younger redder, whereon grow many winged leaves, that is many long and narrow darke greene leaves ſomewhat ſoft in handling, and not hard as the Firre tree leaves are, whereunto they are compared by many ſet on both ſides of a middle ſtalke, alwayes abiding greene and not falling away in Winter: the flowers are ſmall and yellow, growing along cloſe to the branches, whereafterwards the berries come forth, of the bigneſſe and colour of the Holly, or Aſparagus berries, ſweete with a little bitterneſſe, and procuring no harme to them that eate them, for any thing that I have heard: the wood hereof is reddiſh tough and ſtrong.

Taxus. The Yew tree.

The Place and *Time.*

This groweth in many places of this Land, but planted in all whether at home or abroad: it flowreth uſually in *Aprill* or *May*, and the berries be ripe in *Semptember*, and *October*.

The Names.

It is called in Greeke μίλος and σμίλος, but of *Dioſcorides* and *Galen* σμίλαξ *Smilax*, yet as *Dioſcorides* ſaith, ſome called it in his time *Thymalum*, in Latine *Taxum*, and ſo all Latine Authours call it, except *Cordus* on *Dioſcorides* that calleth it *Milax*, and others *Smilax*, becauſe it was generally taken to be either deadly or dangerous to eate thereof, or under it, or to ſleep under it alſo, which in our land is found contrary by many men & children eating of the berries without harme, it is thought that all poyſons became to be called *Taxica*, and by time called *Toxica*, from hence the *Italians* cal it *Taſſo*, the *French If*, the *Germans Eibenbaum*, the *Dutch Ibenboom*, and *Bogenhout*, and we in *Engliſh* Yew.

The

The Vertues.

The opinion of harme that this tree worketh, or peradventure some accidentall harme by distemperature, either by the climate wherein it is bred, or of the persons that take it hath caused, that there is nothing of any good property recorded, by any ancient or moderne Writer hereof, but still said by most to be deadly to beasts, and dangerous to men, and therefore *Matthiolus* calleth the matter into question, whether it be hot or cold: for *Dioscorides* and those that follow him, saying it is cold, appoint those remedies for it that they appoint for Hemlocke, that is to drinke much wine: but *Matthiolus* contesteth there against, in that the berries are sweete with some bitternesse, neither of which qualities portend any coldnesse to be in them, and that birds that feede thereon become blacke, besides the ever greennesse of the tree, as Pines, Firres, &c. all which shew a temperate heate to be therein, and the more, because as he saith, men that have beene drawne on by the sweetenesse of the berries to eate of them, have beene driven into fevers, and laskes, by enflaming the spirits and blood, which effects come not from any cold quality. Of this tree formerly long bowes were wont to be made, which were of great account, as well with us, as with other nations long agoe, for *Virgil Georg.* 2. saith, *Ityreos Taxt torquentur in arcus.*

CHAP. XVIII.

Nux Inglans. The Wallnut.

VNto the Wallnut that we have usually growing in our Land, I must adde some others sought out, both neerer home and farre abroad, as out of *Virginia*, two sorts, one white and another blacke.

1. *Nux Inglans vulgaris.* Our ordinary Wallnut.

This Wallnut groweth to be a very high, and great tree, spreading large armes and boughes, so that they make a goodly shadow, but by reason of the strong sent that the leaves send forth, few are delighted to rest thereunder, the barke of the body and greater armes is of a darke greenish ash-colour, cleft or chapped in divers places, that on the younger branches being more greene: the leaves are large and great, consisting of five or seaven leaves, set one against another, with an odde one at the end somewhat reddish, and very slender while they are young, and of a weake, sweete sent, but when they grow old and more hard are of a stronger smell, and somewhat offensive: at the joynts with the leaves come forth small and long yellowish catkins, which open into small flowers, and falling away the round Nuts come in their places, two or three usually set together, which are covered with a double huske, the outermost, thicke, soft, and green, the inner shell hard, wherein is a white sweete kernell contained, covered with a thin yellowish bitter peeling, which easily parteth from it while it is fresh, but will not peele growing old: the wood or timber hereof is hard and close, of a blackish browne colour, with divers waved veines therein, which maketh it much used in joyners workes, &c. being very durable, being kept dry, but is soone rotted in the weather.

Nux Inglans vulgaris cum fructu Virginiano.
The ordinary Wallnut, and a fruite of Virginia.

Because I said in my former Booke that the many differences of Wallnuts did arise in my opinion from the climate and soyle wherein they grow, let mee shew you their varieties somewhat more largely here, without any further descriptions of the tree, for therein is little diversity, which if any be it shall be shewed.

2. *Nux Inglans caballina.*
The greatest Wallnut.

Wee usually call these *French* Wallnuts, which are the greatest of any, within whose shell are oftentimes put a paire of fine gloves neately foulded up together, that the shell may be close, being tyed together, and carried whether one will, and of the outer rinde whereof some have made childrens purses.

3. *Nux Inglans putamine fragili.*
The thin shelled Wallnut.

The difference in this consisteth chiefly in the nut, whose shell is so tender that it may easily be broken betweene ones fingers, and the nut it selfe very sweete.

4. *Nux Inglans folio serrato.*
The long Wallnut.

Clusius as I said, first set forth the difference of this Wallnut to bee longer, although not

much greater then the ordinary sort and the shell much tenderer and brittle which being planted grew, and bore leaves like unto it, but much tenderer and dented about the edges.

5. *Nux Juglans bifera*, The double bearing Wallnut.

The twise bearing in a yeare of this Wallnut maketh the onely difference from the common sort, for thereof there is no further mention made.

6. *Nux Juglans fructu serotino.* St. *Iohns* Wallnut, or the late ripe Wallnut.

This Wallnut shooteth not forth any leaves untill it be Midsommer, or Saint *Iohns* day, as it is said, so that the tree seemeth as dead, others having had greene leaves thereon long before: the leaves and fruite differre not from others, but that the nuts ripen not untill *October*, and then are fresh when others are past and dry, the shell of this is harder and the kernell sticking closer thereto, that it is more hardly taken out, they taste not so sweet as the ordinary sort, but more Wallowish.

7. *Nux Juglans alba Virginensis.* The white Wallnut of *Virginia*.

The tree hereof groweth more upright, and spreadeth lesse, the leaves are alike, and the nut is rounder, smaller, much thicker and whiter in the outer hard shell then any of the former sort, and the kernell within much lesse also, but white and as sweete.

8. *Nux Juglans nigra Virginensis.* The blacke Wallnut of *Virginia*.

The blacke Wallnut differeth little in the tree from the white, but the nut is blacke and round, very rugged or chapped on the outside, and so hard and thicke a shell that it can very hardly be broken with great strokes of an hammer, having a very small kernell within it.

The Place and *Time*.

It is thought that the Wallnut first came out of *Persia*, for it is not knowne to grow naturally any where, but still have beene planted of the Nuts put into the ground (for I have not heard that they can be produced by any other meanes) where soever they grow, excepting onely the *Virginia* kindes: they blossome earely, before the leaves come forth, and the fruite is ripe in *September*, except the late ripe, which as is said is in *October*.

The Names.

By the name of κάρυα did the ancient Greekes understand all sorts of fruites, whose outer shell or covering was hard, as *Nux Amygdala*, *Nux Euboica*. *Castanea*, *Nux Heracleotica*, *Avellana*, *Nux Indica*, *Nux moschata*, *Nux Pinea*, &c. and because these were brought unto them by Kings, they therefore called them κάρυα βασίλικα: *Nux Regia*, but afterward it was called Διὸς βαλανὸς *Jovis glans*, and so the Latines from them *Diu glans*, but contracting the word, and substracting the first Letter, they called it *Inglans*, other names are found in *Pliny*, whereby the varieties of them were called, as *Persica*, *Tarentina*, and *Mollusca* for those with thinne shels, and *Moracina*, and *Moracilla* in *Macrobius*, for those that come late, their severall titles declare these here, and their generall name by all Authours of late is *Nux Inglans*, or *Nux Regia*, the outer greene shell or rinde, is called in Latine *Gulioca*, and by *Festus Culeolus*: the inner skinne that covereth the kernell is cal'ed *Nauci*. The *Arabians* call it *Ieuz*, *Leuz*, and *Giausi*, which is properly but *Nux*, as *Giausi bandi*, *Nux Bandensis*. the *Italians* *Noci*, the *French* *Noix*, and *Noyer*, the *Spaniards* *Nuezor*, the *Germanes* *Welschnusbaum*, and *Nusbaum*, the *Dutch* *Note*, and *Okernoteboom*, and we in *English* Wallnut.

The Vertues.

Dodonæus is of opinion that the fresh nuts are cold and moist, but *Fuchsius* saith they are drying in the first degree, and warming in the second: the barke of the tree doth binde and dry very much, and the leaves are neere of the same temperature, but the nuts when they are older are heating and drying in the second degree, and of thin parts, and are harder of digestion then when they are fresh, which by reason of their sweeteneste are more pleasing, and better digesting in the stomacke, and taken with sweete wine, they moove the belly downewards, for being old they grieve the stomacke, and cause in hot bodies choller to abound, and the headache, and are an enemy unto those that have a cough: but they are lesse hurtfull to those that have colder stomackes, and are said to kill the broad wormes in the stomacke or belly: if they be taken with Onions, salt and honey, they helpe the biting of a mad dogge, as also the biting of any man, or any other venome or infectious poyson. *Cneus Pompeius* found in the treasury of *Mithridates* King of *Pontus*, when he was overthrowne a scroule of his owne handwriting, of a medicine against any poyson or infection (yet *Galen* attributeth it to *Apollonius Murus*, and *Ætius* taketh it out of *Strutho* his writings) which is this, two dry Wallnuts, and as many good Figges, and twenty leaves of Rue or Herbegrace, bruised and beaten together with two or three cornes of salt, which taken every morning fasting preserveth from danger of poyson or infection that day it is taken: the juyce of the outer greene huskes boyled up with hony, is an excellent gargle for sore mouthes, the heate and inflammations in the throate or stomacke: the kernels when they grow old are more oyly, and therefore are not so fit to be eaten, but then are used to heale the wounds of the sinewes, gangrens, and carbuncles: the said kernels being burned are then very astringent, and will stay laskes, and the feminine courses taken in red Wine, and stay the falling of the haire, and make it faire, being annointed with oyle and wine, the like will also the greene huskes doe, used in the same manner: the kernels beaten with Rue and Wine, being applyed helpeth the Quinsie, and bruised with some honey, and applyed to the eares, easeth the paines and inflammations of them: if they be eaten after Onyons, they take away the strong smell and sharpenesse of them, a peece of the greene huske put unto an hollow tooth, easeth the paines and consumeth the marrow (the worme as they call it) within it: the catkins hereof taken before they fall thereof, dryed and given a dramme weight in pouther with white wine, doth wonderfully helpe those women that are troubled with the rising of the mother, some doe use the greene huskes, dryed and made into pouther instead of Pepper to season their meates, but if some dryed Sage in pouther be put unto it, it will give it the better relish: in the same manner doe some use the young red leaves before they grow greater, and find it a seasoning not to be dispised of poore folkes: the oyle that is pressed out of the kernells (besides that it is farre better for the painters use, to illustrate a white colour then Linseede oyle which deadeth it, and is of singular good use to be laid on guilded workes, or on those workes of wood that are made by burning, such as are those walking staves that have workes on them or the like, to preserve the colour of the gold, or of the other worke for a long time without decay,) is very profitably taken inwardly like oyle of Almonds, to helpe the chollicke and to expell winde very effectually, taking an ounce or two at a time. The young greene nuts before they be halfe ripe, preserved

whole

whole in ſugar, are not onely a dainty junket among other of the like nature, but are of good uſe for thoſe that have weake ſtomackes and defluctions thereon. The diſtilled water of the greene huske before they are halfe ripe is of excellent uſe both to coole the heate of agues, to be drunke an ounce or two at a time, as alſo to reſiſt the infection of the Plague, if ſome thereof alſo be applyed to the ſores thereof, the ſame likewiſe cooleth the heate of greene wounds and old ulcers, and to heale them being bathed therewith, the deſtilled water likewiſe of the greene huskes being ripe, when they are ſhaled from the nuts, is of very good uſe, to be drunke with a little vinegar, for thoſe that are infected with the plague, ſo as before the taking thereof a veine be opened, this is of often experience: the ſaid water is very good againſt the Quinſie to be gargled and bathed therewith, and wonderfully helpeth deafeneſſe, the noiſe and other paines in the eares, the diſtilled water of the young greene leaves in the end of *May*, performeth a ſingular cure on foule running ulcers and ſores, to be bathed with wet clothes or ſponges applyed to them evening and morning: there reſteth on the leaves of this tree a kinde of red thicke dew in the hotteſt time of Summer more then on any other tree round about it, which will be rather dry then bedewed at all, which honey dew being taken doth ſlake the thirſt wonderfully: it is averred by ſome, that if the ripe nuts; huskes and all be put into hony, they will then be of ſo good efficacy for ſores and ſore mouthes, that thereof may fitly be made gargles and lotions, either inward or outward.

CHAP. XIX.

Nux Avellana. The Haſſell nut.

OF theſe ſmall nuts there is both tame and wilde, thoſe that are manured and planted in Orchards, are called Fillberds and the other growing wild, Wood nuts or Haſell nuts uſually, unto which I muſt adjoyne ſome other ſorts, brought from other farre countries.

1. *Nux Avellana ſativa fructu rotundo albo.* The round white Fillberd.

The manured Haſell or Fillberd tree (of this kinde, as of the other tame ſorts) groweth up into a taller and bigger body then the wild Haſell, or wood nut tree doth, but never to any great bulke or ſiſe, and with fewer ſuckers or ſprouts from the roots, and ſpread into ſundry branches, covered with a browniſh ſpeckled thin barke, and greene undermoſt, bearing large wrinckled or crumpled leaves, ſomewhat like unto the Alder leaves, cut in on the edges into ſome deeper dents, but not cut into diviſions, of a ſad greene colour above, and grayiſh underneath: the catkins come forth in the Winter before any leaves appeare, being then firme and cloſe, of a reddiſh yellow colour, and afterwards opening themſelves, become more yellow, falling away when the leaves begin to appeare;

1. 5. *Nux Avellana ſativa & ſylveſtris.*
The Fillberd, and the wild Haſell Nut.

4. *Nux Avellana Macedonica ſive Byſantina.*
Filbert's of Macedonia or Conſtantinople.

the nuts breake forth at other places of the ſtalkes, three or foure or more together, each encloſed in a tough browne huske, which reacheth beyond the nut, and is parted at the end into ſundry jagges; the nut with it is large and round, more then the long ſort, with a white thinne ſhell on the outſide, and a white peeling covering the kernell within which is very ſweete, the wood hereof is ſmooth, white, and ſomewhat tough or hard.

2. *Nux Avellana ſativa alba maximo fructu.* The great white Fillberd.

This differeth in no other thing from the former, but in growing higher and bigger, and the nuts larger by the halfe, but round and white like it.

3. *Nux Avellana ſativa fructu longo.* The long Fillberd.

This Filberd differeth not in the buſh or tree, in the leaves or catkins, in the Nut or the bearded huskes from the former, the onely difference conſiſteth in the nut it ſelfe, which is long and round, and hath a browner ſhell, which is diſtinguiſhed into two ſorts, the one hath the inner thinne skinne or peeling that covereth the kernell, red, and the other white, and each of them of a ſweeter taſte then the former, and the red of this ſort, better alſo then the white.

4. *Nux Avellana Macedonica ſive Byzantina.* Filberds of *Macedonia* or *Conſtantinople*.

Although *Cordus*, and *Geſner* gave the firſt knowledge of this Nut to the Chriſtian world, and that but by a ſhort relation, yet ſince them *Cluſius* hath enlarged the deſcription thereof by the often obſervations thereof, it groweth up ſtraight and tall like a tree, as *Cordus* ſaith it was obſerved in *Macedonia* and *Thracia*, (but as *Cluſius* ſaith, it was reported to him that it grew very low) covered with a whiter and more rugged barke, having ſuch like large crumpled leaves, but ſomewhat longer, the catkins are like the other, but the nuts grow many together in a cluſter, whoſe hard skin or tough huske is much more jagged at the head then the other, and ſomewhat likewiſe at the bottome, the Nut it ſelfe is round like our wood nut with a hard ſhell, the kernell within being very ſweete and pleaſant like the Filberd; ſince which time *Cluſius* hath obſerved it to grow ſomewhat otherwiſe.

5. *Corylus ſive Nux Avellana ſylveſtris.* The Wood nut or Haſell nut.

The Wood Nut groweth with more ſtemmes or ſuckers, from the roote then the manured kinde, yet ſome of a reaſonable bigneſſe, branching forth diverſly, covered with a like diſcoloured barke to the former, the leaves are leſſer and rounder, yet not leſſe crumpled greene above and gray underneath, the catkins and nuts come forth in the ſame manner, but the Nuts are ſmaller and rounder whoſe huske is ſhorter and whiter, and never wholly covereth the nut, but ſtandeth therein like unto an Acorne in the cup, and herein conſiſteth the chiefeſt difference for the manner of growing.

6. *Corylus Virginenſis. Virginian* Haſell Nuts.

The manner of the growing of thoſe Nuts, we have not had ſufficient inſtructions of all, though wee have ſeene and had the Nuts of a long time which are as ſmall or rather ſmaller, and browner then our Wood nuts, ſharper pointed and with a rougher ſhell not ſo hard or eaſie to breake: the kernell is ſomewhat ſweete and white but not ſo pleaſant as ours.

The Place and Time.

Filberds are planted in Orchards, and the wilde nuts, grow in woods and thickets, that are moiſt rather then dry delighting beſt to grow in ſuch a ſoile, the catkins as is ſaid appeare before the Spring, and the fruite is ripe in *Auguſt* or *September* at the furtheſt.

The Names.

It is called in Greeke καρύα ποντικὴ *Nux Pontica, and* λεπτοκαρύα *Nux tenuis ſive parva*, in Latine *Corylus & Nux Abellina*, from the Country which afterwards altered and fell to *Avellana*, as alſo *Nux Preneſtina*, and *Heracleotica*, the ſeverall titles that they beare, decipher them out ſufficiently, as wee and others have and can call them by. The *Arabians* call it *Agilenz* and *Bunduch*, the *Italians Nocivole*, *Nocelle*, and *Avellana*, the *Spaniards Avellanas*, the *French Noiſettes*, *Noiſelles* and *Avellaines*, the *Germanes Haſelnuſz*, the *Dutch Haſelnoet*, and we in *Engliſh* Filberd, for the manured kinde, and Haſell nut, Wood nut, or ſmall nut, for the wilde kinde.

The Vertues.

Theſe ſmall Nuts while they are freſh are ſweete, and much pleaſing to the palate, but the much eating of them breed headache and windineſſe in the ſtomacke, eſpecially when they grow older, but if they be a little heated or parched by the fire, the oylineſſe doth become leſſe offenſive, the parched Nuts made into an electuary, or the milke drawne from the kernels with ſome mede or honyed water, is very good to helpe an old cough, and being parched and a little pepper put to them and drunke, it doth digeſt the deſtillation of rheume from the head, ſome doe hold that theſe Nuts, and not Wallnuts, with figs and Rue, was *Mithridates* medicine, effectually againſt poyſons, the oyle of the nuts is effectuall for the ſame purpoſes. The dryed huskes and ſhels to the weight of two drammes, taken in red Wine ſtayeth the laskes and womens courſes, and ſo doth the red skinne that covereth the kernels, or is more effectuall to ſtay their termes: if a ſnake be ſtroke with an Haſell wand, it doth ſooner ſtunne it, then with any other ſticke, becauſe it is ſo pliant, that it will winde cloſer about it, ſo that being deprived of their motion, they muſt needs dye with paine and want: and it is no hard matter in like manner, ſaith *Tragus* to kill a mad dog that ſhall be ſtrooke with an Haſell ſticke, ſuch as men uſe to walke or ride withall.

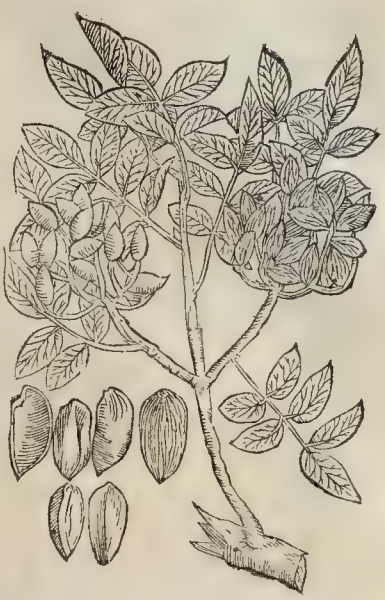
Chap. XX.

Nux Piſtacia. The Fiſticke Nut.

THe Fiſticke Nut groweth to be a tree of a reaſonable large ſiſe in the warme Countries, but very ſlenderly in ours diſperſed into ſundry branches, whoſe barke is of a darke ruſſet colour, the leaves are winged three, five, or ſeven on a ſtalke, each whereof is broader and larger then thoſe of the Aſh, not ſharpe but blunt pointed with us, ſmooth, almoſt ſhining, with divers veines therein, and of a pale yellowiſh greene colour. I never ſaw it beare either fruite or flowers in our Land, the climate being too cold for it, but elſe where it beareth white flowers, as I am given to underſtand many ſet together, on a long cluſter, after which come the fruite many together in the ſame manner

manner which are somewhat long and round nuts, bigger then Filberds, pointed at the ends, with a rough outer shell somewhat like an Almonds outer shell but tough, and hard to breake, yet cleaving into two parts, and smooth and white on the inside thereof, having a full greene nut or kernell within, filling the whole shell, whose rinde or peeling is thicker and red, the kernell is very sweete and pleasant in taste, without any offensive quality therein: this in the warmer countries beareth also a long crooked stalke like as the true Turpentine doth.

Nux Pistacia. The Fisticke Nuts.



The Place and *Time.*

It is naturall to *Bactria*, and other those parts neere to the East Indies, and from thence brought to *Syria* and *Egipt*, and from them unto our *Europe*, where at *Naples* and other warme Countries of *Italy*, they thrive and prosper, and beare fruite in the end of the yeare, but not in any of these colder climates.

The Names.

It is called in Greeke πιστάκια *Pistacia*, of *Nicander* φιστάκια *Phistacia*, and in *Theriacis* ψιττάκιον *Psittacion*, by *Possidonius* βισταῖα *Bistacia*, in Latine *Pistacia* and *Pistacium*, and of some *Nux Pistacia*, *Theophrastus* calleth it *Terebinthus Indica*, for his description thereof agreeth so exactly hereunto, that there can bee no doubt made of it. The *Arabians* call it *Fustecke* or *Festich*, the *Italians Pistacchi*, the *Spaniards Albocagos*, and *Fisticos*, the *French Pistaches*, the *Germanes Pimper nuszlin*, and by that name they likewise call the bladder nut, not putting any difference betweene them, as the most judicious in former times did, the *Dutch Fistiken boom*, and we in *English* Pistackes, and Fisticke nuts or tree.

The Vertues.

The Pistacke kernells be little inferior in goodnesse unto the Pine kernels for they are very friendly to the stomacke, whether they be eaten or drunke, they are good against the stingings or bitings of serpents and other venemous creatures, by reason of the thin essence, and a little bitter and sweet substance is in them: and therefore they open the obstructions of the Liver, and are good also for the chest and lungs, there is also a little astringent quality in them, whereby they strengthen both the liver and the stomacke, to be put either in meates or medicines; they are also good to cleanse the backe and the reines of the gravell and stone breeding therein: they nourish more then any other nuts, and helpe to encrease seede and Venery.

CHAP. XXI.

Nux Vesicaria. The bladder Nut.

AS a bastard brother to the Pistacke, I must adjoyne this bladders nut, whose groweth is not much unlike rising up sometimes into a reasonable tree, and in other places shooting forth sundry suckers, whereby it becommeth rather an hedge bush to be plashed, and let spread, the barke whereof is of a whitish greene colour, the leaves are five for the most part set together on a stalke, each a little dented about the edges, and pointed at the ends, of a pale greene colour: the flowers grow on a long stalke many set together, hanging downewards being all white, the small round cuppe in the middle, making them seeme like unto a white Daffodill: after them come swolne russetish greene skinny bladders, with one or two brownish nuts, lesser then Hasell nuts, with a tough hard shell not easie to breake, and a greenish kernell within it, at the first somewhat sweete, but afterwards loathsome and ready to make one cast, yet it is eaten by some Country people, whose strong stomackes are not so easily provoked: the wood is white, hard and firme. Mr. *Tradescant* hath brought a sort from *Virginia*, having divers nuts in the bladder. *Altera Virginensis*

The Place and *Time.*

It groweth in many places of this land, both as a hedge bush, and a standard tree at *Ashford* in *Kent*, and at *Milton*, three miles from *Cambridge*, and flowreth in *May*, the fruite is ripe in *August* or *September*.

The Names.

There is no mention here of among the ancient Authours, either Greeke or Latine, except it be taken for *Pliny* his *Staphylodendron*, whereof some doe in some part doubt, because he saith the nuts grow in *siliquis*, but these are skinny bladders, yet the rest agreeing to his description thereof, causeth others to thinke his *siliquæ* must be understood these bladders: the *Germanes* as I said call it by the same name they call the Pistacke, and therfore others call it *Pistacium Germanicum*. *Matthiolus* in his Epistles taketh it to be the *Coulcoul*, and *Hebulbem* of the *Turkes*, but that is said to be a nut, of the bignesse of both ones fists, and such this is not, and is of great respect for the pleasant taste among them. It is usually from the forme it carryeth now adayes, called *Nux vesicaria*, and in some places *Pistacia sylvestris*, and so *Scaliger* taketh it to be a *species* of it, *Gesner* saith, that some *Italians* at *Rome*,

Rome called it *Sambucus vallida*, and *Anguilara* ſaith the *Italians* in other places call it *Albero de l'vua*, and *Piſtachio ſalvatico*, the *French* *Nez coupes*, the *Germanes* *Pimpernuſzlin*, as they doe the former, the *Dutch* *Pimpernoeten*, and we Bladder nut.

The Vertues.

The Nuts are as is before ſaid, loathſomē and overturning their ſtomackes that eate them, although *Scaliger* commendeth them to be of the like taſte and quality with Piſtackes, but wee will give him leave to pleaſe his palate, and ſtomacke with them, and will not envy the good he ſhall get by them, we never yet could learne that they were accepted among our people, except with ſome ſtrong clowniſh ſtomacke, which can almoſt digeſt an horſe naile. They have no uſe in Phyſicke, with any judicious that I know, but ſome Empericks, that dare venture to give any medicine, be it never ſo daungerous have boaſted of the helpe they have given to thoſe that were troubled with the ſtone, and others to procure Venery.

Nux veſicaria ſive Staphilodeadron. The bladder Nut.

Chap. XXII.

Fraxinus. The Aſh tree.

THe Aſh according to *Theophraſtus* and other of the later Writers, is diſtinguiſhed into a taller and a lower ſort, or as with us into the tame and the wilde ſort, which ſhall be here declared.

1. *Fraxinus vulgaris.* The common great Aſh.

The common Aſh groweth high quickely, and in time becommeth to have a reaſonable big trunke or body, covered with a ſmooth grayiſh barke, under which there is a thinner which being ſteeped in water a while, will give a blewiſh colour, ſpreading reaſonable well, and bearing winged leaves of many, ſet on both ſides of a middle ſtalke, and one at the end, each being long and ſomewhat narrow, gentle, of a pale green colour, and dented about the edges; at ſundry joynts with the leaves commeth forth a bunche of flowers, and after them a thicke tuft of many thinne browne huskes hanging downewards, each upon a very ſmall ſhort footeſtalke, within which lyeth a ſmall blackiſh browne long flat ſeed very like unto a birds tongue, taſting ſomewhat ſtrong and hot in the mouth: It beareth alſo ſometimes, and in ſome places certaine ſmall round balles called apples, conſiſting of a clammy moſſe, gathered into a lumpe with a hard knot in the middle, the wood is white ſtrong and tough fit for many uſes, for by the toughneſſe, not being apt to cleave or rend, it is much employed about Coaches Carts, &c. and for handles for tooles, and inſtruments of husbandry. *Homer* chaunts the praiſes thereof in *Achilles* ſpeare, made of Aſh, which holdeth good in all the ſpeares, pikes, &c. uſed in warre ever ſince.

2. *Ornus ſive Fraxinus ſylveſtris.* The wild Aſh or Quicken tree.

The Quickēn tree groweth ſeldome to any great height, with ſundry ſpread branches, covered with a more rugged and darker barke then the Aſh, the leaves are winged like unto them, but are leſſer and ſo is every particular one by it ſelfe, not ſo cloſely ſet together, dented about the edges, and of a deepe greene ſhining colour: at the end of the branches come forth white flowers in a reaſonable great tuft or umbell, ſmelling pretty and ſweete, after which follow ſmall round berries, greene at the firſt, and darke red, when they are through ripe, of an unpleaſant taſte, ready to provoke caſting, if one eate many of them, the wood is ſomewhat hard and firme, but of a browner colour then Aſh.

The Place and Time.

The Aſh delighteth beſt to grow in the wetter rather then in the dryer grounds and by Medow ſides: the other groweth in ſundry places of the Land, in woods chiefly, and thoſe by *Heigh gate* in ſundry parts, the balles or apples of the Aſh come forth in the end of Winter, and then they are to be ſeene, but the ſeede and fruite of them both is not ripe untill *September*.

The Names.

The Aſh is called in Greeke μελία, and in Latine *Fraxinus*: the ſeede is called *lingua avis*, but the inner kernell is ſo called rather then the whole huske; the other is likely to be the ὀρεουσία, *Fraxinus montana* of *Theophraſtus*, which

1. *Fraxinus vulgaris.*
The common great Aſh.

2. *Ornus ſive Fraxinus ſylveſtris.*
The Quicken tree, or wild Aſh.

which *Pliny* calleth in Latine *Ornus*, of ſome *Orneogloſſum*, and *Columella Fraxinus ſylveſtris*. *Tragus* calleth it *Fraxinea arbor*, *Dodonæus Fraxinus bubula*, and *Geſner Fraxinus aucuparia*. *Ruellius*, *Geſner*, *Dodonæus*, and others call it *Ornus*, but *Matthiolus*, *Cordus*, *Lobel*, and others call it *Sorbus ſylveſtris*, *Bellonius*, *Cluſius*, and *Thalius*, *Sorbus aucuparia*, becauſe that boyes, and fowlers uſe the berries as baites to catch Blacke birds, Thruſhes, &c. and *Lugdunenſis Sorbus torminalis*, without any ſenſe or reaſon, but they that referre it to *Sorbus* the Service tree, are in my opinion as ſhort in many things, as they that referre it to *Fraxinus*, the Aſh reſembling both of them in the leafe, which cauſeth the variation. The *Italians* call the Aſh *Freſſino*, the *Spaniards Freſno*, the *French Freſne*, the *Germanes Eſcherbaum*, the *Dutch Eſchen*, and we in *Engliſh* the Aſh tree, and the ſeedes Aſhenkeyes: the wilde Aſh is called by the *Germanes*, *Groſſer Mallbaum*, becauſe they have another they call *Kleiner Mallbaum*, as ſhall be ſhewed when we come to ſpeake of it, we in *Engliſh* call it in ſome places wilde Aſh, in others and that more generally, the Quicken tree.

The Vertues.

Both the leaves and the ſeede of the Aſh are ſingular good againſt the biting of the Viper or Adder, or any other venemous creature, for if the young tender toppes with the leaves be taken inwardly, and ſome of them applyed outwardly, it will reſiſt the poyſon that it ſhall doe no harme, *Serenus* ſaith the ſame of the ſeede. *Fraxineum ſemen eum Bacchi rore bibendum eſt*: the wood and the barke is by others held to be effectuall hereunto alſo: and to this purpoſe *Pliny* writeth that thoſe ſerpents will not abide the ſhadow that the Aſh maketh in the morning and the evening which then are longeſt, nor will come neere it, and further ſaith of his owne experience, that if a fire and a ſerpent be encompaſſed within a circle of the bowghes of the Aſh tree, it will ſooner flye into the fire then into them: the decoction of the leaves in wine, are very good to open the obſtructions of the liver and ſpleene as alſo to helpe to breake and expell the ſtone and to cure the jaundiſe: The water deſtilled from the young and tender branches and leaves of the Aſh, is a ſingular good medicine to take every morning faſting a ſmall quantity, for thoſe that are ſubject to a dropſie, or be already groſſe and fat, or tending thereunto, to abate their greatneſſe, and cauſe them to be lancke and gaunt: *Pliny* was much miſtaken in writing that the leaves of the Aſh were deadly to beaſts that carryed burthens, and harmleſſe to the reſt that chewed the cud, which he taketh out of *Theophraſtus*, who ſaith of μίλῳ *Taxus*, and he referreth it to μελία *Fraxinus*, the aſhes of the barke of the Aſh made into a lye, and thoſe heads or other places infected with lepry, or other white ſcurfe or ſcall doth helpe them much: the ſeede called Aſhen keyes, I meane the kernells within the uskes is uſed to be drunke againſt ſtitches and paines in the ſides proceeding of winde helpeth the ſtone, and avoydeth it by provoking urine: it is likewiſe uſed with other things tending to that purpoſe to encreaſe ſeede and Venery. From the chippes of the wood by deſtillation *per deſcenſum* as it is called, is drawne an oyle and a water: the water mixed with a fourth part of the deſtilled water of Violet flowers, and the face that is troubled with redneſſe, pimples, and ſuch like, being bathed therewith will quickely heale it: the oyle as *Monardus* ſaith, conduceth much to thoſe that are ſplenetick or hepaticke: There is nothing extant that is certaine, concerning the wild Aſh in any ancient or moderne writer that I can finde, neither can I give you any thing by magiſtrall experience, onely I muſt tell you of *Sympoſianus* errour, that thought out of *Virgil* his Verſes concerning *Ornus*, that he had ſaid that it bore flowers like the Peare tree, when as *Virgil*, *Georg.* 2. entreateth onely of the inoculating or grafting of one tree into another, that the Straw berrie tree bore Nuts, the Plane tree Apples, the Cheſnut tree Beech maſt, the wilde Aſh the Peare trees bloſſomes, and Elmes Acornes, in theſe verſes following.

Inſeritur

CHAP. XXIII.

Sorbus. The Service tree.

BEcause the true Service tree is so like unto the tame and the wild Ash in the leaves, and that the wild Ash is called a Service by divers, I thinke it meete to joyne it next unto them, and with it some other sorts that have obtained the name of Services, although differing much in forme from it.

1. *Sorbus legitima.* The true Service tree.

The true Service tree groweth in time to be a great and a tall tree, spreading sundry great branches, covered with a rough grayish barke, whereon grow large winged leaves, greater and longer then those of Ash, and each of them broader, more blewish greene, and harder, and more grayish greene underneath, and more dented also about the edges: the flowers grow in clusters, at severall places on the branches with the leaves consisting of foure white leaves a peece, after which follow the fruite as big as Wallnuts shaled out of the greene huskes, tending to yellow when they are ripe with broad browne kernels within them, in some round, which are accounted the best, in some ovall that is long and round, and in some almost Peare fashion, which like other Services are hard and harsh when they are ripe, and must be hung up on strings in a warme roome, or laid covered with straw, chaffe, or some cloathes to make them mellow fit to be eaten, which then will be more pleasant than mellow Medlars, the wood is very firme and close, and yellower then the Ash.

2. *Srobus Torminalis sive vulgaris.* Our common Service tree.

Our common Service tree riseth up to a reasonable height and bignesse, spreading largely with a whitish colored smooth barke, the leaves grow singly by themselves, which are not winged but broad and cut into sundry devisions and broad at the bottome next to the stalke, of a sad greene colour, the flowers grow in clusters of a whitish colour at the end of the branches for the most part, which are succeeded with smaller round berries then the former, and browner also, containing within them small blackish hard kernels: these must likewise be mellowed to be eaten, or else let hung on the branches untill the frosts mellow them on the trees, unlesse the birds devoure them being neglected: the wood hereof is of a browniish yellow colour and hard.

3. *Sorbus sylvestris Anglicus.* Red Chesse apples, or the *English* wild Service.

This tree which we ent tle a Service, from the harshnesse of the greene fruite, groweth not high usually, but ra-

1. *Sorbus legitima.*
The true Service tree.

2. *Sorbus Torminalis vulgaris.*
Our common Service tree.

ther

ther as a hedge bush, whose stemme and branches are covered with an hoary or grayish barke, the leaves are broad, somewhat like unto *Viburnum* the Lithye tree, (which *Gerard* calleth the Wayfaring tree) not cut in nor dented at all about the edges, the flowers are of an over worne mossie colour, after which followeth fruite, of the bignesse of an hedge peare, and reddish on the outside, of an harsh taste like the unripe or hard Services, yet the Country people doe often eate of them, being ripe from the tree, instead of better fruite, but after they have beene gathered and laid by a while to mellow, become more pleasant.

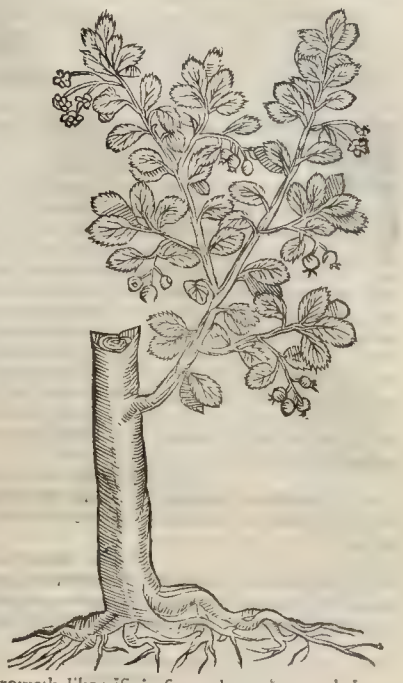
4. *Sorbus sylvestris Aria Theophrasti dicta.*
The wild Service called Aria.

This wild Service tree groweth to be a very great tall and farre spreading tree, with many boughes and branches, whereon are set large crumpled hard leaves of a deepe greene colour on the upper side, and gray or hairy underneath, with divers veines running almost upright therein, and dented about the edges, the flowers are of a white mossie colour, thicke clustring together, made of foure leaves a peece, which turne into browniſh red berries, with a small tuft at the top, containing within them small blackish seedes, and are of a harsh taste like to the rest, yet very pleasant, more then any of the rest, after they are mellowed: the wood is very hard, and firme or close, and whitish withall.

The Place and Time.

The first is seene with us but in a few places, and those onely planted for their rarity. The second is found in many places of *England*. The third in *Westmerland*, on a hill that respecteth the Sea eight miles from *Lancaster* called *Roothersiacke*, but more plentifully in *Wetherslacke* Parke, as I am enformed: The last groweth likewise in some places here and there throughout *England*, as in the parts not farre from *Croydon*, and one tree also groweth on *Hampestead* Heath alone by it selfe, without any other nere it on the left hand of the high way, as you goe on forward to *Hendon*, they do all flower before the end of *May*, and the fruite is ripe in *October*.

4. *Sorbus sylvestris Aria Theophrasti dicta.*
The wild Service tree called Aria.



The Names.

It is called in Greeke ὄρη and ὄρεα, *Oa* and *Oua*, in Latine *Sorbus*: the first is the *Sorbus legitima* of *Clusius*, *Sorbus esculenta* of *Camerarius*, *Sorbus domestica* of *Matthiolus* and *Lobel*, who also thought it might be *Ostrya Theophrasti* but erroniously, as by the discription thereof given before may be seene, all other authors call it *Sorbus* simply: the second is the fourth *Sorbus* of *Pliny* which hee calleth *Torminalis*, as *Cordus*, *Tragus*, and *Matthiolus* doe: though *Lugdunensis* misliketh of it saying that the leaves are nothing like the *Platanus*, whereunto *Pliny* compared them, he therefore calleth that *Sorbus torminalis*, which is called *Ornus* or *Fraxinus silvestris*, as I have shewed you before, because he would call it *Crataegus Theophrasti*, as *Anguillara* did before him; which it is so notwithstanding, nothing hindring but that it may as well be *Crataegus Theophrasti*, as *Sorbi quartum genus Plinij dictum Torminalis*, both the discriptions agreeing fitly hereunto, *Clusius* and *Lobel*, and divers others, and *Gesner in hortis* also call it *Sorbus torminalis*, who yet thinketh it might be a *species* of *Mespilus Aronia*, and peradventure may be *Theophrastus* his *Anthenodonoides*, which *Gaza* calleth *Gallica*. *Bauhinus* placeth it as one of the Medlars, as he doth also our Hawthorne, which in his eighth number he referreth to the *Oxyacantha Pyrastra similis* of *Dioscorides*, and yet in his ninth number maketh that *Oxyacantha Dioscoridis*, to be *Pyracantha* of *Lobel* and *Clusius*, which hath no such divided leafe as the Hawthorne hath, and yet both of them beare berries like Services, and not Apples like Medlars, some also tooke it to be the *Hippomelis* of *Palladius*. The third hath not beene divulged in writing by any before me, and therefore that Latine name may stand untill a fitter may be found, the Natives there call them red Cheese apples, and Sea Oulers. The last is taken by all our Moderne Herbarists to be the *Aria* of *Theophrastus*, although *Bellonius* saith as is shewed before, that that kind of *Ilex* or Oke that is called *Acylaca* in *Candy*, doth hold the name of *Aria* in Mount *Athos*, as is shewed before, *Lobel* calleth it *Aria Theophrasti effigie Alni*. *Clusius Sorbus Aria cognominata*, *Gesner in hortis Aria Alpina vel pilosa*, *Bauhinus* calleth it *Sorbus torminalis Gallorum*, and *Anguilara* and *Lugdunensis Aria* also, and *Theophrasti*, as *Camerarius* doth, who saith *Cordus* called it *Lanata arbor*. The Service is called by the *Italians Sorbe*, by the *Spaniards Servas*, by the *French Cormes*, and *Sorbes*, and the tree *Cormier*, and *Sorbier*, by the *Germanes Sp rwerbaum* the tree, and *Sperbieren* the fruite, the *Dutch Sorben*, and *Sorbenboom*, and we in *English* the Service tree or fruite: the last is called by the *Italians Matallo*, and by the *French Alisier*, and *Cirier* by some.

The Vertues.

Services unmellowed are very harsh, able to draw ones mouth awry almost to be eaten, or else to choke one, but made mellow they are more pleasant, and fit to be taken of most to stay flixes, scowrings, and castings, yet lesse then Medlars, although many doe eate them that needs not, for any such purpose: if they be dryed before they be mellow and kept all the yeare, they may be used in decoctions for the said purpose, either to drinke or

to

to bathe the parts requiring it, and is profitably used in that manner to stay the bleeding of wounds, and at the mouth or nose to be applyed to the forehead, and nape of the necke.

Chap. XXIV.

Mespilus. The Medlar.

THere are observed sundry sorts of Medlars whereof three were knowne to the auncient Writers, the rest are of later invention.

1. *Mespilus maxima sativa.* The great manured Medlar.

The great Medlar groweth neere to the bigness of the Quince, but never so great as an Apple tree that ever I saw, spreading branches, reasonable largely, with longer and narrower leaves then either Apple or Quince, and not dented at all about the edges, at the end of the sprigges stand the flowers made of five white great broad pointed leaves, nicked in the middle with some white threds also: after which commeth the fruite, being round and halfe flat, of a brownish greene colour being ripe, bearing a crowne as it were on the toppe, which were the five greene leaves, as a huske wherein the flower stood before, which crowne of leaves being rubbed off or falne away, the head of the fruite is seene to be somewhat hollow, the fruite is very harsh before it be mellowed as is said of the Services before, and hath usually five hard kernells within it.

2. *Mespilus vulgaris sive minor.* The ordinary or small Medlar.

The ordinary Medlar differeth in nothing from the former, but that it hath some thornes on it, in severall places, which the other hath not, and that the fruite is small and not altogether so pleasant.

3. *Mespilus minor folio serrato.* The common *Italian* Medlar.

This also differeth in nothing from the last that hath thornes, but that the leaves are dented about the edges, when as the other is not.

4 *Mespilus fructu albo magno.* The great white Medlar.

This differeth not from the first sort but in the fruite, which will be as great as it, and more white then it being ripe on the tree, and will not be so browne when it is mellowed, the kernels also within them are not so strong or hard.

5. *Mespilus Aronia sive Neapolitana.* The Medlar of *Naples.*

The Medlar of *Naples* riseth to be a reasonable great and faire spread tree, bearing broad leaves, cut in or divided on the sides into severall parts, but not to the middle ribbe somewhat resembling the Hawthorne leaves, with thornes set somtimes on the branches and sometimes without, the flowers grow in tufts like unto the Service

1. *Mespilus maxima sativa.*
The great manured Medlar.

2. *Mespilus vulgaris.*
The ordinary Medlar.

tree

tree, of a greenish colour, which turne into fruite, many clustring together and hanging downe, smaller then the smallest Medlar, and with a lesser crowne of leaves, and hollownesse at the toppe then it, reddish or yellowish when they are ripe having only three stones or kernells within it, and more sweet and pleasant also.

5. *Mespilus Aronia sive Neapolitana.* The Medlar of Naples.

The Place and Time.

Three of these sorts grow with us here in our Land, the two first in many places, and the last with some few lovers of rarities, the other two have not as yet beene seene here: they flower in *May* for the most part, and beare ripe fruite in *September* and *October*.

The Names.

It is called in Greeke μεσπίλη and μέσπιλον in Latine *Mespilus* and the fruite μέσπιλον *Mespilum*. The first sort may bee the *Mespilus Setanica* of *Theophrastus* and *Pliny*, and taken by many to be the *Mespilus altera* of *Dioscorides*, which he saith some called *Epimelis*, *Tragus* although he call it *Mespilus* yet taketh it to be *Crataegus* of *Theophrastus*, which it cannot be, for that *Theophrastus* saith *Crataegus* hath the leafe of *Mespilus Anthedon*, which hath a divided leafe, for hee describeth no other *Mespilus*, and is the same with *Dioscorides* his *Mespilus Aronia*, as you shall presently heare: it is also that which *Lobel* calleth *Domestica*, *Cordus sativa*, and *Camerarius in horto Setania majoribus vulgari fructibus*, *Tragus Mespilus fructu praestantiore*, and *Dodonæus Mespilus Oxyacantho insita*, or as *Lugdunensis* saith, *insitione mitior facta*. The second is termed *Sylvestris* by *Bauhinus*, as well as *Laurino folio*, and *Germanica* being the more ordinary both with them and us. The third is set out by *Matthiolus* and *Lugdunensis*, but their figures do not expresse the leaves to be dented as they should be. The fourth is spoken of by *Scaliger* and *Lugdunensis*. The last is the *Mespilus*, called *Aronia* of *Dioscorides*, the *Mespilus Anthedon* of *Theophrastus and Pliny*, and is the first *Mespilus* of *Matthiolus*, and generally called *Mespilus Aronia* with all other Writers, onely *Ruellius*, and *Gesner in hortis* calleth it *Paliurus Africana*, and *Cordus Mespilus tricoccos*, and may peradventure be the *Mespilus Gallica* of *Camerarius* in *horto*. The *Arabians* call it *Zarar* or *Zarur*, and *Alzarur*, the *Italians Mespoli* (but they call the last which we call of *Naples Azarolo*, derived as it is likely from the *Arabians Zarur*) the *French Nesflier*, *Mesplier*, and *Meflier*, and the fruite *Nefle* and *Mesple*, the *Germans Nespelbaum*, and the fruite *Nespel*, the *Spaniards Nesperas*, the *Dutch Mespelboom*, and we in *English*, the Medlar tree and fruite.

The Vertues.

Medlars have the like properties that Services have, but are more effectuall in operation to binde and stay any fluxes of blood or humours in man or woman, the leaves also have the same quality, but besides these effects the mellowed fruite is often served among other sorts of fruite to the table, and eaten with pleasure by those that have no neede of physicke, but worketh in women with childe, both to please the taste as in others, and to stay their longings after unusuall meates, &c. as also very effectuall for them that are apt to miscarry, and before their time to be delivered, to helpe that malady, and make them joyfull mothers: that of *Naples* is the more delicate, & is also accounted the more effectuall for the said purposes: the decoction of them is good to gargle and wash the mouth and throate, and teeth, when there is any defluxion of blood to stay it, and of humours, which causeth paines and swellings, to binde those destillations and ease the paines: the same also is a good bath for women to sit in or over, that have their courses come downe too abundantly, or for the piles when they bleede too much: the same also serveth well both to drinke and to bathe the stomacke warme, that is given to casting, to loath or not to hold and containe their meate and digest it, but if a pultis or plaister be made with dryed Medlars, beaten and mixed with the juyce of Red Roses, whereunto a few Cloves and Nutmegs may be added, and a little red Corall also, and applyed to the stomacke it will worke the more effectually: the dryed leaves in pouther strawed on bleeding or fresh wounds, restraineth the blood, and healeth up the wound quickely: both leaves and fruite are of singular good use to binde, and to strengthen whatsoever hath need of those qualities. The Medlar stones made into pouther and drunke in wine wherein some Parsly rootes have lyen infused all night, or a little boyled, doe breake the stone in the kidnies helping to expell them.

CHAP. XXV.

Chamæmespilus & Epimelis. Dwarfe Medlars and other such like small fruites.

THere are some other small fruites to be spoken of, that are fittest to be referred to Medlars and Services, though resembled to Quinces and Apples, by their Authours, and because they were not to be put into the former Chapters, I thought to entreate of them next unto them, in a Chapter peculiar to themselves.

1. *Chamæ-*

1. *Chamæmespilus.* The dwarfe Medlar.

This dwarfe Medlar which *Gesner* so called for some likenesse it had in the fruite, with the ordinary Medlar, although but a little, is a small woodly shrub, covered with a reddish ash coloured barke, having small leaves growing thereon, every one by it selfe, somewhat like unto Basill saith *Gesner*, but gray or hoary underneath, the blossomes are small and greenish, standing either singly or by couples on slender footestalkes, after which follow small reddish round berries, with a small crowne of leaves at the head like unto the Medlar, without any sappe or juyce therein, or very little, and having two or three small seedes like grape kernells within each: the leaves fall every yeare, and the roote liveth shooting up some twiggy stalkes.

2. *Epimelis Galeni.* The small baltard Medlar.

This differeth from the former in that it riseth with longer stemmes or stalkes, whose leaves are greene above and gray underneath, somewhat like unto the former, but somewhat larger, the flowers hereof come forth upon a pretty long footestalke one above another, very like unto the blossomes of *Arbutus* the Strawberry tree, that is, like a little round bottle with small brimmes, and not as the Medlar, laid open into five leaves, which flowers are of a pale blush colour, and turne into small berries, of a yellowish red colour, with a little head or crowne like the other, but lesser, not so bigge as Hawthorne berries, but as dry and sapelesse, with three or foure hard white seedes within them, of a little dry but no great harsh taste: the leaves hereof likewise fall away in Autumne, and rise againe in the Spring.

3. *Cotonaster Gesneri.*
Gesner his baltard low Quince.

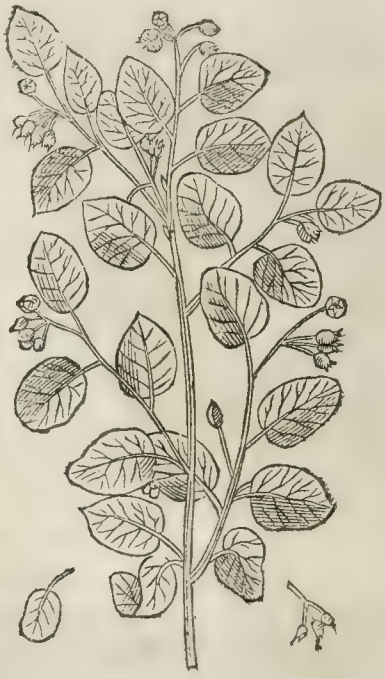
This little shrub, (*Gesner* sheweth to differ from his dwarfe Medlar, least any should suppose them to be both one,) hath larger and longer leaves, a little dented about the edges, yet hoary white, as the Quince tree leaves are, and hath berries not so round nor so red as it, but tending somewhat to yellow, with foure three square seedes in each berry.

The Place and Time.

Both the former and the later, grow in sundry places of *Germany*, and of *France* also, and so doth the other also, and their berries ripen in *August*.

1. *Chamæmespilus.* The dwarfe Medlar.

3. *Cotonaster Gesneri.*
Gesner his baltard low Quince.



2. *Epimelis Galeni.*
Small baltard Medlar.

The

The Names.

It pleaſeth *Geſner* to name the firſt *Chamæmeſpilum*, whom almoſt all ſince have followed, and called ſo in like manner, onely *Lugdunenſis* calleth it *Epimelis*, and maketh it the *Meſpilus* of *Dioſcorides*, which he ſaith ſome called *Epimelis*, and ſome *Setainum*, when as himſelfe ſaith in his Chapter of Medlars, that *Dioſcorides* his *Meſpilus Setania*; is our common Medlar, whoſe fruite as well as tree is farre greater then of this. The ſecond is the *Epimelis of Galen*, whereof he maketh mention *lib. 6. ſimpl. medic.* and differeth from the Medlar ſo called, whereof he ſpeaketh in another place; for he ſaith that the fruite hereof is ſowre, and hurtfull to the ſtomacke, and that the Country people of *Italy* did call it *Vnedo*, (which is probable they did ſo, becauſe the bloſſomes are very like thoſe of the *Arbutus* which is alſo called *Vnedo*) *Lugdunenſis* calleth it *Epimelis altera*, but is not *Cluſius* his third *Vitis Idæa*, as he thinketh, which hath blacke berries, but this hath red as he deſcribeth it, and therefore therein was deceived, yet thinketh it to be the *Cotonaſter* of *Geſner*, which *Cluſius* contradicteth. The third is indeede the *Cotonaſter* of *Geſner*, which *Cluſius* alſo mentioneth in his hiſtory of plants, with his *Chamæmeſpilus*, and *Vitis Idæa*. *Bauhinus* maketh a doubt whether it be not the *Agriomelea* of *Bellonius*. *Bauhinus* ſeemeth to make two ſeverall plants thereof, as may be ſeene in his *Pinax*. Theſe plants have gotten ſundry *Germane* names among the *Alpiſh* inhabitants and others, as by theſe divers names in Latine derived, for the *Germane* may be eaſily underſtood, and becauſe we wanted names to call them by, I have given it them as neere as I can, either from the Latine or their proper effects, and thus much may ſuffice untill we further be informed of them.

The Vertues.

There can be little ſaid of any of theſe plants, ſeeing ſo little hath beene ſaid by thoſe moderne Authours, that firſt wrote of them: for ſome of them being dry berries, are wholly neglected, and the other that have ſome better reliſh or ſweete taſte, are onely eaten by the Mountainers and their children, and not applyed as medicinable for any griefe.

CHAP. XXVI.

Acer. The Maple tree.

THere are onely foure ſorts of Maple trees knowne to us, that I am to ſhew you, but *Bauhinus* doth diſtinguiſh them into foure thus, *Sphendamnus* is that Maple that is white and full of veines, *Zygia* is yellow and criſpt, *Clinotrochon* is yellow and not criſpt, *Glinon* is white with few veines, but wee muſt give them you by other termes.

1. *Acer majus latifolium Sycomorus dictum.* The great broad leafed Maple or Sicomore tree.

The great Maple (which hath beene with many falſely called the Sycomore tree) groweth quickly to be a great

1. *Acer majus latifolium Sycomorus falſo dictum.*
The great broad leafed Maple or Sycomore tree.

2,3. *Acer minus & montanum.*
Our common wood Maple and the mountaine kinde.

and a tall tree, spreading many faire branches, which make a goodly shadow, covered with a reasonable smooth barke, having many very faire large leaves thereon, set upon reddish footestalkes, cut somewhat deepely into five somewhat long parts or divisions, all dented about the edges, greene above and grayish underneath, the flowers are of a whitish yellow greene colour, standing on a long stalke, with some few threds within them, each flower yeelding two winged huskes, parted at the stalke, which are thinne skinnes at the ends, and bunched out, where the seede lyeth within, and are very like unto the common or wood Maple, but much larger, and many more standing together: the wood is whitish and smooth, but not so white, smooth, and close, as the wood kinde is.

4. *Acer Creticum trifolium.*
The three leafed Maple tree.

2. *Acer minus sive vulgare.*

Our common or wood Maple tree.

The common Maple tree groweth lower & flower then the former, somtimes in hedges, no higher then those other hedge bushes, or els much highe rcovered with a more rugged barke, spreading neither so far nor such great branches, the leaves are much smaller, thinner and not so deepely cut in, but yet divided into five parts, and somewhat broad, at the setting on of the stalke, of a deepe and shining green colour on the upperside, and paler underneath: the flowers and seede are very like the former, but fewer set on the stalkes, and lesser also in bulke or bignesse; the wood hereof is very white, very smooth, and very close grained.

3. *Acer montanum.*

The mountaine Maple tree.

This Map'e differeth little from the last, that groweth well and great, differing chiefely in the leafe which is not flat next unto the stalke, and is somewhat deepelier cut into more divisions.

4. *Acer Creticum trifolium.*

The three leafed Maple of *Candy*.

This Maple groweth to be a tree of a meane size, spreading branches reasonable well, the barke whereof is of a darke reddish colour, having broad greene leaves full of veines, divided into three parts, standing equally distant one from another, with a long slender footestalke under them, the flowers stand onely a couple tegether on the stalke, as the seede that followeth doth also, winged somewhat like the last but smaller.

The Place and Time.

The first is no where found wilde or naturall in our Land that I can learne, but onely planted in Orchards or walkes for the shadowes sake, but groweth in sundry places in *Germany*, &c. The second and third are found both on high and low grounds, in Woods, and Groves, Parkes, Chases, and the like through most Countries of this Kingdome, the one in the moister grounds, where the wood will be looser, and the other in the dryer grounds, firmer and closer; but the last is also a stranger to us growing about *Mompelier* and *Candy*, they all flower about the middle of *Aprill*, and the seed is ripe in the end of *September*.

The Names.

It is called in Greeke σφένδαμνος & *Sphendamnus*, in Latine *Acer*. The first is that which *Clusius* calleth *latifolium*, because it hath the greatest and broadest leaves of any, and therefore *Tragus* calleth it *Platanus*, thinking as divers did, but it was the true *Platanus*, and therefore the *French* did call it *Plane*, before the true one was discovered and knowne. *Ruellius* and after him many others called it *Sycomorus* the Sycomore tree, which in divers Countries doth still continue, and with us also being called usually the Sycomore tree: but by this name of *Sycomorus* the Sycomore tree, divers Writers have called divers trees, as first the true Sycomore or Mulberry Figge, called of divers *Ficus Pharaonis*, *Ficus Ægyptia*, *Morus Ægyptia*, and *Ficus Cypria*. *Matthiolus* and others say that the *Italians* call the *Azadirach* by the name of *Sycomorus*. And *Petrus Crescentius*, calleth the *Virga sanguinea*, by the name of *Sycomorus*. And lastly *Ruellius* and others say that this *Acer latifolium*, is called *Sycomorus*, yet *Clusius* saith that the *French* call the lesser or wood sort so. The second is that which is most frequent in our Land, and called *Acer tenuifolia*, by *Cordus* in *histor*. *Acer minor* by *Dodonæus*, *Clusius*, and *Camerarius*, *Opio* by the *Romanes*, *Opulus* by *Gesner in hortis*, and *Cordus*, and *Opulus campestris* by *Lugdunensis*, who also taketh it to be *Carpinus*, but not rightly. The third is the *Acer is altera species, quæ fortè Zygia Theophrasti* of *Lobel*, by *Belonius Acer montanum*, *flavum & crispum*, and *Asphendamnos* by the Country men of *Candy*, by *Lugdunensis Opulus montana*, and can be no other then the *Zygia* of *Theophrastus*, which *Gaza* calleth *Carpinus*, which differeth much from the *Ostrys*, which some as is before said call *Carpinus*. And the last his *Glinon*, which hee rendereth *Gallicum*. The *Italians* call it *Pie doca*, and *Platano acquatico*, the *French Erable*, the *Germanes Masholder* the common sort, and *Ahorne* the greatest, the *Dutch Luytenhout*, and we in *English* Maple, and some, but as falsly as the *French* or any other, the Plane tree.

The Vertues.

Neither *Dioscorides* nor *Galen*, in his censure of simples, make any mention of this tree, yet *lib. 8. med. part. cap* 8. in the medicines for the Liver, written by *Asclepias*, he appointeth a dramme of the roote to be beaten to pouther, and given in water, but *Cornarius* doubteth that the word is mistaken, because none of the Greeke Writers have made any mention thereof, or that it should be used in any disease. And none but *Pliny* hath recorded any of these Maples, but saith that the roote of the Maple being bruised, is applyed with very great effect unto those that have obstructions, or any other paines of the Liver, or Spleene, which *Serenus* delivereth in these Verses following:

Si

Si latus immeritum morbo tentatur acuto,
Accensum tinges lapidem stridentibus undis,
Hinc bibis: aut Aceris radicem tunditis, & una
Cum vino capis, hoc præsens medicamen habetur.

Thy harmelesse side, if sharpe disease invade,
In hissing water quench an heated stone,
This drinke: Or Maple roote in pouther made
Take oft in Wine, a present medicine knowne.

It is used in many joyners works, especially the finest wrought grained wood, which *Pliny* peradventure meant *lib. 16. c. 16.* by that which he there calleth *Bruscum*, and *Molluscum*, the more excellent both of them as he saith, is *tuber Aceris*, the knotty part of the tree, or of the roote thereof, which is held to be fuller of diversified veines therein: either of which saith *Pliny*, if they were large enough to make a table, would excell the Cedar, as some take it, but others thinke it should be *Citrus* the Citron.

CHAP. XXVII.

1. *Platanus orientalis verus.* The true Planetree of the East Countries.

BEcause in the last Chapter it is shewed that the *French* and others were utterly mistaken in calling the Maple the Plane tree: I thought it meetest to shew you which is the true kinde next thereunto, and to joyne thereunto another sort, brought by Mr *Tradescant*, out of *Virginia*. It riseth up to be a very great tree in time, spreading very largely, the barke whereof is rugged, the leaves are very large, cut into five divisions, and each of them deepely gashed on the edges, greene above and whitish underneath, hanging by a slender reddish stalke, the flowers are of a pale white colour, many set together on a long stalke, after which follow sundry round rough bals of the bignesse of Wallnuts, made as it were a bur, but not sticking, wherein lye small seede, the wood is firme, hard, and yellowish browne.

2. *Platanus Occidentalis aut Virginensis.* The Plane tree of the West parts or *Virginia*.

This Plane tree likewise groweth great, and spreadeth fairely, whose leaves being broad and large, have not so deepe divisions in them, and the pills or burres are, although somewhat rough with the compleat roundnesse, not so sharpe as the former, which being set hereby is utterly spoyled in the cutting, they grow also many hanging downe from the ends of the branches, as in the others.

1. *Platanus Orientalis verus.*
The true Plane tree of the East Country.

2. *Platanus Occidentalis aut Virginensis.*
The Plane tree of the West parts or Virginia.

The Place and *Time.*

The former groweth not naturally in any Country of *Europe*, but in *Asia*, *Syria* *Egypt*, and *Africa* many, and they are planted also by the way sides, and in market places, for the shadowes sake onely: it is found with very few in our Christian world, and those onely great lovers of rarities, being very tender, not enduring without extraordinary care and keeping, the cold of our climates, the other is but lately brought from *Virginia* by M. *Tradescant.*

The Names.

It is called πλάτανος in Greeke, and *Platanus* in Latine, *a latè diffusis ramis nomen sortita est*: and by this name all Authours have called it that have written of it. The *Arabians* call it *Dulb*, the *Italians* *Platano*, the *French* *Platane*, that it may differre from the *Plasne*, whereby as is said they call the Maple, the *Germanes* know it not, and therefore they and the *Dutch* have no peculier name, but as they take it from the *French* *Plane*, even as we doe also, calling it the Plane tree: *Dioscorides* calleth the fruite or burres σφαῖρα, and *Pliny* *Pilulæ*. The *Virginian* being so like the other can have no other name.

The Vertues.

Galen saith that the Plane is of a moist and cold nature, but not farre from a temperate, and therefore the green leaves bruised and laid on inflammations and hot swellings doe helpe them, but the barke and the burres are more drying, which being boyled in vinegar, is good to gargle the mouth for the paine of the teeth: the burres also fryed with fat is good against burnings, the burnt barke mixed with water doth clense the skin of any scurfe, lepry, or other deformities of the skin, and doth dry up much also, old moist and running ulcers, bringing them to cicatrising: there is saith *Galen* and *Dioscorides*, a kinde of dust upon the leaves, which every one must be carefull to avoid, that it fall not into their eyes or eares, least it put them to much paine, the burres drunke in wine, resisteth the venome of the Scorpion, and other venemous creatures, the young tender leaves boyled in wine, and the eyes bathed therewith that have either redneſse or rheumes falne into them helpeth them.

CHAP. XXVIII.

Buxus. The Boxe tree.

THe Boxe tree, hath two or three diversities observed therein, which shall be shewed here, and with them another, which divers doe referre hereunto.

1. *Buxus arbor vulgaris.* Our common Boxe tree.

The Boxe tree groweth slowly, and seldome groweth to any great body, or any great height, but when it is suffered, after a long time riseth unto twise a mans height, and of the bigneſse of a mans thigh, with a grayish barke, but in many places very low, spread reasonable well, with branches, whereon are set many thicke small, somewhat long and round pointed leaves, abiding alwayes greene, larger, thicker, and greener then any ordinary Mirtle leaves, greater or lesser, as the bushes be in greatneſse, at the foote of the leaves come forth small greenish flowers, which turne into whitish round berries, with foure points at the toppes, with reddish seede within them: the wood is very solid close, of a whitish yellow colour, and so heavy that it sinketh being put into water.

2. *Buxus auratus.* Guilded Boxe.

This guilded Boxe groweth in like manner as the former, in some places taller and greater then in others, the leaves are altogether like it, but that most of the upper leaves in the Summer time will have a yellow list or guard about the edges, and in nothing else differing from the other.

3. *Chamæbuxus minor.* Small low Boxe.

This small Boxe groweth never high or great, and although neglected or suffered yet still it hath many slender twigs rising from the roote, and every branch apt to take roote, whereby it may quickely be propagated and encreased, the leaves are much smaller and finer then in the former, and of a deeper greene colour, which never bore flower or seede that I could observe or learne.

4. *Pseudo chamæbuxus.* The bastard low Boxe.

This small low plant lyeth most on the ground, with the slender rushlike greene branches, rooting as it spreadeth, and not rising a foote high having divers thicke hard leaves set theron without order, somewhat like unto Boxe leaves, or rather Mirtle leaves, being for the most part pointed at the ends, ever abiding greene: at the ends of the branches among the leaves come forth foure or five flowers of the fashion of Peaſe or Broom blossomes, the uppermost part whereof is whitish, and yellowish in the middle, but purplish lower, and in some purple above, and yellow below, after which come small flat cods like unto the broad *Thlaspi*, containing within them blackish gray round seede like Vetches: the roote spreadeth tough long branches in the ground, and abideth long.

The Place and *Time.*

The first is found with us in many woods, and wood grounds among other sorts of trees, it is also planted in divers Orchards, or house backe sides, where it never groweth high, but serveth as a bush to dry Linnen on, &c. The second hath beene likewise found in sundry places of this land, but onely neere those that have it. The third groweth also in gardens being planted either as a border to keepe up the beds, or as a hedge likewise to dry cloths on. The last *Clusius* found in sundry places of *Austria*, and *Hungaria*. and *Cordus* on the hils in *Bavaria*, &c.

The Names.

Boxe is called πύξος in Greeke διὰ τὸ πυκνὸν τῦ ξύλυ *adensitate ligni dicitur*, and *Buxus* in Latine, and therefrom came *pixides* the small vessels or boxes to hold and containe things in them. *Theophrastus* and *Dioscorides* have but one sort, but *Pliny* hath three, the first he calleth *Gallicum*, because it was made to grow into spires or pillars, unto a great height. The second *Oleastrum*, (but as *Dalechampius* on *Pliny* noteth, there is an errour in the mistaking of the word, in some Greeke copy that he followed, and for ἀγεώτροφον ἄγαν, *secundum omnino agreste esse*, he tooke it to be ἀγελαῖον εἶναι, *Oleastrum esse*) is wholly wild, and not profitable for any thing as the first kind is, being of a most loathsome sent, not fit to set against the house sides, as the third is: Another errour *Pliny* hath, that he saith the head of seede is called *Cratægus*, which he doth confound out of *Theophrastus* that speaketh of *Cratægus* next after *Buxus*, *lib.* 3. *c.* 15. and a third errour herein is, that he saith the Boxe beareth *Viscum* on

the

1. *Buxus arbor vulgaris.*
Our common Boxe tree.

4. *Pſeudo chamebuxus.*
The baſtard low Boxe tree.

the North ſide, and *Hyphear* on the South, which *Theophraſtus* ſaith of the *Ilex* to doe ſo. The firſt is generally called *Buxus & arbor*, or *arboreſcens* by all. The ſecond hath not beene mentioned by any Writer before me. The third is called *Chamæpyxos* by *Tragus*, and *Tabermontanus*, and *Buxus humilis* by *Dodonæus*. The laſt is the *Anonymos flore Coluteæ* of *Cluſius*, the *Anonymos Pervincæ folio* of *Camerarius in horto*: and *Rhus Myrtifolius Plinij Geſneri* alſo, *Geſner* in *Collatione ſtirpium* calleth it *Chamebuxus*, and *Beſler* that ſet out the great *hortus Eyſtetenſis*, *Pſeudochamæbuxus* as I doe. *Thalius* calleth that ſmall plant *Myrtus tenuifolius*, that *Cordus* calleth in *Obſervationum ſylva*, *Fruticulus exiguus foliis myrtinis*, which is this very plant. Box is called *Boſſo* by the *Italians*, and *Box* by the *Spaniards*, *Boys* by the *French*, *Buxbaum* by the *Germanes*, and *Palmboom* by the *Dutch*.

The Vertues.

The leaves of Box are hot and dry, and aſtringent withall, as the taſte declareth, and therefore aſſuredly doth dry and binde, yet is it not much uſed in Phyſicke by any now adayes that I know, although many doe trumpet out the praiſe of it to be good for fluxes, and the *French* diſeaſe, as much as *Guajacum*. *Fernelius* onely doth number the leaves hereof among thoſe things that doe purge, but the practiſe thereof is worne out of uſe, yet I remember that Doctor *Smith*, that was one of Queene *Elizabeths* Phyſitions, appointed the decoction of an ounce of the leaves of Boxe for a purging medicine, to be boyled in whey, and a dramme of the pouther in broth. But *Matthiolus* conteſteth againſt ſuch as tooke it, and the *Guajacum* to be both one: the leaves and the duſt of the wood boyled in lye, will make haires of an Aborne (or *Abraham*) colour, the dwarfe Boxe is fit as is ſaid to border the beds of a Garden, &c. and either they or the leaves of the other dryed and given to horſes, cureth them of the Bots, or Wormes: the wood is uſed for many ſmall workes among the Turners, and the diverſified boxe that hath crooked veines therein, ſerveth for inlaying to Joyners: there is no uſe knowne of the laſt as yet.

One medicine that I learned of a friend, who had tryed it effectuall, I will here ſet downe unto you, to cure the biting of a mad dogge, is to take the leaves and rootes of Cowſlips, of the leaves of Boxe and Penny-royall, of each a like quantity, ſhred them ſmall and put them into hot broth, and let it be ſo taken three dayes together, and apply the herbe, &c. to the bitten place, with ſope and hogges ſuet melted together.

CHAP. XXIX.

Salix. The Willow.

THe Willowes are to be divided into ſundry parts, for ſome grow high, ſome low, ſome with broad leaves, ſome with narrow and long, and that both high and low, ſome alſo onely growing in the waters, others delighting to grow by water ſides, and ditches, yet will alſo grow on the land. I will therefore diſtribute them into foure peculiar ſorts or orders, that is to ſay into thoſe that grow high

1. *Salix arborea angustifolia alba vulgaris.* The ordinary great white Willow tree.

3. *Salix rosea.* The Rose Willow.

and beare narrow leaves, into those that grow high, and beare broad leaves, into the lower sort with broad leaves, and into the lower with narrow leaves, and so I shall comprehend the whole number of them; and yet I must seperate the *Spyrea* of *Clusius* and the *Vitex* or *Agnus castus* into two chapters by themselves.

1. *Salix arborea angustifolia alba vulgaris.*

The ordinary great white Willow tree.

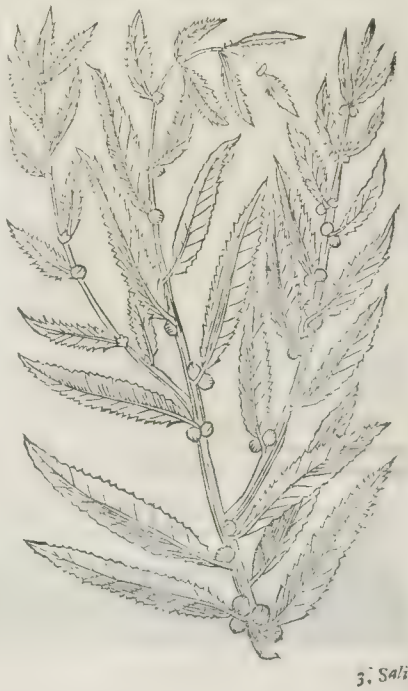
Our ordinary white Willow groweth quickely to be a great and tall tree, if it be not lopped as it is usuall in most places, with a smooth white barke on the body, and bigger branches, the younger sprigges, being somewhat greene with the whitenesse, the leaves are long and narrow, pale greene on the upper side, and of a shining silver white colour underneath, without any dent on the edges, the flowers come forth before the leaves appeare, and are small long and round, yellow mossie heads, smelling sweete for the most part, divers standing one above another, on a long stalke, which in time turne unto downe, that is blowne away with the winde, and the seede with it if it have any: the wood is soft and white, and with the branches hereof cut into long stickes are made stakes for hedges, or to uphold Vines, &c.

2. *Salix angustifolia purpurea seu nigra.*

The ordinary blacke Willow.

The blacke Willow differeth from the former white not growing so great or high, and that the barke is more rough and of a darke reddish colour, the branches lithy and easie to bend, as whereof hopes are made to binde caskes, the leaves likewise are narrower and blacker, and wood not so white.

5. *Salix Viminalis nigra.* The blacke Withye.



3. *Salix*

3. *Salix Roſea.* The Roſe Willow.

The Willow that beareth a tuft of ſmall greeniſh white leaues, on the reddiſh branches, ſet in order to- almoſt like a Roſe, is in growth like unto the laſt, the barke as rough and darke, the leaves not ſo long branches fully ſo lithye and pliant, yet reaſonably.

4. *Salix fragilis.* The hard blacke Willow.

This differeth from the ſecond, in that the branches are hard and blacke, ſtrong, and not pliant as the former, &c.

5. *Salix viminalis nigra.* The blacke Withy.

This Withy hath more ſlender branches, and more fit to be wound, of a darke red colour: the leaves are long and narrow, dented about the edges, of a darke greene, and a little white underneath, having two ſmall round leaves, at the ſetting on of every the long leaves, which ſheweth the kinde thereof.

6, *Salix Gallica nigra.* The *French* blacke Withy,

This differeth from the laſt in this, that the twigges are more yellowiſh browne, the leaves leſſe dented and hath no ſmall round leaves at the bottome of the longer.

The Place and *Time.*

Many of theſe ſorts are found in our owne land in low grounds, neere water courſes and ditches, and the Roſe Willow in ſundry places of *Eſſex*, and *Cambridge* ſhire: the bloſſomes come forth before any leaves appeare, and are in their fulleſt greatneſſe uſually before *Eaſter*, divers gathering them to decke up their houſes on Palme ſunday.

The Names.

It is called in Greeke ἰτέα, παρὰ τὸ ἴεσθαι, *quod cito in altum excreſcat*, and *Salix a ſaliendo* in Latine, becauſe it groweth with that ſpeed that it ſeemeth to leape. The firſt is common both with us and with other nations, and is that which *Theophraſtus* and *Pliny* call *Salix alba*, and *Salix perticalis* by *Matthiolus*, *Cordus*, *Lugdunenſis* and others, becauſe the branches thereof being ſtrong are uſed as ſtakes to hold up any thing, or to be bound thereunto. The ſecond is taken to be the true *Salix Amerina nigra & rubens* of *Pliny*, and of *Columella Salix Amerina & Sabina*, which *Matthiolus* calleth *Græca*, and *Dodonæus Gallica*, and by *Thalius Sabina*, and *Amerina*. The third is not mentioned by any forraigne Authour that I know of, *Gerard* having given the firſt knowledge thereof to the world. The fourth is called by *Bauhinus Salix fragilis*, as it is in the Title. The fift is called by *Lugdunenſis Salix* μελανόφλοιος, *i.e. cortice nigro* of *Theophraſtus*, and the *purpurea* of *Pliny*. The laſt is the firſt *Salix* of *Tragus*, the *Salix Gallica* of *Cordus* on *Dioſcorides*, and by *Lugdunenſis Salix Phenicea*. The *Arabians* call the Willow *Bulef Bhulles*, and *Saffaff* alſo, and *Chalif*, which names *Alpinus* and *Rauwolfius* give to their particular kindes, the *Italians Salice*, the *Spaniards Salce*, and *Salgueiro*, the *French Saulx*, and *Saule*, the *Germanes Weiden* and *Felbinger*, the *Dutch Milgheboom.*

The Vertues.

The Vertues of all the ſorts of theſe Willowes, as of the reſt are ſet downe together at the latter end of them, except ſuch as are mentioned in particular.

CHAP. XXX.

Salix arborea latifolia. The Sallow tree.

IF this kinde there are divers ſorts that plainely differre both from the former and among themſelves.

1. *Salix latifolia rotunda.* The round leafed Sallow.

This Sallow groweth to a reaſonable greatneſſe with a grayiſh white rugged barke outermoſt, and another redder inward, the outermoſt being pliant, and ſtrong, fit to binde things withall: the leaves hereof are broad and almoſt round, endented about the edges, darke greene above and gray underneath with two ſmall round leaves joyned to the foote of them: the flowers or catkins are not ſuch whole heads or tufts as the former kinde, but conſiſt of many ſmall heads, thicke ſet together, which are blowne away with the blackiſh ſeede in them as the others are: the wood hereof is more looſe and ſpongy then the other, and may by beating the head be writhed round or downeward, as is ſeene at the Chriſtmas time in many Noble and Gentlemens houſes ſet at their gates by their Porters.

2. *Salix latifolia oblongior.* The longer leafed Sallow.

This other differeth from the former onely in the leaves, which are not ſo round, but broad and long withall, dented about the edges, and in all things elſe alike: on the leaves of both theſe ſorts are found ſometimes certaine bladders or bliſters, and upon the branches little rough balles.

3. *Salix latifolia minor.* The leſſer broad Willow.

There is another ſort hereof that groweth not ſo high as the former, the leaves being of a meane ſiſe, betweene them two that is not ſo round nor ſo long, but of a darker greene colour, and gray underneath like unto them.

4. *Salix ſubrotundo argenteo folio.* The ſilver leafed Sallow.

This ſilver leafed Sallow groweth low like the laſt, having a browniſh barke to cover the body, but eſpecially the branches, the leaves are more long then broad, and ſhining ſilver-like underneath, ſomewhat leſſer then the laſt, the leaves and the barke being the chiefeſt differences in this from the laſt.

The Place and *Time.*

Theſe ſorts although they are ſometimes found by waters ſides, yet are they alſo found in the moiſter grounds, not neere crookes or ditches, and in the upland grounds as well: their time of flowring is with the former.

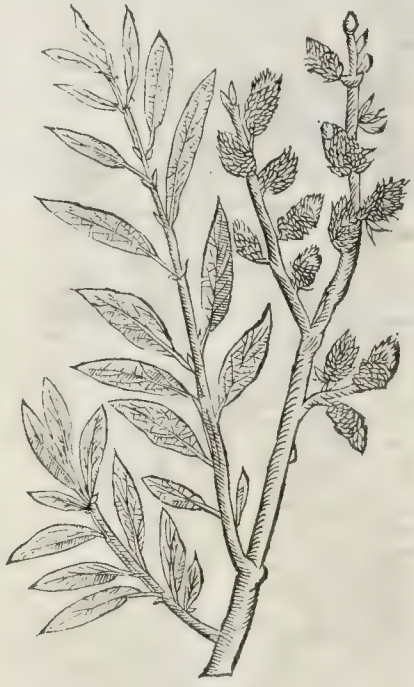
The Names.

This kinde is called *Salix arborea latifolia* to diſtinguiſh it from all the other kindes: the two firſt ſorts are mentioned by *Tragus*, as his fourth kinde, and called *Latifolia* or *platyphyllos* by *Cluſius*, *Camerarius*, *Thalius*, *Geſner*, *Lobel*, and *Lugdunenſis*, which *Tabermontanus* and *Gerard* call *Salix caprea rotundifolia*; and thought to be *Elaagnus* by ſome, and called *Salix latifolia aquatica* by others. The third is mentioned by *Thalius* onely,

and

1. *Salix latifolia rotunda.*
The round leafed Sallow.

2. *Salix latifolia oblongior.*
The long leafed Sallow.



and by *Bauhinus* from him. The laſt by *Bauhinus* onely, who calleth it *Salix ſubrotundo argenteo folio*, as it is in the title.

CHAP. XXXI.

Salix pumila latifolia. The low broad leafed Willow.

THere are likewiſe three or foure ſorts of this low kinde to ſhew you, which are as followeth.

1. *Salix humilis latifolia erecta.* The upright low broad Willow.

The branches of this low Willow are ſhort, not above a cubit long and ſtraked, or as it were creſted all along: the leaves are ſomewhat long with the roundneſſe and pointed at the ends, a little wrinckled above, and ſoft and woolly underneath: this creepeth not as the next, which diſtinguiſheth it.

2. *Salix latifolia repens.* Creeping broad leafed Willow.

The ſtalkes with the ſundry branches of this low Willow, having a rugged barke, doe for the moſt part ſpread on the ground, and take roote againe as they lie, the leaves are ſmall, yet ſomewhat broad and long, pointed at the ends, greene above and gray underneath and ſhining, the catkins hereof are thicker and ſhorter then in any other of theſe lower ſorts, the rootes hereof ſpread much in the ground.

3. *Salix latifolia Alpina repens.* Creeping mountaine broad leafed Willow.

This other ſort differeth little from the laſt, having a little ſmoother bark, a few rounder leaves, and ſmaller catkins, which abide untill *Auguſt*, and then ſhew their ſmall blacke ſeede within them, and great rootes much ſpread.

4. *Salix ſaxatilis minima.* The leaſt red or ſtone Willow.

The ſtocke hereof is thicke at the bottome, but ſhort, ſending forth two or three ſlender ſhort branches, lying on the ground, having long and ſomewhat round darke greene leaves thereon, with many veines therein, at the end whereof ſtandeth a ſmall round head made of many ſmall graines as it were ſet together, which when they are ripe open themſelves and ſheweth forth a ſhort ſoft white downe, out of a three ſquare huske, which is carryed away with the winde.

5. *Salix pumila abortiva.* The leaſt Willow without fruite.

This Willow groweth not much higher then ones hand with ſuch ſmall round leaves thereon, white on both ſides, that they exceede not the bigneſſe of a penny, ſtanding cloſe together, without either flower or ſeed, that it can ſcarſe be taken for a Willow.

6. *Salix Ægyptiaca & Syriaca.* The *Egiptian* Willow or of *Syria*.

This Willow that groweth familiarly both in *Egipt* and *Syria*, is neerer a ſhrub then a tree, ſpreading into many ſlender flexible and yellowiſh branches and ſtemmes alſo from the roote, whereon are ſet faire broad and large leaves

2,3. *Salix humilis latifolia & Alpina repens.*
The Creeping broad leafed and mountaine Willow.

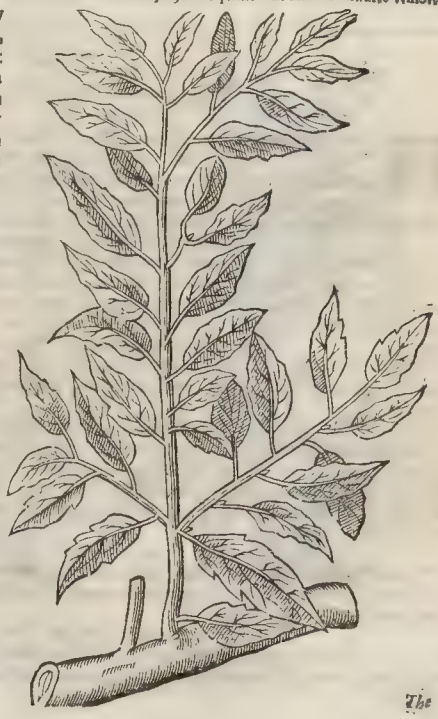
6. *Salix Ægyptiaca & Syriaca.*
The Egyptian Willow or of Syria.

leaves on both ſides, yet but one at a place uſually, eſpecially on the younger ſtemmes and branches, but grow ſmaller on the elder, with ſome leſſer with them alſo, greene on the upper ſide, and grayiſh underneath: at every joynt with the leafe uſually commeth forth a whitiſh ball or tuft, of a ſoft flocky ſubſtance, which by time is diſperſed into the aire, without bearing any ſeede for ought that hath been obſerved, yet may be in that flocky matter, as is uſuall in many other plants that beare flocky heads: but becauſe the flowers are very plentifull, and ſweete withall, the Natives diſtill a water from them, whereof they make a great account, calling it *Machaleb*, uſing it as an eſpeciall helpe for all ſorts of agues, but eſpecially in peſtilentiall and putride feavers, as alſo the infuſion or decoction of the flowers and for paines in the head and faintings of the heart, and the comforting and ſtrengthening thereof.

7. *Salix Arabica humilis foliis Atriplicis.*
The *Arabian* dwarfe Willow.

This *Arabian* likewiſe groweth low, with many pale yellowiſh branches, but thicker, more ſolid and ſtrong then the laſt, beſet on all ſides with leaves, that are of an handbreadth long, and two inches broad, ſomewhat jagged on the edges like unto a wild Arrache, what flowers or fruite it bore, was not obſerved, but of the coles of this ſort of Willow, they make their beſt Gunpouther.

7. *Salix Arabica humilis foliis Atriplicis.* The Arabian dwarfe willow.



The Place and *Time.*

Some of theſe ſorts are found in many places of this Land, as upon *Hampſtead* Heath, *Rumney* Marſhes and the like, although *Cluſius*, *Lugdunenſis*, and *Bauhinus*, have recorded them to grow in *Germany*, *Hungary*, and *Savoy*, &c. The two laſt according to their titles.

The

The Names.

Bauhinus calleth the firſt by the name in the title, as he doth the fourth alſo. The ſecond and third *Cluſius* calleth *Salix pumila latifolia*, the third here being his firſt, and his ſecond, the ſecond here. The fifth *Lugdunenſis* calleth *abortiva*, as it is in the title. The ſixt is remembred by *Alpinus* among his *Egiptian* plants, calling it *Calaf ſive Ban*, and *Veſlingius* ſaith the *Egiptians* and *Syrians* call it *Caleb* alſo, *Rauwolfius* ſaith the *Syrians* called it *Saffef*. The laſt *Rauwolfius*, alſo ſaith is called *Garb* by the *Arabians*, and *Garrab* by the Moores.

CHAP. XXXII.

Salix pumila anguſtifolia. Low narrow leafed Willowes.

HEreof there are divers kindes which grow diverſly ſome in more wet places then others, and firſt I muſt ſpeake of the *Oſier*, becauſe although it grow with longer twigges or roddes, then many of the reſt, yet it beareth narrow long leaves.

1. *Salix aquatica humilis.* The Oſier.

The Oſier hath a ſtumpe or ſtocke of a tree, as bigge as ones arme at the moſt, and not above a foote high, put with an head as bigge as a childes head, being kept thus low of purpoſe, becauſe the ſhootes or wands that riſe out of it, are cut every yeare for uſe, the barke whereof in ſome is yellowiſh or whitiſh, in others browniſh, the leaves are long and narrow, yet broader then any of the reſt for the moſt part that follow, dented about the edges, darke greene on the upper ſide, and whitiſh underneath: this hath not beene obſerved to beare any flowers, becauſe all the ſhootes are yearely lopped off cloſe to the head, but the rods thruſt into the ground will ſpring to be young trees, to be dreſſed in like manner, and ſo will any branch of the former greater ſorts.

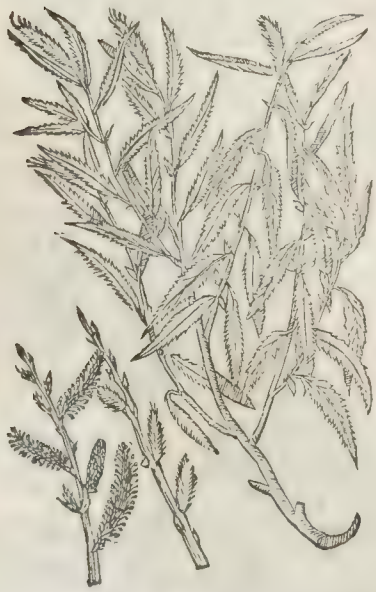
2. *Salix pumila anguſtifolia recta.* The ſtraight dwarfe Willow with narrow leaves.

The ſtemmes of this Willow are ſlender yet upright, not above a foote long, covered with a yellowiſh barke: the leaves are narrow and long like unto thoſe of Line or Flaxe, greene above and gray below, the young ones being wholly gray and hoary: the bloomings or catkins are ſoft and yellow, like the greater kindes, and come forth before the leaves, and paſſe into downe being ripe, that is blowne away with the winde, the roote is blacke of a fingers bigneſſe with fibers thereat, growing a ſlope.

3. *Salix humilis anguſtifolia repens.* Creeping low Willow with narrow leaves.

The branches of this low Willow, grow to be a foote or more long, but ſlender and leaning, and lying upon the ground, where it will ſhoote forth rootes againe, ſet with ſhorter and narrow leaves, divers comming forth together, greene above and gray below, in other things not unlike the former.

1. *Salix aquatica humilis.*
The Oſier.



2. *Salix pumila anguſtifolia recta.*
The ſtraight dwarfe Willow with narrow leaves.

3. *Salix humilis angustifolia repens.*
Creeping low Willow with narrow leaves.

4. *Salix oblongo incano folio.*
The blacke low Willow.

4. *Salix oblongo incano acuto folio.*
The blacke low Willow.

The ſtemme hereof is covered with a darke red barke, parted into ſundry ſhort branches with narrow long and ſharpe pointed darke greene leaves upon them, and hoary underneath, the reſt agreeth with the former.

5. *Salix Helice Theophraſti.*
Hungarian low Willow.

The branches of this Willow are very ſlender and pliant, though the body bee ſomewhat great, covered with a pale yellowiſh barke, the leaves grow by couples, being long narrow and ſharpe pointed, greene with a certaine hoarineſſe above and gray underneath, with ſome ſmall leaves at the bottomes of them, and with ſmall reddiſh bals or bliſters ſometimes on them alſo: the flowers, &c. agree with the former, but this is proper hereunto to have ſcaly heads of leaves at the ends of the branches.

5. *Salix Helice Theophraſti.*
Hungarian low Willow.

6. *Salix Alpina Pyrenea.*
Low Willow of the *Pyrenean* hils.

This ſmall Willow riſeth unto ſcarſe halfe a cubits height, with ſlender ſhort branches, full of ſmall long leaves, hairy all upon the edges, and as ſoft as Velvet, the ſtalke with the catkins thereon are an inch long, being ſoft and ſlender, but elſe like the reſt.

7. *Salix Alpina repens anguſtifolia non incana.*
The greene creeping Willow.
